Subject-wise Synopsis, IBQs & MCQ's

Medical Surgical Nursing

Synopsis

Inflammation and Wound Healing 3
Inflammation 3
Wound Healing 3
Types of Wounds 3
Wound Healing Process 3
Types of Wound Debridement 4
Key Nursing Responsibilities in Prevention and Care of Pressure Ulcer 4
Gangrene 5
Multiple Choice Questions 7
Immune System 9
Overview of Immune System 9
Immunoglobulins 9
Immunological Disorder 10
Multiple Choice Questions 13
Musculoskeletal System 16
Anatomy and Physiology of Musculoskeletal System 16
Classification of Bones 17
Review Points 18
Anatomy of Bone 19
Types of Joints in Human Body 20
Vertebral Column 21
Diagnostic Evaluation 21
Disorders of Musculoskeletal System 22
Orthopedic Surgeries 25
Crutches 26
Gout 28
Tendinitis 28
Bursitis 28
Osteoarthritis 28
Rheumatoid Arthritis 28
Osteomyelitis 29
Osteoporosis 29
Osteomalacia 29
Paget's Disease 29
Rhabdomyolysis 29
Spinal Column Deformities 29
Prolapsed Intervertebral Disc 30
Amputation of the Lower Extremity 30
Pott's Disease 30
Carpel Tunnel Syndrome 30
Disorders of Lower Limb 31
Multiple Choice Questions 33
Gastrointestinal and Hepatobiliary System 42
Gastrointestinal System 42
Hepatic Biliary System 55
Multiple Choice Questions 63
ENT System 81
Anatomy of Ear 81
Physiology of Hearing 82
Disorders of ENT 83
Disorders of Nose 84
Disorders of Throat 85
Multiple Choice Questions 87
Ophthalmology 92
Anatomy and Physiology of Eye 92
Assessment and Diagnostic Tests 93
Disorders of Eye 94
Multiple Choice Questions 100
Integumentary System and Burns 105
Integumentary System 105
Burns 109
Multiple Choice Questions 112
Respiratory System 118
Anatomy and Physiology 118
Classification of Respiratory System 119
Assessment and Diagnostic Tests 121
Disorders of Respiratory System 122
Multiple Choice Questions 129
Cardiovascular System 142
Anatomic and Physiologic Overview of Heart 142
Diagnostic Tests 146
Hemodynamic Monitoring 146
Disorders of Cardiovascular System 149
Coronory Artery Diseases 151
Nursing Care of Patient Undergoing CABG (Coronary Artery Bypass Graft) 153
Other Diseases of Heart 153
Arterial Diseases 154
Multiple Choice Questions 159
Hematology 179
Anatomy and Physiology of Hematologic System 179
Blood Groups and Blood Typing 181
Diagnostic Tests 181
Hematological Diseases and Disorders 181
Blood Transfusion 183
Multiple Choice Questions 186
Renal System 199
Anatomy and Physiology of Renal System 199
Functions of Kidney 201
Investigations 202
Disorders of Renal System 203
Renal Transplant 207
Miscellaneous Urinary Diseases 207
Multiple Choice Questions 209
Endocrine System 219
Anatomy and Physiology of Endocrine System 219
Diagnostic Tests in Endocrinology 221
Disorders of Endocrine System 221
Thyroid Gland 222
Parathyroid Gland 223
Endocrine-Pancreas 224
Adrenal Cortex 225

Scanned with CamScanner

VIDEO-BASED QUESTIONS (VBQs)

1. In the video, the nurse is preparing for which of the following procedure?

a. OG tube insertion
b. NG tube insertion
c. Sengstaken Blakemore tube insertion
d. PEG tube insertion

2. In the video, the nurse is confirming the placement of

a. Orogastric tube
b. Nasogastric tube
c. Sengstaken Blakemore
d. PEG tube

3. The procedure demonstrated in the video is related to

a. NG tube insertion
b. OG tube insertion
c. Sengstaken Blakemore tube insertion
d. PEG tube placement

4. The procedure demonstrated in the video is

a. Endotracheal tube insertion
b. Guedel's airway insertion
c. Laryngeal mask airway insertion
d. Oropharyngeal airway

Ans.

1. b
2. b
3. c
4. c

5. The procedure demonstrated in the video is

a. Endotracheal tube insertion
b. Guedel's airway insertion
c. Laryngeal mask airway insertion
d. Oropharyngeal airway

6. The procedure shown in the video is

a. Oropharyngeal intubation
b. LMA intubation
c. Endotracheal intubation
d. Ryle's tube insertion

7. The purpose of the procedure demonstrated in the video is to

a. Open and maintain patient's airway
b. Prevent the tongue from covering the epiglottis
c. Prevent obstruction of airway from relaxed upper airway muscle
d. All of the above

8. The equipment shown in the video is used to

a. Assess cuff pressure in endotracheal tube
b. Adjust cuff pressure in endotracheal tube
c. Both A and B
d. To confirm the placement of ET tube

9. The name of the handheld instrument used in he procedure is

a. Cuff Sphygmomanometer b. Cuff monitor
c. Cuff manometer d. Cuff barometer

10. Name the step of the procedure shown in the video during assessment using transcutaneous bilirubin meter?

a. Assessing Calibration b. Reading the result
c. Checking battery d. All of the above

Ans.

5.	b
6.	c
7.	d
8.	c
9.	c
10.	a

11. In the video, the healthcare worker is assessing the bilirubin level of the newborn using transcutaneous bilirubin meter. Apart from the site used for assessment in the video, which other site is also preferred for the assessment?

a. Ear pinna
b. Forehead
c. Anterior thigh
d. Abdomen

12. The procedure shown in the video is

a. Rinne's test
b. Romberg's test
c. Assessment of 7th Cranial nerve
d. Tandem gait test

13. A patient with ataxia is undergoing the test shown in the video. What is the possible interpretation if the patient tests positive for the test?

a. Ataxia is cerebellar in nature
b. Ataxia is sensory in nature
c. Ataxia is due to toxic reaction
d. Ataxia is due to cerebral palsy

14. The assessment procedure shown in the videos is

a. Bruits
b. Nuchal rigidity
c. Carotid pulse
d. Apical pulse

15. Which of the following is being assessed in the video

a. Apical pulse
b. Lung sound
c. Aortic regurgitation
d. None of the above

Ans.

11. b
12. b
13. b
14. c
15. a

"Nursing is one of the Fine Arts: I had almost said the finest of Fine Arts."

—Florence Nightingale

UPDATES ON COVID-19

History and Origin of Coronaviruses

- Coronaviruses are large group of viruses that cause illness in humans and animals.
- The outbreak of Novel coronavirus disease (COVID-19) was initially noticed in a seafood market in **Wuhan city in Hubei Province of China** in mid-December, 2019.
- A pneumonia of unknown cause detected in Wuhan, China was first reported to the WHO Country Office in China on 31 December 2019.
- The outbreak was declared a "Public Health Emergency of International Concern" by WHO on 30 January 2020.
- WHO declared COVID-19 a pandemic on 11th March, 2020.

Definition of COVID-19 Case

- **Confirmed Case:** A person with laboratory confirmation of COVID-19 infection, irrespective of clinical signs and symptoms.

Epidemiology

- Current available evidence for COVID-19 suggests that the causative virus (SARS-CoV-2) has a zoonotic source closely related **to bat-origin SARS-like coronavirus**
- It is an **enveloped RNA beta coronavirus** related to the Severe Acute Respiratory Syndrome (SARS) virus
- The virus has been shown to use the angiotensin-converting enzyme 2 (ACE2) receptor for cell entry
- **Source of infection:** The persons infected by the novel coronavirus are the main source of infection.
- **Mode of transmission:**
  - Direct person-to-person transmission occurs through close contact
  - Aerosolized droplets generated through coughing, sneezing or breathing
  - **Direct contact with patient and their body fluids including faeces**
  - **Indirect contact with surfaces and fomites**
  - Infection can also occur if a person touches an infected surface and then touches his or her eyes, nose, or mouth
- **Incubation period:** The median incubation period is **5 days (range 2–14 days).**
- As per the current evidence, the period of infectivity starts 2 days prior to onset of symptoms and lasts up to 8 days

Pathophysiology

- Most patients with COVID-19 predominantly have a respiratory tract infection associated with SARS-CoV-2 infection
- However, in a small proportion of cases, they can progress to a more severe and systemic disease characterized by the Acute Respiratory Distress Syndrome (ARDS), sepsis and septic shock, multiorgan failure, including acute kidney injury and cardiac injury.

Scanned with CamScanner

Clinical Features

- Fever, cough, Fatigue, Shortness of breath, Expectoration, Myalgia, Rhinorrhea, sore throat, diarrhea, Loss of smell (anosmia) or loss of taste (ageusia) preceding the onset of respiratory symptoms.
- As per data from Integrated Health Information Platform (IHIP)/ Integrated Disease Surveillance Programme (IDSP), the common signs and symptoms reported are (as on 11.06.2020)
  - Fever (27%)
  - Cough (21%)
  - Sore throat (10%)
  - Breathlessness (8%)
  - Weakness (7%)
  - Running nose (3%)
  - Others 24%

Risk Factors

- Advanced age (age > 60 years)
- Underlying non-communicable diseases (immune-suppression, diabetes, hypertension, cardiac disease, chronic lung disease, cerebrovascular disease, Chronic kidney disease, and cancer

Severity of Cases

Clinical severity	Clinical presentation
Mild	• Patients with uncomplicated Upper Respiratory Tract Infection (RTI) with mild symptoms such as fever, cough, sore throat, nasal congestion, malaise and headache • Without evidence of breathlessness or Hypoxia (normal O_2 saturation)
Moderate	Pneumonia with no signs of severe disease **Adult or Adolescent:** • Presence of dyspnea or hypoxia • Fever, cough, including SpO_2 (range 90-94%) on room air • Respiratory rate ≥24 breaths/min **Child <2 months:** • Respiratory rate ≥ 60 breaths/min **Child 2-11 months:** • Respiratory rate ≥ 50 breaths/min **Child 1-5 years:** • Respiratory rate ≥ 40 breaths/min
Severe	Severe pneumonia Acute respiratory syndrome Sepsis Septic shock

Infection Prevention Control Practices

- **At triage:** Give suspected patient a triple layer surgical mask and direct patient to separate area or an isolation room if available
- **Apply standard precautions:** It includes use of Personal Protective Equipment (PPE), appropriate patient placement, prevention of sharp injury, safe biomedical waste management, cleaning and disinfection of equipment and environment

- Apply droplet precautions
- Apply contact precautions
- Apply airborne precautions when performing an aerosol generating procedure

Laboratory Diagnosis

- Two kinds of tests are available for COVID-19
  - **Viral tests:** Real time or Conventional RT-PCR test is recommended for diagnosis.
  - **Antibody tests:** SARS-CoV-2 antibody tests are not recommended for diagnosis of current infection with COVID-19
- **Specimen collection:**
  - **Preferred sample:** Throat and nasal swab in viral transport media (VTM) and transported in cold chain
  - **Alternate:** Nasopharyngeal swab, Bronchoalveolar lavage (BAL) or endotracheal aspirate which has to be mixed with the viral transport medium and transported in cold chain

Management

Mild Cases

- There is no definitive treatment available
- Isolation, symptomatic management and supportive care are the main treatment choices.
- Detailed clinical history is taken including that of comorbidities
- Patient is followed up daily for temperature, vitals and Oxygen saturation (SpO_2)
- Counsel patients with mild COVID-19 about signs and symptoms of complications that should prompt urgent care.
- Symptomatic treatment such as antipyretic (Paracetamol) for fever and pain
- Adequate nutrition and appropriate rehydration
- **Tab Hydroxychloroquine (HCQ)** may be considered for any of those having high risk features for severe disease (age >60; Hypertension, diabetes, chronic lung/kidney/liver disease, Cerebrovascular disease and obesity) under strict medical supervision

Moderate Cases

In addition to intervention provided for mild cases:

- **Oxygen support:** Target SpO_2: 92-96% (88-92% in patients with COPD)
- Awake proning may be used as a rescue therapy
- All patients should have daily 12-lead ECG
- Follow C-Reactive Protein (CRP), D-dimer & Ferritin every 48-72 hourly (if available); CBC with differential count, Absolute Lymphocyte count, KFT/LFT daily
- **Tab. Hydroxychloroquine** (400 mg) BD on 1st day followed by 200 mg 1 BD for 4 days. (after ECG Assessment)
- Consider **IV methylprednisolone 0.5 to 1 mg/kg for 3 days** (preferably within 48 hours of admission or if oxygen requirement is increasing and if inflammatory markers are increased)
- Prophylactic dose **of Unfractionated heparin (UFH) or Low Molecular Weight Heparin (LMWH)** (e.g., enoxaparin 40 mg per day SC)
- Control of comorbid condition

Scanned with CamScanner

Management of Severe Cases

- Early supportive therapy and monitoring
  - **Supplemental oxygen therapy:** Initiate oxygen therapy at 5 L/min and titrate flow rates to reach target $SpO_2 \geq 90\%$ in non-pregnant adults and $SpO_2 \geq 92\text{-}96\%$ in pregnant patients
  - Children with emergency signs (obstructed or absent breathing, severe respiratory distress, central cyanosis, shock, coma or convulsions) should receive oxygen therapy during resuscitation to target $SpO_2 \geq 94\%$
  - Use conservative fluid management in patients
- Management of hypoxemic respiratory failure and ARDS
  - High-Flow Nasal Cannula oxygenation (HFNO) or noninvasive mechanical ventilation
  - Endotracheal intubation and mechanical ventilation may be required
- Management of septic shock

Investigational Therapies for COVID-19

At present (as on June 2020), use of the following therapies is based on a limited available evidence (as per the protocol by DGHS, MoHFW)

- **Remdesivir** (under Emergency Use Authorization) may be considered in patients with moderate disease. **Dose:** 200 mg IV on day 1 followed by 100 mg IV daily for 5 days
- **Convalescent plasma** may be considered in patients with moderate disease who are not improving despite use of steroids. **Dose:** Dose is variable ranging from 4 to 13 mL/kg
- **Tocilizumab** (Off Label) may be considered in patients with moderate disease with progressively increasing oxygen requirements and in mechanically ventilated patients not improving despite use of steroids. **Dose:** 8 mg/kg (maximum 800 mg at one time) given slowly in 100 mL NS over 1 hour
- **Hydroxychloroquine. Dose:** 400 mg BD on day 1 followed by 400 mg daily for next 4 days

SEQUENCE OF DONNING AND DOFFING OF PPE WHILE CARING FOR COVID-19 PATIENTS

Sequence for Donning of PPE

S.No.	Procedure
1.	Wash hands with soap and water
2.	Wear shoe cover
3.	Wear 1st pair of gloves
4.	Wear gown
5.	Wear the mask/respirator (check for any leaks)
6.	Wear goggles/face shield
7.	Wear hood
8.	Wear 2nd pair of gloves
9.	Gown fitness check (ask buddy to help)

Sequence for Doffing of PPE

S.No.	Procedure
1.	Check for any leak or soiling in PPE before doffing (disinfect site if contaminated)
2.	Disinfect the hands while wearing gloves (similar to hand hygiene procedure)
3.	Remove shoe covers only by touching the outer surface (by sitting on **DIRTY** chair)
4.	Perform hand hygiene
5.	Remove outer gloves
6.	Perform hand hygiene
7.	Remove hood
8.	Perform hand hygiene
9.	Remove gown
10.	Perform hand hygiene
11.	Remove goggles/face shield
12.	Perform hand hygiene.
13.	Remove second pair of gloves
14.	Perform hand hygiene
15.	Wear new pair for gloves
16.	Remove mask (don't touch the front of mask, handle with slings/bands)
17.	Perform hand hygiene
18.	Clean all pocket articles (Pens and scissors) with alcohol swab/disinfectant
19.	Perform hand hygiene
20.	Clean shoes with alcohol swabs (by sitting on **CLEAN** chair)
21.	Remove last pair of gloves and perform hand hygiene

Contd...

Note:

(a) Get into scrubs or comfortable clothes, remove jewellery, ensure you had water and food and visited washrooms etc. as the nurses are expected to stay inside for at least 6 hours.

(b) The observer needs to be in PPE when observing doffing.

(c) Two chairs should be placed in doffing area labelled **DIRTY & CLEAN**

(d) Check all PPE before starting donning.

(e) Hand hygiene should be done **any time the WHO "5 moments" apply** and **before** PPE and **after** removing PPE.

"Ill-health of body or of mind, is defeat. Health alone is victory."
—Thomas Carlyle

UPDATED QUESTIONS ON COVID-19

1. **Which of the following virus causes the disease COVID-19?**
   a. NIPAH b. SARS
   c. MERS d. SARS-CoV-2
2. **The outbreak of Novel coronavirus disease (COVID-19) was initially reported from:**
   a. Madrid city, Spain b. Wuhan city, China
   c. Rome, Italy d. New York, USA
3. **The outbreak of COVID-19 was declared a "Public Health Emergency of International Concern" by WHO on:**
   a. 31 December, 2019 b. 30 January, 2020
   c. 11 March, 2020 d. 19 March, 2020
4. **WHO declared COVID-19 as global pandemic on:**
   a. 31 December, 2019 b. 30 January, 2020
   c. 11 March, 2020 d. 19 March, 2020
5. **Coronavirus is a:**
   a. Enveloped RNA virus
   b. Enveloped DNA virus
   c. Non-enveloped DNA virus
   d. Single stranded DNA virus
6. **Which of the following diseases are related to coronavirus?**
   a. Severe Acute Respiratory Syndrome (SARS)
   b. Middle East Respiratory Syndrome (MERS)
   c. Both A & B
   d. None of the above
7. **Mode of transmission of COVID-19 is:**
   a. Direct contact b. Respiratory droplets
   c. Fomites d. All of the above
8. **Which of the following patient is at lowest risk of developing complications due to COVID-19:**
   a. Patient aged > 60 years
   b. Under five children
   c. Patient with comorbidities
   d. Patient with immunosuppression
9. **Which of the following signs/symptoms is most commonly reported among COVID-19 infected patients?**
   a. Fever b. Sore throat
   c. Weakness d. Running nose
10. **Some of the common symptoms of COVID-19 are similar to:**
    a. Scabies b. Influenza
    c. Asthma d. Cholera
11. **Dedicated COVID-19 treatment Unit should have preferably negative pressure rooms with a minimum of:**
    a. 5 air exchanges per hour
    b. 8 air exchanges per hour
    c. 12 air exchanges per hour
    d. 15 air exchanges per hour
12. **In COVID treatment unit, high touch surfaces should be disinfected every:**
    a. 1-2 hourly b. 3-4 hourly
    c. 2-4 hourly d. 6-8 hourly
13. **An adult patient with which of the following symptoms is considered to be a moderate case of COVID-19:**
    a. Patients with uncomplicated Upper Respiratory Tract Infection
    b. Patients with pneumonia, presence of dyspnea or hypoxia and RR ≥24 breaths/min
    c. Patients with pneumonia, presence of dyspnea or hypoxia and RR ≥24 breaths/min
    d. Patients with Severe pneumonia, ARDS, and Septic shock
14. **An adult patient with which of the following symptoms is considered to be a severe case of COVID-19:**
    a. Patients with uncomplicated Upper Respiratory Tract Infection
    b. Patients with pneumonia, presence of dyspnea or hypoxia and RR ≥24 breaths/min
    c. Patients with pneumonia, presence of dyspnea or hypoxia and RR ≥24 breaths/min
    d. Patients with Severe pneumonia, ARDS, and Septic shock
15. **Which of the following is the viral test for COVID-19 case findings recommended by ICMR?**
    a. Real time or Conventional RT-PCR test
    b. SARS-CoV-2 antibody tests
    c. Both A and B
    d. None of the above
16. **Which of the following is the most preferred sample for laboratory diagnosis of COVID-19?**
    a. Venous blood sample in a heparinised vial
    b. Throat and nasal swab in viral transport media (VTM)
    c. Mid-stream urine specimen
    d. All of the above
17. **Which of the following drug is recommended by ICMR for prophylactic use in asymptomatic healthcare workers involved in containment and treatment of COVID-19?**
    a. Hydroxychloroquine b. Remdesivir
    c. Tocilizumab d. Methylprednisolone
18. **Which of the following solution is used to disinfect the surfaces in COVID treatment units?**
    a. 1% Hypochlorite solution
    b. Dettol
    c. Savlon
    d. Sterillium

19. Which of the following is the right sequence of donning PPE while caring for COVID-19 patients?

I. Shoe cover II. Hood
III. N-95 mask IV. First pair of gloves
a. I, II, III, IV b. I, III, II, IV
c. I, IV, III, II d. IV, III, II, I

20. Which of the following is the right sequence for doffing PPE after caring for a COVID-19 patient?

I. Shoe cover II. Remove outer gloves
III. Remove hood IV. Remove gown
a. I, II, III, IV b. II, III, II, I
c. I, IV, III, II d. IV, III, II, I

21. The most common complication of COVID-19 is:

a. Fever
b. Dehydration
c. Pneumonia
d. Weakness

22. A neonate born to a COVID positive mother should be tested for COVID-19 within:

a. 14 days of delivery
b. One month of delivery
c. Two months of delivery
d. Six months of delivery

23. All of the statements are correct regarding care of COVID-19 patient who is on mechanical ventilator, except:

a. Apply suction for no longer than 10 seconds
b. Open suctioning is preferred over closed suctioning
c. Airborne precautions should be taken when performing suction
d. Prone positioning is recommended for the patient with COVID-19 while on mechanical ventilator

24. How many number of nurses should involve in dumping the condensation from the ventilator to container?

a. 1 nurse
b. 2 nurses
c. 3 nurses
d. 4 nurses

25. A healthcare worker who comes into contact with a positive COVID-19 patient without proper PPE should be quarantined for:

a. 7 days b. 14 days
c. 21 months d. 28 days

26. Which of the following solution is recommended to disinfect the dead body of COVID-19 patient before putting in body wrap is:

a. 20% sodium hypochlorite solution
b. 50% isopropyl alcohol
c. 5% Savlon solution
d. 1% sodium hypochlorite solution

27. Centre for Disease Control (CDC) recommended distance between persons for social distancing is:

a. 3 feet b. 6 feet
c. 8 feet d. 10 feet

28. As per the social distancing guidelines for COVID-19 by MOHFW, India, the minimum distance that has to be maintained between persons during social gathering is:

a. 1 metre (3 feet)
b. 2 metre (6 feet)
c. 3 metre (9 feet)
d. 4 metre (12 feet)

29. Which of the following is an appropriate measure to handle emotional problems during quarantine period in suspected or confirmed COVID-19 patient?

a. Staying calm, developing a structured schedule for daily activities in isolated zone
b. Switch to social drinking to relieve from anxiety
c. Play outdoor games
d. All of the above

30. How many pairs of gloves is/are used during donning of PPE while caring for COVID-19 patient?

a. 1 pair
b. 2 pairs
c. 3 pairs
d. As per the preference of the nurse

BLOOD SUPPLY OF HEART

Scanned with CamScanner

5

"Food that is good for the heart is likely to be good for the brain."

—Hippocrates

LOBES OF BRAIN AND THEIR FUNCTIONS

THE BRAIN

Cerebrum	Cerebrum is the largest part of the brain
Temporal lobe	Contains the primary auditory cortex, which receives auditory information from the ears and secondary areas
Occipital lobe	The interpretation of visual patterns occurs in this lobe of the brain
Ventricles	Ventricular system in brain comprises of four ventricles • Lateral ventricles (right and left) • Third ventricle • Fourth ventricle (diamond-shaped, situated between pons and cerebellum) The right and left lateral ventricles of the brain are continued with the third ventricle by interventricular foramina
Meninges	• Meninges are the membrane that covers the brain. It has three layers • Dura mater (outermost layer, thick and durable) • Arachnoid mater (Middle layer, impermeable to fluid) • Pia mater (Innermost layer, delicate)
Hypothalamus	• Responsible for secretion of number of essential hormones • Hormones from hypothalamus regulates temperature regulation, thirst, hunger, sleep, mood, sex drive, and the release of other hormones within the body
Cerebrospinal fluid	• Clear, watery fluid is found in the central canal of the spinal cord • Cerebrospinal fluid flows in the space between two of the layers in a space called the **subarachnoid space** • Secreted in Choroid plexuses of lateral ventricles
Respiratory center	• Respiratory center is found in medulla oblongata
Corpus callosum	• It is a mass of white matter, which connects right and left cerebral hemispheres
Parasympathetic nervous system	• It is responsible for "rest and digest" and "feed and breed"
Sympathetic nervous system	• Increased sympathetic stimulation causes vasoconstriction and increases peripheral resistance • Fight or flight response is stimulated by body's sympathetic nervous system

SLINGS AND SPLINTS

Splint type	Indications
Dorsal	Sprains or soft tissue injuries of the wrist
Volar	Sprains or soft tissue injuries of the wrist
Thumb spica	Immobilization of the thumb
Radial gutter	Immobilization of middle fingers
Ulnar gutter	Immobilization of third or fourth fingers
Sugar tong	Immobilization of wrist and elbow following fracture of the proximal forearm and of bones surrounding the elbow joint
Anteroposterior	Fracture of distal bones of the forearm
Posterior long-arm	Fracture of bones of the forearm and of bones surrounding the elbow joint
Posterior gutter (also called long-leg)	Fracture of the upper tibia, fibula, or bones surrounding the knee joint
Stirrup short-leg	Soft tissue injury or bone fracture of the ankle

ACTS AND LEGISLATIONS

Act and legislations	Key updates
Maternity Benefit Act (Amendment) 2017	The amendments to Maternity Benefits Act, 1961 are • Maternity benefit (full paid absence from work) increased from 12 weeks to 26 weeks for two surviving children and 12 weeks for more than two children • 12 weeks maternity benefit for adopting mother • Mandatory provision of creche in establishments having more than 50 employees. Four visit to creche per day should be allowed.
HIV and AIDS (Prevention and Control) Act 2017	• Prohibition of discrimination in employment, healthcare services, educational establishments, use of any goods, accommodation, services, facility etc. • Informed consent for undertaking HIV test or treatment is mandatory (Except certain cases, e.g. court order, blood transfusion, epidemiological surveillance) • No person shall be compelled to disclose HIV status (except by an order of court) • A healthcare provider may disclose the HIV positive status of a person under his direct care to his or her spouse/partner.
National Health Policy, 2017	National Health Policy 2017 replaced the previous NHP 2002. Highlights of NHP 2017 • Aims to raise public healthcare expenditure from current 1.4% to 2.5% of GDP • It envisages providing a larger package of assured comprehensive primary healthcare through the "Health and Wellness Centres" **The package includes** • Major non-communicable diseases (NCDs) • Mental health • Geriatric health • Palliative care services • Rehabilitative care services **Key quantitative objectives** • Increase life expectancy at birth to 70 by year 2025 • Reduction of TFR at national level to 2.1 by 2025. • Reduce neonatal mortality to 16 by 2025 • Reduce still birth rate to single digit by 2025 • Reduce IMR to 28 by 2019 • Reduce under-five mortality to 23 by 2025 • Achieve and maintain elimination status of lymphatic filariasis by 2017, Kala-azar by 2017 and leprosy by 2018. • To reduce prevalence of blindness to 0.25/1000 by 2025 • To achieve and maintain a cure rate of >85% in new sputum positive patients for TB. To reach elimination by 2025. **Coverage of health services** • Increase utilization of health services by 50% from current levels by 2025. • Antenatal coverage to be sustained above 90% • More than 90% of newborn should be fully immunized by one year of age by 2025. • Family planning target above 90% by 2025. • Policy identified coordinated action on 7 priority areas • *Swachh Bharat Abhiyan* ▪ Balanced, healthy diet and regular exercises ▪ Addressing tobacco, alcohol and substance abuse • *Yatri Suraksha:* Prevents RTA and Rail accident related deaths • *Nirbhaya Nari:* Action against gender violence ▪ Reduced stress and improved safety in the work place ▪ Reducing indoor and outdoor air pollution

Act and legislations	Key updates
National Medical Commission Bill, 2017	• Cabinet approved National Medical Commission Bill 2017 on December 15, 2017. The bill replaces the Medical Council Act 1956. • **Key points** ▪ Better coordination with AYUSH systems of treatment ▪ Medical advisory council for advising National Medical Commission ▪ Introduction of National Eligibility-cum-Entrance Test (NEET) for UG admission under the purview of National Medical Commission. ▪ Introduction of licentiate examination for graduating students under the purview of National Medical Commission. ▪ Undergraduate Medical Education Board (UGMED), Post-graduate Medical Education Board (PGMED) to oversee all aspects of medical education at respective levels.
Mental Healthcare Act, 2017	• The parliament has recently passed the Mental Healthcare Bill, which repeals and replaces the Mental Health Act, 1987. • The Mental Healthcare Act, 2017 came into existence on April 7, 2017. • **Salient features includes** ▪ It broadens the definition of the mental disorder. ▪ Act provides for an **'advance directive'** in writing, which is not for minors, stating how they want to be treated for the particular illness, and which has to be vetted by the medical practitioner. ▪ **It does not include mental retardation**. It is defined as a condition of arrested or incomplete development of a person's mind, especially characterized by **sub-normality of intelligence** ▪ It guarantees **rights regarding property**, and the manner of better treatment. ▪ The Bill guarantees every person the **right to access mental healthcare** and treatment from the government. ▪ The Bill **decriminalizes suicide**. It states that whoever attempts suicide will be presumed to be under severe stress, and shall not be punished for it. Therefore, Section 309 of Indian Penal Code will be read as this one. ▪ The **electroconvulsive therapy** will only be allowed with the use of anesthesia and, moreover, not to be given for minors. ▪ Every insurance company shall **provide medical insurance for mentally ill patients.**

"Whatsoever you do, do with all your heart."
—Confucius

CONVERSION FROM CELSIUS (°C) TO FAHRENHEIT (°F)

- **The formula is** (°C × 9/5) + 32 = °F or (°F - 32) × 5/9 = °C
- Let us convert 37°C to Fahrenheit
  - 37°C × 9/5 + 32 = 98.6°F
- Let us convert 98.6°F to Celsius
  - (98.6°F - 32) × 5/9 = 37°C

"Children have more need of role model than of critics."
—Joseph Jonbert

DECONTAMINATION OF EQUIPMENT AND UNIT

Antiseptics and Disinfectants

Key Terms

Sterilization: Freeing of an article, surface or medium by removing or killing all microorganisms including vegetative form of bacteria, spores, viruses, fungi.

Disinfection: Destruction or inhibition of growth of all pathogenic organisms (bacteria, viruses, fungi) on nonliving surfaces. If spores are also killed the process is known as sterilization.

Disinfectant: It is a germicidal chemical substance used on the inanimate objects to kill most recognized pathogenic microorganisms but not necessarily all microbes.

Antisepsis: It is the process of destruction of disease causing microorganisms to prevent infection in patient's body surface. The process may be bactericidal or bacteriostatic.

Antibiotics: Any variety of natural or synthetic material/chemical that inhibits growth or destroys the microorganisms.

Properties of Good Antiseptic/Disinfectant

- Cidal
- Nonstaining and good odor
- Active against all disease-causing microorganisms
- Active in presence of pus, blood and exudates
- Rapid acting
- Nonirritating to tissues/non-corrosive
- Nonabsorbable
- Nonsensitizing

Mechanisms of Action of Antiseptic and Disinfectants

Oxidation of bacterial protoplasm: Potassium permanganate, H_2O_2, Halogens.

Coagulation (denaturation) of bacterial proteins and disrupt cell membrane: Phenols, chlorhexidine, alcohols, aldehydes.

Detergent like action increases permeability of bacterial cell membrane: Cetrimide, soaps

Antiseptics: These are chemical substances, which stops the growth or kill microorganisms on living surfaces such as skin and mucous membrane.

Strengths of Chemical and their Actions on Equipment and Supplies

Chemical	Strength	Type of instruments	Action and time
Glutaraldehyde	2%	All metal instruments Airways and endotracheal tubes Plastic Glass	Sterilize articles in 10 hours Sterilize articles in 10 minutes
Isopropyl alcohol	70%	All metal instruments Scope lenses Ambu bag and its face mask Thermometer probes Clinical glass thermometer Trolley tops Electric razors	Disinfection of articles in 10 minutes
Sodium hypochlorite	0.5% (Add 500 mL of 1% sodium hypochlorite in 500 mL of boiled water to make total quantity of 1 L)	All types of metal, glass, plastic and rubber items scope lenses	Decontamination, disinfection of articles in 10 minutes Fresh solution to be prepared daily
Chlorhexidine gluconate	Add 100 mL 0.5% solution in 900 mL of boiled water to make 1 L	Bedpans Furniture	Disinfection in 10 minutes

Target High - Fifth Premium Edition

Chemical	Strength	Type of instruments	Action and time
Clean solution of phenol	2%	All metal instruments Toughened plastics Glass Delicate items Tubing	Sterilization in 12 hours at room temperature of 20°C
Formalin	7 gm per cubic meter	All metal instruments Toughened plastics Glass Delicate items Tubing	Disinfection in 10 minutes
Savlon	5% pure solution	Cheatle forceps Clinical glass Thermometer Furniture instruments	Disinfection in 20 minutes

Cleaning, Disinfection of Various Items

Procedure	Rationale	Scientific principle
Glass items: Disinfect the items by immersing in 0.5% chlorine/sodium hypochlorite Chlorhexidine solution minimum for 5 minutes in plastic container covered with lids.	To decrease the number of microorganisms on the surface of the items	Chlorine kills many microorganisms by releasing free oxygen
Enamel wares: Immerse the items in a chlorine solution of 0.5%.	To disinfect	Disinfection can kill most of the bacteria and viruses like hepatitis B virus (HBV), human immunodeficiency virus (HIV), (microbiology)
Stainless steel items: Always immerse in 0.5% of chlorine solution for five minutes.	To disinfect	Disinfection destroys many of the pathogens
Needles: Decontaminate all types of needles attached to syringe and flush with 0.5% chlorine solution/chlorhexidine/sodium hypochlorite immediately after use.	To render the article safe for use	To decontaminate and make the article availability for reuse
Proctoscope and bronchoscope: Immerse both obturator and speculum in a 0.5% chlorine solution minimum for 10 minutes, then rinse in water, boil for 10 minutes. Then send for autoclaving.	To decontaminate	To decontaminate and make the article availability for reuse
Sharp instruments: Immerse the sharp instruments in a 0.5% chlorine solution or in 2% glutaraldehyde (CIDEX) for 12 minutes at 20°C. Add antirust agents, e.g. sodium nitrate, 0.1%, if available.	To disinfect and sterilize the instruments	Disinfection destroys many of the pathogens
Laryngoscope: Detach the blade separate and immerse it in a 2% glutaraldehyde solution for 12 minutes	To decontaminate	By decontaminating we can make it ready for next use

Commonly used Skin Disinfectants and Antiseptics

Biocides	Most commonly used dilution
Alcohols (ethanol, isopropanol, n-propanol)	60–95%
Chlorhexidine gluconate	Aqueous or detergent preparations containing 0.5% or 0.75% chlorhexidine alcohol preparations containing 4% chlorhexidine
Chloroxylenol (parachlorometaxylenol: PCMX)	0.3–3.75%
Hexachlorophene	3%
Iodophors (povidone-iodine)	7.5–10%
Quaternary ammonium compounds	0.05 to 0.2% quat
Triclosan	0.2–2%

—George Jessel

SOME DISEASE CONDITIONS AND THEIR PRIMARY SIGNS/SYMPTOMS

Disease/condition	Important signs/symptoms
Addison's disease	Bronze like skin pigmentation
Angina	Crushing, stabbing pain relieved by Nitroglycerin (NTG)
Appendicitis	Rebound tenderness at McBurney's point Rovsing's sign (palpation of LLQ elicits pain in RLQ) Psoas sign (pain from flexing the thigh to the hip)
Asthma	Wheezing on expiration
Basilar skull fracture	Raccoon eyes (periorbital ecchymosis) Battle's sign (mastoid ecchymosis)
Buerger's disease (Inflammation and thrombosis in small and medium-sized blood vessels)	Intermittent claudication (pain at buttocks or legs from poor circulation resulting in impaired walking)
Bulimia	Chipmunk faces (parotid gland swelling)
Candidiasis	White cheesy odorless vaginal discharges
Cataract	Blurry vision
Chancroid	Painful chancres
Chicken pox	Pleomorphism: All stages of the rash (papules, vesicles and crusts) are seen simultaneously
Chlamydia	Milky discharge and painful urination
Cholecystitis	Murphy's Sign (pain in the Right Upper Quadrant)
Cholera	Rice-watery stool and washer woman's hands (wrinkled hands from dehydration)
Cirrhosis of liver	Spider angioma
COPD	Barrel-Chested
Cushing's syndrome	Moon face appearance and buffalo hump
Cushing's triad	Bradypnea (irregular decreased respiration) Bradycardia Systolic hypertension
Cytomegalovirus (CMV) infection	Owl's eye appearance of cells (huge nucleus in cells)
Deep vein thrombosis (DVT)	Homan's Sign
Dengue	Thrombocytopenia, fever, rash, and headache, positive Herman's sign
Dengue	Petechiae
Diabetes mellitus	Polydipsia, polyphagia, polyuria
Diabetic ketoacidosis	Acetone breathe
Diphtheria	Pseudomembrane formation
Down syndrome	Protruding tongue, single crease on palm, flat nasal bridge, epicanthal fold, flat facial profile
Emphysema	Barrel chest
Gastroesophageal reflux disease (GERD)	Heartburn
Genital Warts	Warts are 1-2 mm in diameter
Glaucoma	Tunnel vision

Contd...

Scanned with CamScanner

Disease/condition	Important signs/symptoms
Gonorrhea	Green, creamy discharges and painful urination
Grave's disease (hyperthyroidism)	Exophthalmos (bulging of the eye out of the orbit)
Guillain-Barre syndrome	Ascending muscles weakness
Hepatitis	Icteric sclera (yellowish discoloration of sclera)
Herpes Simplex Type II	Painful vesicles on genitalia
Hirschsprung's disease (toxic megacolon)	Ribbon-like stool
Hyperthyroidism	Exophthalmos
Intussusception	Sausage-shaped mass, current jelly like stool
Kawasaki disease	Strawberry Tongue
Leprosy (Hanson's disease)	Leonine faces (faces that resemble that of a lion)
Malaria	Stepladder like fever with chills
Measles	Koplik's spots (clustered white lesions on buccal mucosa)
Meningitis	Brudzinski's sign (forced flexion of the neck elicits a reflex flexion of the hips) Kernig's sign (stiffness of hamstrings causing inability to straighten the leg when the hip is flexed to 90 degrees)
Multiple sclerosis	Charcot's Triad: Nystagmus, intention tremor, and dysarthria
Mumps	*Parotitis (swollen, painful salivary glands)*
Myasthenia gravis	Descending muscle weakness, ptosis (drooping of eyelids)
Myocardial infarction (MI)	Levine's sign (clutching of the chest) Crushing, stabbing pain radiating to left shoulder, neck, and arms. Not relieved by NTG
Pancreatitis	Cullen's sign (ecchymosis of the umbilicus), Grey Turner's sign (bruising of the flank)
Parkinson's disease	Pill-rolling tremors
Patent ductus arteriosus	Washing machine-like murmur
Pernicious anemia	Beefy red tongue (Schilling's Test)
Pneumonia	• Rust-colored sputum or • Greenish rusty sputum
Pregnancy induced hypertension (PIH)	Proteinuria, hypertension, edema
Pulmonary tuberculosis (PTB)	Low-grade afternoon fever
Pyloric stenosis	Olive like mass, projectile vomiting
Retinal detachment	Flashes of light, shadow with curtain across vision
Syphilis	Painless chancres
Systemic lupus erythematosus	Butterfly rash
Tetanus	Risus sardonicus or rictus grin
Tetany	Hypocalcemia, [+] Trousseau's sign (jerky movements); Chvostek sign (muscle twitching face)
Tetralogy of Fallot • Pulmonary stenosis • Overriding of aorta • Ventricular septal defect • Right ventricular hypertrophy	Characterized by clubbing of fingernails
Thrombophlebitis	Homan's sign
Trichomoniasis	Yellow, itchy, frothy, and foul-smelling vaginal discharges
Typhoid	Rose spots in the abdomen

"We don't know life, how can we know death?"
—Confucius

RADIATING PAIN/REFERRED PAIN

Location of pain	Description
Head	"Ice-cream headache" or "brain freeze" is an example of referred pain. In this, the vagus nerve (in the throat) or the trigeminal nerve (in the palate) transmit pain signals, because of the rapid cooling and rewarming of the capillaries in the sinuses.
Upper chest/left limb	Myocardial ischemia; the sensation may occur in the upper chest as a restricted feeling, or as an ache in the left shoulder, arm or even hand.
Right tip of scapula	Liver, gallbladder
Left shoulder	Thoracic diaphragm, spleen (Kehr's sign), lung
Back	Pancreas
Palm of hand	Palmaris longus: A problem originating in the forearm might be felt in the palm, and not in the forearm.
Phantom limb pain	Phantom limb pain is the sensation of pain from a limb that has been lost or from which a person no longer receives physical signals. It is an experience reported by quadriplegics and patients with amputated extremities.

"Just when the caterpillar thought the world was ending, he turned into a butterfly."

—Proverb

FETAL CIRCULATION AND ITS POSTNATAL CHANGES

There are 3 shunts or bypass channels in fetus (DV, FO and DA) and 3 vessels connecting to placenta (2 A +1 V)

Sequences of Postnatal events

Clamping → Interruption of umbilical cord
↓
Physiological closure of **DV** and umbilical vessels
↓
Pulmonary vascular resistance and ↑systemic resistance
↓
Functional closure of DA (10–15 hrs)
↓
Anatomical closure of DA (by 2–3 wks)
↓
Anatomical closure of DV and umbilical v/s (by 2–3 months)
↓
Functional closure of FO (by 3 months)
↓
Anatomical closure of FO (by 6 months)

Fate of fetal shunts

Lt. Umbilical vein → Ligamentum teres
Foramen ovale is replaced by → Fossa ovalis
DA becomes → Ligamentum arteriosum
DV becomes → Ligamentum venosum
Urachus (Fibrous remnant) → **Median** umbilical ligament
Umbilical artery (distal part) forms → **Medial** umbilical ligament

Note:
a - Artery
v - Vein

CRANIAL NERVES, THEIR TYPES AND FUNCTIONS

Cranial Nerve	Fibers	Structures innervated	Functions	Brainstem nucleus
I Olfactory	Sensory	Olfactory epithelium (via olfactory bulb)	Olfaction	
II Optic	Sensory	Retina	Vision	
III Oculomotor	Motor	Superior/middle/inferior rectus, inferior oblique, levator palpebrae	Movement of eyeball	Oculomotor nucleus
	Parasympathetic	Pupillary constrictor, ciliary muscle of eyeball. Both via the ciliary ganglion	Pupillary constriction and accommodation	Oculomotor nucleus
IV Trochlear	Motor	Superior oblique	Movement of eyeball	Trochlear nucleus
V Trigeminal	Sensory	Face, scalp, cornea, nasal and oral cavities, cranial dura mater.	General sensation	Trigeminal sensory nucleus
	Motor	Muscles of mastication	Opening/closing mouth	Trigeminal motor nucleus
		Tensor tympani muscle	Tension of tympanic membrane	Trigeminal motor nucleus
VI Abducens	Motor	Lateral rectus	Movement of eyeball	Abducens nucleus
VII Facial	Sensory	Anterior 2/3 of tongue	Taste	Nucleus solitarius
	Motor	Muscles of facial expression	Facial movement	Facial motor nucleus
		Stapedius muscle	Tension of ossicles	Facial motor nucleus
	Parasympathetic	Salivary and lacrimal glands via submandibular and pterygopalatine ganglia	Salivation and lacrimation	Superior salivatory nucleus
VIII Vestibulocochlear	Sensory	Cochlea	Hearing	Cochlear nucleus
		Vestibular apparatus	Proprioception of head, balance.	Vestibular nucleus
IX Glossopharyngeal	Sensory	Eustachian tube, middle ear	General sensation	Trigeminal sensory nucleus
		Carotid Body, and sinus	Chemo/baroreception	
		Pharynx, posterior 1/3 of tongue	Taste	Nucleus solitarius
	Motor	Stylopharyngeus	Swallowing	
	Parasympathetic	Salivary glands via the otic ganglion	Salivation	Inferior salivatory nucleus
X Vagus	Sensory	Pharynx, larynx, esophagus, external ear	General sensation	Trigeminal sensory nucleus
		Aortic bodies and arch	Chemo/baroreception	
		Thoracic and abdominal viscera	Visceral sensation	Nucleus solitarus
	Motor	Soft palate, larynx, pharynx, upper esophagus	Speech, swallowing	Nucleus ambiguus
	Parasympathetic	Cardiovascular, respiratory and gastrointestinal systems	Control of these systems	Dorsal motor nucleus of vagus
XI Accessory	Motor	Sternomastoid, trapezius	Movement of head and shoulders	Nucleus ambiguus, cranial nerves
XII Hypoglossal	Motor	Intrinsic and extrinsic muscles of tongue	Movement of tongue	Hypoglossal nucleus

"An imaginary ailment is worse than a disease."

—Yiddish Proverb

TYPES OF JOINTS IN HUMAN BODY

Name of the joints	Description	Examples
Fibrous joint	These joints are linked with tough, fibrous material and these joints permits no movement	Joint between the skull bone the sutures
Cartilaginous joint	These are connected entirely by cartilage (fibrocartilage or hyaline). These joints allow more movement between the bone than a fibrous joint but less than highly mobile synovial joint	• Between the manubrium and sternum • Between the vertebra • Symphysis pubis • Epiphyseal plates
Synovial joint	It is characterized by the presence of space or capsule between the articulating bones. The end of the bones are held together by fibrous tissue and capsule is lubricated with small amount of fluid called synovial fluid and permits range of motion	
Types of synovial joints		
Ball and socket joint	The head of one bone is ball-shaped and articulate with a cup-shaped socket of another. The joint allows wide range of movement, including flexion, extension, adduction, abduction rotation and circumduction	Hip joint, shoulder joint
Hinge joint	Articulating surface of bone forms an arrangement like hinge on a door and movement is restricted to flexion and extension	Elbow, knee, ankle, interphalangeal
Gliding joint	Surface are flat or curved, gliding one over another, but the amount of movement is very restricted	Carpals and tarsal bone, intervertebral joint
Pivot joint	In this one bone fits into a hoop-shaped ligament that hold its close to another bone and allow it to rotate in ring form	Head, radioulnar joint
Condyloid joint	Joint sits within a cup-shaped depression of another bone	Condylar process of mandible and temporal bone, between metacarpal and phalanges of hand, between metatarsals and phalanges of foot
Saddle joint	The articulating surface of bone fit together like a man sitting on a saddle	At the base of thumb, between trapezium and first metacarpal bone

ENDOCRINE GLANDS AND HORMONES

Hormones	Secreting gland	Action	Deficiency leads to	Excessive amount leads to
Growth hormone (GH)	Anterior pituitary gland	Promotes growth	Growth retardation Dwarfism (short stature)	Acromegaly in adult Gigantism in children
Prolactin	Anterior pituitary gland	Helps to produce milk	Lack of milk production	
Follicle-stimulating hormone (FSH)	Anterior pituitary gland	**Stimulates** • The growth of follicles in the ovaries • Sperm development in the testes	Infertility or subfertility	
Luteinizing hormone (LH)	Anterior pituitary gland	Triggers ovulation in females Stimulates testosterone production in males.	Delayed puberty	
Oxytocin	Posterior pituitary	Uterine contractions; lactation		
Vasopressin (antidiuretic hormone)	Posterior pituitary	• Stimulates water retention • Raises blood pressure by contracting arterioles	Diabetes insipidus	Syndrome of inappropriate antidiuretic hormone (SIADH)
Thyroxine (T4) and Triiodothyronine (T3).	Thyroid	• To increase the basal metabolic rate • Affects protein synthesis • Helps regulate long bone growth (synergy with growth hormone) and neural maturation, and • Increase the body's sensitivity to catecholamines (such as adrenaline) by permissiveness. The thyroid hormones are essential to proper development and differentiation of all cells of the human body. These hormones also regulate protein, fat, and carbohydrate metabolism, affecting how human cells use energetic compounds.	Hypothyroidism	Hyperthyroidism
Calcitonin	Thyroid	Calcitonin helps to mobilize calcium from blood to bone Inhibits osteoclast activity in bones	Osteoporosis, renal stone, hypercalcemia	Hypocalcemia

contd...

Scanned with CamScanner

Target High - Fifth Premium Edition

Hormones	Secreting gland	Action	Deficiency leads to	Excessive amount leads to
Parathormone	Parathyroid	Parathormone helps to mobilize calcium from bone to blood Stimulates osteoclast activity in bones	Hypocalcemia	Hypercalcemia, osteoporosis, renal stone
Mineralocorticoids (aldosterone)	Adrenal cortex	Aldosterone is largely responsible for the long-term regulation of blood pressure. Aldosterone effects on the distal convoluted tubule and collecting duct of the kidney where it causes increased reabsorption of sodium and increased excretion of both potassium (by principal cells) and hydrogen ions (by intercalated cells of the collecting duct)	This condition may result in hyperkalemia, when it is sometimes termed 'type 4 renal tubular acidosis' even though it doesn't actually cause acidosis. It can also cause urinary sodium wasting, leading to volume depletion and hypotension.	Hypertension (high blood pressure) and low blood potassium levels
Glucocorticoids	Adrenal cortex	It stimulates gluconeogenesis, the production of glucose from newly released amino acids and lipids. It increases blood glucose levels in response to stress, by inhibiting glucose uptake into muscle and fat cells	Addison's disease	Cushing syndrome
Adrenal androgens (dehydroepiandrosterone (DHEA) and testosterone)	Adrenal cortex	**Testosterone:** A hormone with a wide variety of effects, ranging from enhancing muscle mass and stimulation of cell growth to the development of the secondary sex characteristics **Dihydrotestosterone (DHT):** A metabolite of testosterone, and a more potent androgen than testosterone in that it binds more strongly to androgen receptors	Some of the suggested symptoms of androgen deficiency in women may include: • Lethargy • Loss of muscle mass and strength • Loss of libido • Lack of motivation • Low emotional state • Lowered mood	Acne, hirsutism, virilization and reproductive dysfunction
Insulin	Beta cells of pancreatic islets	**Insulin** helps in controlling the blood glucose levels by facilitating the liver, muscle and fat cells to utilize glucose from the blood. The **major function of insulin** is to counter the concerted actions of a number of hyperglycemia-generating hormones and to maintain low blood glucose levels	Diabetes mellitus Hyperglycemia	Hypoglycemia
Glucagon	Alpha cells of the pancreas	The pancreas releases **glucagon** when the concentration of glucose in the bloodstream falls too low. **Glucagon** causes the liver to convert stored glycogen into glucose, which is released into the bloodstream.		**Pompe disease** is an inherited disorder caused by the build up of a complex sugar called **glycogen** in the body's cells. (Glycogen storage disease type II)

POSITIONS

Name of the positions	Descriptions and images	Uses
Supine	It is a back-lying position with arms on the side 	• Physical examination • Resting • Undergoing anesthesia • Lung biopsy
Dorsal recumbent	It is also a back lying position, in this patient's head and shoulder may be elevated on a small pillow. Arms are resting on side. Legs are apart with knees flexed and foot resting on the bed. 	• Physical examination of abdominal and genital area • Perineal care • PV examination
Trendelenburg	Patient is lying on the back with arms on the side. In this position bed is positioned in such a way that head of the bed is lower than foot of the patient and there is no flexion at the waist level. 	• Shock patient • Hypotensive patient • Cord prolapse patient • To shift abdominal organ upward during certain surgeries. • Air embolism
Reverse Trendelenburg	It is just opposite to Trendelenburg position. In this position, head of the bed is elevated than the foot level with no flexion at waist level. 	• To minimize gastroesophageal reflex

Contd...

Scanned with CamScanner

Name of the positions	Descriptions and images	Uses
Lateral	Patient is lying either on left or right side, with hip and knees flexed, top leg in front of the bottom leg. In this position pressure, on back and coccyx will be relieved and pressure is distributed along the scapula, lateral aspect of the ilium and the greater trochanter of the femur.	• To promote lung and cardiac function • To relieve pressure on back and coccyx • After liver biopsy right lateral position. • Patient with pyloric stenosis after meals right lateral to promote entry of food into stomach and intestine • During seizure attack and air embolism - left lateral
Sim's	Patient is lying on lest side with semi-prone position, one arm is located behind the patient and other arm is flexed at shoulder and elbow. Both legs are flexed at the level of hip and knee but the upper leg is more flexed and is drawn up to the level of chest. 	• Rectal examination • Administering enema • To prevent aspiration
Low Fowler's	In this position, head of the bed is elevated at 30° with flexion at the level of waist. 	• To prevent aspiration during tube feeding • During increased ICP
Semi-Fowler's	In this position, head of the bed is elevated to 45° with flexion at the level of waist. 	• To promote lung expansion • To relieve tension on surgical site following abdominal surgeries • Tracheoesophageal fistula • Paracentesis

Contd...

Scanned with CamScanner

Name of the positions	Descriptions and images	Uses
High Fowler's	Head of the bed is elevated at 90° with flexion at the level of waist. 	• To prevent the risk of choking • To relieve respiratory distress • Nasogastric tube intubation • ARDS • Asthma • COPD • Emphysema • Pleural effusion
Orthopneic position	In this position, patient is sitting on or side of a bed, with an overhead table to lean forward, pillows will be provided to increase the comfort level of the client.	• To relieve respiratory distress • Thoracentesis • Pericarditis patient • ARDS • Asthma • COPD • Emphysema
Prone position	Patient is lying on the abdomen with head turned to one side, to promote comfort, pillow can be used under head and a small pillow or towel roll can be used under the abdomen. 	• To prevent aspiration • Recovery position after anesthesia • To relieve pressure on the back and coccyx • Renal biopsy • Neural tube defect • Position after spinal surgery and hemorrhoidectomy
Lithotomy	Lying on back with legs flexed at hip and knee joint and legs are supported with leg rest and strap. 	• Child birth • Pelvic gynecological surgeries • Transurethral Resection of Prostrate (TURP)
Knee-chest position (Genupectoral position)	Patient rests on the knees and chest with head is turned to one side, arms extended on the bed, and elbows flexed and resting so that they partially bear the patient's weight; the abdomen remains unsupported, though a small pillow may be placed under the chest. In this position severe hypotension occurs because of pooling of blood in the extremities 	• Sigmoidoscopy • Lumbar laminectomy

INSTRUMENTS

Name of the instruments	Picture of the instruments	Uses
Adson thumb forceps		• For holding and manipulating delicate tissues
Alli's/Alli's tissue forceps		• Alli's tissue forceps are used for grasping organs and slippery or dense tissue during electrosurgery
Vulsellum		• Used in gynecological operations to hold the tip of cervix • This structure is similar to Alli's forceps except they are very long
Artery forceps		• Used for grasping, compressing, and holding the end of an artery during ligation
Right angled artery forceps		• To isolate, encircle and ligate vessels or ducts, especially those present in depths

Contd...

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Kocher's Forceps		• To hold securely superior thyroid pedicle vessels • Hold retracting cut ends of vessels in tough fibrous tissue • Hold ribs during rib resection • To cause artificial rupture of gestational membrane
Babcock forceps		• Used to grasp delicate tissue in laser procedures. They are frequently used with intestinal and laparotomy procedures.
Bard parker handle or scalpel handle (Also known as BP Handle or Blade Holder)		• Intended to be used with BP Safety Blades for tissue separation, and other procedures that require a sharp surgical blade to puncture or cut.
Cautery or electrocautery		• Removal of unsightly warts • To burn or coagulate the specific area of tissue
Cheatle forceps		• Used to remove sterilized instruments from boilers and formalin cabinets. The forceps are placed in a container of methylated spirits when not in use.
Deavers retractor		• Used to hold back the abdominal wall during abdominal or thoracic procedures.

Contd...

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Doyen's towel clip		• Used to fix draping towels. • Used for fixing diathermy cables, suction tubes etc
Doyens-retractor		• Used in pelvic surgery
Cat's Paw/Volkman's retractor		• Retraction of skin and tough fascia
Langenbeck retractor		• In operation involving a lot of dissection in superficial muscle pain which requires retraction, e.g. Hernioplasty, Thyroidectomy
Mayo's towel clip		• Fix drapes in a manner to expose operative field only • Also used to fix tubing's and cautery wire to drapes in a way that they don't fall
Morris double ended retractor		• To retract strong structures like abdominal wall muscles and it gives wider space to work

Contd...

Target High - Fifth Premium Edition

Name of the instruments	Picture of the instruments	Uses
Mosquito artery forceps or small artery forceps		• As a hemostat, holding cut edges, to open up abscess, hold free ends of the suture, hold cut end of the sutures, breaking loculi, etc.
Needle-Holder (Mayo Hager Needle Holder)		• Used to hold a suturing needle for closing wounds during suturing and surgical procedures
Scalpel blade		• For incisions
Scissors		• Are used for sharp as well as blunt dissection and also for cutting various tubing's, surgical dressings, gauze, sutures, etc.
Self-retaining retractor		• Self-retaining retractors allow hands free operation during a surgery
Ear syringe		• To instil irrigating solutions into the ear

Contd..

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Iris scissors		• It is a scissor with sharp pointed tips used during ophthalmic surgery.
Sputum mug		• To collect expectorate from patient. • Before collecting expectorate some disinfecting solutions should be poured into the mug.
Rampleys sponge holding forceps		• To hold cotton or sterile gauze piece with or without antiseptic solution to clean body part before medical, diagnostic or surgical procedure.
Tongue forceps		• To hold tongue during oral surgeries without causing any damage or injury to it.
Aneurysm needle		• To hold delicate structures such as blood vessels and nerves during procedures
Trochar		• To create holes in body part, e.g.: to create holes before laparoscopic surgery.

Contd...

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Proctoscope / rectoscope		• To examine anus, rectum and sigmoid colon.
Reflex hammer	 	• To elicit deep tendon reflexes during neurological and physical examination to assess the functioning of central and peripheral nervous system.
Kidney tray		• To collect waste material following surgery or any procedure.
Tongue depressor	 	• These are the instruments which allow us to depress the tongue and allow the visualization of mouth and throat. • Nowadays wooden type disposable tongue depressors are commonly used than stainless steel type tongue depressor.

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
		
Thudichum nasal speculum		• Speculum widens the nasal cavity and allows the better visualization of nasal cavity during therapeutic and diagnostic procedures.
Toothed dissecting forceps		• Used to hold tissue during procedures
Nontoothed dissecting forceps		• Used in the reconstruction of eyelid surgery
Adsons Pickup forceps (Adsons Tissue forceps)		• Adson Tissue Forceps are used for holding and manipulating delicate tissues. These **forceps** have a wide and flat thumb grasp area that is commonly serrated.
Crocodile forceps/ hartmann alligator forceps		• Used to remove foreign body during ENT procedure

Contd..

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Tracheal dilator		• Used to widen the opening made in the trachea during procedures like tracheostomy and to keep the tracheal opening patent.
Magill forceps		• It is a right handed instrument used to place ET tube correctly in laryngeal inlet • It is also used to remove foreign bodies and throat packs.
AMBU bag		• Artificial manual breathing unit or bag valve mask unit used to provide positive pressure ventilation to those patients who all are breathing inadequately.
Asepto syringe		• Irrigation of wound or cavities.
Bone chisel		• Used for cutting and shaping the bone during the procedure
Bone cutting forceps		• Used for cutting bones during surgery or following infection in a particular part of bone.

Contd...

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Bandage scissors		• Used for sizing dressing and removing circumferential bandages • Also used to cut plaster, fabric occasionally
Punch biopsy forceps		• To obtain biopsy from various body organs • To remove embedded hair follicles, callous formations and tiny cysts or nodules
Nelson inhaler		• Used for steam inhalation purpose. Hot water mixed with medication is poured into the jar before inhalation.
Laryngoscope		• Helps in visualization of larynx and helps in ET intubation. Curved blades are known as macintosh and straight blades are known as miller.
Ophthalmoscope/ funduscope		• Allows the visualization of the fundus of eye

Contd...

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Otoscope/auriscope		• Allows the visualization of inner ear structures.
Jolles thyroid retractor		• Self-retaining thyroid retractor used in thyroid surgeries to retract skin.
Suction cannulas aural speculum		• It is used for ear examination and ear surgeries.
Army-navy retractor		• It is also known as right angle retractor or US army retractor. • It is a double ended retractor with fenestrated handle used to retract small or shallow incision. • Mainly used during plastic surgery procedure to expose skin. • Usually they are used in pairs to provide traction and counter traction.
Weitlaner retractor		• Self-retaining retractor used during basic plastic surgeries, large bone and joint surgeries and mastoid surgeries.

Contd...

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Gelpi retractor		• Used in small surgical site. • It is self-retaining retractor.
Goulet retractor		• It is a handheld retractor used for holding back tissue from small, and superficial incisions.
Balfour with bladder blade retractor		• Also known as balfour abdominal retractor • It is a self-retaining retractor • Used during specific abdominal procedures, cesarean sections and bowel resection.
Kelly hemostat (Kelly forceps)		• This instrument is available as curved and straight forms. • Used to clamp large blood vessels and to dissect tissues.
Curved artery forceps		• Used for grasping large sections of tissue or passing sutures in abdominal procedures. They have long shanks and short jaws with full and horizontal serrations.
Hemoclip applier with hemoclips		• Hemoclip applicator is used to apply hemoclip and to ensure good ligation.

Contd...

Scanned with CamScanner

Target High - Fifth Premium Edition

Name of the instruments	Picture of the instruments	Uses
Russian tissue forceps		• Used to hold dense tissue during procedures such as wound debridement and closure.
Dressing forceps		• Dressing forceps are thumb forceps used for holding dressing material during dressing or surgery procedures.
Debakey forceps		• A traumatic forceps used during vascular procedure to avoid tissue damage during manipulation.

Name of the instruments	Picture of the instruments	Uses
Guedel airway (oropharyngeal airway)		• To maintain or open a patient's airway. It does this by preventing the tongue from covering the epiglottis, which could prevent the person from breathing.
Doppler fetal monitor		• It is a hand-held ultrasound transducer used to detect the fetal heartbeat for prenatal care
Neonatal jaundice meter		• The transcutaneous jaundice meter is a noninvasive method for screening babies for jaundice
Single-use clinical thermometer (disposal thermometer)		**Procedure** • Unwrap the thermometer and place in the mouth under the tongue into either heat pocket for 60 seconds. • Remove thermometer and wait for 10 seconds. • Read the temperature by looking at the last blue dot and discard after use.
Oxygen hood		• Used for babies who can breathe on their own but still need extra oxygen

Contd...

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
		
Cold box		• Used for safe transportation of vaccines
Ice pack vaccine carrier	 	• Used for transportation of vaccines
Vaccine carrier (vaccine carrier has a strap)		• Used for transportation of vaccines

Contd.

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Ice lined refrigerator		• Used for storage of vaccines
Deep freezer		• Used for transportation of vaccines
Walk-in freezer		• Used for storage of vaccines on large scale
Suction machine (wall mount)		• Used for suction in hospital settings
Needle destroyer		• To destroy the used disposable **needles**

Contd...

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
		
Incentive spirometer		• To facilitate a sustained slow deep breath. • Incentive spirometry is designed to mimic natural sighing by encouraging patients to take slow, deep breaths
Mouth suction device/nasal aspirator		• For mouth suction and nasal aspiration of babies without backflow
Mucous extractor		• Used with a suction machine to maintain an airway by removing secretions from the mouth, throat or lungs

Contd...

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Metallic vacuum cup (vacuum delivery)		• To assist delivery of a baby using a vacuum device • It is a mushroom-shaped metal cup varying from 40 to 60 mm in diameter
Pinard fetoscope		• It is a type of stethoscope used to listen the heart beat of a fetus during pregnancy
Cardiotocography machine (CTG)		• To perform nonstress test during antenatal period
USG machine (ultrasound machine)		• Uses high-frequency sound waves to capture live images from the inside of your body. Used for diagnostic purpose
Skin stapler		• Used to close both internal and skin wounds

Contd...

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Skin stapler remover		• Used for removal of skin staples
CPR machine		• Used as an adjunct to CPR during advanced cardiac life support by professional health care providers
Video laryngoscope		• Helps in indirect visualization during intubation
Cuff manometer		• Cuff manometer is used to check pressure in ET tube or LMA • Cuff pressure should be maintained at 20 to 30 H_2O

Scanned with CamScanner

"A surgeon should be young a physician old."

—French Proverb

OBSTETRICS AND GYNECOLOGICAL INSTRUMENTS

Name of the instruments	Picture of the instruments	Uses
Uterine sound		• Used to measure the length and depth of the uterine cavity
Ayre's spatula		• This Instrument is used to collect pap smear. The broad end is for vaginal sample collection and narrow end is for cervical sample collection.
Ovum forceps		• Used to remove placental fragments and product of conception inside the uterus • Also used as hemostatic clamp.
Sims anterior vaginal wall retractor		• Helps to allow easy visualization of cervix and vagina

Contd...

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Uterine curette		• Used to scrap endometrial cavity or uterine cavity to obtain samples.
Episiotomy scissors		• To provide episiotomy during second stage of labor. • Used to perform episiotomies during delivery and labor
Sim's vaginal speculum		• It is a double bladed speculum used during gynecological examination to examine vagina and cervix.
Cusco's speculum		• It is a self-retaining double bladed vaginal speculum used to examine vagina and cervix
IUCD removing hook		• Used to remove the intrauterine contraceptive device.
Umbilical scissor/cord cutting scissors		• To cut the umbilical cord following delivery of the baby.

Contd.

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Metal ventose cup		• These are the cups used during assisted vacuum deliveries.
Silastic ventose cup		
Copper T		• It is an intrauterine birth control device used for birth control and spacing.
Umbilical cord clamp		• To clamp the umbilical cord following delivery
Hegar dilator		• These are the dilators of varying sizes used to increase size from few millimetres. • These dilators are used to treat vaginismus and to increase cervical dilation. • These dilators are also used to increase the size of stoma following colostomy.
Uterine dressing forceps		• Used for packing uterine cavity. • Used to remove tissue and intrauterine devices during gynecological procedures.

Contd...

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Simpson perforator		• Used to remove fetus or to perforate fetus skull in an arrested labor where mother's life is at risk.
Fergussons tubular vaginal speculum		• It is a tubular speculum used to diagnose vaginal and cervical conditions.
Doyen's myoma screw		• Used to remove fibroids from endometrium during myomectomy.
Richardson retractor		• Used during appendectomy surgery, cesarean sections and laparotomy to hold and retract back muscles.

Contd.

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Wilet Scalp traction forceps		• Used during labor to ease the delivery of a new-born by grasping its scalp with the smooth flattened blades.
Amniotic perforator		• Instrument used to rupture amniotic membrane with minimal risk to mother and fetus.
Craniotomy forceps		• Also known as cranioclast • They are heavy toothed instruments used for breaking up the skull of fetus. • They are used as last resource in difficult labor or obstruct labor when the fetus died in the womb.
Breech hook		• In difficult breech delivery head or trunk of the unborn fetus is extracted by inserting blunt hook around the neck or shoulder.
Cleidotomy scissor		• In case of dead fetus with shoulder dystocia for bulk reduction of one or both clavicles are divided using this instrument.
Wrigley outlet forceps		• These forceps are used to deliver head of the baby when it is at +3 station. • These forceps are used at the end of second stage when there is urgency to deliver in terms of fetal distress or maternal issues.

—Nicholas Murray Butler

TUBES AND CATHETERS

Name of tubes/ catheter	Images	Descriptions	Usages
Blood transfusion set		Set contains one filter inside the chamber as compared to IV set, in order to remove clots or small clumps of platelet during transfusion.	• Blood transfusion
Endotracheal tube		Tube is placed in the trachea through mouth in order to provide artificial ventilation	• Establish and maintain airway patency • To prevent aspiration
Foley's catheter		Tube passes through urethra into bladder in order to drain urine. It has got two lumens one for connecting the urinary bag and other for inflating the balloon.	• Urinary drainage
IV set		Its needle is inserted into the vein, or the tip is connected to the cannula inserted into the vein.	• IV administration of fluids • IV administration of drugs
IV cannula		Cannula is a medical device placed inside a vein to provide venous access. It is available in various gauges (14-24 gauge i.e. orange to yellow), lengths (19-44 mm), compositions, and designs. Orange is the biggest size cannula while the yellow is the smallest	• To create venous access

Contd.

Scanned with CamScanner

Name of tubes/ catheter	Images	Descriptions	Usages
Laryngeal mask airway		It is a device used to create airway during procedures and in emergency situations where ET intubation is difficult or failed.	• To create patent airway
Nasogastric tube		It is a tube inserted into the stomach via nostrils.	• To provide feed and medicine • For gastric lavage
Sengstaken-blakemore tube		It is a three-way catheter with 2 balloons, one balloon will rest in the esophagus and other in the stomach. Inflated balloon helps to control variceal bleeding	• Patient with massive esophageal vericeal bleeding
Pig-tail drainage catheter		Pig tail catheters inserted into the body under strict aseptic technique with the purpose of removing unwanted body fluids from an organ, cavity or abscess. Its locking tip look like pig tail and it has got several holes which facilitate drainage.	• To remove unwanted body fluids from an organ, cavity or abscess
T tube		Placed in common bile duct during GB surgery or in radiology attached to a drainage bag but not sutured in. It is an external port that placed into common bile duct.and extend outside the body. The port is an easy access to allow drainage of bile and stone from the bile duct.	• To drain bile
Tracheostomy tube		It is a tube inserted directly into the trachea via surgical incision on trachea	• To create patent airway • Prolonged intubation • Upper airway obstruction • Inability to intubate

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Combi-tube (or) double lumen airway tube	 	• It is a type of endotracheal tube which is used in tracheal intubation during thoracic surgery and other medical conditions to achieve selective, one-sided ventilation of either the right or the left lung.
Gastrostomy tube (PEG tube)	 	• **PEG**- Percutaneous Endoscopic Gastrostomy • It is a flexible feeding tube placed through the abdominal wall and into the stomach. • **PEG** allows nutrition, fluids and/or medications to be put directly into the stomach, bypassing the mouth and esophagus.
Nasojejunal (NJ) feeding tube		• **NJ feeding tubes** are frequently used for long-term enteral nutrition.

Contd.

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Butterfly scalp vein cannula (winged infusion set)		• It is primarily used for venepuncture. • It consists of a ▪ Hypodermic needle ▪ Two bilateral flexible wings ▪ Flexible small bore transparent tubing (20-35 cm long) ▪ A connector (female Leur).
Silicone catheter		• **Compare to rubber catheters, silicone catheters** cause less injuries and reduce substantially irritation of the urinary mucosa. It is recommended for patients requiring longterm indwelling urinary catheters.
Three way foleys catheter		• Just like two-way Foley catheter, one connector of the three-way catheter is used to drain the urine while the other is used to inflate the balloon. • The third channel allows for continuous bladder irrigation that helps in removing debris and blood clots.
Suprapubic catheter (SPC)	 	• It is inserted into the bladder through a incision in the abdomen, a few inches below the umbilicus.

Contd...

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Red rubber catheter		• **Red rubber catheters** are used like other straight catheters. The catheter is inserted through the urethra into the bladder. • **Red rubber catheters** are designed to be used once and then thrown away.
Suction catheter	 	• Used to extract bodily secretions, such as mucus or saliva from the upper airway. • It has color coded connectors for fast size identification.
Metallic catheter		• Catheter made up of metal
Colostomy bag (stoma bag or ostomy bag)		• Waterproof **pouch** used to collect waste from the bowel.

Contd.

Scanned with CamScanner

Name of the instruments	Picture of the instruments	Uses
Bakri baloon	 	• The **Bakri Balloon** is a silicone, obstetrical balloon specifically designed to treat postpartum hemorrhage (PPH).

"Health is like money, we never have a true idea of its value until we lose it."
—Josh Billings

NORMAL VALUES

Hemogram

Hemoglobin

Male :	13.5–17.0 g/dL
Female:	11.5–16.0 g/dL

Hematocrit

Male :	0.40 - 0.51 or 40% to 51%
Female:	0.34 - 0.48 or 34% to 48%
RBCs	4.5 to 6 million/mm³ or 4.5 - 6.0 x 10^{12}/L of blood
WBCs	4000–11000 cells/mm³
Platelets	1,50,000–4,00,000 cells/mm³ of blood

Interpretations of abnormal CBC

- Decrease in hemoglobin (anemia) is due to iron or other deficiency, bleeding or marrow suppression such as chemotherapy. Hemoglobin is increased in polycythemia vera
- WBC increases are due to steroid use, infection or leukemia, decrease due to marrow suppression.
- Platelet decreases are due to increased consumption of Platelet in ITP or splenomegaly, or decreased production due to marrow suppression. Platelet count drops in case of Dengue.

Coagulation Studies

INR (International Normalized Ratio of PT or prothrombin time)	0.9–1.1
Therapeutic coumadin (Warfarin)	2.0–3.0
Mechanical heart valves	2.5–3.5
PTT (Partial thromboplastin time)	21–33 seconds
Therapeutic heparin	60–85 seconds
PT	10–14 seconds
Bleeding Time	3–7 minutes
Thrombine time	11–15 seconds

Renal Function

Sodium	135–145 mEq/L
Potassium	3.5–5.5 mEq/L
Chloride	98–107 mEq/L
Bicarbonate	24–28 mEq/L
BUN (Blood Urea Nitrogen	7–20 mg/dL or 2.5–8.0 mmol/L
Creatinine	0.6–1.2 mg/dL or 60–125 μmol/L

- Electrolyte disturbances may be due to renal failure, alterations in hydration (hypo or hyper), drug use (diuretics), alterations in pH (acidosis or alkalosis), diabetic ketoacidosis, adrenal disease, etc.
- Renal failure (and increasing BUN and creatinine) may be due to acute tubular necrosis (due to hypotension), glomerulonephritis, diabetic nephropathy, urinary tract infection, etc.

contd...

Liver Function Test (Normal Values)

Albumin	3.5–5.0 g/dL
Total bilirubin	0.3-1.2 mg/dL
Direct bilirubin (conjugated)	0.1-0.4 mg/dL
Indirect bilirubin (unconjugated)	0.2-0.8 mg/dL
AST (Aspartate Aminotransferase)	10– 42 U/L
ALT (Alanine Aminotransferase)	10–40 U/L

- In liver failure (due to hepatitis or cirrhosis) serum albumin will be decreased due to reduced production, serum bilirubin will be increased due to loss of liver metabolic function, serum enzymes will be increased due to "leakage" of contents of damaged cells

Pulmonary Function Tests

FEV_1 (Forced Expiratory Volume in one second/percentage of predicted based on total forced expiratory volume)

Normal	>75%
Mild disease	<60%
Moderate disease	40–60%
Severe disease	<40%

Scanned with CamScanner

Thyroid Function Test

- **Normal TSH** : 0.35 – 5.00 mIU/L
  Suppressed : <0.10 mIU/L
  Elevated : >15.0 mIU/L
- TSH is elevated in hypothyroidism due to primary thyroid deficiency.
- TSH is depressed with excess exogenous thyroid hormone, Grave's disease or a secreting thyroid adenoma.
- Normal TSH level during pregnancy is lower than the normal non-pregnancy level.

Blood Sugar Profile

Random Blood Glucose (Random)	70–125 mg/dL
Glucose (Fasting)	70–100 mg/dL
Glucose (Post Prandial)	<140 mg/dL
HbA1c (Glycated Hemoglobin) *(To identify the three-month average plasma glucose concentration)*	4–5.6%
HbA1c level 5.7 to 6.4: High risk for diabetes. HbA1c level >6.4: Diabetes.	

- Increased serum glucose may be related to either undiagnosed diabetes, or poorly controlled diabetes due to noncompliance or the "brittleness" of the underlying disease.
- Decreased serum glucose is typically due to insulin overdose or inadequate dietary intake of calories in the face of insulin or oral hypoglycemic use.

Cardiac Markers

Cardiac markers	Normal range and onset
Troponin I	0–0.1 ng/mL (onset: 4-6 hours, peak: 12-24 hours, return to normal: 4-7 days)
Troponin T	0–0.2 ng/mL (onset: 3-4 hours, peak: 10-24 hours, return to normal: 10-14 days)
Myoglobin (Male)	10–95 ng/mL (onset: 1-3 hours, peak: 6-10 hours, return to normal: 12-24 hours)
Myoglobin (Female)	10–65 ng/mL (onset: 1-3 hours, peak: 6-10 hours, return to normal: 12-24 hours)
Troponin I	0–0.1 ng/mL (onset: 4-6 hours, peak: 12-24 hours, return to normal: 4-7 days)

contd...

Cardiac markers	Normal range and onset
Creatinine kinase Index (CK-Index)	0–3
Creatinine Kinase-MB (CK-MB)	0–3 ng/mL
Total creatinine kinase	38–120 ng/mL

Arterial Blood Gas Values (ABG)

pH	7.35–7.45
$PaCO_2$	35–45 mm Hg
HCO_3	22–26 mEq/L
O_2 saturation	96–100%
PaO_2	85–100 mm Hg

Urine Routine and Microscopy

Color	Straw
Specific gravity	1.005 to 1.030
pH	4.6–8.0
Na	40–220 mEq/24 hours
K	25–125 mEq/24 hrs
Cl	80–250 mEq/day
Total Nitrogen	10–20 g/24 hrs
Creatinine	1.0 – 2.0 g/24 hrs
Calcium	0.1 – 0.7 g/24 hrs
Protein	1–15 mg/dL
Osmolality	80–1300 mOsm/L
Urine bilirubin	Negative
Urine blood	Negative
Urine ketone	Negative
Urine leukocytes	Negative
RBC's	0–2/HPF
WBC's	0–2/HPF
RBC casts	0/HPF

Scanned with CamScanner

"Words are the most powerful drug used by the mankind."

—Rudyard Kipling

RECENT UPDATES ON COMMUNITY HEALTH NURSING

Update Topic	Remarks
First Dengue vaccine	Dengvaxia (CYD-TDV) is a live recombinant tetravalent dengue vaccine developed by Sanofi Pasteur. It was first approved in Mexico for marketing in December 2015. Till date (Sept. 2018), India has not approved Dengvaxia for marketing in the country due to pending clinical trials.
Mission Parivar Vikas (MPV)	Family planning services There are 145 high fertility districts (TFR ≥3) spread over 7 states in India (UP, Bihar, Rajasthan, MP, Chhattisgarh, Jharkhand and Assam). MPV is a strategic approach to substantially increase the access to contraceptives and family planning services in these 145 districts. **Key points** • Antara program: Injectable contraceptives at sub center level in 145 focus districts • Incentivizing ASHAs @ ₹100/dose and beneficiary @ ₹100/dose
CHHAYA (Centchroman)	Ormeloxifene (Centchroman) is a non-hormonal, non-steroidal oral contraceptive. It is one of the selective estrogen receptor modulator. Available in 30 mg tablet. A single table should be taken twice a week (Sunday and Wednesday) for first 3 months and then once a weekly (every Sunday). First pill is taken on the 1st day of the period (or the first Sunday after first day of period). Other barrier methods (e.g. Condom) should be used for the first month.
Pradhan Mantri Surakshit Matritva Abhiyan (PMSMA)	PMSMA was launched on June 9, 2016. The objective of the program is to boost the health care facilities for pregnant women, especially the poor women. Women will be provided free health check-up and treatment for free on 9th day of every month. These facilities were made available at all Government hospitals.
Mother's Absolute Affection (MAA)	MAA was launched in August 2016. Efforts on promotion, protection and support of breast feeding practices through health services. Components of MAA include: • Community level interventions: capacity building • Health facility strengthening • Monitoring
Pneumonia vaccine	Single largest infectious cause of death among under-five children worldwide *Streptococcus pneumoniae* is the most common cause of bacterial pneumonia in children Hib is the second common cause of pneumonia The recommended vaccine for pneumonia is **Pneumococcal Conjugate Vaccines (PCV-13)** **PCV** is frozen sensitive vaccine. Discard if frozen. New **PCV for pneumonia** was launched by Minister of Health and Family Welfare, J P Nadda at Mandi in Himachal Pradesh on May 2017.
Measles-Rubella Campaign	Intensification of 1st and 2nd dose of measles vaccination coverage was undertaken under **Mission Indradhanush** from the year 2015 Measles-Rubella vaccination campaign was launched at Bangalore, Karnataka in February 2017. Started in 5 states (Karnataka, Tamil Nadu, Puducherry, Goa and Lakshadweep).
Rotavirus vaccine	Rotavirus is the leading cause of acute severe diarrhea in under-five children worldwide. Rota virus vaccine was launched under Universal Immunization Programme on **March 26, 2016** Launched in four states (Odisha, Himachal Pradesh, Andhra Pradesh and Haryana) in the first phase.
HPV vaccines	Prevention of cervical cancer is best achieved through immunization of girls, prior to sexual debut. 3 types of HPV vaccine: Bivalent, Quadrivalent, Nonavalent HPV vaccine
New TB drugs	BEDAQUILINE and DELAMANID Drugs Controller General (India) approved Bedaquiline 10 mg tablet (14.1.2015) and Delamanid 50 mg tablet (2.8.2017) for the treatment of Tuberculosis under RNTCP program for treatment of TB patients with specific indications.

"The kingdom of heaven is not a place but a state of mind."

—J. Burroughs

COMMUNICABLE DISEASES

Disease	Causative agent	Incubation period	Mode of transmission	Sign and symptoms	Complications
Smallpox	Variola virus	-	Respiratory	Fever, typical rash occur in centrifugal distribution	
Chickenpox	Varicella-zoster	14–16 days	Person to person by droplet	Vesicular rashes; Pleomorphism is a characteristic feature of the rash in chickenpox fever, malaise	**Reye's syndrome:** occurs during recovery from viral disease. Disseminated Intravascular Coagulation (DIC) may occur
Measles (Rubeola)	Myxoviruses	10–14 days	Droplet	Fever, coryza, nasal discharge, cough, redness of eyes, lacrimation, vomiting, diarrhea, koplik's spot, maculopapular rashes begin behind the ear and spread rapidly in few hours over face and neck and extend down to the body taking 2–3 days to progress to the lower extremities.	Otitis media Conjunctivitis Pneumonia
Rubella (Germen measles)	RNA virus of toga virus family.	2–3 week Average 18 days	Droplet	Coryza, sore throat, low grade fever, lymphadenopathy, rash	Arthralgia Thrombocytopenic purpura
Mumps	Genus rubulavirus of the family paramyxoviridae	2–3 week usually 18 days	Droplet	Pain and swelling in either or both parotid gland but may also involve sublingual and submandibular glands, ear ache, pain and stiffness on opening the mouth	Orchitis Ovaritis and oophoritis Pancreatitis (children)
Influenza	Type A, Type B, Type C viruses in the orthomyxoviridae family	18–72 hours	Droplet	Inflammation and necrosis of superficial epithelium of respiratory tract, fever, chills, aches, pain, cough, generalized weakness	Reye's syndrome Pneumonia Acute sinusitis and bronchitis
Diphtheria	Corynebacterium diphtheriae	2–6 days	Droplet infection	Sore throat, difficulty swallowing, low grade fever, throat may show mild erythema, localized exudate, pseudo membrane, difficulty with vision, speech and swallowing, toxins produced by the bacteria may cause nerve damage resulting in often paralysis of soft palate, eye muscles and extremities	Neurological problems (encephalopathy, convulsions), infantile spasms

Contd...

Target High - Fifth Premium Edition

Disease	Causative agent	Incubation period	Mode of transmission	Sign and symptoms	Complications
Pertussis (whooping cough)	*B. pertussis*	7–14 days	Droplet and direct contact	Lacrimation, sneezing, coryza, anorexia, malaise, hacking night cough, deep high pitched inspiration (whoop), vomiting, cyanosis, apnea, hemorrhage, epistaxis, hemoptysis, cerebral hemorrhage, convulsions, coma.	Bronchitis (common), Bronchiectasis, epistaxis and hemoptysis, Subconjunctival hemorrhage
Meningococcal meningitis	*N. meningitidis*	3–4 days	Droplet	Headache, vomiting, stiff neck, photophobia, various neurological sign	Total hearing loss, Balance and coordination problems, Septicemia, Arthritis
Severe acute respiratory syndrome (SARS)	New strain of coronavirus	2–7 days	Close contact with the patients infected material	Fever, malaise, chills, headache, myalgia, dizziness, cough, sore throat, running nose.	Pulmonary decompensation, ARDS
Tuberculosis	*M. tuberculosis*	3–6 weeks	Droplet infection	Persistent Cough of about 3–4 weeks duration, weight loss, fever, hemoptysis	Spinal pain, Cardiac temponade, Hemoptysis, Lung abscess
Poliomyelitis	Polio virus	7–14 days	Primary mode: Fecal-oral route. Less commonly through droplet	Fever, malaise, anorexia, nausea, vomiting, signs of meningeal irritation, child finds difficulty in sitting, descending paralysis, muscle strength vary in different muscle, cranial nerve involvement is present in bulbar and bulbospinal forms of paralytic poliomyelitis	Pneumonia, Edema, mycocarditis, corpulmonale, soft tissue and bone deformities
Hepatitis A (formerly known as infectious hepatitis, epidemic jaundice)	Hepatitis A virus	10–50 days	Fecal oral route	Nonspecific symptoms such as nausea, vomiting, anorexia, mild fever, jaundice, generalized weakness, aches and pain	Hepatic encephalopathy, Cirrhosis, Liver failure, Fulminant Hepatic failure
Hepatitis B (serum hepatitis B)	Hepatitis B virus	50–180 days	Parenteral route Perinatal transmission Sexual transmission	Jaundice, flu-like sign and symptoms, chronic hepatitis and can lead to complications like, liver cancer, cirrhosis, etc.	
Hepatitis C	Hepatitis C virus	6–7 weeks	Parenteral transmission	Chronic hepatitis, liver cirrhosis, liver cancer	
Hepatitis E (enterically transmitted hepatitis non A non B	Hepatitis E virus	2–9 weeks	Water borne disease (fecal-oral route)	Initial phase of mild fever, anorexia, nausea and vomiting, abdominal pain, itching without skin lesions, skin rash, or joint pain Juandice. Hepatomegaly	
Hepatitis D	Hepatitis D virus	2–12 weeks	Parenteral route	Mild-to-severe or even fulminant hepatitis

Disease	Causative agent	Incubation period	Mode of transmission	Sign and symptoms	Complications
Hepatitis G	Hepatitis G virus				
Diarrhea	Virus and bacteria		Fecal oral route	Passage of watery stools leading to dehydration which shows signs of sunken eyes, skin pinch goes back slowly, etc.	Acidosis
Cholera	*V. cholerae*	Hours to 5 days	Fecally contaminated water, food and drinks enter Direct contact	Profuse painless watery diarrhea, vomiting, rice water stool leading to dehydration symptoms presenting as sunken eyes, hollow cheeks, scaphoid abdomen, sub-normal temperature, **washerman's hand and feet**, absent pulse, unrecordable BP, loss of skin elasticity	Severe dehydration, Shock, Renal failure
Typhoid fever (enteric fever)	*S. typhi*	10–14 days	Fecal-oral route or urine-oral route	Malaise, headache, sore throat, cough, abdominal pain, constipation, constipation is present either in the early stage or pea soup diarrhea, fever, abdominal distention, rose spot rashes	Intestinal hemorrhage, Intestinal perforation, Shock

NORMS FOR HEALTH PERSONNEL/CENTERS IN COMMUNITY

Health personnel/Center	Population/Area Covered
One Nurse	3500
One Doctor	5000
One Pharmacist	1,00,000
One Lab Technician	10,000
One ASHA (Accredited Social Health Activist)	**Rural:** Village with a population of 1000 **Urban:** 1000–2500 population
One Anganwadi Worker	**Plains:** 400–800 **Hilly/tribal areas:** 300–800
One Village Health Guide	Village with a population of 1000
One Trained Dai	Village with a population of 1000
One CHC	**Plains:** 1,20,000 Hilly/tribal areas: 80,000
One PHC	**Plains:** 30,000 Hilly/tribal areas: 20,000
One Sub center	5000 in plains 3000 in hilly/tribal areas

"It is not how much you do – it is how much love we put into the doing."
— Mother Teresa

LEVELS OF PREVENTION

Primordial prevention
- It is a new concept receiving special attention in the prevention of chronic diseases.
- It emphasizes on the prevention of emergence of risk factors in countries or population in which they have not yet appeared.
- In primordial prevention efforts are directed towards discouraging children from adopting harmful lifestyles.
- The main intervention in primordial prevention is through individual and mass education.

Primary prevention
- It can be defined as action taken prior to the onset of disease, which removes the possibility that a disease will ever occur.
- It signifies intervention in the prepathogenesis phase of disease or health problem or other departure from health.

Secondary prevention
- It means action which halts the progress of disease at its incipient stage and prevents complication.
- The interventions are early diagnosis and adequate treatment.
- Through early diagnosis and adequate treatment this strategy attempts to arrest disease progress and to restore health.

Tertiary prevention
- It signifies the intervention in the late pathogenesis phase.
- It can be defined as all measures available to reduce or limit impairment and disabilities, minimize suffering caused by existing departure from good health and to promote patient's adjustment to immediate conditions, e.g. rehabilitation activities.

COLD CHAIN METHODS AND EQUIPMENT

	Equipment	Temperature	Location of use
Electrical	Walk-in-freezer (WIF)	-15 to -25°C	National, State and Regional vaccine store
	Walk-in-Coolers (WIC)	2 to 8°C	Government medical store depot, state and regional vaccine store
	Deep Freezer (DF)	-15 to -25°C	District level and above For freezing of ice packs at sub-district levels
	Ice lined refrigerator (ILR)	2 to 8°C	District and sub-district level
	Domestic refrigerator (Front load refrigerator)	2 to 8°C	Private clinic, Nursing home
Non-Electrical	Cold boxes	Fully frozen ice packs are placed at bottom and sides	Used for transportation of vaccine in all peripheral centers
	Vaccine carriers	4 fully frozen ice packs are used	Used for outreach section and can carry 16 to 20 vials at a time
	Day carrier	2 fully frozen ice packs are used	Can carry 6 to 8 vials for few hours, mainly used in a nearby session.

VACCINES USED TO PREVENT DISEASES

Name of vaccines	Diseases prevented
Vaccines currently in use in Universal Immunization Programme (UIP)	
BCG vaccine	Tuberculosis
DPT vaccine	Diphtheria, Pertussis (Whooping cough) and Tetanus
Hepatitis B vaccine	Hepatitis–B
Japanese Encephalitis Vaccine	Japanese Encephalitis
Measles Vaccine	Measles
Oral Polio Vaccine (OPV)	Polio
Pentavalent vaccine	Diphtheria, Pertussis, Tetanus, Hepatitis B, Hemophilus influenza B
Tetanus Toxoid vaccine	Maternal and Neonatal Tetanus
Inactivated Polio Vaccine (IPV)	Polio
Rota virus vaccine (RVV)	Rota Viral Diarrhea
Newer vaccines to be introduced into the UIP	
Pneumococcal Conjugate Vaccine (PCV)	Pneumonia

IMMUNIZATION SCHEDULE

Vaccine	Age	Dose	Route	Site
For pregnant women				
TT-1	Early in pregnancy	0.5 mL	Intramuscular	Upper arm
TT-2	4 weeks after TT-1*	0.5 mL	Intramuscular	Upper arm
TT- Booster	If received 2 TT doses in a pregnancy within the last 3 years*	0.5 mL	Intramuscular	Upper arm
For infants				
BCG	At birth or as early as possible till one year of age	0.1 mL (0.05 mL until 1 month age)	Intradermal	Left upper arm
Hepatitis B - Birth	At birth or as early as possible within 24 hours	0.5 mL	Intramuscular	Anterolateral side of mid-thigh
Hepatitis-B 1, 2 and 3	At 6 weeks, 10 weeks and 14 weeks	0.5 mL	Intramuscular	Anterolateral side of mid-thigh
OPV-0	At birth or as early as possible within the first 15 days	2 drops	Oral	Oral
OPV 1, 2 and 3	At 6 weeks, 10 weeks and 14 weeks (OPV can be given till 5 years of age)	2 drops	Oral	Oral
Pentavalent 1, 2 and 3	At 6 weeks, 10 weeks and 14 weeks (can be given till one year of age)	0.5 mL	Intramuscular	Anterolateral side of mid-thigh
Rotavirus#	At 6 weeks, 10 weeks and 14 weeks (can be given till one year of age)	5 drops	Oral	Oral
IPV	Two fractional dose at 6 and 14 weeks of age	0.1 mL	Intra dermal two fractional dose	Intradermal Right upper arm
Measles /MR 1st Dose	9 completed months-12 months. (can be given till 5 years of age)	0.5 mL	Subcutaneous	Right upper arm
JE - 1**	9 completed months-12 months.	0.5 mL	Subcutaneous	Left upper Arm
Vitamin A (1st dose)	At 9 completed months with measles-Rubella	1 mL (1 lakh IU)	Oral	Oral
For children				
DPT booster-1	16–24 months	0.5 mL	Intramuscular	Anterolateral side of mid-thigh
Measles/ MR 2nd dose$	16–24 months	0.5 mL	Subcutaneous	Right upper arm
OPV Booster	16–24 months	2 drops	Oral	Oral
JE-2	16–24 months	0.5 mL	Subcutaneous	Left upper arm
Vitamin A*** (2nd to 9th dose)	16–18 months. Then one dose every 6 months up to the age of 5 years.	2 mL (2 lakh IU)	Oral	Oral
DPT Booster-2nd	5–6 years	0.5 mL	Intramuscular	Upper arm
TT	10 years and 16 years	0.5 mL	Intramuscular	Upper arm

*Give TT-2 or Booster doses before 36 weeks of pregnancy. However, give these even if more than 36 weeks have passed. Give TT to a woman in labor, if she has not previously received TT.

**JE Vaccine is introduced in select endemic districts after the campaign.

*** The 2nd to 9th doses of Vitamin A can be administered to children 1-5 years old during biannual rounds, in collaboration with ICDS.

#Phased introduction, at present in Andhra Pradesh, Haryana, Himachal Pradesh and Orissa from 2016 & expanded in Madhya Pradesh, Assam, Rajasthan, and Tripura in February 2017 and planned in Tamil Nadu & Uttar Pradesh in 2017.

$Phased introduction, at present in five states namely Karnataka, Tamil Nadu, Goa, Lakshadweep and Puducherry (As of February 2017)

DEMOGRAPHY IN INDIA

Vital Statistics

Indicators	Rate
Infant mortality rate (IMR)	34 per 1000 live births
Under five mortality rate	43 per 1000 live births
Neonatal mortality rate	25 per 1000 live births
Maternal mortality ratio (MMR)	167 per 1,00,000 live births

States with Highest and Lowest Indicators of Vital Statistics

Indicators		State	Value
Crude Birth Rate (National average 20.4)	Highest	Bihar	26.8
	Lowest	Andaman & Nicobar Islands	11.7
		Kerala	14.3
Crude Death Rate (National average 6.4)	Highest	Odisha	7.8
	Lowest	Delhi	4.0
Infant Mortality Rate (National average 34	Highest	Madhya Pradesh	47
	Lowest	Goa	8

Source: SRS Statistical Report 2017, Office of the Registrar General and Census Commissioner, India

Demographic Trends in India – 2017

Variables	Values
Crude birth rate	20.4 per 1000
Crude death rate	6.4 per 1000
Total fertility rate	2.2 *(Ref: NFHS-4 (2015-16)*
Net reproduction rate	1.08
Gross reproduction rate	1.1
Life expectancy in males	65.8 years
Life expectancy in females	69.3
Sex ratio	943 females per 1000 males*
Population density	382 per sq. km
Literacy rate	73%

Source: Census 2011, SRS Statistical Report 2017, Office of the Registrar General and Census Commissioner, India

Most common causes of

Maternal Mortality : Hemorrhage (38%)
Neonatal Mortality : Prematurity/preterm (35%)
Infant Mortality : Prematurity/low birth weight (35.9%)
Death (all ages) : Cardiovascular disease (23.5%)

Demographic Data—India

Number of districts : 640
Urban population : 31.14%
Eligible couples : 19%
Elderly (60+) : 8.3%
Under-5 children : 9.3%
Lowest population density : Arunachal Pradesh (17/sq.km)
Highest sex ratio : Kerala (1084 females per 1000 males)
Highest population density : Delhi (11297/sq.km)
Highest literacy rate : Kerala (94%)
Lowest literacy rate : Bihar (64%)
Most common method of family planning : Condom (48.1%)

COMMUNITY NUTRITION PROGRAM

Program	Explanation
Vitamin A Prophylaxis Program	Control of blindness through administration of vitamin A preparations.
Prophylaxis against Nutritional Anemia	Distribution of iron and folic acid to pregnant women and children (1 – 12 years). ICDS, MCH, PHC are engaged in the implementation of this program.
Control of Iodine Deficiency Disorders	Identification of goiter endemic region and supply of iodinated salt and to assess the impact of goiter control measures.
Special Nutritional Program	**Launched in 1970** for the nutritional benefit of children below 6 years of age, pregnant and nursing mothers. Supplementary food supply about 300 kcal and 10 – 12 g of protein per children per day.
Balawadi Nutrition Program	**Started in 1970** for the benefit of children in the age group of 3 – 6 years.
ICDS Program	**Started in 1975,** there is strong nutritional component in this program in the form of supplementary nutrition, vitamin A prophylaxis, iron and folic acid distribution Beneficiaries are children below 6 years of age and adolescent girls 11 – 18 years, pregnant and lactating mothers.
Mid-day Meal Program	**Launched in 1961,** the major objective of this program is to attract more children for admission to school and retain them so that literacy improvement of children could be brought about.
Mid-day Meal Scheme	It is also known as **National Program of Nutritional Support to Primary Education Launched in 1995** and revised in 2004. The main objective is being universalization of primary education by increasing enrolment, retention, and attendance and simultaneously impacting on nutrition of students in primary classes.

REVIEW OF HEALTH PROGRAMS IN INDIA, LAUNCH YEAR AND OBJECTIVES

Name of the programs	Year	Main objectives
National Anti-Malaria Program and converted to National Malaria Eradication Program	1953 1958	To eradicate malaria once and for all from the country
Urban Malaria Scheme	1971	To reduce or interrupt malaria transmission in town and cities
National Filaria Control Program	1955	Filarial control strategy includes vector control through anti-larval operations, source reduction, detection and treatment of microfilaria carrier
Kala-azar Control Program	1990 – 1991	To brought down the incidence rate of kala-azar
National Leprosy Control Program	1955	To achieve control of leprosy through early detection of cases and dapsone monotherapy
National Leprosy Eradication Program	1983	National Leprosy Eradication Program was launched as a continuation of the National Leprosy Control Program of 1955
National Tuberculosis Control Program Revised National Tuberculosis Control Program (RNTCP)	1962 1992	To reduce the TB in the community to that level when it ceases to be a public health problem
National AIDS control Program	1987	To prevent further transmission of HIV, to decrease morbidity and mortality associated with HIV infection and to minimize the socio economic impact resulting from HIV infection
National Program for Control of Blindness	1976	Reduce the prevalence of blindness from 1.4% to 0.3%
Iodine Deficiency Disorders Program	1962	To reduce the incidence of goiter through fortification of common salt
Pulse Polio Immunization Program	1995	To eradicate polio by providing additional polio drops in December and January every year on fixed days
National Rural Health Mission	5th April 2005	To improve rural health care delivery system
National Guinea Worm Eradication Program	1984	Significantly reduce the disease in the affected area
National Cancer Control Program	1975 – 76	Prevention, early diagnosis and treatment of cancer
National Mental Health Program	1982	To ensure mental health care services to all, especially the community at risk and under privileged sections of the population, to encourage application of mental health knowledge in general health care and social development
National Program for Control and Treatment of Occupational Diseases	1998 – 1999	Prevention control and treatment of occupational health problems
Integrated Disease Surveillance Project	Nov 2004	To detect early warning signals of impending outbreaks and help initiate an effective response in a timely manner in urban and rural areas
National Water Supply and Sanitation Program	1954	Providing safe water supply and adequate drainage facilities for the entire urban and rural population of the country

VITAMINS: FUNCTIONS, SOURCES AND DEFICIENCY DISEASES

Vitamins	Functions	Sources	Deficiency diseases
Vitamin A (Retinol)	• Contributes to the production of retinal pigments • Required for the normal functioning of epithelial and glandular tissues • Supports growth especially skeletal growth • It is anti-infective	Liver, egg, butter, cheese, whole milk, fish, meat, yellow and green fruit, some roots such as carrot	• Night blindness • Conjunctival xerosis • Bitot's spot • Corneal xerosis • Keratomalacia • Xerophthalmia
Vitamin D (1,25 dihydroxy-cholecalciferol)	• Promotes intestinal absorption of calcium and phosphate • Stimulates normal mineralization • Permits normal growth	Liver, egg yolk, butter, cheese, exposure to sunlight	• Rickets • Osteomalacia
Vitamin E (Tocopherol)	Antioxidant property	Vegetable oil, cotton seed, sunflower seed, egg yolk, butter	
Vitamin K	Stimulates or helps in the production of certain anticoagulant factors	Green leafy vegetables, Cow's milk	Prolonged blood clotting time
Vitamin B1 (Thiamine)	This vitamin is essential for the oxidative pathway of glucose	Whole grain cereals, wheat, yeast, pulses, oilseed and nuts Meat, fish egg, vegetables and fruits contain only small amount	• Beriberi • Wernicke's encephalopathy
Vitamin B2 (Riboflavin)	• Fundamental role in cellular oxidation • Maintain the integrity of mucocutaneous structure.	Milk, egg, liver, green leafy vegetables	Angular stomatitis
Vitamin B3 (Niacin)	• Essential for metabolism of carbohydrate • Essential for the normal functioning of skin, intestinal and nervous tissue	Meat, poultry, fish, legumes, groundnut	Pellagra characterized by 4Ds • Diarrhea • Dermatitis • Dementia • Death
Vitamin B6 (Pyridoxine)	Important for the metabolism of carbohydrate and amino acid	Milk, liver, meat, egg yolk, fish, whole grain cereals, legumes and vegetables	Peripheral neuritis
Vitamin B5 (Pantothenic acid)	Specific role in the biosynthesis of corticosteroids		
Vitamin B12 (cyanocobala-min)	It cooperates with folate in the biosynthesis of DNA	Meat, fish, egg, milk, cheese	Megaloblastic anemia (Pernicious anemia)
Vitamin C (Ascorbic acid)	• Antioxidant and plays an important role in tissue oxidation • Synthesis of collagen	Fresh fruits and green leafy vegetable, fresh meat, fish,	Scurvy

BMCHRS

HEALTH PLANNING IN INDIA

Year	Committee	Main features
1946	Bhore Committee	• Sir Joseph Bhore was the chairman • Also known as **Health Survey and Development Committee** • Comprehensive proposal for the development of National Program of Health Services. • Integration of preventive and curative services at all levels • Development of primary healthcare in 2 stages
1962	Mudaliar Committee	• Commonly known as **health survey and planning committee** • Advice for the strengthening of existing primary health care centers before new centres were established • Strengthening of the district hospital with specialist services to serve as central base of regional services • Integration of medical and health services as recommended by Bhore committee • Constitution of All India Health Service on the pattern of Indian Administrative Services
1963	Chadha Committee	• Monthly home visit should be implemented through basic health workers. • The workers were envisaged as **multipurpose workers** to look after additional duties of collection of vital statistics and family planning, in addition to malaria vigilance • The family planning health assistants were to supervise 3–4 of these basic health workers
1965	Mukherjee Committee	• Separate staff for the family planning program • The committee also recommended to delink malaria activities from family planning
1966	Mukherjee Committee	• The committee worked out the details of the basic health services which should be provided at the block level, and some consequential strengthening required at higher levels of administration
1967	Jungalwalla Committee	• Integration of health services from top to bottom, similar seniority and unified cadre to be implemented Elimination of private practice by government doctors
1972 – 73	Kartar Singh Committee	• The Government of India constituted a committee in 1972 known as **the Committee of Multipurpose Workers** under health and family planning under the chairmanship of Kartar Singh
1974 – 75	Shrivastav Committee	• The Government of India in the Ministry of Health and Family Planning had in November 1974 setup "Group on Medical Education as Support Manpower" popularly known as the Shrivastav Committee
1977	Rural Heath Scheme	• Following the recommendation of Shrivastav Committee Government launched Rural Health Scheme in 1977 • The main aim of program was to train community health workers
1981	Health for All by 2008	• To identify the goal for health for all by 2000 AD and to outline with that perspective the specific Programs for the sixth five year plan

Scanned with CamScanner

FIVE YEAR PLANS

Plan	Time Period
First Five-Year Plan	1951–1956
Second Five-Year Plan	1956–1961
Third Five-Year Plan	1961–1966
Annual Plan	1966–1969
Forth Five-Year Plan	1969–1974
Fifth Five-Year Plan	1974–1979
Outlay	1979–1980
Sixth Five-Year Plan	1980–1985
Seventh Five-Year Plan	1985–1990
Annual Plan	1990–1991
Annual Plan	1991–1992
Eighth Five-Year Plan	1992–1997
Ninth Five-Year Plan	1997–2002
Tenth Five-Year Plan	2002–2007
Eleventh Five-Year Plan	2007–2012
Twelfth Five-Year Plan	2012–2017

"The physician heals, nature makes well."

—Aristotle

FRYE'S ABCDE CASCADE FOR PRIORITIZING CARE

Frye's ABCDE cascade provides a framework for prioritizing care by identifying the most important treatment concerns.

A **Airway:** This category includes everything that affects a patent airway, including a foreign object, fluid from an upper respiratory infection, and edema from trauma or an allergic reaction.

B **Breathing:** This category includes everything that affects the breathing pattern, including hyperventilation or hypoventilation and abnormal breathing patterns, such as Korsakoff's, Biot's, or Cheyne-Stokes respiration.

C **Circulation:** This category includes everything that affects the circulation, including fluid and electrolyte disturbances and disease processes that affect cardiac output.

D **Disease processes:** If the patient has no problem with the airway, breathing, or circulation, then the nurse should evaluate the disease processes, giving priority to the disease process that poses the greatest immediate risk. For example, if a patient has terminal cancer and hypoglycemia, hypoglycemia is a more immediate concern.

E **Everything else:** This category includes such issues as writing an incident report and completing the patient chart. When evaluating needs, this category is never the highest priority.

"What mental health needs is more sunlight, more candor and more unashamed conversation."

—Glenn Close

TRIAGE CATEGORIES

Immediate/Emergent Category

These casualties require immediate life-saving treatment.

Urgent Category

These casualties require significant intervention as soon as possible.

Delayed Category

These patients will require medical intervention, but not with any urgency.

Triage Category	Priority	Color	Conditions
Immediate/Emergent	1	Red	Chest wounds, shock, open fractures, 2-3 burns
Delayed/Urgent	2	Yellow	Stable abdominal wound, eye and CNS injuries
Minimal	3	Green	Minor burns, minor fractures, minor bleeding
Expectant	4	Black	Unresponsive, high spinal cord injury

ARTERIAL BLOOD GAS

Interpreting Arterial Blood Gas Levels

- Determine whether the pH value is normal or shows acidosis or alkalosis. (pH below 7.35 indicates acidosis and pH above 7.45 indicates alkalosis)
- Determine whether the partial pressure of arterial carbon dioxide ($PaCO_2$) is normal or shows acidosis or alkalosis.
- Determine whether the bicarbonate (HCO_3^-) level is normal or shows acidosis or alkalosis.
- Determine whether the pH value matches the $PaCO_2$ (respiratory) or the HCO_3^- (metabolic) value.
- If the pH value is abnormal and the $PaCO_2$ value, the HCO_3^- value, or both are abnormal, the condition is uncompensated. If the pH value is normal and the $PaCO_2$ value and the HCO_3^- value are abnormal, the condition is compensated.

Normal ABG Value

pH	7.35 – 7.45
$PaCO_2$ (mm Hg)	35 – 45
HCO_3^- (mmol/L)	21 – 28
PaO_2 (mm Hg)	80 – 100

Examples

Case 1: Measurement of arterial blood gas shows pH 7.2, $PaCO_2$ 70 mm Hg, HCO_3^- 27 mmol/L, and PaO_2 59 mm Hg. How would you interpret this?
Interpretation: This patient has **respiratory acidosis (raised carbon dioxide).**
Rationale: pH 7.2 indicates acidosis. The increased CO_2 (and reduced O_2) indicates respiratory acidosis. If the CO_2 is normal and the HCO_3^- is less than normal in this case (below 21) it could be **Metabolic acidosis.**

Case 2: Measurement of arterial blood gas shows pH 7.2, PaO_2 100 mm Hg, $PaCO_2$ 25 mm Hg, and HCO_3^- 10 mmol/L. What is your assessment?
Interpretation: These results show that he/she has metabolic acidosis (low HCO_3^-) with respiratory compensation (low CO_2).
Rationale: Low pH (7.2) indicates acidity low HCO_3^- indicates metabolic acidosis. Note that the $PaCO_2$ 25 mm Hg is also below normal. This means the respiratory compensation (hyperventilation) has happened to increase the pH. Hence it is Metabolic acidosis with respiratory compensation.

Case 3: Measurement of arterial blood gas shows pH 7.5, PaO_2 115 mm Hg, $PaCO_2$ 29 mm Hg, and HCO_3^- 24 mmol/L. What does this mean?
Interpretation: Respiratory alkalosis (low CO_2)
Rationale: Higher pH (7.5) indicates alkalosis. Low CO_2 and normal HCO_3^- indicates respiratory alkalosis due to hyperventilation.

SHOCKS: TYPES, MANAGEMENT AND SOLUTIONS

Types	Causes	Pathophysiology	Clinical feature	Treatment
Hypovolemic	• Hemorrhage • Dehydration	• Preload ↓ • Contractility normal or ↑ • Afterload (SVR) ↑	• HR ↑ • BP ↓ • Cardiac output ↓ • CRT Delayed • Extremities cool & pale • Weak thready pulse	• Prevent losses • Secure large bore IV access, Fluid resuscitation with crystalloids
		Distributive		
1. Septic	• Infections • Sepsis	• Preload ↓ • Contractility normal or ↓ afterload ↓	• HR ↑ • BP ↓ • Cardiac output ↓ • CRT Flash/delayed • Extremities warm & pink	• IV Antibiotics, Fluids • IV Noradrenaline →drug of choice
2. Anaphylactic	• Anaphylaxis	• Preload ↓ • Contractility variable • Afterload ↓	• HR ↑ • BP ↓ • Cardiac output ↓ • CRT Flash/delayed • Extremities warm	• IV Epinephrine, Fluids
3. Neurogenic	• Spinal cord injury • Traumatic brain injury (TBI)	• Preload ↓ • Contractility normal • Afterload (SVR) ↓ • Loss of sympathetic tone	• HR ↓ • BP ↓ • Cardiac output ↓ • CRT Flash/normal • Extremities warm	• High flow O2 • Fluid resuscitation • Vasopressors
Cardiogenic	• Myocarditis • Dysrhythmia	• Preload ↓ • Contractility ↓ • Afterload (SVR) ▪ ↑ (Rt ventricular) ▪ ↓ (Left ventricular)	• HR ↑ • BP ↓ • Cardiac output ↓ • CRT delayed	• Inotropes • Cautious use of fluids, ECMO • DOC: Noradrenaline
Obstructive	• Tamponade • Tension pneumothorax • Pulmonary embolus • Chest trauma	• Preload ↓ • Contractility normal • Afterload (SVR) ↑	• HR ↑ • BP ↓ • Cardiac output ↓ • CRT Delayed • Extremities cool	• Pericardiocentesis • Chest tube
Dissociative	• CO poisoning • Cyanide	• Variable	• HR ↑ • BP Normal or ↑ • Cardiac output ↑ • CRT normal • Extremities normal	• Antidotes • Hyperbaric oxygen therapy

Types of Shock and its Management

Types of shock	Management
All Types of Shock	• Increase perfusion to vital organs • Increase peripheral perfusion • Decrease myocardial oxygen demand and workload • Relieve pulmonary congestion • Correct acid-base imbalances • Ensure adequate oxygenation
Cardiogenic Shock	• Administer an inotropic medication, such as dobutamine, dopamine, milrinone, or inamrinone
Hypovolemic Shock	• Increase intravascular volume with the appropriate solution, such as blood or a blood product, a colloid preparation, a plasma expander, or a crystalloid solution
Distributive Shock: Anaphylactic Shock	• Administer adrenalin and an antihistamine

Types of Solutions

Type of Parenteral Solution	Examples	Indications
Hypertonic Solution	• Dextrose 5% in normal saline solution • 3% NaCl • Dextrose 10% in water	• To treat severe hyponatremia • To treat hypoglycemia
Hypotonic Solution	• Half-normal saline solution	• To expand the intracellular compartment • To replace free water • To replace sodium and chloride
Isotonic Solution	• Normal saline solution	• To increase extracellular fluid volume • To treat hypovolemia • To replace sodium and chloride
	• Lactated Ringer's solution	• To treat hypovolemia and fluid lost from burns and GI tract • To provide electrolyte replacement • To maintain fluid volume;
	• Dextrose 5% in water (D5W)	• To provide free water to treat hypernatremia and hyperkalemia

Colloid Solution

- Albumin
- Fluid resuscitation
- Dextran
- Hydroxyethyl starch
- Gelofusine

SKELETAL AND SKIN TRACTION

Types and description	Purposes	Nursing management
Skeletal traction **Balanced suspension to femur** Used in patients age 3 and older on the upper tibia and thigh with 20 – 35 lb (9 – 16 kg) of weight	• Realignment of fractures of the femur • Relief of muscle spasms associated with femoral fractures	• Neurovascular checks are vital to assess circulatory status and prevent compartmental syndrome • Tissue pressure monitoring is performed
Cervical traction via skull tongs Used in patients of any age, but especially in young adults, bilaterally on skull bones with 20–30 lb (9–14 kg) of weight	• Realignment of fractures of cervical vertebrae • Relief of pressure on cervical nerves	• Patients may be severely injured and may have quadriplegia
Halopelvic traction Used in adolescents and young adults on the skull and pelvis with no weight (bars extending between the skull and pelvic portions hold the body in the desired position)	• Preoperative straightening of scoliosis curvature	• Dressing is complicated because the vertical bars interfere with clothing • Traction may remain in place postoperatively to be replaced by a brace or cast
Skin traction **Buck's extension** Most commonly used in adults on one or both legs with 5–8 lb (2.5–3.5 kg) of weight per leg	• Preoperative traction for hip fractures • "Pulling" contracted muscles • Relief of leg or back muscle spasms	• Patient generally lies recumbent • Traction may be removed for skin care even if fracture is present
Skin traction **Cervical head halter** Used in adults under the chin and around the face and back of the head with 5–15 lb (2.5–7 kg) of weight	• Relief of muscle spasms caused by degenerative or arthritic conditions of the cervical vertebrae or by muscle strain	• Patients may be in low- or high-Fowler's position, depending on the purpose of the traction • Patients should be removed from traction for sleeping • Patients can use this type of traction at home for cervical arthritic conditions
Cotrel's traction Used in adolescents and young adults with a head halter (5 – 7 lb [2.5 – 3 kg] of weight) and a pelvic belt (10 – 20 lb [4.5 – 9 kg] of weight)	• Preoperative muscle stretching in patients with scoliosis	• Pulling in opposite directions may cause pain or discomfort • Traction can be removed briefly for massage and skin care
Dunlop's traction Used in adolescents and young adults on the lower humerus (5 – 7 lb of weight) and forearm (3 – 5 lb [1.5 – 2.5 kg] of weight)	• Realignment of fractures of the humerus	• Traction to the forearm should be removed daily for skin care
Pelvic belt or girdle Used in older adolescents and adults on the abdomen or pelvis with 20 – 35 lb of weight	• Relief of muscle spasms and pain associated with disk conditions	• Patient may be placed in the William's position, which permits 45-degree knee and hip flexion to relax the lumbosacral muscles • Traction straps shouldn't put pressure on sciatic nerves
Pelvic sling Used in adults under the pelvis and buttocks like a hammock with 20 – 35 lb of weight	• Holding of fractured pelvic Bones	• Buttocks must be slightly off the bed. • Patients can be removed from the sling for care and toileting if facility policy permits.
Russell traction Used in patients age 5 and older on one or both legs with 2 – 5 lb (1 – 2.5 kg) of weight per leg	• Preoperative traction for hip fractures • "Pulling" contracted muscles • Treatment of Legg-Calvé-Perthes disease	• Patient is positioned on back for most effective pull.

"Happiness is the most powerful of all tonics."
—Herbert Spence

TYPES OF INSULIN

Types of insulin	Onset of action	Peak action	Duration of action
Rapid-acting insulins lispro (Humalog) and aspart (NovoLog)	5–25 minutes	30–90 minutes	2–5 hours
Regular insulin	30–60 minutes	1–5 hours	6–10 hours
Intermediate-acting insulin ([Neutral protamine Hagedorn (NPH) or Lente insulin]	1–4 hours	6–12 hours	12–24 hours
Long-acting insulins (Protamine zinc or Ultralente insulin)	4–8 hours	16–18 hours	Up to 30 hours

COMPARISON BETWEEN DIABETIC KETOACIDOSIS (DKA) AND HYPEROSMOLAR HYPERGLYCEMIC NONKETOTIC SYNDROME (HHNS)

	Associated with	Onset	Symptoms
DKA	Type 1 diabetes mellitus	Rapid	• Hyperventilation (Kussmaul's respirations) • Acetone breath odor • Blood glucose level above normal (200 – 800 mg/dL) • Mild hyponatremia • Positive or large serum ketones • Serum osmolality slightly elevated • Hyperkalemia initially, then hypokalemia • Metabolic acidosis
HHNS	Type 2 diabetes mellitus	Slow	• Slightly rapid respirations • No breath odor • Blood glucose level markedly elevated (above 600 mg/dL) • Hypernatremia • Negative or small serum ketones • Serum osmolality markedly elevated • Normal serum potassium • Lack of acidosis

"The best of all medicines is resting and fasting."

—Benjamin Franklin

ACUTE CORONARY SYNDROMES AND THEIR TREATMENT

Conditions and descriptions	Signs and symptoms	Diagnosis	Treatment
Unstable angina • Angina increasing in frequency and severity from patient's baseline • Easily induced • Lasts 5 – 15 minutes	• Burning, squeezing, substernal or retrosternal pain spreading across chest • May radiate to inside of arm, neck, jaw, or shoulder blade • Often relieved by rest or nitrates	• ECG may be normal or may show ischemia with transient T wave or ST-segment changes • **Cardiac biomarkers usually remain within normal limits**	• Rest • Nitrates • Beta adrenergic blockers to reduce the workload and oxygen demand • Calcium channel blockers • Oxygen administration • Antiplatelet drugs
Non-ST segment elevation myocardial infarction (MI) • MI that usually occurs due to occlusion of coronary vessel • Occlusion may be complete or partial	• Symptoms are similar to angina but pain more intense than that of angina • Pain not relieved with rest • Difficult to distinguish from angina • S3 and S4 may be present	• Positive cardiac markers • ECG shows **ST-segment depression** or may be normal • ECG may have ST-segment elevation for less than 20 minutes	• Oxygen administration • Aspirin for antiplatelet effect • Beta-adrenergic blockers to reduce the workload and oxygen demand • Angiotensin converting enzyme (ACE) inhibitor to reduce after-load and preload
ST-segment elevation (MI) • MI that usually occurs due to complete occlusion of coronary vessel	• Symptoms are similar to Non-ST segment elevation MI	• Positive cardiac markers • ECG shows **ST-segment elevation** or new left bundle-branch block in leads associated with occluded artery • Nuclear imaging studies show areas of ischemia	• Oxygen administration • Aspirin for antiplatelet effect • Fibrinolytic therapy for eligible patients • Coronary angioplasty • Beta adrenergic blockers • ACE inhibitors

—Dag Hammarskjold

ECG WAVEFORMS AND PATHOLOGICAL FINDINGS

WAVEFORMS

- P wave: Atrial depolarization (contraction)
- QRS complex: Ventricular depolarization (contraction)
- T wave: Ventricular repolarization (relaxation of ventricles)
- (U wave: unknown)

P wave (0.08 - 0.10 s)
P-R interval (0.12 - 0.20 s)

QRS (0.06 - 0.10 s)
Q-T_c interval (≤ 0.44 s)*

*Q-T_c = $QT/\sqrt{RR}$

Scanned with CamScanner

ECG Changes and Interpretations

ECG Changes	Interpretations
Shortened QT Interval	Hypercalcemia, some drugs, certain genetic abnormalities, hyperkalemia
Prolonged QT Interval	Hypocalcemia, some drugs, certain genetic abnormalities
Flattened or Inverted T-waves	Coronary ischemia, hypokalemia, left ventricular hypertrophy, digoxin effect, some drugs
Hyperacute T-waves	Possibly the first manifestation of acute myocardial infarction, where T waves become more prominent, symmetrical, and pointed
Peaked T wave, ORS wide, prolonged PR, QT short	Hyperkalemia, treat with calcium chloride, glucose and insulin or dialysis
Prominent U-waves	Hypokalemia

Abnormal ECG Tracing

• Peak T wave	Hyperkalemia
• T wave inversion	Myocardial infarction
• ST segment depression	Angina pectoris
• ST segment elevation	Myocardial infarction
• Widening of QRS complexes	Arrhythmia
• Positive U wave	Hypokalemia

GLASGOW COMA SCALE

Behavior	Response	Score
Eye opening response	Spontaneously	4
	To speech	3
	To pain	2
	No response	1
Best verbal response	Oriented to time, place and person	5
	Confused	4
	Inappropriate words	3
	Incomprehensible sounds	2
	No response	1
Best motor response	Obeys commands	6
	Moves to localized pain	5
	Flexion withdrawal from pain	4
	Abnormal flexion (decorticate)	3
	Abnormal extension (decerebrate)	2
	No response	1
Total Score	Best Response	15
	Comatose client	8 or less
	Totally unresponsive	3

TYPES OF HEAD INJURIES

Types of injury	Mechanism
Concussion	• Sudden blow to the head that causes anterograde and retrograde brain injury • Brief period of cerebral paralysis; full recovery usually occurs in 12 hours
Contusion	• Sudden impact, commonly resulting from acceleration-deceleration forces, that displaces cerebrospinal fluid and causes the brain to hit the inside of the skull
Laceration	• High-velocity acceleration-deceleration injury or a penetrating trauma, such as a stab wound or gunshot wound • Tearing of the cortical surface

"Don't be afraid to fail, be afraid not to try."

—Michael Jordon

COMMON SCALES USED FOR ASSESSMENT/TREATMENT

1	GCS	The **Glasgow Coma Scale (GCS)** is the most common scoring system used to describe the level of consciousness in a person following a traumatic brain injury. Score ranges from 3 to 15. The first description was in 1975 by Jennett and Bond.
2	Asia impairement scale	The American Spinal Injury Association (ASIA) as a universal classification tool for Spinal Cord Injury based on a standardized sensory and motor assessment
3	Behavioral pain scale	The Behavioral Pain Scale (BPS) can be used to assess pain in in adults, including those in the ICU. It can be used for intubated patients and nonintubated patients.
4	CPOT	The pain assessment tool, CPOT is based on four domains: The patient's facial expressions, body movements, compliance with ventilator (or voice use for non-intubated patients), and muscle tension . The total score can vary between 0 and 8, where 0 indicates no pain behavior and 8 indicates clear signs of pain behavior
5	Braden scale	The Braden Scale for Predicting Pressure Ulcer Risk, is a tool that was developed in 1987 by Barbara Braden and Nancy Bergstrom.
6	Norton scale	The Norton Scale was developed in the 1960s and is widely used to assess the risk for pressure ulcer in adult patients.
7	Waterlow Scale	It provides predictive information about the risk of developing a pressure sore
8	VIP scale	the Visual Infusion Phlebitis (VIP) score tool for assessment of the early signs of phlebitis, along with prompt removal of peripheral intravenous cannulas
9	CPIS	Clinical pulmonary infection score (CPIS) as a screening tool in ventilatory associated pneumonia (VAP)
9	BOAS scale	The Beck Oral Assessment Scale and the mucosal-plaque score were used to assess the oral cavity
10	ROSIER	The Recognition of Stroke in the Emergency Room (ROSIER) scale as a stroke recognition tool
11	NIHSS	The National Institutes of Health Stroke Scale, or NIH Stroke Scale (NIHSS) is a tool used by healthcare providers to objectively quantify the impairment caused by a stroke
12	FLACC scale	the Face, Legs, Activity, Cry, Consolability scale or FLACC scale is a measurement used to assess pain for children between the ages of 2 months and 7 years or individuals that are unable to communicate their pain
13	CRIES scale	A new neonatal postoperative pain measurement score. C--Crying; R--Requires increased oxygen administration; I--Increased vital signs; E--Expression; S--Sleeplessness
14	FOUR score	FOUR: **F**ull **O**utline of **UnR**esponsiveness. The **FOUR Score** is a clinical grading scale designed for use by medical professionals in the assessment of patients with impaired level of consciousness
15	GCS –Pupils score	GCS Pupils Score (GCS-P) was constructed to bring together information about a patient's responsiveness as reflected in the GCS Score and the pupil reaction The GCS-P is calculated by subtracting the Pupil Reactivity Score (PRS) from the Glasgow Coma Scale (GCS) total score: **GCS-P = GCS - PRS**
16	CDR Scale	The **Clinical Dementia Rating** or **CDR** is a numeric scale used to quantify the severity of symptoms of dementia
17	RASS	The Richmond Agitation and Sedation **Scale (RASS)** is a validated and reliable method to assess patients' level of sedation in the intensive care unit.

Contd...

Scanned with CamScanner

18	ABBEY pain scale	The Abbey Pain Scale is a standardized pain assessment tool developed for use in demented nonverbal patients
19	MMSE (**Folstein** test)	The **Mini-Mental** State Exam **(MMSE)** is a 30-point questionnaire, widely used test of cognitive function. Any **score of** 24 or more (**out of** 30) indicates a normal cognition
20	PANAS	Positive and Negative Affect Schedule (PANAS) is a self-report questionnaire that consists of two 10-item scales to measure both positive and negative affect.
21	SOFA Score	**Sequential organ failure assessment score (SOFA score)**, previously known as the **sepsis-related organ failure assessment score** is used to track a person's status during the stay in an intensive care unit (ICU) to determine the extent of a person's organ function or rate of failure
22	APACHE II Score	APACHE - Acute Physiology, Age, Chronic Health Evaluation The **APACHE II** Scoring System is designed to measure the severity of disease in patients admitted to the intensive care unit.
23	**CAGE Questionnaire (CAGE)**	The CAGE questionnaire is a series of four questions that doctors can use to check for signs of possible alcohol dependency

48

"When you are sick of your sickness, you are no longer sick."

—Chinese Proverb

LEVEL OF SPINAL CORD INJURY AND ASSOCIATED MOTOR LOSS

Levels of spinal injury	Associated motor loss
C1 – C4	• Quadriplegia and loss of respiratory function
C4 – C5	• Quadriplegia and may affect respiratory function if edema damages the phrenic nerve
C5 – C6	• Quadriplegia • Gross motor movement of the arms remains intact with use of the scapular elevators; diaphragmatic breathing remains intact but may not be able to support ventilation because of the loss of intercostal muscle innervation
C6 – C7	• Quadriplegia • Diaphragmatic breathing remains intact but may not be able to support ventilation; arm muscles remain innervated and capable of elbow flexion, wrist extension, and weak thumb grasp
C7 – C8	• Quadriplegia • Diaphragmatic breathing remains intact, but ventilation and airway secretion removal may be compromised because of loss of intercostals muscle innervations. Biceps and triceps muscles respond to voluntary control, and wrist flexion may be possible
T1 and L1 – L2	• Paraplegia • Voluntary motor function of the arms remains intact • Loss of some intercostals muscle innervations may affect ventilation and secretion removal
Cauda equina	• Mixed loss of motor, sensory, bowel, bladder, and sexual function and depends on which roots are damaged
Sacral spinal nerves	• Loss of bowel, bladder and sexual function

BURNS

Types of Burn Injury, Area Calculation and Fluid Resuscitation Formulae

Classification and Comparison of Burn Injury

Characteristic	Superficial, partial-thickness (First-degree) burn	Deep, partial-thickness (Second-degree) burn	Full-thickness (Third-degree) burn
Appearance	Dry with no blisters	Weeping, edematous blisters	Dry, leathery, and possibly edematous
Color	Pink	White to pink or red	White to charred
Comfort	Painful	Very painful	Little no pain
Depth	Epidermis only	Epidermis, dermis, and possibly some subcutaneous tissue	Subcutaneous tissue and possibly fascia, muscle and bone

Rule of Nines to Calculate Burn Area

Adult body area	%
Arm x 2	18%
Head	9%
Groin	1%
Leg x 2	36%
Anterior trunk	18%
Posterior trunk	18%

Rule of Nines

Formulae for Calculation of Fluid Replacement for Burn Victims

Consensus Formula

- Ringer lactate (RL) or other balanced saline solution: 2–4 ml × kg body weight × % total body surface area burned
- Half of the fluid need to be given in 8 hours and remaining half over next 16 hours.

Evans Formula

- Colloids: 1 ml × kg body weight × % total body surface area burned
- Electrolyte (saline): 1 ml × kg body weight × % total body surface area burned
- Glucose (5% D): 2000 ml for insensible water loss
  - Day 1: Half of the fluid need to be given in 8 hours and remaining half over next 16 hours.
  - Day 2: Half of the previous day's colloids and electrolyte; all insensible water loss.

Brooke Army Formula

- Colloids: 0.5 mL × kg body weight x % total body surface area burned
- Electrolyte (RL): 1.5 mL × kg body weight × % total body surface area burned
- Glucose (5% D): 2000 mL for insensible water loss
  - Day 1: Half of the fluid need to be given in 8 hours and remaining half over next 16 hours.
  - Day 2: Half of the previous day's colloids and electrolyte; all insensible water loss.

Parkland/ Baxter formula

- RL: 4 mL × kg body weight × % total body surface area burned
  - Day 1: Half of the fluid need to be given in 8 hours and remaining half over next 16 hours.
  - Day 2: Varies; colloids are added.

LUNG VOLUMES AND CAPACITIES

Lung Volume

Lung volume	Description	Normal volume
Tidal volume (TV)	Amount of air inspired during normal, relaxed breathing	About 500 mL,
inspiratory reserve volume (IRV)	The additional air that can be forcibly inhaled after the inspiration of a normal tidal volume	About 3100 mL
Expiratory reserve volume (ERV)	The additional air that can be forcibly exhaled after the expiration of a normal tidal volume	1200 mL
Residual volume (RV)	The volume of air still remaining in the lungs after the expiratory reserve volume is exhaled	1200 mL

Lung Capacities

- The **total lung capacity (TLC)**, about 6,000 mL, is the maximum amount of air that can fill the lungs (TLC = TV + IRV + ERV + RV).
- The **vital capacity (VC)**, about 4,800 mL, is the total amount of air that can be expired after fully inhaling (VC = TV + IRV + ERV = approximately 80 percent TLC). The value varies according to age and body size.
- The **inspiratory capacity (IC)**, about 3,600 mL, is the maximum amount of air that can be inspired (IC = TV + IRV).
- The **functional residual capacity (FRC)**, about 2,400 mL, is the amount of air remaining in the lungs after a normal expiration (FRC = RV + ERV).

"Our prayers should be for a sound mind in a healthy body."
—Juvenal

IMMUNOGLOBULINS AND THEIR CHARACTERISTICS

Immunoglobulin A	About 10–15% of the antibodies present in the body are IgA antibodies. Found in **Breast milk**
Immunoglobulin D	Antibodies are found in small amounts in the tissues that line the belly or chest
Immunoglobulin E	IgE antibody levels are often high in people with allergies
Immunoglobulin G	• **They are the smallest but most common antibody** (75–80%) of all the antibodies in the body. • IgG antibodies are very important in fighting bacterial and viral infections. • **IgG** is the only antibody class that significantly crosses the **human placenta.**
Immunoglobulin M	First type of antibody made in response to an infection. The largest in size 5–10% of all the antibodies in the body.

DRUGS AND THEIR ACTIONS

Antibiotics

Sl. No.	Group of drug	Action	Mode of action	Drugs include in the group
1	Penicillins	Bactericidal	Inhibit cell wall synthesis and the bacteria dies	**(A) Natural penicillins** ▪ Benzyl penicillin - G (action lasts for 4–6 hours.) ▪ Procaine penicillin - G (action lasts for 12–24 hours.) ▪ Benzathine penicillin (penidura) - one inj. in a week **(B) Semisynthetic penicillin** ▪ Phenoxymethylpenicillin ▪ Amoxicillin phenoxyl ethyl penicllin **(C) Synthetic penicillin** ▪ Methicillin sodium, cloxacillin sodium oxacillin sodium **(D) Broad spectrum penicillin** ▪ Ampicillin, carbenicillin
2.	Cephalosporins	Bactericidal	Bind bacterial enzyme which is necessary for cell wall synthesis.	**(A) First generation cephalosporins** ▪ Cefazolin, cefadroxil, cephalexin **(B) Second generation cephalosporins** ▪ Cefuroxime, cefotetan, cefoxitin **(C) Third generation cephalosporins** ▪ Cefotaxime, ceftriaxone cefixime ceftazidime **(D) Fourth generation cephalosporins** ▪ Inj. cefpirome, inj. cefeprime
3.	Aminoglycosides	Bactericidal	Inhibit synthesis of bacterial cell proteins by binding, ribosomes and causing death of bacteria.	▪ Gentamicin, amikacin, kanamycin, tobramycin, neomycin, sisomycin, netilmicin, streptomycin
4.	Fluoroquinolones (FQS)	Bactericidal	Inhibit DNA replication by inhibiting DNA gyrase enzyme	▪ Ceiprofloxacin, ofloxacin, norfloxacin, levofloxacin, lomefloxacin, nalidixic acid.
5.	Sulfonamides	Bacteriostatic	Sulfonamide interfere in folic acid synthesis and lack of folic acid cause death of bacteria	▪ Sulfadiazine, sulfamerazine, sulfamethoxazole, sulfamethizole, sulfacetamide sodium, sulfaguanidine
6.	Macrolides	Bactericidal	Inhibits protein synthesis by binding bacterial ribosomes	▪ Erythromycin, azithromycin, roxithromycin, clindamycin, lincomycin, spiramycin, spectinomycin, vancomycin
7.	Chloramphenicol	Bacteriostatic	Inhibits protein synthesis	
8.	Tetracycline	Bacteriostatic	Inhibits protein synthesis

Antitubercular Drugs

Treatment Regimen in DOTS (Directly Observed Treatment, Short-course), Chemotherapy

Categories	Types of patient	Drug regimen and duration
Category I (Red Box)	New sputum smear positive Seriously ill sputum smear negative Seriously ill extrapulmonary	Intensive Phase (2 months): HRZE Continuation Phase (4 months): HR
Category II (Blue box)	Sputum smear - positive relapse Sputum smear - positive failure Sputum smear - treatment after default	Intensive Phase (3 months): HRZE; Inj. Streptomycin (0.75 mg) IM. Continuation Phase (5 months): HRE
Category III (Green box)	Sputum smear negative not seriously ill Extra pulmonary not seriously ill	Intensive Phase (2 months): HRE Continuation Phase (4 months): HR

NOTE:

- All the drugs are given 3 times a week on alternate days
- H-Isoniazid, R-Rifampicin, Z-Pyrazinamide, E-Ethambutol
- Category III is no longer exists in the programme

Ref: Module for MPWs and other DOT providers. Central TB Division. DGHS, MoHFW, New Delhi.

Side Effects of Antitubercular Drugs

Isoniazid: Hepatitis, peripheral neuropathy, skin rash, fatigue, pellagra-like syndrome pyridoxine deficiency

Rifampicin: Orange discoloration of urine, saliva and sweat, skin rash, gastritis hepatitis

Pyrazinamide: Joint pain, gout due to hyperuricemia and hepatitis

Ethambutol: Ocular toxicity, blurring and red-green color blindness

Streptomycin: Vestibular damage, unsteadiness of gait, reduced hearing (ototoxicity), contraindicated in pregnancy.

Anticancer Drugs

Common Combination Chemotherapy Regimens

Cancer type	Drugs	Acronym
Breast cancer	Cyclophosphamide, methotrexate, 5-fluorouracil	CMF
	Doxorubicin, cyclophosphamide	AC
Hodgkin's disease	Mustine, vincristine, procarbazine, prednisolone	MOPP
	Doxorubicin, bleomycin, vinblastine, dacarbazine	ABVD
Non-Hodgkin's lymphoma	Cyclophosphamide, doxorubicin, vincristine, prednisolone	CHOP
Germ cell tumor	Bleomycin, etoposide, cisplatin	BEP
Stomach cancer	Epirubicin, cisplatin, 5-fluorouracil	ECF
	Epirubicin, cisplatin, capecitabine	ECX
Bladder cancer	Methotrexate, vincristine, doxorubicin, cisplatin	MVAC
Lung cancer	Cyclophosphamide, doxorubicin, vincristine,	CAV
Colorectal cancer	5-fluorouracil, folinic acid, oxaliplatin	FOLFOX

GROWTH AND DEVELOPMENT

Age and Weight of the Baby

Age of the baby	Weight of the baby
Birth	X
5-6 months	2X
1 year	3X
2 years	4X
3 years	5X
5 years	6X
7 years	7X
10 years	10X

Age and Height of the Baby

Age of the baby	Height of the baby
Birth	50 cm
3 months	60 cm
6 months	65 cm
9 months	70 cm
1 year	75 cm
2 years	90 cm
4 years	100 cm

Gross Motor Development

It is an orderly sequence to ultimate attainment of locomotion and more complex motor task thereafter. Key gross motor development milestone are given in the table.

Age	Milestone
3 months	Neck holding
5 months	Rolls over
6 months	Sits in tripod fashion
8 months	Sitting without support
9 months	Stand with support
12 months	Creeps well; walk but falls; stand without support
15 months	Walk alone; creeps upstairs
18 months	Runs; explore drawers
2 years	Walk up and downstairs (2 feet/step); jumps
3 years	Rides tricycle; alternate feet going upstairs
4 years	Hops on one foot; alternate feet going downstairs

Scanned with CamScanner

Fine Motor Development

This primarily involves the development of fine manipulation skills and coordination with age. Fine motor developments are given in the table.

Age	Fine motor development milestones
4 months	Bidextrous reach (reaching out of object with both hands)
6 months	Unidextrous reaching (reaching out for object with one hand); transfer object
9 months	Immature pincer grasp
12 months	Mature pincer grasp
15 months	Imitate scribbling; tower of 2 blocks
18 months	Scribbles; tower of 3 block
2 years	Tower of 6 blocks; vertical and circular strokes
3 years	Tower of 9 block; copies circle
4 years	Copies cross; bridge with blocks
5 years	Copies triangle; gate with blocks

Personal and Social Development and General Understanding

Age	Social and adaptive milestones
2 months	Social smile (smile after being talked to)
3 months	Recognizes mother; anticipates feed
6 months	Recognizes strangers; stranger anxiety
9 months	Waves bye-bye
12 months	Comes when called; plays simple ball game
15 months	Jargon
18 months	Copies parents in task
2 years	Ask for food, drink, toilet, pulls people to show toys
3 years	Share toys; know full name and gender
4 years	Plays cooperatively in a group; goes to toilet alone
5 years	Helps in household tasks, dresses and undresses

COMPARISON OF COMPONENTS FOR ADULTS, CHILDREN, AND INFANTS BLS/CPR

Component	Adults	Children	Infants
	Unresponsive (for all ages)		
Recognition	No breathing or no normal breathing (i.e. only gasping)	No breathing or only gasping	
	No pulse palpated within 10 seconds for all age groups (HCP only)		
CPR sequence	C-A-B		
Compression rate	At least 100/min		
Compression depth	At least 2 inches (5 cm)	At least 1/3 AP diameter about 2 inches (5 cm)	At least 1/3 AP diameter About 11/2 inches (4 cm)
Chest wall recoil	Allow complete recoil between compressions HCPs rotate compressors every 2 minutes		
Compression interruptions	Minimize interruptions in chest compressions Attempt to limit interruptions to <10 seconds		
Airway	Head tilt-chin lift (HCP suspected trauma: jaw thrust)		
Compression-to-ventilation ratio (until advanced airway placed)	30:2 1 or 2 rescuers	30:2 Single rescuer 15:2 2 HCP rescuers	
Ventilations: when rescuer untrained or trained and not proficient	Compressions only		
Ventilations with advanced airway (HCP)	1 breath every 6 – 8 seconds (8 – 10 breaths/min) Asynchronous with chest compressions about 1 second per breath Visible chest rise		
Defibrillation	Attach an AED as soon as available. Minimize Interruptions in chest compressions before and after shock; resume CPR beginning with compressions immediately after each shock.

"Disease is a lack of health. Health is not a lack of disease."

—Famous quote

STAGES OF PERSONALITY DEVELOPMENT

Freud's Stage of Psychosexual Development

Stages of development	Main characteristics	Examples of unsuccessful task completion
Oral (Birth to 18 months)	Focus of libido is on Mouth, Tongue and Lips. Pleasure centers on mouth – sucking, biting, chewing	Smoking, over eating, obesity, alcoholism, nail biting, drug addiction, difficulty in trusting others
Anal (18 months to 3 years)	Pleasure focuses on bowel and bladder. Elimination and toilet training are central focus.	Perfectionism or messiness, obsessive compulsive disorder.
Phallic (3–6 years)	Awareness of genital area as source of pleasure. Child learns sexual identity. Conflicts ends as child represses urge and identifies with same sex parent. The development of Electra complex *(female)* and Oedipus complex *(male)* occurs during this stage of development. Freud described this as the child's unconscious desire to eliminate the parent of the same sex and to possess the parent of the opposite sex.	Sexual dysfunction (transexuality, homosexuality, sexual identity problem) difficulty accepting authority
Latency (6–12 Years)	Quite stage in sexual development. Child learns to socialize.	Inability to conceptualize; lack of motivation in school or job.
Genital (12 years to adulthood)	The genitals are again the focus of stimulation. Sexual maturity and satisfactory relationships with opposite sex is the central focus	Unsatisfactory relationship, impotence, premature ejaculation.

Erikson's Stages of Personality Development

Stage and approximate ages	Important events	Virtue	Tasks	Consequences of unsuccessful task completion
Infants Trust Vs mistrust Birth to 18 months	Feeding	Hope	Viewing the world as safe and reliable, relationships as nurturing, stable and dependable	Suspiciousness, trouble with personal relationship
Toddler Autonomy Vs shame and doubt 1.5–3 years	Toilet training	Will	Achieving a sense of control and free will	Low self-esteem, dependency
Pre-school Initiative Vs guilt 3–6 years	Explorative	Purpose	Beginning development of conscious learning to manage conflict and anxiety	Passive personality, strong feeling of guilt.
School age Industry Vs inferiority 6–12 years	Schooling	Competence	Emerging confidence in child's own ability, taking pleasure in accomplishments	Unmotivated, unreliable
Adolescence Identity Vs role confusion 12–19 years	Social relationship	Fidelity	Formulate a sense of self and belongingness	Substance abuse, difficulty in keeping personal relationship.
Young adult Intimacy Vs isolation 20–40 years	Relationship	Love	Formulating adult, loving relationship and meaningful attachment to others	Emotional immaturity, may deny need for personal relationship
Middle adult Generativity Vs stagnation 41–65 years	Risk and parenthood	Care	Being creative and productive, focus is on establishment of family and guiding to the next generation	Inability to show concern for anyone but self
Maturity Ego integrity Vs despair 65 years to death	Reflection of life	Wisdom	Accepting the responsibility for one's self and life	Has difficulty dealing with issues of aging and death, may have feeling of hopelessness

"Wisdom is to the soul, what health is to the body."

—La Rouchefoucauld

EGO DEFENSE MECHANISMS WITH EXAMPLES

Defense mechanism and their description	Examples
Repression Unconscious and involuntary forgetting of painful ideas, events and conflicts	Forgetting a loved one's birthday after a fight.
Denial Unconscious refusal to admit an unacceptable idea or behavior, usually the first defense learned and used	The mother of a child who is fatally ill may refuse to admit that there is anything wrong even though she is fully informed of the diagnosis and expected outcome.
Displacement Unconsciously discharging pent-up feelings to a less threatening object	A husband comes home after a bad day at work and yells at his wife.
Reaction formation Replacing unacceptable feelings with their exact opposites	A jealous boy who hates his elder brother may show his exaggerated respect and affection towards him.
Rationalization It is a process in which an individual justifies his failures and socially unacceptable behavior by giving socially approved reasons	A student who fails in examination may complain that the hostel atmosphere is not favorable and has resulted in failure.
Sublimation Consciously or unconsciously channeling instinctual drives into acceptable activities	Aggressiveness might be transformed into competitiveness in business and sports.
Compensation Consciously covering up for a weakness by over emphasizing or making up a desirable trait	A student who fails in his studies may compensate by becoming the college champion in athletics.
Projection Unconsciously or consciously blaming someone else for one's difficulties	A person who blames another for his own mistakes is using the projection mechanism. A surgeon, whose patient does not respond as he anticipated, may tend to blame the theater nurse who helped that surgeon at the time of operation.
Intellectualization Separation of the emotions of a painful event or situation from the facts involved; acknowledging the facts but not the emotions	Person shows no emotional expression when discussing serious car accident.
Undoing Consciously doing something to counteract or make up for a transgression or wrong doing	Giving a treat to a child who is being punished for wrong doing.
Regression Unconscious return to an earlier and more comfortable developmental level	An adult throws a temper tantrum when he does not get his own way.
Dissociation The unconscious separation of painful feelings and emotions from an unacceptable idea, situation or object	Amnesia that prevents recalls of previous days auto accident or adult remembers nothing of childhood sexual abuse.
Conversion The unconscious expression of intrapsychic conflict symbolically through physical symptoms	A student awakens with the migraine headache in the morning of a final examination and feels too ill to take the test

"Laughter is a tranquilizer with no side effects."
—Arnold H. Glasow

INTERPRETATION OF BMI

BMI Value	Interpretation
Less than 18.5	Underweight
18.5 – 24.9	Normal weight
25.0 – 29.9	Overweight
30.0 – 34.9	Class I Obesity
35.0 – 39.9	Class II Obesity
> 40.0	Class III Obesity

Formula to calculate BMI:
BMI = Weight in kg/(height in meter)^2

58

"Health and wealth create beauty."
—English Proverb

NEUROTRANSMITTERS' CHART

Neurotrans-mitter	Function	Effect of deficit	Effect of surplus	Agonist drug	Antagonist drug
Acetylcholine (ACh)	Excitatory: Stimulates muscle contraction; Involved in memory, Learning and general intellectual functioning	Alzheimer's	Severe muscle spasms	Nicotine Black widow spider venom	Curare
Dopamine	Inhibitory: Pleasurable sensations involved in movement, attention, learning	Parkinson's	Schizophrenia drug addiction	L-dopa Cocaine	Antipsychotic drug like thorazine
Serotonin	Inhibitory: Moods and emotional states	Depression, Mood Disorders	Autism	Prozac SSRIs	
Norepineph-rine	Excitatory: Used for arousal in the flight/fight response, plays a role in learning and memory retrieval	Mental disorders, especially depression	Anxiety	Caffeine, Am-phetamines	Lithium
GABA (Gama Aminobutyric acid)	Inhibitory: Helps to offset excitatory massages and regulate daily sleep-wake cycles	Anxiety	Sleep and eating disorders	Valium, Xanax	
Endorphins	Inhibitory: Involved in pain perception and positive emotions	Body experience pain	Body may not give adequate warning about pain, artificial highs	Opiates	Naloxone
Glutamate	Excitatory: Used in memory, learning, movement		Too much glutamate (and too little GABA associated with epileptic seizures)

"The doctor dresses the wound and God heals it."

—Popular Saying

PHASES OF WOUND HEALING PROCESS

• **Hemostasis (Vascular Response)**	A brief period of vasoconstriction occurs as an attempt to stop the bleeding. Capillaries dilate 10 to 30 minutes after injury due to serotonin released by platelets. Plasma flows into injured area to transport oxygen, nutrients and to dilute toxins.
• **Inflammatory phase**	From right after injury lasts for 2-6 days. This is a defensive reaction involving increased blood flow and capillary permeability and helps in phagocytosis. Redness, swelling and pain in the affected area are common in this phase
• **Proliferative phase (resolution phase)**	Granulation tissue forms (pink-tored moist tissue). Epithelialization occurs in this stage. Wound contracts and begins to close.
• **Maturation phase**	Collagen reorganizes and strengthens. It takes 2-3 weeks to regain strength but not beyond 70–75% of its original strength

SPECIFIC ANTIDOTES AGAINST POISONING

Poisoning	Antidote
Arsenic	Dimercaprol
Atropine	Physostigmine
Barbiturate/Benzadiazepine	Flumazenil
Copper	D-penicillamine
Heparin	Protamine sulphate
Insulin	Glucose/fruit juice
Iodine	Sodium thiosulphate
Iron	Deferoxamine
Lead	**Parenteral:** Dimercaprol, Calcium disodium edetate **Oral:** Succimer, D-Penicillamine
Magnesium sulphate	Inj. calcium gluconate 10% IV
Morphine, Opioids	Naloxone (narcan)
Mushroom : Poisoning	Atropine
Neostigmine bromide (used in myasthenia gravis)	Atropine sulfate
Organophosphorus poisoning	Atropine sulfate
Paracetamol	N-Acetyl cysteine
Salicylate (Aspirin)	Frusemide + Vit K + $NaHCO_3$ /forced alkaline diuresis with $NaHCO_3$
Warfarin	Vit K+ fresh blood

DRUG STORAGE TEMPERATURE

Condition	Temperature
Freezer	-20 to -10°C
Refrigerator	2 to 8°C
Cold	Temperature not exceeding 8°C
Cool	8 to 15°C
Room temperature	15 to 30°C
Warm	30 to 40°C
Excessive heat	Above 40°C

IMPORTANT DRUG SCHEDULES IN INDIA

Schedule G	List of drugs that don't need prescription but requires a mandatory text on label "Caution: It is dangerous to take this preparation, except under medical supervision", e.g. antihistaminics.
Schedule H	List of drugs that can be sold only when a prescription is produced. Most drugs belong to this category.
Schedule P	It is about drug expiry period, i.e. maximum period till which drug can be used with intact potency.
Schedule W	List of drugs marketed under generic names only.
Schedule X	List of psychotropic drugs which need special license for manufacture and sale.
Schedule Y	Guidelines on clinical trials, import and manufacture of new drugs.

Note:

1. OTC (Over the Counter) drugs do not require a prescription and are drugs which do not belong to schedule H and X.
2. Drugs under schedule G, H and X cannot be directly advertised to the patient.

SOME IMPORTANT SOCIAL WELFARE/HEALTH/DEVELOPMENT PROGRAM LAUNCHED BY GOVERNMENT OF INDIA FROM 2014 TILL AUGUST 2019

Programme	Launch date	Objectives and features
Pradhan Mantri Kisan Mandhan Yojana	Effective from 9 August 2019	• Farmers between 18 and 40 years of age will get Rs 3,000 monthly pension after attaining the age of 60
Pradhan Mantri Kisan Samman Nidhi	24 February 2019	• All small and marginal farmers will get up to Rs.6,000 per year as minimum income support
Ayushman Bharat Yojana or Pradhan Mantri Jan Arogya Yojana or National Health Protection Scheme	23 September 2018	• Aims to help economically vulnerable Indians who are in need of healthcare facilities • Plans to make secondary and tertiary healthcare completely cashless
Pradhan Mantri Ujjawala Yojana	1 May 2016	• To provide LPG connections to 5 crore BPL families
Setu Bharatam Project	4 April 2016	• To make national highways free of railway crossings by 2019
Pradhan Mantri Fasal Bima Yojana	18 February 2016	• Agriculture insurance scheme • Is in force since Kharif 2016
Shyama Prasad Mukherji Rurban Mission	21 February 2016	• To develop smart village on the line of smart cities • 300 Rurban clusters developed in 3 years
Mission Indradhanush	25 December 2014	• To achieve full immunization coverage for all children by 2020 • Coverage against 7 life-threatening diseases, i.e. Diphtheria, Whooping Cough, Tetanus, Polio, Tuberculosis, Measles, Hepatitis B
Ujwal DISCOM Assurance Yojana (UDAY)	5 November 2015	• Energy efficiency and conservation • Reduction of cost of generation of power • Development of renewable energy
Stand Up India, Start Up India	15 August 2015	• To promote bank financing for business start-ups • To promote entrepreneurship and job creation
Nai Manzil Scheme	8 August 2015	• To address educational and livelihood needs of minorities • Focus on skill development for 17-35 age group
Deen Dayal Upadhyaya Gram Jyoti Yojana	25 July 2015	• Subsumed Rajiv Gandhi Gramin Vidyutikaran Yojana • To achieve 100% rural electrification
Pradhan Mantri Krishi Sinchai Yojana	2 July 2015	• To attain water efficiency by 2020 • Will be achieved through converging existing programmes

Contd...

Scanned with CamScanner

Programme	Launch date	Objectives and features
Smart Cities Mission	25 June 2015	• Focus is on building urban infrastructure
AMRUT Yojana	25 June 2015	• Atal Mission for Rejuvenation and Urban Development • To develop infrastructure in 500 towns and cities
Namami Gange Yojana	14 May 2015	• Integrated Ganga Conservation Mission • Focus is on pollution abatement and socio-economic development
Pradhan Mantri Jeevan Jyoti Bima Yojana	9 May 2015	• To provide for life insurance cover to the needy • Offers ₹ 2 lakh coverage for ₹ 330 premium • Administered by the LIC India
Atal Pension Yojana	9 May 2015	• To enhance old age income security of the working poor • Fixed pension between ₹ 1000 and 5000 per month
Pradhan Mantri Suraksha Bima Yojana	9 May 2015	• Accident Insurance Scheme • Offers death and disability cover (1-2 lakh) on account of an accident • Annual premium of ₹ 12 only.
Pradhan Mantri MUDRA Yojana (PMMY)	8 April 2015	• Micro Units Development and Refinance Agency Ltd. • Has three categories—Shishu, Kishor and Tarun • Provides loans between 50000 to 10 lakh rupees
Soil Health Card Scheme	19 February 2015	• To improve farm productivity • **Slogan:** *Swasth Dharaa Khet Haraa*
Beti Bachao, Beti Padhao	22 January 2015	• Launched first in the state of Haryana • To address the declining Child Sex Ratio issue • To celebrate the girl child and facilitate her education
HRIDAY Yojana	21 January 2015	• Heritage Development and Augmentation Yojana • To promote inclusive and sustainable development of heritage sites
Saansad Adarsh Gram Yojana	11 October 2014	• To realize the ideal of Gram Swaraj • Village development scheme under MPLADs
Swachh Bharat Mission	2 October 2014	• To make India 100% open defecation free by 2019 • Eradication of manual scavenging • Focus is on attitudinal change of people towards clean India
Make in India	25 September 2014	• To make India a global manufacturing hub • Aimed to create 1 crore jobs per year • Manufacturing sector to grow over 10%
Deen Dayal Upadhyaya Antyodaya Yojana	25 September 2014	• To alleviate poverty in rural and urban areas • Implemented by Rural Development and Housing and Urban poverty alleviation ministries
Pradhan Mantri Jan Dhan Yojana	28 August 2014	• To achieve 100% financial inclusion; 22 crore bank accounts opened so far • **Slogan:** *Mera Khata – Bhagya Vidhaata*
SKILL India Mission	28 August 2014	• Skill Development in Youth • Aimed to skill 300 million people by 2022
Digital India	26 August 2014	• To achieve digitally empowered knowledge economy • Transformed version of National e-Governance Plan • Worth 1 lakh crore rupees
Mission Housing for All — Urban	25 June 2015	• To provide housing to all eligible by 2022

—Mahatma Gandhi

1 MEDICAL SURGICAL NURSING

SYNOPSIS

INFLAMMATION AND WOUND HEALING

INFLAMMATION

Definition: Inflammation is a localized reaction intended to neutralize, control or eliminate the offending agent to prepare the site for repair.

Five Cardinal Signs of Inflammation

1. Redness
2. Warmth (Heat)
3. Swelling
4. Pain
5. Loss of function.

Note

Fever is systemic response of inflammation.

Chemical Mediators

a. Histamine released by mast cells at the site of injury causes vasodilation and vascular permeability.
b. Kinins are responsible to attract neutrophils.
c. Prostaglandins cause increased vascular permeability.

Three Phases of Inflammation

Phase 1: **Inflammatory response (3-5 days)**

a. Transient vasoconstriction occurs immediately after injury followed by vasodilation and increased capillary permeability which results in redness, swelling and warmth.
b. Exudate consists of plasma, plasma proteins, solutes, WBCs etc. migrate into tissues resulting in pressure of fluid on nerve endings (*pain and loss of function*)
c. Leukocytes are responsible for engulfing offending organisms and for removing cellular debris. (*phagocytosis by macrophages*).

Phase 2: **Repair and Regeneration (2-8weeks)**

a. It is characterized by new collagen formation.
b. These fibres are laid down in disorganized manner to make scar but the link between fibres is weak. Thus new tissue is susceptible to disruption on aggressive activity.

Phase 3: **Remodelling and Maturation (Months to years)**

a. In this phase, tissue continues to remodel, strengthen and improve its cellular organization.
b. Increase in organization of collagen fibers and bonds become stronger.

Exudate

The fluid involved in inflammatory edema is known as Exudate

a. **Serous exudate:** Water-like exudate; seen in minor injury
b. **Fibrinous exudate:** Contains fibrin
c. **Purulent exudate (pus):** Creamy white exudate from dead neutrophils; seen in bacterial infection
d. **Hemorrhagic exudate:** Bloody red exudate

WOUND HEALING

Key Points

Key Terminologies

- Cellulitis: Inflammation of subcutaneous connective tissue (inner layer of the skin)
- Colonization: Presence of proliferating bacteria without causing systemic or local infections (without a host response to presence of bacteria)
- Dehiscence: Wound ruptures along (splitting) a surgical line
- Full thickness wound: Wound indicates that damage extends below all layers of the skin into the subcutaneous tissue or beyond (i.e. muscle, tendons, bone or other adjacent structures)
- Maceration: Softening and breaking down of skin surrounding the wound due to prolonged contact with moisture.
- Partial thickness wound: Loss of epidermis with involvement of all or part of dermis layer of the skin.
- Sloughing: Process of shedding necrotic (dead) tissue from the wound or skin.

Definition: Wound healing is a complex and dynamic process of replacing devitalized and missing cellular structures and tissue layers.

TYPES OF WOUNDS

- **Acute wound:** Heals without many complications within expected time frame, e.g. surgical wound and trauma wounds.
- **Chronic wound:** Underlying pathology or infection causes wound or interferes with the healing process. For example, diabetic ulcer and pressure ulcer.

WOUND HEALING PROCESS

- **Healing by primary intention:** No or little scar tissue. For example, surgical wounds.

Scanned with CamScanner

- **Healing by secondary intention:** Marked loss of tissue. Edges of the wound are too far and wound gets closed naturally through granulation and epithelialization. For example, lacerated wounds, pressure ulcers, and traumatic injuries.
- **Healing by tertiary intention:** Characterized by delayed wound closure. This results in granulation of wound edges. Characterized by edema, infection, exudates from wound and excessive scar formation.

Four Stages of Wound Healing

1. **Hemostasis:** Causes coagulation
2. **Inflammation:** Destroys bacteria and removes debris
3. **Proliferation:** Fills and covers the wound
4. **Maturation:** Tissue gains strength and flexibility.

Wound healing can progress backward or forward depending on internal and external patient conditions.

Hemostasis

(A brief period of vasoconstriction as an attempt to stop the bleeding).

- Begins at the onset of injury and its objective is to stop bleeding.
- Blood vessels constrict to restrict the blood flow.
- Platelets stick together and adhere to sub-endothelium surface of epithelial wall of blood vessel in order to seal the break.
- After this, first fibrin strand begins to adhere in about 60 seconds.
- As the fibrin mesh begins, blood is transformed from liquid to gel through coagulation.

Inflammatory Phase

(Starts immediately after injury and lasts for 2-6 hrs)

- Injured blood vessels leak transudate (neutrophils, water, salt and proteins) and cause localized swelling.
- Increased capillary permeability and blood flow to the site of injury assists phagocytosis.
- During this phase, damaged cells, pathogens and bacteria are removed from wound area.
- Swelling, redness and pain in the injured/affected area are common in this phase.

Proliferation

This stage has three distinct phases:

1. Filling the wound
2. Contraction of wound margins
3. Covering the wound (Epithelialization)
   - It is a phase of rebuilding of new tissue made up of collagen and extracellular matrix.
   - Formation of granulation tissue (pink-to-red moist tissue) followed by epithelialization (migration of epithelial cells across wound surface).
   - New network of blood vessels is constructed for sufficient supply of oxygen and nutrients to granulation tissue.

Maturation Phase

(Remodelling stage)

- Strengthening and reorganization of collagen occurs (remodelling of Collagen).
- Cells that had been used to repair the wound but no longer needed are removed by apoptosis.
- Scar thickness reduces and make the area stronger.

- The process takes months to year. It takes 2-3 weeks to regain 50% of strength.
- Only 70%-75% of its original strength will be regained at the end of wound healing process.

Key Points

- Healthy granulation tissue is pink or red and uneven in texture.
- Dark granulation tissue can be a sign of poor perfusion or infection.
- Stages of wound care can be speeded up by keeping wounds clean and moist.
- Factors that lead to chronic wounds are: Venous disease, infection, diabetes, metabolic deficiencies.

TYPES OF WOUND DEBRIDEMENT

Goal of debridement is to remove all the devitalized tissue from the wound bed to promote wound healing. The five methods of debridement are given below:

- **Mechanical debridement:** It is the process of removal of damaged tissue or foreign objects from a wound by physical force
- **Chemical or enzymatic debridement:** Topical application of proteolytic substance (e.g. Enzymes) can assist in removal of devitalized tissue from wound.
- **Sharp debridement:** Sharp instrument (e.g. Scissors, scalpel) is used in the removal of necrotic or foreign material from the wound.
- **Autolytic debridement:** Useful in pressure ulcers. Synthetic dressings (e.g. Transparent adhesives, hydrogel) are used to cover the wound. This facilitates the naturally available enzymes in wound to digest devitalized tissue itself.
- **Biologic debridement or Maggot debridement therapy:** Introduction of live, disinfected maggots (fly larvae) into the non-healing skin and soft tissue of a human for the purpose of cleaning out the necrotic tissue within a wound.

KEY NURSING RESPONSIBILITIES IN PREVENTION AND CARE OF PRESSURE ULCER

- Change of position every 2 hours is the most effective method of prevention of pressure ulcer in a bedridden patient
- Norton or Braden scales are valid risk assessment tools for assessment of pressure ulcers.
- Waterlow scale is used for risk assessment for pressure ulcer.
- Do not allow the skin to remain wet. Clean as soon as it becomes wet.
- Provide bath regularly.
- Avoid use of soap that dries the skin.
- Apply cream on dry, scaly skin.
- Prevent skin from contact with feces and urine
- Use pressure reducing devices
- Further trauma to the wound should be avoided by reducing friction and cuts
- Prevent further infection by covering the wound (where ever applicable)

Scanned with CamScanner

GANGRENE

- Gangrene is a type of tissue death due to lack of blood supply and oxygen.
- Gangrene is usually external, affecting extremities but it can also affect internal tissues.

Types of Gangrene

Table 1 Types of gangrene

Dry Gangrene	Wet Gangrene
• Begins in the distal part of the limb due to ischemia and spread upward. • Most commonly affects limbs • Commonly due to arterial occlusion e.g. Raynaud's disease, Buerger's disease • Organ is dry, shrink and black in color • Bacteria fail to survive	• Affects naturally moist tissues such as oral cavity, bowel, cervix, lungs etc. • More commonly affects bowel • Commonly due to blockage of venous supply and less commonly due to blockage of arterial supply, e.g. Diabetic foot, bed sore, gas gangrene • Organ is moist, soft, swollen, rotten and dark • This gangrene favors bacterial growth.

Dry gangrene

Wet Gangrene (gas gangrene)

A special form of wet gangrene caused by Gram-positive anaerobic bacteria of *Clostridium* species is known as gas gangrene.

Golden points to remember

- **Nociception** is the physiologic process by which information about tissue damage is communicated to the Central Nervous System (CNS).
- **Prostaglandins** increase the sensitivity of pain receptors by enhancing the pain-provoking effect of bradykinin.
- **Endorphins** interact with the opiate receptors in the brain to reduce our perception of **pain** and act similarly to drugs such as morphine and codeine.
- **Nociceptor** is a sensory neuron that responds to damaging or potentially damaging stimuli by sending "possible threat" signals (pain) to the spinal cord and the brain.
- **Dehiscence** is the separation and disruption of previously joined wound edges.
- **Hyperbaric oxygen** therapy means delivery of O_2 at increased atmospheric pressure, that accelerates granulation tissue formation and wound healing.
- Primary leukocyte that responds during inflammation is Neutrophil.
- Increase in immature neutrophils is known as **'left shift.'**
- Most common cause of altered inflammatory response is **Neutropenia**.
- Phagocytosis is also known as opsonisation. This is used to neutralize foreign molecules.
- **Increased Erythrocyte Sedimentation Rate (ESR)** indicates inflammatory process.
- **Eosinophilic response** is seen in allergy, parasitic infection and cancer.
- In the first 24 hours of Inflammation process, Ischemic cell injury and infiltration of neutrophils
- During 24 to 48 hours to inflammatory process, **Macrophages** become dominant.
- The **inflammatory/exudative phase of wound healing** is from onset of wound (day 1 to day 4).
- Blood vessels constrict to restrict the blood flow during **hemostasis stage** of wound healing.
- Increased capillary permeability and blood flow to the site of injury occur during **inflammatory phase** of wound healing.
- Contraction of wound margins and covering (epithelialization) occurs during **proliferation stage** of wound healing.
- **Surgical wound** is an example of healing with primary intention.
- Lacerated wounds, pressure ulcers and traumatic injuries are the examples of healing with secondary intention.
- Healthy granulation tissue is pink or red and uneven in texture.
- Dark granulation tissue can be a sign of poor perfusion or infection.
- **Position change every 2 hours** is the most effective method of prevention of pressure ulcer in a bedridden patient.
- **Norton or Braden scales** are valid risk assessment tools for the assessment of pressure ulcers.
- **Waterlow scale or score** is used for risk assessment for pressure ulcer.
- Gangrene is a type of tissue death due to lack of blood supply and oxygen.
- Dry gangrene mostly affects limbs.
- Moist gangrene mostly affects bowel.

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

1. **An opening of surgical wound edges is called:** *(AIIMS Nagpur NO 2018)*
   a. Wound evisceration
   b. Wound rupture
   c. Wound approximation
   d. Wound dehiscence

Explanation:

- *Wound dehiscence* is a surgical complication in which a wound ruptures along a surgical incision. It may be due to too tight suturing or loose improper suturing, sneezing, and coughing.
- Wound evisceration - surgical incision opens (dehiscence) and the abdominal organs protrude or come out of the incision.

2. **Diffuse, purulent inflammation of a tissue is called _____.** *(AIIMS Nagpur NO 2018)*
   a. Abscess
   b. Cellulitis
   c. Boils
   d. Ulcers

Explanation:

- **Cellulitis** is a bacterial infection of underlying layers of the skin and the site of infection turns red with swelling and pain. It can be purulent (presence of pus) or non-purulent.
- **Key point:** Cellulitis is diffuse whereas abscess is localized.

3. **Severe generalized edema is called as:** *(Safdarjung NO 2018)*
   a. Myxedema
   b. Pitting edema
   c. Anasarca
   d. Dependent edema

Explanation:

- When Edema is massive and generalized, it is called anasarca. It is caused by a variety of clinical conditions like heart failure, renal failure, liver failure, or problems with the lymphatic system.
- The swelling is mainly caused by abnormal retention of body fluids in extracellular space and body tissues. Due to this, Anasarca is also known as dropsy, massive edema or generalized edema. In Anasarca the inflammation is widespread throughout the whole body.

4. **Which of the following is NOT a plasma-derived chemical mediators?**
   a. Cytokines
   b. Complement components
   c. Kinins
   d. Coagulation proteins

5. **Cytokines are secreted by .....**
   a. Neutrophils
   b. B-Lymphocytes
   c. Endothelial cells
   d. All of the above

6. **Which of the following increases vascular permeability during acute inflammation**
   a. Histamine
   b. Cytokines
   c. AFP
   d. Both A and B

7. **Mechanism behind the characteristic feature of acute inflammation is .....**
   a. Redness and pain
   b. Pancytopenia
   c. Vasodilatation and increased vascular permeability
   d. Spongy bone marrow

8. **The classical substances that increasing the sensitivity of pain receptors by enhancing the pain-provoking effect of bradykinin is** *(ESIC 2019)*
   a. Nociceptor
   b. Endorphins
   c. Prostaglandins
   d. Encephalin

Explanation:

- High levels of prostaglandins are produced in response to injury or infection and cause inflammation, which is associated with the symptoms of redness, swelling, pain and fever. This is an important part of the body's normal healing process.
- **In contrast,** Endorphins – causes analgesic effect.

9. **Which of the following is a substance that decreases pain transmission and causes an inflammatory response?** *(AIIMS-BBS SNO 2019)*
   a. Substance P
   b. Endorphin
   c. Prostaglandin
   d. Histamine

10. **First process in wound healing:**
    a. Collagen fibril will form
    b. Granulation tissue will appear
    c. First intentional healing will take place
    d. Neutrophils line the wound edge

11. **The inflammatory/exudative phase of wound healing will last for** *(ESIC 2019)*
    a. 1 year
    b. 1-4 days
    c. 21 days to a month
    d. 5-20 days.

Explanation: The inflammatory/exudative phase of wound healing is from onset of wound (day 1) to Day 4. **Healing actions in this stage include** Clot formation to arrest bleeding, migration of inflammatory cells to the site of wound, neutralization of bacteria by macrophages and WBC and secretion of growth factors and cytokines.

12. **Surgically creating an opening into an organ or space in the body by a sharp instrument is known as**
    a. Laceration
    b. Abrasion
    c. Puncture
    d. Incision

13. **If the incisional area of an abdominal surgery is weak, what is possible to happen when abdominal muscles contract and increases intraabdominal pressure?**
    a. Evisceration
    b. Dehiscence
    c. Laceration
    d. Shearing

Ans.

1.	d
2.	b
3.	c
4.	a
5.	d
6.	d
7.	c
8.	c
9.	b
10.	d
11.	b
12.	d
13.	b

Scanned with CamScanner

14. Stab wound for a drainage system is known as
    a. Incision b. Puncture
    c. Cautery d. Laceration
15. In which of the following, the phases of wound healing is arranged in sequence
    a. Inflammatory phase, hemostasis, reconstruction, maturation
    b. Hemostasis, reconstruction, maturation, inflammatory phase
    c. Hemostasis, inflammatory phase, reconstruction, maturation
    d. Hemostasis, maturation, inflammatory phase, reconstruction
16. Which of the following is in the blood clot that helps hold the wound together during hemostasis phase of wound healing?
    a. Granulation b. Neutrophil
    c. Fibrin d. Leucocytes
17. Wound dehiscence primarily takes place during which phase of wound healing?
    a. Maturation phase b. Homeostasis
    c. Inflammatory phase d. Reconstruction phase
18. Overgrowth of a collagenous scar tissue at the site of the wound is known as
    a. Granulation b. Keloid
    c. Hematoma d. Celluloid
19. The term applied for the fluid, cells, or other substances that are slowly discharged, from cells or blood through small pores or breaks in cell membranes is .....
    a. Exudate b. Pus
    c. Infiltrates d. Secretion
20. Soft, pink, fleshy projections consisting of capillaries surrounded by fibrous collagen
    a. Keloid b. Granulation tissue
    c. Cellulitis d. Collagen
21. Which of the following factors is most likely to inhibit wound healing by interfering with the mechanisms that release oxygen to tissues and reducing the amount of functional hemoglobin in blood?
    a. Obesity b. Smoking
    c. Radiation d. None of the above
22. All of the following factors lead to impaired wound healing process except
    a. Impaired oxygenation, obesity and smoking
    b. Drugs, diabetes mellitus and wound stress
    c. Height, weight and body mass
    d. Radiation, malnutrition and age
23. Complications of wound healing is.....
    a. Infection and suppuration
    b. Hypertrophied scar or keloid formation
    c. Contracture
    d. All of the above
24. The dressings over closed wound usually removed on the
    a. Day after surgery
    b. next of surgery
    c. On the third day
    d. When the Doctor gives the order
25. How often would you inspect the dressings during the first day after surgery?
    a. Every hour for the first 24 hours
    b. Two to four hours for the first 24 hours
    c. Two to four hours for first 12 hours
    d. Every 6 to 8 hours for the first 24 hours
26. All of the following are evidence of an infection, Except
    a. Elevated WBC
    b. Purulent drainage
    c. Primary intention
    d. Increased leukocytes
27. Correct about healing by primary intention is .....
    a. It is seen in healthy wound
    b. Epithelial layer damage is there
    c. Minimal granulation tissue formation
    d. All of the above
28. Correct about healing by secondary intention is .....
    a. Seen in extensive tissue damage.
    b. Wound contraction will be there
    c. Abundant granulation tissue and scarring can be seen
    d. All of the above
29. Healing of a laceration can be promoted by .....
    a. Antibiotics
    b. Daily dressing
    c. Pressure dressing and ROM
    d. Pressure dressing and dry cold application
30. Plasma protein level below .....will lead to edema
    a. 5 g/dl b. 6 g/dl
    c. 7 g/dl d. 8 g/dl
31. Hemorrhage with collection of blood in the soft tissue is called
    a. Contusion b. Purpura
    c. Ecchymoses d. Hematoma
32. Removal of nonviable tissue from an open wound to promote healing is known as
    a. Debridement b. Dressing
    c. Cleansing d. Excision
33. Sharp removal of tissue at the wound margin or at the wound base until viable tissue is removed is known as
    a. Selective debridement b. Excisional debridement
    c. Cleansing d. Dressing
34. What is the most appropriate nursing intervention while treating a laceration? *(ISRO)*
    a. Monitor blood pressure
    b. Elevate the body part
    c. Apply pressure dressing and heat
    d. Apply pressure dressing and ice pack

Ref: https://www.drugs.com/cg/laceration-aftercare-instructions.html

Explanation: For the management of Laceration, Apply direct pressure over the wound to stop bleeding and apply ice on the wound every 15 to 20 mins. Ice helps prevent tissue damage and decreases swelling and pain.

35. In order to cease bleeding from an open wound, indirect pressure is applied to the affected artery which is
    a. Distal to the wound
    b. Proximal to the wound
    c. Lateral to the wound
    d. Medial to the wound
36. Characteristic of wet gangrene is .....
    a. Venous obstruction is there
    b. It is invariably followed by bacterial infection
    c. It is most commonly seen in the bowel
    d. All of the above

OVERVIEW OF IMMUNE SYSTEM

Lymphatic System

- It is the major part of the immune system which contains lymphatic vessels which carry lymph- a clear fluid.
- Lymph contains lymphocytes, other WBCs, waste products and debris from other organs.
- Group of lymphocytes are seen in lymph node
- Spleen and thymus are the lymphoid organs.

Immunity

- It is the ability of a body to fight against infectious agents and other foreign materials.

Types of Immunity

There are two types:

1. Innate immunity
2. Acquired immunity/adaptive

Figure 1 ■ Types of immunity

Innate Immunity

- Immune system is activated immediately after the exposure to antigen.
- It is non-specific type.
- External components of innate immunity - Skin, mucosal barrier, body secretions such as saliva, tears, HCl in the stomach, normal flora of the body
- Internal components of innate immunity – Inflammatory response, phagocytic cells, natural killer cells etc

Acquired Immunity or Adaptive Immunity

- Immunity developed by an individual during its life time.
- This has two components:
  - **Humeral immunity:** Antibody mediated immunity - B- lymphocyte is responsible.
  - **Cell mediated immunity:** T lymphocytes are responsible.

Figure 2 ■ Classification of acquired immunity

Table 2 Difference between innate and acquired immunity

Innate immunity	Acquired immunity
No time lag, action is immediate	There is a lag period
Not antigen specific	Antigen specific
No memory	Development of memory

IMMUNOGLOBULINS

Table 3 Summarized description of different types of immunoglobulins

Name	Description
Immunoglobulin A	• About 10–15% of the antibodies present in the body are IgA antibodies • Found in areas of the body such as nose, breathing passages, digestive tract, ears, eyes, and vagina • IgA is present in colostrum and body secretions.
Immunoglobulin D	• Antibodies are found in small amounts in the tissues that line the belly or chest
Immunoglobulin E	• Antibodies are found in the lungs, skin, and mucus membranes, IgE antibody levels are often high in people with allergies
Immunoglobulin G	• Found in all body fluids. They are the smallest but most common antibodies (75–80%). • IgG antibodies are very important in fighting bacterial and viral infections. • IgG is the only antibody class that significantly crosses the human placenta.
Immunoglobulin M	• They are found in blood and lymph fluid and are the first type of antibody made in response to an infection. IgM antibodies are about 5–10% of all the antibodies in the body. They are biggest in size so called as macro antibody.

IMMUNOLOGICAL DISORDER

Acquired Immunodeficiency Syndrome (AIDS)

- AIDS is caused by HIV (Human Immunodeficiency virus).
- HIV is a retro virus and has RNA as genetic material (makes DNA from RNA).
- HIV/AIDS is characterised by reduced CD4 + (T-helper cells). It also affects monocytes, macrophages, dendritic cells (skin), microglial cells (CNS).
- Normal life span of CD4+ T cells is 100 days but HIV infected CD4 cell dies within 2 days.
- Normal value of CD4 +T cells is from 500 to 1200 cells/ microliters.
- As the disease progresses, CD4 +T cells count decreases.
- Immune system remains healthy when CD4 +T cells > 500 cells/ microliters.
- Problems related to immune system arise when CD4 +T cells count ranges from 200 to 500 cells/microliters.
- Immune system becomes severely compromised when CD4 +T cells count is less than 200 cells /microliters.
- **Normal CD4 to CD8 ratio is 2:1.** This ratio decreases with the progression of disease.
- HIV infection leads to immune-compromise and opportunistic infections increase in the affected person.
- **HIV virus infect and destroy helper T cells.**

Transmission of HIV/AIDS

- Sexual intercourse with infected person
- Exposure to blood or blood products of infected person.
- Perinatal transmission or vertical transmission (During delivery or through breastfeed)
- Exposure to body fluids (Semen, vaginal secretions, saliva, CSF, tears)
- Shareing of needles.

Table 4 WHO clinical staging of HIV/AIDS for adults and adolescents

Stages	Clinical manifestations
Primary HIV infection	• Acute retroviral syndrome • Asymptomatic
Clinical stage 1	• Asymptomatic • Persistent generalized lymphadenopathy (PGL)
Clinical stage 2	• Moderate unexplained weight loss (<10% of measured body weight) • Recurrent oral ulcerations • Recurrent respiratory tract infections • Herpes zoster • Angular cheilitis and papular pruritic eruptions • Seborrhoeic dermatitis • Fungal nail infections of fingers
Clinical stage 3	• Severe weight loss (>10% of presumed or measured body weight) • Unexplained chronic diarrhoea for longer than one month • Unexplained persistent fever (for longer than one month) • Oral candidiasis • Oral hairy leukoplakia • Pulmonary tuberculosis (TB) diagnosed in last two years • Severe presumed bacterial infections • Acute necrotizing ulcerative stomatitis, gingivitis or periodontitis • Unexplained anemia (<8 g/dl), and or neutropenia (<500/mm^3) and or thrombocytopenia (<50,000/mm^3) for more than one month
Clinical stage 4	• **HIV wasting syndrome** • Pneumocystis pneumonia • **Kaposi's sarcoma** • Recurrent severe or radiological bacterial pneumonia • Chronic herpes simplex infection (orolabial, genital or anorectal of more than one month's duration) • Oesophageal candidiasis • **HIV encephalopathy** • Extrapulmonary TB • Central nervous system (CNS) toxoplasmosis • Extrapulmonary cryptococcosis including meningitis
Clinical stage 5	• Disseminated non-tuberculous mycobacteria infection • Progressive multifocal leukoencephalopathy (PML) • Candida of trachea, bronchi or lungs • Cryptosporidiosis Isosporiasis • Visceral herpes simplex infection • Cytomegalovirus (CMV) infection (retinitis or of an organ other than liver, spleen or lymph nodes)

Contd...

Scanned with CamScanner

Stages	Clinical manifestations
Clinical stage 5	• Any disseminated mycosis (e.g. histoplasmosis, coccidioidomycosis, penicilliosis) • Recurrent non-typhoidal salmonella septicemia • Lymphoma (cerebral or B cell non-Hodgkin) Invasive cervical carcinoma • Visceral leishmaniasis • Symptomatic HIV-associated nephropathy • Symptomatic HIV-associated cardiomyopathy

Source: WHO (2005) clinical staging of HIV/AIDS

Diagnostics Tests for HIV and AIDS

- **ELISA Test (Enzyme-Linked Immunosorbent Assay):** This test is sensitive in chronic HIV infection but less sensitive for recent infection. If ELISA test is positive, the Western blot test is usually administered to confirm the diagnosis.
- **Western Blot:** This is a very sensitive blood test used as confirmatory test for HIV infection.
- **Viral Load Test:** This test measures the amount of HIV in the blood. It is used to monitor progress of treatment or to detect early HIV infection.
- **CD4 cell count test** is useful for monitoring progress of the disease.

Management

Antiretroviral Drugs (ART)

- **Nucleoside reverse transcriptase inhibitors (NRTIs):** Abacavir (ABC), Didanosine (DDI), Emtricitabine (FTC), Lamivudine (3TC), Stavudine (d4T), Tenofovir alafenamide (TAF), Tenofovir disoproxil fumarate (TDF), Zidovudine (ZDV)
- **Non-nucleoside reverse transcriptase inhibitors (NNRTIs):** Delavirdine (DLV), Doravirine (DOR), Efavirenz (EFV), Etravirine (ETR), Nevirapine (NVP), Rilpivirine (RPV)
- **Protease inhibitors (PIs):** Atazanavir (ATV), Darunavir (DRV), Forsamprenavir (FPV), Indinavir (IDV), Nelfinavir (NFV), Ritonavir (RTV), Tipranavir (TPV), Saquinavir (SQV)
- **Fusion inhibitors:** Enfuvirtide (ENF)
- **C-C Chemokine Receptor type 5 Antagonists (CCR5 antagonist):** Maraviroc (MVC)

When to Start ART Therapy

Table 5

WHO clinical staging	Recommendations
HIV Infected Adults and Adolescents	
Clinical Stage I and II	Start ART if CD4 ≤ 500
Clinical Stage III and IV	Start ART irrespective of CD4 count
All Pregnant/Breastfeeding Women	
All clinical Stages	Start ART irrespective of CD4 count
HIV-TB Co-Infected Patients	
Patients with HIV and TB co-infection (Pulmonary or Extra Pulmonary)	• Start ART irrespective of CD4 count • Start ATT first, initiate ART as early as possible between 2 weeks -2 months. • For patients with CD4 below 50, ART might be initiated simultaneously with ATT with strict clinical and laboratory monitoring

Source: National Aids Control Organization (NACO Guidelines)

Table 6 Dosing schedules for ART for pregnant women

Clinical scenario	ARV prophylaxis and dosing	Antepartum	Intrapartum	Postpartum
Pregnant women requiring ART	Tenofovir (TDF)- 300 mg OD, Lamivudine (3TC) – 300 mg OD, Efavirenz (EFV) - 600 mg OD	Start ART as soon as possible	Continue ART	Continue ART life-long

Key Points

Key Points to Remember In Nursing Care of HIV Patient

- Maintain confidentiality
- Explain about side-effects of medications
- Provide counselling and psychological support

Golden points to remember

- The major class of immunoglobulin present in human serum is **IgG**.
- **IgE** is associated with allergic reactions.
- **IgG** is most abundant immunoglobulin (75%), found in all body fluids (Remember G-greatest).
- **IgM** is the largest (size) immunoglobulin (Remember – M-Macro).
- Antibodies are produced by B lymphocytes. They function in the **humoral immunity**.
- T lymphocytes is associated with **cell mediated immunity**.
- Contact dermatitis occurs due to delayed hypersensitivity (Type IV) type of reaction.
- **Corticosteroids** block the action of **phospholipase**, thereby reducing the production of both prostaglandin and leukotrienes.
- Administration of corticosteroids diminishes the activity of the immune system, so they may mask some usual symptoms of infection.
- **Psychoneuroimmunology (PNI)** is an interdisciplinary science that seeks to understand the reactions among psychology, neurologic and immune responses.
- **Cytokines cause fever** by their ability to initiate metabolic changes in the temperature regulating center.
- The **cardinal sign** of inflammation includes **redness, heat, pain, swelling** and **loss of function**.
- Life span of **CD4+ T** cells is 100 days, but in HIV infected patients it is only 2 days that cause immunodeficiency in patient.
- **Sirolimus** is an immunosuppressive agent used in renal transplant recipient in combination with corticosteroids and cyclosporine.
- **Kaposi sarcoma** is a tumor caused by human herpes virus 8, it is commonly associated with human immunodeficiency virus.
- Drugs commonly used in **ART (Anti-Retroviral Therapy)** are Zidovudine (ZDV) also known as azidothymidine (AZT), Nevirapine and Stavudine.
- The average risk of HIV infection after needlestick injury to HIV-infected blood is 1 in 300.
- The average risk after exposure of nose, eye, or mouth to HIV-infected blood is 0.1% (1 per 1,000).
- Persistent generalized lymphadenopathy is caused by HIV infection.

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

ANATOMY AND PHYSIOLOGY

37. Antibodies are produced by: *(JIPMER 2012)*
a. Plasma Cells b. Lymphocytes
c. Erythrocytes d. Basophills

38. Immunoglobulin increased during secondary response is .....
a. IgD b. IgG
c. IgM d. IgA

39. Plasma cells are formed from .....
a. T cells b. B cells
c. RBC d. WBC

40. Secondary immune response is mediated by
a. IgA b. IgG
c. IgM d. IgE

41. All of the following are organs of the lymphatic system Except? *(AIIMS Raipur Staff Nurse Grade I-2018)*
a. Tonsils b. Thymus
c. Spleen d. Pancreas

Explanation: Lymphatic system is a network of very small tubes that drain lymph fluid from all are the body. The major parts of lymph tissue are located in bone marrow, spleen, thymus, lymph nodes and tonsils.

42. How to palpate lymph nodes?
a. With pressure and tip of fingers
b. Apply pressure while palpating the lymph nodes
c. Palpate superficial lymph nodes with the pads of the fingers.
d. Use palm of hand while palpating the lymph nodes

43. Humoral immunity is provided by
a. T-lymphocytes b. B- lymphocytes
c. Immunoglobulin d. Interferon

44. Humoral immunity is also known as .....
a. Cell mediated b. Antibody mediated
c. Natural d. Interferon mediated

45. T cell immunity is .....
a. Cell mediated b. Antibody mediated
c. Natural d. Interferon mediated

46. Occurrence of certain disease or subclinical infection provides ..... Immunity
a. Natural active
b. Natural passive
c. Active artificial
d. Passive artificial

47. Vaccination provides ..... immunity
a. Natural active
b. Natural passive
c. Active artificial
d. Passive artificial

48. When a B-cell is exposed to an antigen for the first time
a. The primary response occurs
b. The primary response takes 1-3 hours to become effective
c. The B-cell divides to form plasma cells and T-helper cells
d. The B-memory cells produce antibodies

INTRODUCTION

49. The following statements are TRUE in reference to endotoxins, EXCEPT *(AIIMS Raipur Grade II 2017)*
a. They are lipopolysaccharides in nature
b. They are released from the bacterial surface by natural lysis
c. They are heat liable proteins
d. Their toxicity depends in the lipid component

Explanation:

Characteristics	Exotoxins	Endotoxins
Source	Living gram positive and gram negative bacteria	Lysed gram negative bacteria
Location	Released from the cell	Part of cell
Chemical Composition	Protein	Lipopolysaccharide
Heat Sensitivity	Liable (6°-8°C)	Stable (25°C)
Immune Reactions	Strong	Weak
Conversion to Toxoids	Possible	Not possible
Fever	No	Yes
Enzyme Activity	It has mostly enzymatic activity.	It has no enzymatic activity.
Molecular Weight	Its molecular weight is 10 KDa.	Its molecular weight is 50-1000 KDa.
Denaturing	On boiling it get denatured.	On boiling it cannot be denatured.
Specificity	Specific to particular bacterial strain	Non specific
Antigenicity	High	Poor
Examples	Staphylococcus aureus, Bacillus cereus, Streptococcus pyogenes, Vibrio cholera, Bacillus anthracis.	E. coli, Salmonella typhi, Shigella.

Ans.

37.	b

IMMUNE SYSTEM

50. Type of hypersensitivity reaction occurs during transfusion and erythroblastosis fetalis are
a. Type I b. Type II
c. Type III d. Type IV

51. Lifelong immunity developed after the occurrence of disease is known as .....
a. Natural passive immunity b. Artificial passive immunity
c. Natural active immunity d. Artificial active immunity

52. Cell mediated immunity is carried out by
a. B lymphocytes b. T lymphocytes
c. Monocytes d. CD4 cells

53. Which of the following type of hypersensitivity is known as delayed type hypersensitivity and is carried out by T lymphocytes
a. Type I b. Type II
c. Type III d. Type IV

54. Identify the correct statement related to type I hypersensitivity
a. Immunoglobulin responsible for type I hypersensitivity reaction is IgE
b. Mast cells are important cells in type I hypersensitivity
c. Immunoglobulin responsible for type I hypersensitivity reaction is IgG
d. Both A and B

55. Immediate treatment of Anaphylaxis is: *(NCFL 2019)*
a. Adrenaline b. Benzyl penicillin
c. Hydrocortisone d. Atropine

Ans.

50.	b
51.	c
52.	b
53.	d
54.	d
55.	a
56.	b
57.	d
58.	d
59.	b
60.	d
61.	b
62.	d
63.	d
64.	b
65.	c
66.	a
67.	a
68.	a
69.	a

Explanation: Adrenaline or epinephrine is the immediate treatment of anaphylaxis. It will stimulate the alpha adrenoceptors and thereby it increases peripheral vascular resistance that leads to the improvement of blood pressure, reversing of peripheral vasodilation, coronary perfusion and it decreases angioedema.

56. During blood transfusion therapy patient developed wheezing and her skin becomes flushed with hives. These are the characteristics of .....
a. Hemolytic reaction b. Allergic reaction
c. Transfusion reaction d. Thrombotic crisis

57. Identify the transfusion reactions among the following?
a. Hemolytic transfusion reactions—immediate or delayed
b. Infections
c. Allergic reactions d. All of the above

58. Identify autoimmune diseases among the following
a. SLE b. Grave's disease
c. Myasthenia gravis d. All of the above

59. The nurse is caring for a child who is taking corticosteroids for systemic lupus erythematosus. The nurse carefully monitors child's condition because the nurse is aware that corticosteroids can have what major action?
a. They increase liver enzymes *(AIIMS Raipur NO 2019)*
b. They can mask signs of infection
c. They cause bone marrow suppression
d. They decrease renal function

Explanation: Corticosteroids suppress the immune system, so the immune response to infection is diminished. It may mask or hide some signs and symptoms of infection.

60. HLA elevates in ..... condition
a. Congenital malformation b. Malignant tumor
c. Hepatic disorders d. Autoimmune disorders

61. A rise of an existing antibody level in response to irrelevant stimulus is called: *(AIIMS Raipur Grade II 2017)*
a. Anaphylactic reaction b. Anamnestic reaction
c. Agglutination reaction d. Precipitation reaction

Explanation: Anamnestic reaction, also known as booster response, is a delayed immunologic response. Exposure to antigen in a sensitized individual results in massive production of existing antibody. Agglutination reaction is the process that occurs if an antigen is mixed with corresponding antibody. Anaphylactic reaction are life threatening reactions which exhibits symptoms such as generalized itching and hives, swelling, wheezing and difficulty breathing, fainting, and/or other allergy symptoms. Precipitation reaction refers to the formation of an insoluble salt when two solutions containing soluble salts are combined.

62. Which of the following is a priority in planning care for a client with a diagnosis of immune deficiency?
a. Providing emotional support to decrease anxiety
b. Identifying factors that decreased the immune function
c. Encouraging discussion about lifestyle changes
d. Protecting the client from infection

Explanation: Immunodeficiency is state of diminished or absence of immune response that increases susceptibility to infection. Protecting the client from the infection is the priority while planning the care of patient with compromised immunity.

63. Delayed hypersensitivity reaction can be managed with ...
a. Adrenaline b. Dopamine
c. IV fluid d. Corticosteroids

64. The aim of immunosuppressive therapy is to:
a. Stimulate the antibody production against foreign antigens
b. Suppress the production of antibodies against foreign antigens
c. Promote phagocytosis
d. All of the above

Explanation: The purpose of immunosuppressive therapy is to reduce the immune response to foreign antigens (infections) by suppressing the production of antibodies against it.

65. Corticosteroid suppresses the function of .....
a. Sympathetic response b. Parasympathetic
c. Immune response d. Cardiac system

66. Nurse needs to suspect anaphylactic reaction following the IM administration of streptomycin if the patient is complaining of .....
a. Edema and itching at the injection site
b. Increases in induration
c. Increase in body temperature
d. Vertigo

67. Secondary immunodeficiency is most commonly due to ...
a. Drugs b. Anxiety
c. Malnutrition d. Infection

68. Following traumatic injury and infection a patient is receiving high-dose corticosteroids and broad-spectrum antibiotics. The suspected condition is
a. Candidiasis b. CMV
c. Shigella d. Plasmodium

69. Which of the following viral infection causes Kaposi's sarcoma?
a. Human herpes virus 8 (HHV8)
b. Cytomegalo virus
c. Rota virus d. Human papilloma virus

Scanned with CamScanner

Explanation: Kaposi sarcoma (KS) is a tumor caused by infection with a virus called the Kaposi sarcoma associated herpesvirus (KSHV), also known as human herpesvirus 8 (HHV8). KSHV is in the same family as Epstein-Barr virus (EBV), the virus that causes infectious mononucleosis (mono) and is linked to several types of cancer.

70. About Kawasaki disease all are true EXCEPT
a. Seen in children
b. Coronary artery is involved
c. Mucocutaneous lesions
d. Suppurative lymphadenopathy

71. Strawberry tongue is seen in
a. PAN
b. Kawasaki disease
c. MPA
d. Wegener's

HIV AND AIDS

72. HIV affects .....
a. B-cells
b. Helper T cells
c. Neutrophil
d. Lymphocyte

73. While screening for HIV, blood is tested for .....
a. P24 antigen
b. HIV DNA plasma
c. HIV antibodies
d. Presence of HIV RNA

74. Which of the following diagnostic test is considered as a gold standard for confirmation of HIV infection?
a. ELISA test
b. Tri-dot test
c. Western blot test
d. Polymerase Chain Reaction (PCR test)

Explanation: Western blot is often used as a follow-up test to confirm the presence of an antibody of HIV virus. This test is considered to be the gold standard for confirmation of HIV infection.

75. Which among the following is the most appropriate intervention to prevent the progression of HIV to AIDS?
a. Monthly plasmapheresis
b. Abstinence
c. Compliance with complete therapeutic regimen
d. Monthly blood test

76. Risk for vertical transmission of HIV is more during .....
a. Antenatal period
b. Intranatal period
c. Postnatal period
d. Breast feeding

77. Which of the following statement is false? *(LNJP H D 2012)*
a. Untreated HIV infection can remain in the early chronic stage for a decade or more
b. Infection with HIV results in a chronic disease with acute exacerbations
c. Late stage detection is called AIDS
d. Opportunistic disease occurs more often when the CD4 T cells count is high and viral load is low

78. The diagnosis of HIV AIDS is made based on
a. CD4+ T cell count
b. Sudden weight loss
c. Diarrhea
d. Persistent fever

79. Which of the following is an indicator of AIDS?
a. CD4 count lower than 1000 cells/mm³ *(DSSSB 2013)*
b. CD4 count lower than 600 cells/mm³
c. CD4 count lower than 400 cells/mm³
d. CD4 count less than 200 cells/mm³

Explanation: According to the CDC disease staging system, the definition of AIDS includes all HIV-infected individuals with CD4 counts of <200 cells/μL (or CD4 percentage <14%) as well as those with certain HIV-related conditions and symptoms.

80. The clinical symptoms of wasting syndrome in AIDS include: *(AIIMS Raipur Grade II 2017)*
a. Involuntary weight loss
b. Chronic diarrhea
c. Protein - energy malnutrition
d. Oesophageal candidiasis
a. A, B, C
b. B, C, D
c. A, B, D
d. A, B, C, D

Explanation: The symptoms of wasting syndrome in AIDS includes involuntary weight loss, diarrhea for at least a month, protein energy malnutrition, extreme weakness and fever that's not related to infection. Esophageal candidiasis is an opportunistic infection of oesophagus by candida albicans.

81. Organism responsible for pneumonia in AIDS patient is....
a. Cytomegalo virus
b. Fungi
c. Pneumocystis carinii
d. Mycoplasma

82. Which of the following condition is associated with AIDS
a. Invasive cervical cancer
b. Kaposi's sarcoma
c. Burkitt's lymphoma
d. All of the above

83. Find out the malignancies associated with HIV AIDS
a. Kaposi's Sarcoma
b. Non Hodgkin's lymphoma
c. Gastric adenocarcinoma
d. All of the above

84. Which is the most common cancer associated with AIDS? *(Kerala PSC, Nov 2014)*
a. Leukemia
b. Adenocarcinoma
c. Osteosarcoma
d. Kaposi's sarcoma

Explanation: Kaposi sarcoma (KS) is one of the first conditions recognized as an opportunistic sequela of HIV infection, and remains the most common AIDS-associated neoplasm. Non-Hodgkin lymphoma (NHL) is the second most common AIDS related cancer.

85. While providing oral care to a retro positive client, nurse should .....
a. Use special mouth care solution
b. Use soft tooth brush
c. Isolate the client
d. Wear gloves

86. While taking temperature of HIV positive client nurse should
a. Wear all PPE
b. Wear mask and gloves
c. Use 1% hypochlorite solution
d. Wash hands before and after the procedure

87. Which among the following food item need to avoid by an immunocompromised person who is experiencing frequent diarrhea?
a. Milk
b. Rice water
c. Fruits
d. Curd

88. Antiretroviral drugs help to .....
a. Treat HIV infection
b. Decrease viral RNA levels
c. Control pneumocystis carinii pneumonia
d. Decrease pain and diarrhea

89. Opportunistic diseases .....
a. Can be sudden in onset
b. Can occur at any point of time
c. Occur during immunosuppression
d. Can be treated with oral antibiotics

90. Rapidly progressive dementia is seen in?
a. Alzheimer's disease
b. Vascular dementia
c. HIV Dementia
d. Parkinson's disease

CLASSIFICATION OF BONES

Table 7 Classification of bones with their numbers in human body

S.No.	Name	Number	Bone
		Axial skeleton (80 bones)	
1	• Cranial bones	8	Frontal bone-1 Parietal bones-2 Temporal bones-2 Occipital bone-1 Ethmoid bone-1 Sphenoid bone-1
	• Facial bones	14	Zygomatic bone-2 Maxilla bones-2 Nasal bones-2 Lacrimal bones-2 Vomer bones-1 Palatine bones-2 Inferior nasal conchae-2 Mandible-1
2	Hyoid bone	01	Hyoid bone-1
3	Auditory ossicles	06	Malleus-2 Incus-2 Stapes-2
4	Rib cage	25	Ribs-24 Sternum-01
5	Vertebral column	26	Cervical vertebra-7 Thoracic vertebra-12 Lumbar vertebra-5 Sacrum vertebra-01 Coccyx vertebra-01
Total			**80 bones**
		Appendicular skeleton (126 bones)	
	Shoulder girdle	4	Scapulae-2, Clavicle-2
1	Upper extremity	60	Humerus-2 (1 + 1) Radius-2 (1 + 1) Ulna-2 (1 + 1) Carpals-16 (8 + 8) Metacarpals-10 (5 + 5) Phalanges-28 (14 + 14)
2	Pelvic girdle	02	Innominate bones-2
3	Lower extremity	60	Femur-2 (1 + 1) Tibia-2 (1 + 1) Fibula 2 (1 + 1) Patella-2 (1 + 1) Tarsals-14 (7 + 7) Metatarsals-10 (5 + 5) Phalanges-28 (14 + 14)
Total bones			**80 (Axial) + 126 (Appendicular) = 206**

- There are 206 bones in human body.
- Among 206 bones, 80 bones are the part of axial skeleton which compose skull, vertebral column and thorax
- 126 bones are the part of appendicular skeleton system
- Based upon the shape, bones in the human body are classified into four categories:

Scanned with CamScanner

Table 8 Types of bones on the basis of shape

Category	Description with example
Long bone	These are shaped like rods or shaft with rounded end, e.g. humerus, radius, ulna, femur, tibia, fibula etc.
Short bone	They do not have long axis, they are cubical, e.g. carpals, tarsals
Flat bone	They protect the underlying structure and provide surface area for muscle attachment, e.g. sternum, skull
Irregular bone	These bones are having various shape, e.g. vertebral column, ear ossicles, facial bone, pelvic bone

REVIEW POINTS

- Osteoblasts vs osteoclasts vs osteocytes
  - Osteoblasts = stem cells that give rise to osteocytes = build bone.
  - Osteocytes = mature bones cells = reside in bone for housekeeping.
  - Osteoclasts = large cells that break down bone.
- Bones are classified as **long bones, short bones, flat bones and irregular bones.**
- Long bones include femur, tibia, fibula, radius, ulna, and humerus. They consist of a long, thin part called the **diaphysis, or shaft,** and two bulbous-type ends called the **epiphysis.**
- **Short bones are basically** cube-shaped as wide as they are long. Examples: Bones found in the wrist and ankle.
- **Flat bones** are thin and generally flat. Examples of flat bones are the cranial bones, which protect the brain, and the scapula (shoulder blade).
- **Irregular bones** include many of the bones that do not fall into the other three categories. They have complex shapes and include bones like the vertebrae.
- Bones are composed of **spongy and compact bone, periosteum and endosteum,** and a **medullary cavity.**
- The **periosteum** is a dense, white, fibrous sheath that covers the surface of the bone and here muscles and tendons are attached.
- The **medullary** cavity of the bone is a cavity in the center of the bone filled with yellow, and fatty marrow.
- The **endosteum** is the layer of cells that line the medullary cavity.
- The human skeleton consists of **206 bones** and is divided into two parts.
- **Joints** are classified as **immovable, slightly movable, or freely movable.**
- The **vertebral column,** or backbone of the human skeleton, is typically made up of **26 bones (33 bones if sacrum and coccyx are considered as 5 and 4 respectively)**
- Cervical spine contains 7 smaller vertebrae.
- Thoracic spine consists of 12 midsized vertebrae.
- Lumbar spine consists of 5 large vertebrae.
- Sacrum, which is one bone made up of **5 fused sacral vertebrae.**
- The coccyx, or tailbone, is made up of **four vertebrae fused** into one or two bones.
- **Largest bone: Femur**
- **Smallest bone: Stapes (Bone in the middle ear)**
- **Total number of ribs:** 12 pairs
- **Acetabulum:** Concave surface of the pelvis. It is socket of pelvis in which head of femur fits.
- **Acromion:** It is a bony process on the scapula (shoulder blade).

- **Knee cap:** Patella
- **Most mobile joint:** Ball and socket joint. E.g. Shoulder joint.
- **Least stable joint:** Ball and socket joint.
- **Collar bone:** Clavicle
- **Smallest vertebra:** Cervical
- **Only movable bone of the skull:** Mandible bone
- **Example of Pivot Joint:** Proximal radioulnar joint, distal radioulnar joint, median atlanto-axial joint
- **Example of hinge joint:** Knee joint, elbow joint and ankle joint
- **Example of ball and socket joint:** Shoulder joint, hip joint
- **Example of gliding joint:** Wrist joint.
- **Coronal suture:** Unites the frontal bone with the parietal bones.
- **Sagittal suture:** Unites the 2 parietal bones in the midline.
- **Lambdoid suture:** Unites the parietal bones with the occipital bone.
- **Squamosal suture:** Unites the squamous portion of the temporal bone with the parietal bones.
- **Metopic suture:** (if present) Unites the 2 frontal bones
- **Tendons:** Tendons are tough bands of connective tissue found in the joints. **They connect muscles to bones.**
- **Ligaments:** Ligaments connect the bones to each other, and are designed to help stabilize the joints and provide a structure for the bones.
- **Most prominent cartilage of the larynx:** Thyroid cartilage

Figures 4 A and B (A) Lateral view of new born skull; (B) Superior view of newborn skull

- **Total no. of muscles – 639.**
- Voluntary muscles = you can control = skeletal muscles, e.g. Biceps.
- Involuntary muscles = you cannot control = smooth (e.g. gut) and cardiac (heart) muscles.
- Total no. of intercostals muscles = 11 pairs.
- **Longest muscle – Sartorius**
- **Shortest muscle – Stapedius muscle**
- **Strongest muscle – Masseter (helps in mastication)**
- **Site of injection**
  - Infants below 18 months – Vastus lateralis muscle
  - Children – Deltoid, ventrogluteal, dorsogluteal (not recommended for < 3 years), vastus lateralis muscle
  - Adult (> 18 yrs) – Deltoid, ventrogluteal, dorsogluteal, vastus lateralis muscle

Scanned with CamScanner

Anatomical terms of motion

- **Flexion and extension:** *Flexion* describes bending movement that *decreases* the angle between a segment and its proximal segment. *Extension* is the opposite of flexion.
- **Abduction and adduction:** *Abduction* refers to a motion that pulls a structure or part *away from* the midline of the body. *Adduction* refers to a motion that pulls a structure or part *toward* the midline of the body.
- **Elevation and depression:** The terms elevation and depression refer to movement above and below the horizontal.
- **Rotation:** Internal rotation (or medial rotation) refers to rotation towards the axis of the body. External rotation (or lateral rotation) refers to rotation away from the center of the body.
- **Pronation and supination:** Pronation and supination refer to rotation of the forearm or foot so that in the anatomical position the palm or sole is facing anteriorly (supination) or posteriorly (pronation).

- Diaphragm is a dome shaped muscular structure which separates the thoracic cavity and abdominal cavity. Diaphragm helps in respiration.

Figures 5 A to F ■ Angular movements: (A and B) Flexion and extension at the shoulder and knees; (C) Extension and flexion of the head and neck; (D) Angular movements: Flexion and extension of the vertebral column; (E) Abduction, adduction and circumduction of the upper limb at the shoulder; (F) Rotation of the head, neck and lower limb

ANATOMY OF BONE

- Long bone has a shaft called diaphysis.
- Diaphysis is a hollow cylinder that covers the bone marrow.
- The two ends of long bones are called proximal and distal epiphyses
- In children epiphyses are separated from diaphysis by epiphyseal plate.
- Epiphyseal plate or cartilage is the site for bone growth, once the bone growth is compete this cartilage is replaced with bone and it will join to the diaphysis.
- Fracture to the epiphyseal cartilage resulting in retreated bone growth and limb shortening in children.

Scanned with CamScanner

- Bone is covered with an outer layer known as periosteum, which has good blood and nerve supply.

Figure 6 ■ Anatomy of bone

Microscopic Anatomy of Long Bone

- Fundamental functional unit of a compact bone is known as haversian system or osteon.
- Haversian system contain vessels in the central part known as haversian canal.
- Around the haversian canal there are concentric circular layers called lamellae.
- Space between the lamellae is known as lacunae.
- Osteocytes are present in the lacunae.
- Canaliculi are small channels for blood vessels through which blood flows into the bone and back from the bone with nutrients and waste products.

Figure 7 ■ Microscopic anatomy of long bone

Composition of Bone

- Bone is made up of collagen and it provides strength to the bone and inorganic salts like calcium and phosphate allow bone to withstand compression.
- Bone has three types of cells and these are osteoblast, osteocyte and osteoclast.
  - **Osteoblast:** Bone forming cells
  - **Osteocytes:** Mature form of osteoblast found in the bone matrix
  - **Osteoclast:** Bone removing cells.

TYPES OF JOINTS IN HUMAN BODY

1 Suture
2 Syndesmosis - Joint ossious membrane (Blu Radius & Ulna)
3 Gomphosis - Teeth

on structure basis

Table 9 Types of joints in human body with their description and examples

Name of the joints	Description	Examples
Fibrous joint (Synarthrosis)	These joints are linked with tough, fibrous material and they do not permit movement	Joint between the skull bone the sutures
Cartilaginous joint (Amphiarthrosis)	These are connected entirely by cartilage (fibrocartilage or hyaline). These joints allow more movement between the bone than a fibrous joint but less than highly mobile synovial joint	• Between the manubrium and sternum • Between the vertebra • Symphysis pubis • Epiphyseal plates
Synovial joint	It is characterized by the presence of space or capsule between the articulating bones. The end of the bones are held together by fibrous tissue and capsule is lubricated with small amount of fluid called synovial fluid and it permits range of motion	
Types of Synovial Joints (Diarthrosis)		
Ball and socket joint	The head of one bone is ball-shaped and articulate with a cup-shaped socket of another. The joint allows wide range of movement, including flexion, extension, adduction, abduction, rotation and circumduction	Hip joint, shoulder joint
Hinge joint	Articulating surface of bone forms an arrangement like hinge on a door and movement is restricted to flexion and extension	Elbow, knee, ankle, interphalangeal

Contd...

- Uniaxial joint - HP < Hinge, Pivot
- Biaxial Joint < Condylord, Ellipsoid
- Multiaxial < Saddle Joint, Ball & Socket

Scanned with CamScanner

Knee joint - 1. condylar joint
2. hinge joint

Name of the joints	Description	Examples
Gliding joint	Surface is flat or curved, gliding one over another, but the amount of movement is very restricted	Carpals and tarsal bone, intervertebral joint (inter) CAT
Pivot joint	In this type of joint one bone fits into a hoop-shaped ligament that holds it close to another bone and allows it to rotate in ring form	Head, radioulnar joint (proximal & distal) Distal tibia-fibular joint (C1-C2) - Atlanto Axial joint
Condyloid joint	Joint sits within a cup-shaped depression of another bone	Condylar process of mandible and temporal bone, between metacarpal and phalanges of hand, between metatarsals and phalanges of foot } - ellipsoid
Saddle joint	The articulating surface of bone fits together like a man sitting on a saddle	At the base of thumb, between trapezium and first metacarpal bone - Sternum & clavicle, carpal & metacarpal

Functional Basis
(i) Synarthrosis - no movement - skull
(ii) Amphiarthrosis - cartilaginous - slidly movement
(iii) Diarthrosis - freely movable -

VERTEBRAL COLUMN

- It consists of 33 vertebrae and are divided as follows:
  - Cervical -7
  - Thoracic-12
  - Lumbar-5
  - Sacral- 5 fused vertebra
  - Coccyx – 4 fused vertebrae
- Vertebrae are separated by disc except at first and second cervical, the sacrum and at the coccyx.
- C1 vertebrae which support the skull is known as atlas and the C2 vertebrae which pivot the atlas is known as axis.
- There are 12 pairs of ribs in human body attached to thoracic vertebrae.
- First 7 pairs of ribs are known as true ribs as they are attached directly to sternum with costal cartilage
- Last five pairs of ribs are known as false ribs, among these three pairs are attached to the vertebrae through common cartilage. Last two pairs attached only to vertebrae and are called as floating ribs.

DIAGNOSTIC EVALUATION

Table 10

X-ray discovered by - Wilhelm Röntgen (1895) - wrist joint

Name of the test	Description
Arthrography	• To find out joint pain or to assess the progression of a joint disease. • Contrast injected into the joint and then joint is put on range of motion exercises and series of X-ray are taken to find out the problem. • **Nursing Responsibility:** Assess the allergy toward contrast agent
Bone densitometry	• To assess the bone mineral density. • This study helps us to find out the risk or progression of osteoporosis.
Bone scan	• To find out or to assess the progression of a bone tumor or a degenerative disease. • Radio isotope is injected via IV route and scan is performed 2-3 hours later. • Increased uptake of isotope can be seen in bone diseases such as osteosarcoma, osteomyelitis and metastatic bone disease.
Arthroscopy	• Direct visualization of a joint through fibro optic endoscope. • This procedure is done under strict aseptic technique along with local or general anesthesia. • After the procedure, joint is covered with compression dressing to control bleeding. • **Joint is elevated to reduce swelling** • **Ice pack may be applied to enhance the comfort of the client**
Arthrocentesis	• This procedure is performed to remove excessive synovial fluid from the joint for examination • Anti-inflammatory medications may be injected into the joint • Informed consent needs to be obtained • Apply elastic compression dressing after the procedure
Electromyography	• Electrical potential of muscles and nerves leading them, is studied • Needle electrodes are inserted into selected muscles and responses are recorded on an oscilloscope. • Contraindicated in patient receiving anticoagulants and in patient with active skin infection. • Patient has to be instructed not to use any cream or lotion on the day of test.
Biopsy	• Test is performed to assess the composition and structure of bone marrow, bone, muscles or synovium. • Analgesics need to be given and the biopsy site for edema, pain, and bleeding and hematoma formation is assessed.

Scanned with CamScanner

DISORDERS OF MUSCULOSKELETAL SYSTEM

Fractures

- A **fracture** is defined as a complete or incomplete damage in the continuity of a ***bone***
- A **traumatic fracture** is caused by some type of accident, fall, or other kind of force.
- A **pathologic fracture** is a broken bone caused by disease. For example, osteoporosis, bone cyst.

Sprain - ligament injury
Strain - tendon, muscle injury
Dislocation injury - shoulder injury

Types of Fracture

Figure 8 ■ Types of fracture

- **Complete fracture:** Bone is broken completely into two separate parts
- **Incomplete fracture:** Bone is broken but doesn't completely break
- **Comminuted fracture:** Bone is broken into several small parts
- **Greenstick fracture:** One side of bone surface is broken and another is only bend (most commonly in children)
- **Simple fracture (closed):** Bone is broken under the skin and no change in skin texture/continuity
- **Compound fracture (open):** Bone is broken along with skin and sometime bone comes out of skin

Clinical Findings

- Pain at fracture site
- **Crepitus sound when fractured limb is moved**
- Shortening of extremity
- 5 P'S (pain, pulselessness, pallor, paresthesia, paralysis)

5P's - Broken
B - Bruising on site
R - Reduce movement
O - Odd appearance
K - Bruising
E - Edema
N - neurovascular injury
Poikilothermia

Key Nursing Interventions

- Assess for shock because there may be significant blood loss.
- Assess for signs of fat embolism (confusion, dyspnea, hypotension, tachycardia, tachypnea).
- Apply cold packs at fracture sites (it helps to decrease bleeding and edema).
- Notify the healthcare provider about any sign of **fat emboli, dyspnea, chest pain, decreased saturation and diaphoresis**
- **Provide diet high in protein, vitamin C to help in quick healing**
- **Diet with high calcium content is usually not indicated in prolonged bedridden patient because decalcification is already there and it can cause further calculi in renal.**
- Maintain hydration
- Isometric exercise
- **Positioning frequently or every 2 hours**
- Teach about three point (non- weight bearing) and four point gait (weight bearing)

Stages of Bone Healing

- **Inflammatory phase** (48 hrs after the injury); hematoma is formed
- **Repairing phase** (lasts for 2-3 weeks); develops new tissue and cartilage known as callus
- **Bone remodeling**; also called final phase, solid bone replaces spongy bone

Casts

(POP - Plaster of Paris)

Care of Patient with Casts

- Casts are rigid immobilizing agents applied externally to a body part to immobilize that part.
- It is used following fracture to immobilize that part.

Table 11 Types of casts

Types of casts	Description
• Short arm casts	Cast is extending from below the elbow to palmar crease and is secured around the thumb
• Thumb spica or gauntlet cast	Cast extends from below the elbow and covers thumb
• Long arm casts	Extending from axilla to palmar crease, elbow is immobilized at right angle.
• Short leg cats	Extending below knee to base of toe
• Long leg casts	Tending from the junction of thigh to the base of toe
• Walking casts	Short or long leg casts reinforced for strength
• Body casts	Encircle the body
• Shoulder spica casts	Body jacket like casts which cover shoulder, trunk and elbow
• Hip spica cast	Encircle body and leg. In double hip spica casts both legs and body are covered with casts.

Scanned with CamScanner

Fiberglass Casts

- Made up of polyurethane resins. It is lighter in weight, stronger, water resistant and durable.
- It will set within 30 minutes of application
- Application of this cast causes an exothermic reaction. So educate the patient about this expected reaction.

Plaster Casts

- It is made up of plaster of paris
- Less costly, heavy, not water resistant and can take up to 24-72 hours to set
- Application of plaster is an exothermic reaction
- A freshly applied cast should be exposed to air and supported on a firm surface
- Elevation of the applied part is needed to reduce the swelling.

Key Points

- **Handle the cast with palm not with finger which cause pressure area within the cast**
- Prevent the cast from any kind of damage until it dry
- Cast should **not be covered** until it is dry and use fan to circulate air
- **Elevate the casted limb on pillow but not amputated limb as it creates contracture**
- Never let the wet cast to rest on a flat surface because it cause pressure within the cast
- Check and compare the pulse on both sides of body; it should be equal
- **Perform blanching (capillary refill) test**
- Educate the patient to notify the healthcare provider if any sign of infection is present **(increase temperature, foul smell from cast)**

Splint

- It is used to support and immobilize a body part in functional position.
- It is easy to apply and does not cover the entire part so circulation is not compromised.
- It can be easily removed so visualization of injured part can be easily done.
- Protect the open wound with sterile dressing before splinting.

Braces

- Used to support, control movement and to prevent additional injury.
- These are indicated for longer term of use and by using braces deformity is corrected, movement is enhanced and discomfort is minimized.

Nursing Responsibility of a Patient in Casts, Splint and Braces

- Assess the neurovascular status of the client before and after the procedure
- Look for five P's (pain, pallor, paresthesia, pulselessness and paralysis)
- In the first 24-48 hours after the application make sure that extremity is above the level of heart to decrease edema
- Monitor for complications such as compartment syndrome, pressure ulcer, disuse syndrome.

Compartment Syndrome

- Increased pressure in a particular area compromise the circulation and decreases the tissue perfusion. It will leads to ischemia and irreversible neuromuscular damage.
- Manifestations: Dusky pale appearance of the extremity, cool skin, increased capillary refill time, paresthesia and unrelieved pain.
- If the casts, splint or braces are tight, loosen them or remove them.
- Fasciotomy can be done to relieve pressure within the compartment.

Pressure Ulcer

- Inappropriately applied casts can cause pressure on tissue and leads to tissue hypoxia.
- Pressure necrosis happen when the patient reports hot spot and tightness under the casts.
- To assess the area physician may remove or cut an area (window) in the casts.

Disuse Syndrome

- Immobilization of a part leads to muscle atrophy and loss of strength.
- To prevent this, nurse must educate the client to tense and contract muscles without moving bones
- Isometric exercises help to prevent this complication.

Patient with External Fixator

- It is used to treat complex open fracture with soft tissue damage.
- External fixator insert pin into the bones and these pins are attached to an external metal apparatus to provide proper alignment
- Immediate fracture stabilization, minimal blood loss as compared to internal fixation, improved wound care, increased patient comfort are the advantages of external fixator
- Most common complication associated with external fixator is pin site infection.

Pain around the pin site, warmth, redness, swelling, purulent discharge are indicative of pin site infection which can develop as osteomyelitis.

Figure 9 External fixation

Scanned with CamScanner

Traction

- It uses puling force to align injured body part
- **Purpose**
  - To eliminate muscles spasm
  - To relieve pressure on nerve
  - To prevent further deformities
  - To regain normal alignment of bone

Table 12 Description of different types of traction

Types of traction	Description
Straight and running traction (For example: Buck's extension traction)	Traction in straight line with body part resting on the bed. Counter traction is provided by patient's weight
Balanced suspension traction	It supports the affected extremity off the bed and allows some movements. Counter traction is given by slings or splints
Skin traction For example: • Buck traction for lower extremity • Chin Halter Strap for neck pain • Pelvic belt (lower back pain) • Hamilton Russell traction (femur) • Bryant's traction (femur) • Dunlop's traction (upper arm, recommended for not more than 20 minutes)	**Traction is applied to the skin.** **Weight for traction used on** • **Extremity – 2 to 3.5 kg** • **Pelvis – 4.5 to 9 kg**
Skeletal traction For example: Halo traction (skull traction)	**Weight is put on** pins/wire/screw which are attached surgically to the **bone**. Most commonly used for femur. (e.g. Thomas Splint with Pearson attachment) Preferred when continuous traction is needed. - Halo - Skull / cervical traction

Care after traction:

- T– Temperature may be from infection or fractured extremities
- R– Rope of traction should be hanged freely
- A– Alignment should be maintained (counter traction needed)
- C– Circulation should check with 5 P's (pain, pallor, paresthesia, pulselessness and paralysis)
- T– Type and location of fracture
- I– Increase fluid intake
- O– Overhead trapeze use
- N– Never touch the weight to bed as well as to floor

Key Points

- **In a client with traction** neurovascular assessment is the priority nursing intervention
- **In a client with skin traction** dorsiflexion of the foot indicates functioning of peroneal nerve; plantarflexion of the foot indicates functioning of the tibial nerve
- **In a client with skeletal traction** nurse should not remove weight from the traction unless a life threatening emergency.

The tractions used in different types of fractures have been shown in the figure as:

Skin traction - 2-3.5kg of.

Russell's traction

Stabilize femur

Buck's extension

- Knee immobilization
- Fracture of Hip/Femur

Contd.

Scanned with CamScanner

Figure 10 ■ Types of traction

ORTHOPEDIC SURGERIES

- **Open Reduction with Internal Fixation (ORIF):** It is a surgical procedure to fix a bone using surgical plates, screws, nails, or pins
- **Closed Reduction with Internal Fixation (CRIF):** It is reduction without any open surgery, followed by internal fixation.

Joint Replacement

Total Knee Replacement (TKR) or Total Knee Arthroplasty

- **Indications**
  - Osteoarthritis, Rheumatoid arthritis or Trauma (fracture of surrounding bones)
  - Best age for TKR: 50 to 80 years
- **Common complication**
  - Pain and swelling of legs
  - Chest pain and sudden breathlessness (risk of fat embolism)
- **Nursing management**
  - Compression bandage postoperatively
  - Ice or cold packs over the affected knee to arrest edema and bleeding

Total Hip Replacement (THR) or Total Hip Arthroplasty

- Replacement of severely damaged hip joint with prosthesis (artificial joint)
- **Indications**
  - Osteoarthritis, Rheumatoid arthritis, Femoral neck fracture
- Points to remember for care of Patient with Posterior or Posteriolateral approach for THR
- **Don'ts**
  - Do not cross operated legs past the midline
  - Do not sit with crossed legs
  - Do not sit in low height chair
  - Avoid hip flexion more than 90 degree
  - Patient should not turn to the operative side

Scanned with CamScanner

Figure 11 ■ Dont's for the patient with total hip replacement

- **Do's**
  - Use high toilet
  - Use pillow between legs while sleeping (abduction pillow)
  - Use long device to grab the things instead of bending past 90 degree
  - Always sit on high chair with comfort/padded arms (hip should be higher than knee while seated)
  - Promote use of trapeze (horizontal bar hung by ropes)
  - Use anti embolic stocking to prevent DVT
  - Maintain alignment of fractured leg

Figure 12 ■ Do's for the patient with total hip replacement

- **Signs and symptoms of hip prosthesis dislocation**
  - Shortening of the affected limb
  - Abnormal internal or external rotation of the affected limb
  - Intense pain, swelling and immobilization of affected hip
  - Popping (sound) sensation in hip

CRUTCHES

- **Temporary crutch:** Used when ligament of knee is damaged
- **Permanent crutch:** Used when paralysis of the lower extremities
- One crutch can bear 80% and two can bear 100% of body weight.

Types

- **Forearm crutch:** It contains metal band and hand grip which fits around forearm
- **Axillary crutch:** It contains padded surface that fits in the axilla **(most commonly used)**

How to Measure

- Patient's height, angle of elbow and distance between axilla and crutch pad are important aspects to be considered
- Distance between axilla and crutch pad should be **2 - 4 finger width (4-5 cm)**
- Distance between anterior axilla fold to point of crutch or lateral to the heel should be **15-16 cm.**

Point to be Considered

- Never put whole body weight on axilla because it damages brachial plexus that can cause paralysis of arm **(crutch palsy).**
- Always support weight by the help of flexed elbow **(flexion angle should be 25-30 degree and verify with the help of Goniometer).**
- Wear flat shoes to provide a good base of support.
- Exercise to strengthen upper arm, triceps and elbow is important.
- For wide base of support, tripod position along with erect vertebra, neck and head are very important.
- Don't look down while crutch walking.
- **Hunching shoulder** if patient uses too long crutch and **stooping shoulder** if uses too short crutch

Scanned with CamScanner

swing through - leg crutch on affected

Key Points

Nurse should stand on the affected side while ambulating the client

Crutch Walking (GAIT)

or crutch + left leg
left crutch + Rt leg

Types

- **Four point gait (weight bearing gait):** Most commonly used when both legs are in a weakened condition.
- **Three point gait (non weight bearing gait):** Used when injured legs can bear some weight. – First Both crutch + affected leg than Nor leg
- **Three point swing through gait:** It is used to keep all pressure off from injured legs and swing both legs trough.

Both crutch + affected leg

Steps While Ascending Stairs

- Two point gait - unaffected crutch affected leg then affected crutch unaff leg

- Shift weight to the crutches
- Advance unaffected leg up to next stair
- Shift weight to the unaffected leg
- Advance crutch along with affected leg to the unaffected leg (next stair)

affected unaffected

→ LEFT side stand (nurse)

Figure 13 ■ Steps while ascending stairs - Crutch walking

Steps While Descending Stairs

- If Tingling sensation during walking, stop walking
- First sign of Nerve compression

- Shift weight to unaffected leg
- Advance affected leg along with crutch down the stair
- Shift weight to the crutch
- Advance unaffected leg down to the stair

Figure 14 ■ Steps while descending stairs - Crutch walking

Scanned with CamScanner

Sitting in Chair with Crutches

- Position the posterior surface of the unaffected leg against the front of the chair
- Move the crutches in hand of affected side
- Hold the arm of the chair with the unaffected hand
- Flex the unaffected leg and lower into chair
- Keep the affected leg straight in front of the chair
- Patient wants to stand, reverse the steps and walk

Note

If both lower limbs are paralysed and supported with braces then hold the crutches in hand of patient's stronger side.

GOUT

Normal value 4.5-8 mg/dl

- Gout is an inflammatory arthritis caused by deposition of uric acid crystals in joint

End product of purine metabolism

- **Causes of primary gout include:**
  - Reduced excretion of uric acid by kidney
  - Abnormality with purine metabolism
  - Over production of uric acid
  - Starvation
  - Consumption of seafood, red meat and organ meats
  - More consumption of beer.
- Reasons for secondary gout
  - Some medication such as cyclosporine and thiazide diuretics
  - Hypertension
  - Diabetes mellitus
  - Leukopenia
  - Polycythemia
  - Myeloma
  - Truncal obesity
  - High cholesterol
  - Renal disease

Note

Incidence of primary gout is more among men than in women.

- **Clinical manifestation**
  - Acutely painful joints with swelling and redness
  - Commonly affects great toe, mid foot and ankle

Taphi 2

- **Diagnosis**
  - Increased serum uric acid level
  - Elevated WBC count
  - Needle aspiration of synovial fluid shows needle like intracellular crystals.

confirmatory test

- **Treatment**
  - NSAID (indomethacin)
  - **Allopurinol is the drug of choice to treat gout**
  - Other drugs include sulfinpyrazone and probenecid
  - **Dietary restrictions: Avoid alcohol, limited intake of purine-rich foods (liver and sardines), increase intake of fluid**
  - Corticosteroid may be used
  - **Colchicine is used to stop acute attacks.**
- **Key nursing interventions:**
  - Bed rest; pain relief; comfort measures
  - Dietary restrictions
  - Family teaching.

↑ fluid intake (2L)

TENDINITIS

- **Tendinitis (also tendonitis), meaning inflammation of a tendon. It affects tendon and tendon muscle attachments.**
- **Achilles' tendon, hip, elbow, knee and shoulder rotator cuff are the most commonly affected parts.**
- **Causes:** Hypermobility in calcific tendinitis, abnormal body development, postural malalignment and trauma.

BURSITIS

- Bursitis is a painful inflammation of a bursa.
- Commonly affected parts are subdeltoid, olecranon, trochanteric, and subacromial bursae.
- **Types:** Acute, chronic, septic, calcific
- **Signs and symptoms:** Pain on palpation of affected area, warmth and restricted movement
- **Treatment:** Rest and symptomatic treatment. NSAID for pain and antibiotics for infection.

OSTEOARTHRITIS

joint

- Osteoarthritis is a non-inflammatory degenerative joint disease
- **Most commonly affect weight bearing joints, e.g. Hip, Knee, Lower vertebral column**
- **Most common form of arthritis**
- Associated with aging and obesity
- **Signs and symptoms**
  - **Presence Heberden's nodes or Bouchard's nodes (Fig. 15)**
  - Joint stiffness and soreness of the joint
  - Dull pain which increases with weight bearing
  - Rest may relieve pain
  - Decreased range of motion
- **Treatment:** NSAID, salicylates, muscle relaxants and intra-articular steroids.
- **Key nursing interventions**
  - Hot or cold compression as ordered
  - Encourage patient to perform ADL

Figure 15 ■ Heberden's nodes or Bouchard's nodes

RHEUMATOID ARTHRITIS

- It is an inflammatory condition affecting connective tissue and synovial membrane of the joint
- **Manifestations:** Tenderness, stiffness of the joint (morning stiffness lasting for 30 mins), and decreased Range of Motion
- **Rheumatoid arthritis is a most common cause of Swan Neck Deformity** of fingers **(Fig. 16)**
- **Diagnosis:** Elevated ESR and Rheumatoid factor
- **Medical Management:** NSAIDs, Antirheumatic drugs (e.g. Methotrexate, Hydroxychloroquine, Salfasalazine), Glucocorticoids.

Scanned with CamScanner

Osteoblast - Made up
Osteoclast - Breaks down

- **Surgical Management:** Synovectomy, arthrodesis and joint replacement

Figure 16 ■ Swan neck deformity

OSTEOMYELITIS

- It is the infection and inflammation of bone and bone marrow.
- It can occur because of direct bone injury (gunshot wound, bone surgery), through hematogenous route from other site of infection.
- **More than 50% of infections are caused by *Staphylococcus aureus*.**
- *Other infections include pseudomonas, enterococci and streptococci.*
- **Management**
  - Antibiotic therapy Hyperbaric oxygen therapy
  - Surgical debridement of bone.
- **Key nursing interventions**
  - Relieving pain
  - Improve physical mobility
  - Control infectious process
  - Patient teaching regarding mobility and exercise.

bone pores -Asymptomatic

OSTEOPOROSIS

sponge

- Defined as decreased bone mass and bone density. Bone becomes weak and brittle.
- **Osteoporosis is the most prevalent bone disease in the world**
- The condition is a result of imbalance between bone resorption and bone formation.
- It increases the risk of fracture.
- **Usual onset of age is 30 years. Rapid progression is seen in postmenopausal women.**
- **Etiological factor include:**
  - Menopause
  - Prolonged use of corticosteroids
  - Deficiency of vitamin D and calcium
  - Smoking and alcohol
- **Clinical manifestation:**
  - Tingling and numbness
  - Lower backache
  - Kyphosis
- **Treatment**
  - Calcium intake is increased to 1,500 mg/day
  - Hormone replacement therapy (estrogen and progesterone)
  - Calcitonin and biphosphonates to prevent bone resorption.
- **Key nursing interventions:**
  - Teach about dietary sources of calcium (Milk, yogurt, cheese, seafood, legumes, etc.)
  - Encourage modification of life style (avoid smoking and alcohol; increase mobility, etc.)

OSTEOMALACIA

- Softening of the bone due to impaired bone metabolism. It is primarily due to inadequate calcium, phosphate, and vitamin D or because of resorption of calcium
- The bones are **porous and brittle in osteoporosis**, whereas in **osteomalacia** the bones are soft
- **Management:** Vitamin D and Calcium supplements, exposure to sunlight

PAGET'S DISEASE

- It is a disorder of bone remodeling process.
- Body absorbs old bones and forms abnormal new bone.
- Paget's disease of bone most commonly occurs in the pelvis, skull and legs.

RHABDOMYOLYSIS

- It refers to the breakdown of the muscle tissue due to muscle trauma which may result in myoglobinuria (presence of myoglobin in urine). Accumulated myoglobin may even lead to renal failure if left untreated.
- **Signs and symptoms:** Muscle weakness, tenderness and swelling. Dark, reddish brown urine.
- **Treatment**
  - IV crystalloids to increase GFR.
  - Diuretics and or dialysis may be required
  - If compartment syndrome develops, immediate fasciotomy and debridement may be necessary.

SPINAL COLUMN DEFORMITIES

Scoliosis: Lateral curvature of the spine
Kyphosis: Outward curvature of thoracic spine. It is also known as **humpback** or **Dowager's hump.**
Lordosis: Inward curvature of the lumbar spine. Seen in pregnant women and obese persons.

Figures 17 A to C ■ (A) Scolosis; (B) Kyphosis; (C) Lordosis

Scanned with CamScanner

PROLAPSED INTERVERTEBRAL DISC

Figure 18 ■ Top views of vertebrae showing herniated disc

- Nucleus of the disc protrudes into the annulus and causes nerve compression.
- **Manifestations**
  - Numbness, pain or tingling in one or both arms or legs
  - Pain behind the shoulder blades or in the buttocks
  - In severe cases - Loss of bladder and/or bowel control, numbness in the genital area, and impotence (in men)
  - Location of symptoms depends on location of prolapse
- **Management**
  - Bed rest, maintain head and spine in alignment
  - Avoid prolonged sitting, avoid flexion, extension and rotation of the joint
  - Cervical collar
  - Analgesics, anti-inflammatory and sedatives
  - Exercises regimen to strengthen the muscles
  - Surgery if conservative treatment fails
- **Client is advised to sleep on one side with hip and knee flexed and a pillow between legs**
- **Post-operative Monitoring Following Cervical Disc Surgery**
  - **Assess respiratory status and encourage deep breathing and coughing exercises**
  - **Look for laryngeal nerve damage: Hoarseness of voice and inability to cough indicate this.**
- **Post-operative monitoring following lumbar disc surgery**
  - **Assess movement, sensation, color, temperature and paraesthesia in the lower extremities.**
  - **Assess bowel and bladder movements.**
  - **Client has to be in supine position following surgery**
  - **Avoid prolonged sitting as it cause pressure in the surgical site**

Key Points

- C5-C6 and C6-C7 are the most common site for cervical vertebrae prolapse
- L4-L5 and L5-S1 are the most common sites for lumbar vertebrae prolapse.

AMPUTATION OF THE LOWER EXTREMITY

- Removal of a limb or part of limb is known as amputation.
- **Complications:** Bleeding, infection, ghost pain (phantom limb pain), flexion contracture
- **Phantom limb pain (ghost pain):** Pain experienced by the patient following amputation from the part of limb that is no longer existing. The pain experienced is real.
- **Nursing Management**
  - Prone position may be recommended following amputation
  - Stump should not be elevated on a pillow because it can lead to flexion contracture. If physician recommended, then the foot end of the bed can be elevated.
  - **Above knee amputation:** Prevent the external rotation of stump by using sand bag.
  - **Below knee amputation:** Discourage prolonged sitting and hanging the stump while sitting
  - Reinforce surgical dressing and elastic compression dressing which shrink the stump, reduce edema and prepare the stump for prosthesis.

POTT'S DISEASE

- TB of the spine which can cause kyphosis and paraplegia
- Anti-tubercular drugs are the treatment of choice.

CARPEL TUNNEL SYNDROME

- Compression of the median nerve causes this condition
- Pain, numbness, paraesthesia and weakness over thumb, index and middle finger are the manifestation.

Figure 19 ■ Carpel tunnel syndrome

Scanned with CamScanner

DISORDERS OF LOWER LIMB

Table 13 Disorders of lower limb

Conditions	Description	Picture
Genu-valgum (Knock-knee)	Both knees are touching each other when the leg is straightened.	
Genu-varum (Bowlegged)	Angular deformity of proximal tibia in which child appears bow legged	Genu recurvatum	Due to abnormal intra uterine position which may recover spontaneously

Target High Extra Edge

- **Osteoporosis** is the most prevalent bone disease in the world.
- **Monteggia fracture** is a fracture of the proximal third of the ulna with dislocation of the radius.
- Fracture of the distal radius is called **Colle's fracture.**
- Tripod fracture is seen in Zygomatic bone.
- **Compartment syndrome** is a complication of fracture in this increased pressure within the myofascial compartment.
- Compartment syndrome is a serious complication of casting and splinting. It occurs when there is an increased pressure within a confined space which compromises blood flow, and low tissue perfusion occurs
- **Osteoporosis** (porosity and brittleness of bone) is caused by deficiency of Vitamin D,
- Vitamin D Deficiency in adults leads to Osteomalacia.
- Cardinal symptoms of rickets are craniotabes (thinning of skull bones), rachitic rosary (rib beading), pigeon breast (pectus carinatum), bowing of legs, waddling gait and short stature.

Scanned with CamScanner

- **Rachitic rosary** can be frequently seen in Rickets. It is a classic beading of osteochondral junction of ribs.
- **Carpopedal spasm** indicates hypocalcemia.
- An injury to the joint ligament and joint capsule is termed as **Sprain**.
- The largest synovial joint in the human body is **knee joint**.
- **Colle's fracture** refers to the fracture of Radius. It is a type of fracture of the distal forearm.
- Colles' fracture is commonly described as a **dinner fork deformity**.
- Significant elevation of ESR and C reactive Protein (CRP) is seen during actual phase of Rheumatoid Arthritis (RA).
- Carpal tunnel syndrome is caused by the compression of the **median nerve**.
- Cubital tunnel syndrome occurs when the **ulnar nerve** in the arm becomes compressed or irritated.
- **Foot drop** is caused by an injury to the common peroneal nerve.
- Diet with high calcium content is usually not indicated to prolonged bedridden patient with fracture because decalcification is already there and it causes further **renal calculi**.
- Provide a **diet high in protein and vitamin C** to the patient with fracture.
- Handle the cast with palm not with finger as it could cause **pressure area** within the cast.
- Cast should **not be covered** until it is dry. Use fan to circulate air.
- Elevate the casted limb on pillow but not amputated limb as it creates **contracture**.
- Pain around the pin site, warmth, redness, swelling, purulent discharge is indicative of pin-site infection which can develop as **osteomyelitis**.
- **Buck's skin traction** is used to treat knee injuries.
- Gallow's/Bryant's traction is used in the fracture of shaft of femur.
- Russel's traction is used in trochanteric fracture.
- In a client with **traction** neurovascular assessment is the priority nursing intervention.
- In a client with **skin traction** dorsiflexion of the foot indicates functioning of peroneal nerve; plantarflexion of the foot indicates functioning of the tibial nerve.
- In a client with **skeletal traction** Nurse should not remove weight from the traction unless a life-threatening emergency.
- Nurse should stand on the affected side while **ambulating the client**.
- **Four-point gait or weight-bearing gait is** most commonly used when both legs are in a weakened condition.
- **Three-point gait or non-weight bearing gait** is used when injured legs can bear some weight.
- **Three-point swing through gait** is used to keep all pressure off from injured legs and swing both legs through.
- **Gout** is a syndrome of acute attacks of arthritis caused by **hyperuricemia**.
- Incidence of **primary gout** is more among men than in women.
- Allopurinol is a drug of choice to treat **chronic gout** or prevention of gout.
- **Cochicine** is used to treat acute gout attack.
- Limited intake of purine-rich food (e.g. liver and sardines) is advised for the patient with gout.
- **Gout** most classically affects the joint in the base of the big toe.
- Osteoarthritis most commonly affects weight-bearing joints, for example, hip, knee, lower vertebral column.
- Osteoarthritis is most common type of arthritis.
- Rheumatoid arthritis is a most common cause of **Swan Neck Deformity** of fingers.
- Staphylococcus aureus is responsible for more than 50% of infections that causes osteomyelitis.
- Paget's disease is a disorder of bone remodeling process.
- **Scoliosis** is a lateral curvature of the spine.
- Kyphosis is outward curvature of the thoracic spine. It is also known as **humpback**.
- Lordosis is inward curvature of the lumbar spine.
- Patient with prolapsed intervertebral disc is advised to sleep on one side with hip and knee flexed and a pillow between legs.
- C5-C6 and C6-C7 are the most common sites for cervical vertebrae prolapse.
- L4-L5 and L5-S1 are the most common sites for lumbar vertebrae prolapse.
  - Prone position may be recommended following amputation of lower limb.
  - In lower limb amputation, stump should not be elevated on a pillow because it can lead to flexion contracture. If physician recommended, then the foot end of the bed can be elevated.
  - In above knee amputation, prevent the external rotation of stump by using sand bag.
  - In below knee amputation, discourage prolonged sitting and hanging the stump while sitting.

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

ANATOMY AND PHYSIOLOGY

91. Winging of scapula is caused due to injury to which of the following parts? *(AIIMS BBS NO 2018)*
a. Ulnar nerve
b. Thoracodorsal nerve
c. Long thoracic nerve of bell
d. Dorsal scapular nerve

Explanation: Injury to the long thoracic nerve causes serratus anterior Paralysis is the most common cause for Winging of Scapula. Winging of scapula (or scapula alata) is a musculoskeletal disorder characterized by the protrusion of shoulder blade, or shoulder bone, from a person's back in an abnormal position.

92. Muscle of thigh present in anterior aspect: *(Safdarjung NO 2018)*
a. Rectus femoris
b. Hamstring
c. Deltoid
d. Tibialis anterior

Explanation: The muscles present in the anterior aspect of the thigh are Sartorius, Quadriceps femoris, Rectus femoris and Articularis genu. Hamstring muscles are present at the back of thigh and knee. Deltoid muscle is the muscle of the scapular region and upper limb. Tibialis anterior is the muscle of the anterior compartment of the leg.

93. Identify the hip bone from the following: *(DSSSB PHN, 2015)*
a. Femur
b. Humerus
c. Innominate
d. Sacrum

94. The muscle covers the shoulder and the back of the neck is: *(Kerala PSC, Nov 2014)*
a. Trapezius
b. Masseter
c. Biceps
d. Temporalis

95. In an adult, the skeleton comprises around: *(ESIC Chennai May 2012)*
a. 40–50% of the total body weight
b. 30–40% of the total body weight
c. 60–70% of the total body weight
d. 10–20% of the total body weight

96. Which bone is the largest bone in human body: *(ESIC Chennai May 2012)*
a. Tibia
b. Radius
c. Femur
d. Humerus

97. Contraction of the abdominal muscles is important in: *(ESIC Chennai May 2012)*
a. Normal (quiet) expiration
b. Forced (maximum) expiration
c. Normal (quiet) inspiration
d. Forced (maximum) inspiration

98. Total number of bones in human body: *(ESIC Chennai May 2012; RRB Feb 2012; LNJP H D 2012)*
a. 206
b. 213
c. 209
d. 300

99. Total number of facial bones *(RRB Feb 2012)*
a. 12
b. 10
c. 14
d. 16

100. The number of cervical vertebrae in a normal adult is: *(AIIMS Bhopal Nursing Officer, 2018)*
a. 11
b. 9
c. 5
d. 7

Explanation:

Cervical	7
Thoracic	12
Lumbar	5

101. Which answer best explains the location of the humerus?
a. Knee to ankle
b. Elbow to wrist (on the pinky side)
c. Elbow to wrist (on the thumb side)
d. Shoulder to elbow

102. The elbow is _____ to the wrist: *(PGIMER 2000)*
a. Distal
b. Anterior
c. Posterior
d. Proximal

Explanation: The elbow before the wrist, means it is proximal to the wrist.

103. The long-term effects of a prolonged diet that contains too little calcium would include
a. Increased calcitonin secretion
b. Increased thyroid hormone secretion
c. Decreased bone thickness
d. Acromegaly

104. The basic structural and functional unit of the skeletal muscle is the
a. Fasciculus
b. Fiber
c. Myofibril
d. Sarcomere

105. The trapezius muscle is located in the.....
a. Lower leg
b. Back
c. Forearm
d. Buttocks

106. Osteoclasts are known as
a. Bone forming cells
b. Bone destroying cells
c. Bone repairing cells
d. All of the above

107. Which of the following is known as bone forming cells?
a. Fibrinoblasts
b. Osteocytes
c. Osteoclasts
d. Osteoblasts

108. Site of growth in length of a long bone is .....
a. Diaphysis
b. Epiphyseal plate
c. Bone marrow
d. Periosteum

109. Covering of the bone is
a. Diaphysis
b. Epiphyseal plate
c. Bone marrow
d. Periosteum

Scanned with CamScanner

110. True regarding isometric contraction is
a. Shortening of muscle fiber
b. Lengthening of muscle fiber
c. Length of muscle fiber remains the same
d. Pressure of the muscle remain unchanged

111. True regarding concentric isotonic contraction is
a. Shortening of muscle fiber
b. Lengthening of muscle fiber
c. Length of muscle fiber remains the same
d. Pressure of the muscle remain unchanged

112. Thin filament is
a. Actin b. Troponin
c. Tropomyosin d. All of the above

113. The maintenance of posture in a normal adult human being depends upon
a. Integrity of reflex arc
b. Muscle power
c. Type of muscle fibers
d. Joint movements in physiological range

114. Major constituent of bone is
a. Calcium sulphate b. Calcium phosphate
c. Magnesium sulphate d. Sodium chloride

115. Vitamin essential for a healthy skeletal system is .....
a. Vitamin A b. Vitamin D
c. Vitamin E d. Vitamin K

116. Osteocytes are located in .....
a. Lamellae b. Haversian canals
c. Canaliculi d. Lacunae

117. True regarding intramembranous ossification is
a. In the bones of the roof of the skull
b. As a process that produces most of the skeletal system
c. When ones develop from cartilage models
d. When osteoblasts invade the spaces left by dying cartilage cells

118. Bones in the axial skeleton include .....
a. Skull b. Ribs
c. Sternum d. All of the above

119. Life span of platelets is
a. 90-120 Day b. 1-3 Day
c. 8-12 Day d. 1 Day

120. Smallest bone is .....
a. Malleus b. Incus
c. Stapes d. Phalangenes

121. Relationship between biceps brachii and triceps brachii muscles are .....
a. Synergists b. Antagonists
c. Both flex the forearm d. Both extend the forearm

122. Main abductor muscle of the upper limb is .....
a. Latissimus dorsi b. Deltoid
c. Pectoralis major d. Pectoralis minor

123. The Hering-Breuer reflex
a. Responds to the increase in blood carbon dioxide levels
b. Responds to the decrease in blood oxygen levels
c. Limits the extent of expiration
d. Occurs when stretch receptors-in the lung send signals that inhibit the respiratory center

124. Haversian canal together with the lamellae and surrounding is known as .....
a. Haversian system b. Canaliculi
c. Cancellous bone d. Medullary cavity

125. Ossification starts with .....bone
a. Fontanel b. Clavicle
c. Humerus d. Femur

126. Ossification of Posterior fontanels completes at .....
a. 3 months b. 6 months
c. 12 months d. 18 months

127. Ossification of anterior fontanels completes at .....
a. 3 months b. 6 months
c. 12 months d. 18 months

128. Anterior fontanel is formed by all EXCEPT
a. Coronal suture b. Frontal bone
c. Lambdoid suture d. Sagittal suture

129. Number of bones in the skull is .....
a. 22 b. 24
c. 26 d. 28

130. The one and only mobile or movable bone in the skull is ...
a. Maxilla b. Mandible
c. Ear ossicle d. Frontal

131. Sinuses means
a. Cavities in the bones b. Nasal cavity
c. Nasal blockage d. Space between tissues

132. Teeth are located in ..... bone
a. Maxilla and mandible b. ethmoid and sphenoid
c. maxilla and frontal bone d. Zygomatic and vomer

133. The structures of ear are encased in
a. Temporal bone b. Parietal bone
c. Ethmoid bone d. Frontal bone

134. Forgotten muscle is .....
a. Supraspinatus b. Infraspinatus
c. Subscapularis d. Teres minor

135. Total number of vertebrae is .....
a. 25 b. 27
c. 29 d. 33

136. Which among the following is the largest vertebra?
a. Cervical b. Lumbar
c. Thoracic d. Sacrum

137. Which among the following is the smallest vertebra?
a. Axis
b. Cervical
c. Lumbar
d. Thoracic

138. Which of the following sections of vertebral column is matched with its correct number of vertebrae?
a. Thoracic - 7 vertebrae
b. Cervical - 12 vertebrae
c. Sacral - 3 fused vertebrae
d. Lumbar - 5 vertebrae

139. Which of the following vertebral bone consists of 5 fused bones?
a. Atlas
b. Axis
c. Coccyx
d. Sacrum

140. The epithelial tissue that lines the urinary bladder is
a. Simple
b. Stratified
c. Transitional
d. Squamous

141. First bone of the vertebral column is called as
a. Atlas b. Axis
c. Clavicle d. Hyoid

Scanned with CamScanner

142. Second vertebral bone is also known as
a. Atlas b. Axis
c. Sacrum d. Coccyx

143. There are _____ pairs of ribs present in human body
a. 10 pairs b. 11 pairs
c. 12 pairs d. 13 pairs

144. How many pairs of true ribs are there?
a. 7 b. 8
c. 10 d. 12

145. Number of floating ribs is
a. 2 pairs b. 3 pairs
c. 4 pairs d. 5 pairs

146. False rib is .....
a. 1st rib b. 2nd rib
c. 7th rib d. 10th rib

147. True ribs are (pair or number)
a. 7th rib b. 8th rib
c. 10th rib d. 12th rib

148. Ear ossicles are made of .....
a. Hyaline cartilage b. Fibrocartilage
c. Elastic cartilage d. None of the above

149. Bone without medullary cavity is
a. Fibula b. Clavicle
c. Femur d. Humerus

150. Collar bone is .....
a. Atlas b. Axis bone
c. Clavicle d. Scapula

151. Most commonly fractured carpal bone
a. Hamate b. Lunate
c. Scaphoid d. Capitates

152. Which of the following is NOT a long bone?
a. Humerus b. Sternum
c. Tibia d. Ulnar

153. Location of the humerus is .....?
a. Knee to ankle b. Knee to hip
c. Elbow to wrist d. Shoulder to elbow

154. Knee is supplied by ..... artery
a. Great saphenous b. Popliteal
c. Dorsalis pedis d. Posterior tibial

155. Total number of metatarsal bones in human body are
a. 8 b. 10
c. 14 d. 16

156. Total number of carpal bones in human body is
a. 8 b. 10
c. 14 d. 16

157. Ilium" is the part of .....
a. Shoulder girdle b. Pelvis
c. Spine d. Upper extremity

158. The part of the bone that enters into the formation of a joint is called:- *(AIIMS Raipur Grade II 2017)*
a. Articulating surface b. Bony sinus
c. Condyle d. Facet

Explanation: Sinus refers to any of the cavities in the skull that are connected with nasal activity. Condyle is a round prominence at the end of bone, mostly a part of joint which articulates with another bone. A facet is a small smooth area on a bone, usually an articular surface.

159. Largest joint of the human body is
a. Ankle joint b. Elbow joint
c. Knee joint d. Wrist joint

160. Which is a hinge joint?
a. Knee b. Elbow
c. Atlanto Axial d. Both A and B

161. Which of the following is an example of saddle joint?
a. Carpometacarpal joint of the thumb
b. Elbow joint
c. Ankle joint
d. Knee joint

162. Example for ellipsoid joint is
a. Wrist b. Knee
c. Ankle d. Shoulder

163. Type of joint in symphysis pubis is
a. Primary cartilaginous
b. Secondary cartilaginous
c. Synovial
d. Syndesmosis

164. A strong weight bearing synovial joints with irregular elevations and depressions that produce interlocking of the bones is called: *(AIIMS Raipur Grade II 2017)*
a. Vestigial tail b. Symphysis pubis
c. Sacroiliac joints d. Sacrococcygeal joint

Explanation: The true vestigial tail of humans arises from distal remnant of the embryonic tail. It contains adipose and connective tissue, central bundles of striated muscle, blood vessels, and nerves which is covered by skin and does not contain Bone, cartilage, notochord, and spinal cord. The pubic symphysis is a cartilaginous joint that sits between and joins left and right the superior rami of the pubic bones which is located in front of and below the urinary bladder. The sacrococcygeal joint is an amphiarthrodial joint formed between the oval surface at the apex of the sacrum and the base of the coccyx

165. 'Knee Joint' is the example of which of the following joints? *(AIIMS Bhopal Nursing officer, 2018)*
a. Ball and socket joint b. Hinge joint
c. Pivot joint d. Saddle joint

Explanation:

Joint	Definition
Ball and socket joint	The ball and socket joint (or spheroid joint) is a type of synovial joint in which the ball-shaped surface of one rounded bone fits into the cup-like depression of another bone. E.g.: hip joint, shoulder joint
Hinge joint	a joint between bones that permits motion in only one plane. E.g.: ankle, elbow, and knee
Pivot joint	a freely moveable joint that allows only rotary movement around a single axis. E.g.: Proximal radioulnar joint, Distal radioulnar joint, Median atlanto-axial joint
Saddle joint	A saddle joint is a synovial joint where one of the bones forming the joint is shaped like a saddle with the other bone resting on it like a rider on a horse. E.g.: Carpometacarpal joint of the thumb, between the malleus and incus in the middle ear

Scanned with CamScanner

166. Surgical fusion of a joint is known as: *(JIPMER 2012)*
a. Arthrodesis b. Arthroplasty
c. Arthrotomy d. Nailing

167. The presence of synovial fluid in joints reduces: *(JIPMER 2012)*
a. Efficiency b. Workload
c. Friction in joints d. Speed of movements

168. Movement of a body part away from the midline is .....
a. Abduction b. Adduction
c. Extension d. Flexion

169. Movement of a body part towards the midline is .....
a. Abduction b. Adduction
c. Extension d. Flexion

170. The type of joint present between ear ossicles is
a. Primary cartilaginous b. Secondary cartilaginous
c. Synovial d. Fibrous

171. Fibrous joints between the bones of the skull are called
a. Fossa b. Sutures
c. Synovial joints d. Cartilaginous joints

172. Knee cap is .....
a. Femur b. Fibula
c. Patella d. Tibia

173. Patella completely ossifies by the age of
a. 6 yrs b. 10 yrs
c. 14 yrs d. 21 yrs

174. Strongest muscle in the human body based on its weight is
a. Triceps b. Biceps
c. Masseter d. Deltoid

175. Which of the following is a connective tissue?
a. Blood b. Cartilage
c. Bone d. All of the above

176. Correct order of stages of the cell during mitosis is
a. Prophase-Telophase-Metaphase-Anaphase
b. Telophase -Anaphase- Prophase-Metaphase
c. Metaphase-Prophase -Anaphase-Telophase
d. Prophase- Metaphase-Anaphase-Telophase

177. Type of cartilage seen at temporo-mandibular joint is
a. Hyaline cartilage b. Fibrocartilage
c. Elastic cartilage d. All of the above

178. Which is the most prominent cartilage found in larynx?
a. Cricoid b. Thyroid
c. Hyoid d. Epiglottis

179. Longest muscle in the body
a. Biceps b. Triceps
c. Sartorius d. Quadriceps

180. Total number of intercostal muscles are
a. 9 pairs b. 10 pairs
c. 11 pairs d. 12 pairs

181. The trapezius muscle is located in the
a. Lower leg b. Back
c. Abdomen d. Calf

182. Which of the following is the largest cavity is human body?
a. Abdominopelvic cavity
b. Cranial cavity
c. Thoracic cavity
d. Pelvic cavity

183. Most common congenital anomaly of face is
a. Cleft lip with or without palate
b. Cleft palate only
c. Cleft lip with cleft palate
d. Submucous cleft palate

184. Smallest abdominal muscle is
a. External oblique b. Internal oblique
c. Transversalis d. Rectus abdominis

185. Elevation of the ribs during passive/normal inspiration caused by .....
a. Diaphragm b. External intercostals
c. Internal intercostal d. Sternocleidomastoid

186. The anterior hip muscle that flexes the thigh is the
a. Iliopsoas
b. Gluteus medius
c. Tensor fascia latae
d. Glute maximus

187. The anterior thigh muscle that extends the leg is the
a. Sartorius
b. Quadriceps femoris
c. Hamstring muscles
d. Iliopsoas

188. Function of superior oblique muscle is
a. Intorsion, adduction and depression
b. Intorsion, abduction and elevation
c. Intorsion, abduction and depression
d. Extorsion, abduction and depression

189. The strongest ligament in the body is
a. Iliofemoral ligament b. Lacunar ligament
c. Ligamentum flavum d. Inguinal ligament

190. Type of cartilage seen at temporo-mandibular joint is
a. Hyaline cartilage b. Fibrocartilage
c. Elastic cartilage d. All of the above

191. Insertion of pectoralis major is at
a. Humerus b. Femur
c. Knee d. Clavicle

192. Cleft lip is due to non-fusion of
a. Maxillary process with lateral nasal process
b. Maxillary process with medial nasal process
c. Maxillary process with mandibular process
d. All of the above

193. All of the following muscles are composite muscle Excep
a. Pectineus b. Rectus femoris
c. Adductor magnus d. Biceps femoris

194. Protein synthesis occurs in
a. Ribosome
b. Lysosomes
c. Endosomes
d. Golgi apparatus

195. Site of injection in gluteus
a. Inferomedial
b. Superomedial
c. Superolateral
d. Superomedial

196. Posterior dislocation of the femur on the tibia is prevent by
a. Anterior cruciate ligament
b. Posterior cruciate ligament
c. Medial collateral ligament
d. Lateral collateral ligament

197. Which of the following statements about muscle tissue true?
a. Smooth muscle is striated
b. Skeletal muscle is non-striated
c. Smooth muscle is involuntary
d. Cardiac muscle is not-striated

Scanned with CamScanner

198. Which of these structures has no cartilage in it?
a. Epiglottis b. Trachea
c. Bronchi d. Bronchiole

199. Correct regarding Tendon is .....
a. It connects bone to muscle
b. It connects bone to bone
c. It connects muscle to muscle
d. All of the above

200. Correct regarding ligament is .....
a. It connects bone to muscle
b. It connects bone to bone
c. It connects muscle to muscle
d. All of the above

201. Resorption of bone tissue is done by .....
a. Osteoids b. Osteocytes
c. Osteoclasts d. Osteoblasts

202. Function of superior oblique muscle is
a. Intortion, adduction and depression
b. Intortion, abduction and elevation
c. Intortion, abduction and depression
d. Extortion, abduction and depression

DISORDERS OF MUSCULOSKELETAL SYSTEM

Introduction

203. In electromyogram (EMG) .....
a. Insert needle into 4th or 5th ICS
b. Insertion of small needles into certain muscles.
c. Placement of electrodes over the chest
d. Placement of catheter into the ventricles of brain

204. Carpal tunnel syndrome is caused by the compression of: *(AIIMS-BBS SNO 2019, JIPMER 2012)*
a. The median nerve b. The radial nerve
c. The ulnar nerve d. The femoral nerve

205. A patient is complaining of fatigue, weight loss, and a low-grade fever and pain in fingers, elbows, and ankles. These symptoms are suggestive of .....
a. Bone pain
b. Osteoarthritis
c. Rheumatoid arthritis
d. Systemic lupus erythematosus (SLE)

206. A nurse is caring for an old lady with osteoarthritis and she asks following facts are true regarding osteoarthritis EXCEPT: *(NCFL 2019)*
a. Crepitus b. Tophi
c. Subcutaneous nodes d. Pain on moving the joint

Explanation: A tophus (plural: tophi) are symptoms of gout that occurs when crystals of uric acid builds up around the joints. All other given features are associated with osteoarthritis.

207. Heberden nodes is seen in .....
a. Rheumatoid arthritis
b. Osteoarthritis
c. Spondylosis
d. Tendinitis

208. Clinical manifestation of ankylosing spondylitis include
a. Fever and headache
b. Fatigue and night sweats
c. Low back pain
d. Urinary incontinence

SKELETAL SYSTEM

Bone Pathology

209. Correct regarding osteoporosis is .....
a. High risk in elderly and postmenopausal woman.
b. Leads to reduction of bone tissue mass
c. There is normal levels of serum calcium and inorganic phosphorus
d. All of the above.

210. Risk factor for osteoporosis is .....
a. Hyperthyroidism
b. Hypoparathyroidism
c. Prolonged use of glucocorticoids
d. Consumption of milk

211. Risk factors of osteoporosis includes all EXCEPT
a. Hyperthyroidism
b. Hyperparathyroidism
c. Post-menopausal women
d. Obesity

212. Abnormal hardening of bone and an elevation in bone density is known as
a. Osteoporosis b. Osteopetrosis
c. Osteomalecia d. Arthritis

Explanation:
- Osteopetrosis is a bone disease that makes bones abnormally dense and hard that is susceptible to fracture.
- Osteoporosis - decreased bone density (weakening).
- Otosclerosis - abnormality in ear ossicles which leads to deafness.
- Osteomalecia - softening of the bones caused by impaired bone metabolism.

213. Causes of osteomalacia includes
a. Calcium deficiency b. Vitamin D deficiency
c. Both A and b d. Exposure to sunlight

214. Pott's disease is .....
a. TB meningitis b. TB spine
c. TB bone d. TB lung

215. Anterior curvature of the spine is called as
a. Lordosis b. Kyphosis
c. Scoliosis d. Osteomalacia

216. Posterior curvature of the spine is called as
a. Lordosis b. Kyphosis
c. Scoliosis d. Osteomalacia

217. Lateral curvature of spine is called as
a. Lordosis b. Kyphosis
c. Scoliosis d. Osteomalacia

218. In rheumatoid arthritis, during the acute phase the values which are significant are_____ *(ESIC 2019)*
a. ESR and C reactive Protein (CRP) elevation
b. RFT elevation (renal Function Test)
c. CBC elevation (Complete Blood Count)
d. LFT elevation (Liver Function Test)

Explanation: Abnormal values of the tests for evaluation of systemic inflammation are the most typical humoral features of Rheumatoid Arthritis. These includes erythrocyte sedimentation rate/ESR, acute phase proteins (such as C-Reactive protein) and plasma viscosity.

219. Risk for developing rheumatoid arthritis is more in .....
a. A 30-year-old woman b. A 30-year-old man
c. A 65-year-old woman d. A 65-year-old man

Ans.

Scanned with CamScanner

220. First line drug of choice for a client recently diagnosed with rheumatoid arthritis is .....
   a. NSAIDs b. Opioid analgesics
   c. Local anesthetics d. All of the above
221. Main goal of treatment in rheumatoid arthritis is to
   a. To treat the disease completely
   b. To prevent osteoporosis
   c. To control inflammation
   d. To maintain ROM
222. All of the following tests are used in diagnosis of Rheumatoid Arthritis, Except:
   a. AFP level
   b. Erythrocyte Sedimentation Rate (ESR)
   c. Anti-cyclic citrullinated peptide (Anti-CCP)
   d. C reactive protein (CRP)
223. Which of the following condition improves with pregnancy?
   a. Rheumatoid arthritis b. SLE
   c. Myasthenia gravis d. Multiple sclerosis

FRACTURE AND DISLOCATIONS

224. The clinical manifestations of fractures include:
   a. Fever, heaviness, weakness
   b. Edema, pallor, ecchymosis
   c. Pain, pallor, paresthesia
   d. Pain, coolness, loss of pulse
225. Fracture occurs at the distal end of the fibula: *(Kerala PSC, Nov 2014)*
   a. Colles' fracture b. Oblique fracture
   c. Spiral fracture d. Pott's fracture
226. Which of the following is a fracture in which bone is shattered into numerous fragments? *(Staff Nurse G II 2014)*
   a. Displaced fracture b. Avulsion fracture
   c. Comminuted fracture d. Spiral fracture
227. A bone fracture resulting in an open wound through which bone fragments usually protrude is known as
   a. Simple fracture b. Buckled fracture
   c. Compound fracture d. Complete fracture
228. All of the following are the causes of pathological fracture EXCEPT?
   a. Osteoporosis b. Osteomyelitis
   c. Primary Hyperparathyroidism
   d. Multiple sclerosis
229. Complications of fracture healing include .....
   a. Fibrous union b. Nonunion
   c. Pseudo arthrosis d. All of the above
230. What type of fracture is green stick fracture?
   a. Complete fracture b. Incomplete fracture
   c. Complicated d. Penetrating
231. Impacted fracture is also known as .....
   a. Buckled fracture b. Complicated fracture
   c. Communicated fracture d. Green stick fracture
232. Which of the following term is used for the fracture in which the broken bone causes damage to other organs or structures
   a. Communicated fracture b. Complicated fracture
   c. Buckled fracture d. Complete fracture
233. Colle's fracture refers to the injury of: *(DSSSB PHN, 2015)*
   a. Shoulder joint b. Knee joint
   c. Wrist joint d. Elbow joint
234. Colle's fracture refers to the fracture of: *(Daman and Diu NO 2018)*
   a. Ulna b. Humerus
   c. Radius d. Olecranon

Ans.

220.	a
221.	c
222.	a
223.	a

236.	d
237.	d
238.	a
239.	a
240.	d

Explanation: A Colle's fracture is a type of complete fracture of the radius bone of the distal forearm close to the wrist resulting in an upward (posterior) displacement of the radius and obvious deformity. The clinical presentation of Colle's fracture is commonly described as **a dinner fork deformity** along with inability to grasp objects.

235. Fracture of the distal radius is called: *(DSSSB 2013)*
   a. Hume fracture b. Monteggia fracture
   c. Galeazzi fracture d. Colles' fracture
236. Hangman's fracture refers to
   a. Fracture of median radius
   b. Fracture of metacarpal bones
   c. Fracture of clavicle bone
   d. C2-C3 traumatic spondylolisthesis
237. Which of the following statement describes pathological fracture?
   a. Break or splinter of the bone into more than two fragments
   b. A bone fracture accompanied by damage to regional organs and/or neurovascular bundles.
   c. Ends of the bone are driven into each other
   d. Fracture is caused by a disease that weakens the bones
238. Older adults are more prone to develop hip fracture because of
   a. Decreased bone density b. Sedentary life style
   c. Weakness in them d. Age

Explanation: Hip fracture is more common among older adults because their bone density decreases, becomes thinner and weaker due to calcium loss.

239. Elderly women are more prone to develop hip fracture because.....
   a. Decreased estrogen secretion
   b. Increased bone density
   c. Increased calcium absorption
   d. Sedentary life style

Explanation: Estrogen withdrawal among elderly women leads to osteoporosis and decreased bone density, so they are more prone to develop hip fracture.

240. A 30-year-old male patient was admitted with a fractured femur. A nurse would assess for sign of circulatory impairment in this client by asking him to
   a. Turn himself in bed b. Cough and deep breathe
   c. Perform biceps exercise d. Twist his toes

Scanned with CamScanner

241. Which of the following assessment findings best indicates a fracture of the femoral neck?
a. Pain in the affected leg
b. Hematoma in the affected leg
c. Pain and edema in the affected leg
d. Affected leg is shortened, adducted and extremely rotated

242. A patient is lying in a supine position. External rotation of the lower extremity can be prevented in this patient by using
a. Foot board below the extremity
b. Sandbag on the foot
c. Trochanter roll to the knee
d. Trochanter roll to the thigh

243. A life threatening condition that can develop after the fracture of femur is
a. Atelectasis b. Pneumonia
c. Nerve damage d. Fat embolism

244. Complication of fracture is .....
a. Nerve injury b. Fat embolism
c. Soft tissue injury d. All of the above

245. Colle's fracture refers to all of the following EXCEPT
a. Fracture of medial malleolus
b. Transverse wrist fracture
c. Distal radius fracture
d. Dinner-fork deformity of the wrist

246. Fracture of malleoli or lower end of the fibula is known as
a. Colles' fracture b. Pott's fracture
c. Jone's fracture d. Jefferson's fracture

247. Fracture of the base of the first metacarpal bone which extends into the carpometacarpal (CMC) joint is known as
a. Hangman's fracture b. Jone's fracture
c. Bennet fracture d. Boxer's fracture

Explanation:
- Bennet fracture, an intra-articular fracture, is the most common type of fracture of the thumb.
- Boxer's fracture refers to fracture of 5th Metacarpal bones.
- Hangman's fracture is a fracture of the axis in the cervical region. It is often seen with people who tries to hang themselves.
- Jones fracture is a fracture between the base and middle part of the fifth metatarsal of the foot.

248. Parameter need to be monitored in a client with fracture of the pelvis is .....
a. Changes in urine output
b. Lower limb sensation
c. Femoral pulse d. Pain

249. Which nerve is most likely to be injured in fracture of shaft of humerus?
a. Median nerve b. Musculo- cutaneous nerve
c. Radial nerve d. Dinar nerve

INFECTIONS

250. Organism responsible for pyogenic osteomyelitis is
a. Staphylococcus aureus b. Salmonella
c. Pseudomonas d. Pneumococci

251. Infection needs to be suspected in a casted extremity if there is .....
a. Pain b. No pulse
c. Paranesthesia d. Hot spot

252. Pathogens responsible for septic arthritis are
a. Streptococci b. Staphylococci
c. Haemophilus influenzae d. All of the above

INTERVENTIONS

253. The nurse is caring for a patient immediately after a below knee amputation. Which of these assessments should the nurse consider a priority? *(RAK MSc 2018)*
a. Sacral edema
b. Mobility
c. Stump dressing
d. Blood sugar level

Explanation: The priority intervention would be stump dressing as if it is not done periodically or ignored may cause change in shape of stump, edema or interferes with shrinking of stump that later creates a problem for making a properly fitted prosthesis.

254. Important nursing intervention after bone biopsy include
a. NPO
b. Send samples to the laboratory
c. Monitor the site for bleeding, swelling and hematoma formation
d. Analgesics

255. Manual manipulation of dislocated shoulder joint is known as .....
a. A Close reduction b. An open reduction
c. Internal fixation d. External fixation

256. Pain and muscle spasm associated with disc herniation can be managed with .....
a. Lie down in supine position
b. Teach muscle strengthening exercises
c. Always wear belt
d. Use of cold and hot compresses along with analgesics

257. Healing following fracture to the distal shaft of the humerus is indicated by .....
a. Formation of callus b. Formation of keloids
c. Formation of scar d. Presence of contracture

258. Correct regarding open reduction and internal fixation (ORIF) is
a. Fast method of recovery.
b. Can use in all patients
c. Adequate alignment is not obtained from CRIF then ORIF will use
d. Plaster of Paris can be used instead of ORIF

259. Neurovascular problem following fracture is indicated by
a. Pain
b. Pulselessness distal to the injury
c. Pallor
d. Loss of movement

260. The repair and reconstruction of the joint is called: *(AIIMS Raipur Grade II 2017)*
a. Arthrodesis b. Arthrotomy
c. Arthroplasty d. Amputation

Explanation: Arthrotomy is creation of an opening in joint. Arthrodesis is surgical immobilization of joint by fusion of bones. Amputation is the removal of limb by trauma, illness or surgery.

261. Total hip arthroplasty means
a. Fuse the joint
b. Replace the hip joint
c. Fixation of femur with rod
d. Remove the cartilage tissue

262. Spica cast is used for *(ISRO)*
a. Arm b. Leg
c. Foot d. Hip

Scanned with CamScanner

263. After total hip replacement the precautions to be taken to avoid dislocation of prosthesis include.....

a. Avoid crossing your legs and bending your hip past a right angle
b. Avoid low chair
c. Sleep with a pillow between legs for 6 weeks
d. All of the above

Explanation: All of the above management is indicated to prevent hip prosthesis dislocation. Avoid bending over to pick things up is also recommended.

264. Following above knee amputation edema in the stump can be managed with .....

a. Keep abduction pillow in between
b. Provide Trendelenburg position
c. Keep the remaining limb elevated on a pillow
d. Rewrap the elastic bandage as necessary

265. Following above knee amputation stump should be elevated.

a. To prevent edema
b. To prevent hip flexion contractures
c. Promote hemostasis
d. Promote healing

Explanation: For the first 24 hours after surgery, keep the residual limb raised on one to two pillows to prevent edema. After 24 hours, keep the residual limb flat on the bed to prevent hip flexion contractures (tightening).

271. a
272. c
273. d
274. b
275. a

266. A nurse caring for a patient with hip replacement should be most concerned about which of the following findings?

a. Complaints of pain during repositioning.
b. Scant bloody discharge on the surgical dressing.
c. Complaints of pain following physical therapy.
d. Temperature of 102°F.

267. Which of the following position is appropriate for a patient who is on first postoperative day after total hip replacement?

a. Supine with abduction pillow
b. Prone with abduction pillow
c. Semi Fowler's position
d. Trendelenburg position

268. A patient is scheduled for a right total hip replacement. The nurse should teach which of the following postoperative leg positions? *(RAK MSc 2018)*

a. Maintain legs in adduction
b. Maintain legs in abduction
c. Maintain internal leg rotation
d. Maintain >90° hip flexion

Explanation:

- The reason for maintaining legs in abduction following the right hip replacement is to maintain the alignment of legs with the hip. Abduction means to move the legs away from the midline, doing so, it prevents internal rotation of legs and displacement of the replaced hip bone.
- **Maintaining leg adduction, doing internal rotation and keeping the legs at an angle >90°** will interfere with the alignment of the newly replaced hip bone.

269. Health education after total ankle replacement include...

a. Avoid walking for 6 weeks
b. Elevate the leg always
c. Wear elastic stockings always
d. Non weight bearing for 6 weeks

270. The surgical procedure done to relieve pressure in compartment syndrome is: *(DSSSB 2013)*

a. Open reduction with internal fixation (ORIF)
b. Meniscectomy
c. Fasciotomy
d. Arthroplasty

Explanation: Fasciotomy or fasciectomy is a surgical procedure where the fascia is cut to relieve tension or pressure commonly to treat the resulting loss of circulation to an area of tissue or muscle. Fasciotomy is a limb-saving procedure when used to treat acute compartment syndrome.

271. An 8-year-old girl was diagnosed with a closed fracture of the radius at approximately 2 PM. The fracture was reduced in the emergency room and her arm placed in a cast. At 11 PM her mother brought her back to the emergency room due to unrelenting pain that has not been relieved by the prescribed narcotics. What should the nurse do first? *(AIIMS Raipur NO 2019)*

a. Notify the doctor immediately
b. Apply ice
c. Elevate the arm
d. Give additional pain medication as ordered

Explanation: Compartment syndrome is a serious complication of casting and splinting. Ischemia and irreversible neuromuscular damage can occur. The first action should be to notify the physician. Applying ice and elevating the arm will worsen the condition further. [*Refer synopsis for more details about Compartment syndrome (Page no. 23)*]

272. A patient who recently underwent amputation of a leg complains of pain in the amputated part. The nurse should explain to the patient which of the following? *(AIIMS Bhopal Grade-I 2018)*

a. The patient is experiencing central pain syndrome
b. The pain cannot exist because the leg has been amputated
c. The pain is a phenomenon known as "ghost pain"
d. The pain is a real experience for the patient

Explanation: Ghost pain (Phantom pain) sensations are described as perceptions that an individual experience relating to an limb or an organ that is not physically a part of the body (amputation or limb loss)

273. A nurse is caring for a patient who has had hip replacement (THR). Which of the following findings are of paramount importance? *(AIIMS Bhopal Nursing officer, 2018)*

a. Complaints of pain during repositioning
b. Scant bloody discharge on the surgical dressing
c. Complaints of pain following physical therapy
d. Temperature of 101.8°F (38.7°C)

Explanation: Except option D others are normal findings following THR. Increased temperature indicates risk for infection.

274. Least priority nursing care in a client with rheumatoid arthritis is .....

a. Prevent joint deformity
b. Maintaining usual ways of accomplishing task
c. Relieving pain
d. Preserving joint function

275. Which among the following needs to be assessed by the nurse in a postoperative patient who underwent spinal fusion surgery?

a. Lower extremity sensation and mobility
b. Urinary control
c. Urine out put
d. Pain level in patient

Scanned with CamScanner

276. Chemotherapy before the surgical resection of osteosarcoma will help to .....
a. Avoid the need for surgery
b. Reduce the tumor size
c. Kill the tumor cell and prevent blood supply
d. All of the above

277. Gout is a disorder of
a. Pyrimidine metabolism
b. Purine metabolism
c. Amino acid transport defect
d. Mismatch repair of DNA

278. Gout is a type of arthritis that occurs due to the accumulation of _____
a. Purines b. Creatinine
c. Uric acid d. Bilirubin

279. Needle-like crystals forms around the joints that cause severe pain is a feature of
a. Gout arthritis b. Rheumatoid arthritis
c. Ankylosis d. All of the above

280. Gout tends to start at which of the following site?
a. Elbow b. Knee joint
c. Index finger or thumb d. Big toe

281. Drug used to treat acute gout attack
a. Allopurinol b. Sulfinpyrazone
c. Colchicine d. Probenacid

282. Drug of choice for gout is .....
a. Phenytoin b. Allopurinal
c. Diazepam d. Methyl prednisolone

Explanation: Allopurinol is an antihyperuricemic which prevents the production of uric acid. So Allopurinol is used to prevent gout attacks. NSAIDs and Colchicine are best for treating the inflammation and pain during a gout attack.

283. [illegible]MD drug of choice to treat uncomplicated rheumatoid [illegible]ritis is .....
a. Aspirin b. Dexamethasone
c. Ibuprofen d. Diclofenac sodium

284. [illegible] side effect of allopurinol is .....
a. Maculopapular rash b. Nasal congestion
c. Headache d. Neutropenia

285. [illegible] of a fracture patient should be rich in .....
a. Calcium b. Potassium
c. Phosphorus d. Sodium

TRACTIONS

286. [illegible]poses of traction include
a. Used in the treatment of fracture
b. It helps to reduce muscle spasm and contracture
c. Helps in internal reduction
d. Both A and B

287. Bryant's traction is indicated in: *(Kerala PSC, Nov 2014)*
a. Fractures of femur b. Fractures of humerus
c. Spinal fractures d. Fractures of radius

288. Identify skin traction among the following:
a. Buck's extension traction b. Russell's traction
c. Dunlop's traction d. All of the above

Explanation: Skin traction is one of two basic types of traction used for the treatment of fractured bones. It works by applying weight to tape, sponge rubber, or canvas materials which have been attached to the skin surrounding the damaged body structure. Buck's traction is a form of traction where pull is exerted in one plane. It is used when partial or temporary immobilization is required, and it is used to provide comfort following injury while awaiting surgical fixation, especially in hip and femur injuries. Russell's Traction can be used for fractures of the tibial plateau, it works by supporting the flexed knee in a sling and applying a horizontal pulling force by use of traction tape and elastic bandage attached to the lower leg.

Dunlop's Traction is used for fractures of the upper extremities. It works in the form of horizontal traction which is applied to the abducted humorous, while vertical traction is applied to the flexed forearm.

289. In an immobilized patient with traction, muscle atrophy can be prevented by .....
a. ROM exercises b. Stretching exercises
c. Isotonic contractions d. Isometric contractions

290. Foot drop is caused by an injury to: *(AIIMS-BBS SNO 2019)*
a. The tibial nerve
b. The common peroneal nerve
c. The obturator nerve
d. The sciatic nerve

291. Which of the following intervention is most appropriate to prevent foot drop in a client with buck's traction?
a. Provide proper positioning for the patient
b. Keep pillows under patient's heels
c. Teach the patient isometric exercise
d. All of the above

Explanation: Mobility and muscle tone can be improved through isometric exercise. Hence teaching isometric exercise to patient can prevent foot drop. Use of foot board effective in foot drop prevention.

Muscular System

292. Rhabdomyosarcoma in children originates in
a. Cerebrum b. Kidney
c. Striated muscles d. Tendons

293. A painful condition that occurs when pressure within the muscles builds to dangerous levels that decreases the blood flow is known as
a. Compartment syndrome
b. Myasthenia gravis
c. Parkinsonism
d. Neuroleptic malignant syndrome

294. In adolescents, Osgood-Schlatter disease is a common cause of pain and swelling in the
a. Lateral aspect of ankle b. Inferior aspect of knee
c. Dorsal aspect of foot d. Proximal aspect of humerous

295. Muscle strength 3/5 indicates .....
a. Active movement against resistance
b. No active movement at all
c. Active movement against gravity and resistance
d. Active movement against gravity but not against resistance

296. All are abnormal findings in musculoskeletal system EXCEPT
a. No deformity or crepitus
b. Positive ortolani sign
c. Ulnar deviation and subluxation
d. Swan neck deformity

297. Over stress and stretching of ligament lead to .....
a. Strains b. Sprains
c. Contracture d. Dislocation

298. Risk for falls is higher in older adult because of .....
a. Changes in balance b. Osteoporosis
c. Shuffling gait d. Hormonal imbalances

Scanned with CamScanner

GASTROINTESTINAL AND HEPATOBILIARY SYSTEM

GASTROINTESTINAL SYSTEM

Anatomy and Physiology of GI System

- GI system extends from mouth to anus and the total length is 23-26 feet.
- Part of GI system includes mouth, pharynx, esophagus, stomach, small intestine, large intestine, rectum and anus.

Figure 20 ■ Gastrointestinal system

Mouth

- Mouth is the first site of digestion.
- Three pairs of salivary glands are named as:
  - Parotid
  - Submaxillary (submandibular), and
  - Sublingual glands secrete saliva to the oral cavity.
- Approximately 1.5 L of saliva is secreted daily.

Figure 21 ■ Salivary glands

Scanned with CamScanner

- Parotid is the largest salivary gland
- Mumps (Viral infection) affects parotid gland
- Submaxillary gland is the gland with longest duct

Esophagus

- It's a collapsible tube of **25 cm length**
- Located in the mediastinum of thoracic cavity
- It is located anterior to the spine and posterior to the trachea and heart.
- It passes through the diaphragm at an opening called the **diaphragmatic hiatus.**
- Upper esophageal sphincter prevents the entry of air into the esophagus, lower esophageal sphincter prevents GERD.

Figure 22 ■ Esophagus

- If lower esophageal sphincter fails to close properly. It leads to GERD and then to Barett's esophagus.
- Achalasia - Failure of the lower esophageal sphincter to relax
- Upper portion of esophagus and the external sphincter of the anus are under voluntary control and remaining portions are involuntary in control

Stomach

Figure 23 ■ Stomach

- Stomach is a distensible pouch located left to the midline just under the left diaphragm.
- Capacity - 1500 ml.
- The inlet of esophagus into the stomach is known as **esophagogastric junction**
- Esophagogastric junction is surrounded by a ring of smooth muscle known as lower esophageal sphincter or **cardiac sphincter**
- Stomach is divided into four anatomic region:
  - Cardiac (entrance),
  - Fundus
  - Body
  - Pylorus (outlet)
- Circular muscle in the wall of pylorus becomes the pyloric sphincter.
- **Pyloric sphincter controls the opening between the stomach and small intestine.**
- **Stomach produces 2.4 L of gastric juice per day.**
- **Gastric chief cells** (zymogenic cells/peptic cells) **secrete pepsinogen** which helps in digestion of protein
- **Parietal cells (oxytonic cells/ delomorphous) secrete HCl and intrinsic factor.**
- Intrinsic factor is essential for the absorption of Vit B12.

Small Intestine

- The longest segment of the GI system
- It is divided into three parts:
  - Duodenum (25 cm); shortest part of small intestine
  - Jejunum (8 feet)
  - Ileum (12 feet)
- Absorption of Vit B12 takes place in ileum
- The common bile duct allows the passage of both bile and pancreatic secretion.
- Common bile duct empties into the duodenum at **ampulla of vater** and this opening is surrounded by sphincter of oddi.
- **Sphincter of oddi** contain three sphincters.
- Junction between small intestine and the large intestine is the cecum which is located in the right lower quadrant. ileocecal valve located here.
- **Ileocecal valve** controls the entry of content into the large intestine as well as it **prevent the reflex of bacteria from large to small intestine.**
- **Vermiform appendix** is located near to ileocecal junction in the right lower quadrant.
- Deficiency of vit B12 results in pernicious anemia.

Figure 24 ■ Small Intestine and Large intestine

Scanned with CamScanner

Large Intestine

- Total length of large intestine is approximately 1.5 meter and is divided in there parts cecum, colon and rectum.
- Colon is further divided as:
  - Ascending colon (shortest portion of colon)
  - Transverse colon
  - Descending colon
  - Sigmoid colon.
- Rectum continues in an external opening called anus.
- Network of striated muscles form both internal and external anal sphincter.

Layers of Digestive System

- Layers of digestive system from inner to outer is mucosa, submucosa, muscularis and serosa/adventitia. The description has been summarized as follows:

Table 14 Layers of digetive system

Layer	Description
Mucosa	• Inner most layer contains many of the goblet cells which secrete mucus. • Mucosal layer also contains villi in some of the parts to increase the area of absorption
Submucosa	• Contains nerves including the submucus plexus (Meissner's plexus), blood vessels and elastic fibers with collagen.
Muscularis	• Comprises both longitudinal and circular smooth muscles which help with continued peristalsis.
Serosa/ adventitia	• Outermost layer • Made up of loose connective tissue and coated in mucus so as to prevent any frictional damage from the intestine rubbing against other tissue.

Blood Supply to the GI System

- GI system – Supplied by arteries originating from abdominal and thoracic aorta.
- Stomach – Supplied by gastric artery which is a branch of splenic artery.
- Small Intestine – Superior mesenteric artery branches.
- Colon – Superior mesenteric artery (right colic and middle colic branches) and inferior mesenteric artery (left colic and sigmoid branches)
- Venous drainage of the GI system is unique, because the venous blood from the GI organs merged to form large vessel called portal vein. Nutrient rich blood in the **portal vein** enters the liver and undergoes detoxification process before it enters into the general circulation.

Nerve Supply to the GI System

- Both sympathetic and para sympathetic nervous system supply the GI system
- Sympathetic nervous system exerts inhibitory action on GI system, i.e. it decreases gastric secretion, motility and constriction of sphincter and blood vessels
- Sympathetic nervous system slows down GI activity and parasympathetic nervous system speed up the GI activity.
- GI system has its own nerve supply called enteric nervous system. It's also known as **intrinsic nervous system.**
- Myenteric plexus control GI movement and submucosal plexus control secretion and local blood flow.
- Enteric nervous system is one of the main division of autonomic nervous system also known as second brain. Enteric nervous system communicated with CNS via vagus nerve.

Digestion Process in Human

- Swallowing is a voluntary act and is controlled by medulla oblongata
- Pancreatic secretions have an alkaline pH because of high concentration of bicarbonate.

Table 15 Enzymes secreted in digestion process in human

Part of the digestive system	Enzyme secreted	Digestion
Mouth	Salivary glands in the mouth secrete saliva which contains **ptyalin or salivary amylase**	• Starch (carbohydrate) digestion begins at mouth. • 30% of starch hydrolyzed by the action of salivary amylase • Starch + salivary amylase gives maltose
Pharynx and esophagus	Helps in swallowing and to carry food from mouth to stomach	
Stomach	HCl, intrinsic factor, pepsinogen and pepsin	• Intrinsic factor combines with Vit B12 and helps in its absorption • The mass of food that is semi-digested, acidic and pulpy in the stomach is called the chyme • HCl converts inactive form of pepsinogen to pepsin • Pepsin converts protein into peptones and proteoses. • Prorenin (proenzyme) is converted into renin by HCl. • Casein (milk protein) is converted into peptides by renin.
Small intestine	**Pancreatic juice** trypsinogen, chymotrypsinogen, elastase, carboxypeptidase, pancreatic lipase, and amylase. **Bile and bile salts**	• Enterokinase converts trypsinogen into trypsin • Trypsin converts proteins into dipeptides • Trypsin converts chymotrypsinogen into chymotrypsin. • Chymotrypsin converts peptones into dipeptides. • Fats → fatty acids and glycerol with the help of pancreatic lipase and bile salts. • Carbohydrates → simple sugars/ monosaccharides with the help of pancreatic amylase.

Scanned with CamScanner

Waste Products of Digestion

- The brown color of the fecal matter is due to the breakdown of bile by intestinal bacteria.
- Chemicals formed by intestinal bacteria such as **indole and skatole are responsible for fecal odor.**
- Internal anal sphincter is under autonomic nervous system control
- External anal sphincter is under voluntary control of somatic motor neurons (exit spinal cord at S2-S4).

Abdominal Quadrants and Organs

Figure 25 ■ Abdominal quadrants and organs

Diagnostic Evaluation in GI System

Table 16 Diagnostic evaluation

Name of the procedure	Description	Important points to remember
Stool test • Inspecting stool specimen for consistency and color • Stool for occult blood	Stool specimens are collected on random basis unless it's a quantitative study	• Random sample should be sent to the lab immediately • Quantitative specimen should be refrigerated until they are taken to the laboratory. • Stool for occult blood is a screening test to detect colon cancer in the early stage. • In stool for occult blood testing is done to detect heme, the iron containing pigment of hemoglobin. • This test is contraindicated in a patient with hemorrhoidal bleeding • False positive test result can occur in occult blood test if patient has eaten meat, liver, poultry, turnips, broccoli, cauliflower, sardines, within seven days before testing • Medications such as aspirin, ibuprofen, indomethacin, corticosteroids, anti-coagulants, cancer chemotherapeutic agents can cause false positive stool for occult blood result.
Hydrogen breath test	This test determines the amount of hydrogen expelled in breath after it has been produced in colon and absorbed into the blood	• This test is to evaluate carbohydrate absorption • This test is also helpful to evaluate bacterial overgrowth in the intestine and short bowel syndrome.
Urea breath test	To detect *H. pylori*. Patient is given capsule of carbon labeled urea and then a breath sample is taken after 10-20 minutes. *H. pylori* metabolizes urea rapidly and the labeled carbon get absorbed quickly. It can be determined by measuring carbon dioxide in the expired air.	**Patient is instructed to avoid:** • **Antibiotics and loperamide:** For one month before the test • **Sucralfate and omeprazole:** For one week before the test • Cimetidine, ranitidine, famotidine and nizatidine - 24 hours before the test

Contd...

Scanned with CamScanner

Name of the procedure	Description	Important points to remember
Abdominal ultrasonography	In USG high frequency sound waves are passed into internal body structures and ultrasonic echoes are recorded in an oscilloscope.	• USG requires non-ionizing radiation and there is no noticeable side effect. • **Disadvantage:** USG can't examine the structures lies behind bony tissue • Patient fasts for 8-12 hours before the test to decrease gas in the bowel. • If USG is to be done to study gallbladder conditions. **Fat free diet in the evening before procedure, is advised** • If USG and barium studies are planned on same day then USG has to be conducted before barium study, otherwise barium will interfere with sound wave transmission.
Upper GI tract study Or Barium swallow 	• A radiopaque liquid like barium sulfate is ingested by the client. • Its tasteless, odorless, non-granular, completely insoluble and non-absorbable liquid. • Multiple X-rays are taken during the procedures. • In double contrast study first a thick barium suspension is given to outline the GI tract following that a tablet which releases carbon dioxide in presence of water is given.	• **Assess for known allergy toward iodine, shelly fish or sea food before procedure** • Patient is advised to maintain low residue diet several days before the procedure • NPO after midnight before the test • Physician prescribes laxatives to clean the GI tract before the procedure • Ask patient to refrain from smoking in the morning before the examination • Withhold all medications which have influence on GI system • After the procedure, fluids are encouraged to eliminate contrast agent from the tract. • **Stool color will be changed to chalky white while barium sulfate is getting eliminated.** • If patient is getting T. metformin, this needs to be withheld and alternative medicines need to be taken as it can cause lactic acidosis by combining with contrast agent.
Capsule endoscopy 	• A small camera which looks like a capsule will be swallowed and it will take series of pictures of GI cavity and it will send to externally worn source. • After 8-72 hours this capsule will be eliminated from the body, naturally.	• NPO after midnight before the procedure • Bowel preparation with laxatives before the procedure
Lower GI tract study Or Barium enema 	When barium is instilled via rectum to visualize GI tract it's known as barium enema. In double contrast or air contrast enema air will be instilled following barium. In this study, air will be filled in the lumen which is lined with barium and allows easy detection of small lesions.	• The purpose of barium enema is to detect polyps, tumors and other lesions in the GI tract. • Bowel preparation is necessary before the procedure • Assess known allergy towards iodine, shelly fish or sea food before procedure. • Cramping and discomfort are expected in double contrast enema • Low residue diet 2 days before the procedure • Clear liquid diet and laxatives in the evening before the procedure • NPO after midnight • Cleansing enema in the morning on the day of procedure • **If upper GI studies are also there it has to be done following lower GI study** • **Barium enema study is contraindicated in client with perforation, obstruction and active GI bleeding.** • Fluids are encouraged after the study to eliminate contrast. • Stool color will be changed to chalky white while barium sulfate is getting eliminated. • If patient is getting T. metformin this needs to be withheld as it can cause lactic acidosis by combining with contrast agent.

Contd...

Scanned with CamScanner

Name of the procedure	Description	Important points to remember
Computed tomography	• Cross sectional images of abdominal organ and structures are taken.	• NPO 6-8 hours before the procedure • If CT scan is performed with contrast agent allergy needs to be assessed. • If barium studies are also there it has to be scheduled after CT scan
MRI	• Non-invasive technique which uses magnetic field and radio waves to produce image. • Its useful in evaluating abdominal soft tissue and blood vessels.	• MRI in contraindicated in patient with permanent pacemaker, artificial heart valve, implantable defibrillator, implanted insulin pumps and metal device • NPO 6-8 hours before the procedure • Remove all the jewelry and metalic things from body before the procedure • Client with claustrophobia may require sedation before the procedure • Inform the client that knocking sound may be heard during the procedure
Gastrointestinal motility studies	• Liquid and solid component of food mixed with radionuclide markers.	• After ingestion of food, the patient is placed under scintiscanner. This measures the rate of passage of radioactive food out of the stomach • This procedure is done to study the gastric emptying and colonic passage time
Upper gastrointestinal fibroscopy Or Esophagogastroduodenoscopy	• Fibroscope is flexible tube with fibro optic lenses which allow the visualization of esophagus, stomach and duodenum.	• It can be used as both therapeutic and diagnostic purposes • After patient is sedated, fibroscope is lubricated with jelly and slowly passed through the mouth. • Patient wears a mouth guard to protect the scope from biting.
Endoscopic retrograde cholangiopancreatography (ERCP)	• Side viewing flexible endoscope is used to view common bile duct, hepatic duct and pancreatic duct through ampulla of vater in the duodenum.	• NPO 6-12 hours before the procedure • Atropine may be administered to decrease the secretions • Sometimes glucagon may be given to relax sphincters • Left lateral position will be given during and after the procedure. • After the procedure, patient will be advised to eat or drink after the return of gag reflex. • Post procedure complications include perforation, bleeding, elevated temperature and difficulty in swallowing
Anoscopy, proctoscopy and sigmoidoscopy	• Anoscope used for visualization of anus and rectum • Proctoscope for the visualization of rectum • Sigmoidoscope is used for the visualization of sigmoid colon	• Patient is positioned in knee chest position and the back of the table is inclined about 45 degree. • During the procedure patient feels like urge to have bowel movement • Enema before the procedure until the returns are clear. • After the procedure, observe the patient for bleeding and signs of intestinal perforation (fever, rectal drainage, abdominal distention and pain).
Fiberoptic colonoscopy	Direct visualization of colon and cecum	• This can is be diagnostic and therapeutic • Patient positioned initially on left side with legs drawn towards the chest • Patient's position is kept on changing during the procedure • Enema before the procedure • Limit the intake of fluids 24-72 hours before the procedure • Patient is advised to maintain clear liquid diet at noon, the day before the procedure • NPO after mid night

Scanned with CamScanner

Disorders of Gastrointestinal System

Disorders of Lips Mouth and Gums

The disorders of lips, mouth and gums have been discussed here as follows:

Table 17

Name of the condition	Description	Intervention
Chancre	• Reddened circumscribed lesions that ulcerates and become crusted • It is the primary lesion of syphilis and is contagious.	• Cold soak to lips and mouth care • Antibiotic
Leukoplakia	• White patches in the buccal mucosa which is usually painless	• Instruct patient to consult doctor if it is persisting for more than 2 weeks
Hairy leukoplakia	• White patches with hair like projections most commonly occur along the lateral boarders of tongue. • Often seen among HIV patients and patient with tobacco use.	Valaciclovir Gentian violet
Oral Lichen planus 	• White papules which are painful and usually ulcerated. It may develop as malignancy.	• Corticosteroid administration • Avoidance of irritating substance
Candidiasis 	• Cheesy white plaque that looks like milk curd. If rubbed, it will bleed. • Causative organism is *Candida albicans* (fungus)	• Antifungal medications
Kaposi sarcoma	• Appears first in the oral mucosa as red, purple or blue lesions • Seen in patient with HIV infection	Radiation therapy Chemotherapy Surgical excision
Gingivitis	• Inflammation of gums	• Follow good oral hygiene

Scanned with CamScanner

Name of the condition	Description	Intervention
Dental plaque 	• Gel like substance adhere to the teeth	• Effective mouth care
Periapical abscess 	• Abscessed tooth with collection of pus in the apical dental periosteum	• Aspiration of pus by dental surgeon
Parotiditis	• Inflammation of parotid salivary gland • Most common organism is *Staphylococcus aureus* (except mumps).	• Good oral hygiene • Discontinue the medications which diminishes salivation • Antibiotics and analgesics are also necessary • Parotidectomy is the surgery of choice
Sialadenitis	• Inflammation of salivary gland	• Good oral hygiene • Discontinue the medications which diminishes salivation • Antibiotics and analgesics • Surgical drainage and excision of the gland and its duct
Sialolithiasis	• Salivary calculi • Most commonly affecting submandibular gland. • Calculi are formed mainly from calcium and phosphate.	• Lithotripsy is the procedure of choice
Xerostomia	• Dry mouth	• Avoid irritating food and fluids • Increases the fluid intake
Stomatitis	• Inflammation of oral/buccal mucosa	• Periodic mouth care

Disorders of Esophagus

Table 18

Condition	Description	Intervention
Dysphagia	Difficulty in swallowing	
Odynophagia	Painful swallowing	
Dyspepsia	Indigestion Involves discomfort or pain in the upper abdomen	**Functional dyspepsia:** treat *H. pylori* with antibiotics
Achalasia	Ineffective peristalsis in the distal esophagus and failure of esophageal sphincter to relax	Calcium channel blockers Small frequent feeding and soft diet

Scanned with CamScanner

Hiatal Hernia

Esophagus enters into the stomach through an opening in the diaphragm known as hiatus

Figures 26 A and B ■ (A) Normal stomach; (B) Hiatal hernia

In hiatal hernia this opening becomes large and upper portion of the stomach moves into lower thorax

Two types are there:

- **Type 1 or sliding:** Upper portion of the stomach and gastro-esophageal junction are displaced and move in and out of the thorax.
- **Type 2 or paraesophageal:** All parts of the stomach move beside the esophagus.

Clinical manifestations

- Herat burn, regurgitation, dysphagia
- Reflux is more commonly seen in sliding type while sense of fullness is seen in paraesophageal type.

Assessment and diagnostic findings

- X-ray, barium study and fluoroscopy

Management

- **Sliding hernia:** Elevation of head end of the bed during and after feeding is needed.
- Surgery is needed for permanent correction of sliding hernia.
- **Paraesophagal hernia:** Emergency surgery is needed to correct torsion.

Esophageal Diverticulum

Figure 27 ■ Esophageal diverticulum

Scanned with CamScanner

- Outpouching of mucosal and submucosal layer through the weak muscularis portion
- **Zenker's diverticulum** or paraesophagal diverticulum: Most commonly seen in the upper portion of the esophagus.
- **Epiphrenic diverticulum:** Largest diverticulum which is seen in the lower portion of the esophagus just above the diaphragm

Clinical manifestation

- **In Paraesophagal diverticulum** difficulty in swallowing, fullness in the neck, regurgitation of undigested food.
- Halitosis (bad breath) and sore taste in the mouth are common because of the decomposition of the food retained in the diverticulum.

Assessment and diagnosis

- Barium study
- **Esophageal manometry:** To rule out motion disorders
- **Esophagoscopy is contraindicated** because of the risk of perforation.

Management

- Diverticulectomy is the surgery of choice

Key Points

Patient is advised to avoid gas forming food or food containing seeds, nuts or roughage because these food items may be trapped in diverticulum and cause diverticulitis.

Gastroesophageal Reflux Disease (GERD)

- Back flow of gastric or duodenal content into the esophagus

Causes

- Incompetent lower esophageal sphincter (cardiac sphincter), pyloric stenosis or due to a motility disorder.

Clinical manifestation

- Heartburn (pyrosis), dyspepsia, dysphagia, odynophagia, esophagitis

Assessment and diagnostic findings

- **Endoscopy and Barium swallow** to evaluate the damage to mucosa
- Scintigraphy (to assess gastric emptying)
- Ambulatory esophageal pH monitoring: To evaluate degree of acid reflux

Management

- **Dietary modification:** Encourage low fat diet; avoid caffeine, tobacco, beer, carbonated beverages and milk
- Avoid eating and drinking 2 hours before the bed time
- Maintain normal body weight
- Avoid tight fitting clothes
- Elevate head end of the bed and elevate upper part of the body over a pillow
- **Pharmacological Management:**
  - H_2 histamine receptor antagonists (decrease acidity) - Reduce gastric acidity: Ranitidine.
  - Proton pump inhibitors (decrease acidity and increase lower esophageal sphincter tone): Pantoprazole and Omeprazole.
  - **Gastric emptying:** Prokinetic agents: Reglan.
- **Surgery: Neissan fundoplication:** Wrapping of the gastric fundus around the sphincter area of the esophagus

Benign and Malignant Tumor of Esophagus

- Leiomyoma is the most common type of benign esophageal tumor
- Adenocarcinoma is the most common type of malignant tumor of esophagus
- **Dysphagia is the initial symptom** of esophageal cancer
- Characteristic X-ray in cancer of esophagus is bird beak appearance or rat tail appearance

Figure 28 ■ Tumor of esophagus

Gastritis

- Inflammation of gastric mucosa.
- Causes: use of aspirin, NSAIDs, excessive alcohol intake, radiation therapy, bile reflux and microorganism such as H. pylori.
- Gastric mucosa become edematous, hyperemic and undergo erosion.

Peptic Ulcer Disease

- It is the erosion of the mucosal wall of stomach, duodenum or in esophagus.
- Based upon the location, it is also called as esophageal ulcer, gastric ulcer or duodenal ulcer.
- **Peptic ulcer is more commonly seen in duodenum.**
- **Causes: Helicobactor pylori (*H. pylori*); NSAID**
- Increased secretion of HCl is seen in this condition. **HCl secretion is increased** with the use of milk, caffeinated beverages, smoking and alcohol use.
- **Management**
  - **Histamine blocker** such as ranitidine or cimetidine is used to decrease gastric acid production.
  - **Proton pump inhibitor** such as omeprazole, lansoprazole, pantoprazole is used to suppress acid production.
  - Sucralfate (cytoprotective drug)
  - Avoid smoking, alcohol use and caffeinated beverages and coffee
- Surgical management of choice for peptic ulcer disease are as follows:
  - **Total gastrectomy:** removal of entire stomach and some portion of esophagus attached to it and anastomosis of esophagus to jejunum or duodenum. So it is also called as **esophagojejunostomy or esophagoduodenostomy**
  - **Vagotomy:** Removal of the vagus nerve supply to stomach and there by decreases the stimuli for gastric acid secretion
  - **Gastric resection:** Removal of the lower portion of the stomach usually along with vagotomy. It is also called as **antrectomy.**
  - **Billroth I:** Partial gastrectomy and anastomosis of remaining stomach to duodenum. It is also called as **gastroduodenostomy.**
  - **Billroth II:** Reconstruction after a partial gastrectomy, the duodenal stump is closed and a **gastrojejunostomy** is created.
  - **Pyloroplasty:** Enlargement of pylorus to prevent or decrease pyloric obstruction and thereby enhancing gastric emptying.

Scanned with CamScanner

Figures 29 A, B and C ■ (A) Resection of distal portion of stomach, (B) Billroth I, (C) Billroth II

Table 19 Comparison between gastric and duodenal ulcers

Characteristic	Gastric ulcer	Duodenal ulcer
Incidence		
Age	50 or more	30-60 years
Male: female	1:1	2-3:1
Clinical manifestations	• Normal or hypo-secretion of HCl • Weight loss • Pain occurs 30–60 min after a meal. • **Pain relieved by vomiting** • **Ingestion of food may increases the pain** • Vomiting and hematemesis are seen	• Hyper secretion of HCl • May have weight gain • Pain occur 2-3 hours of eating • Wakes up in the night due to pain • **Ingestion of food may decreases pain** • Vomiting is uncommon • Malena is common • Chances of perforation are more • Rare possibility for malignancy

Key Points

- *H. pylori* is the only bacteria classified as Class I carcinogen by WHO.

Gastrointestinal Bleeding

- Bleeding from the any part of the GI system is known as GI bleed.
- **Causes:** Peptic ulcer disease, esophageal varices, diverticular disease, ulcerative colitis and tumors.
- **Signs and symptoms**
  - Coffee-ground vomitus
  - Bloody, maroon-colored, or black and tarry stools
  - Anemia in case of chronic GI bleeding.
- **Treatment**
  - Treatment depends on location
  - Gastric lavage
  - A **Sengstaken-Blakemore** tube to control bleeding from esophagal varices
  - Cauterization or endoscopic injection sclerotherapy.

Dumping Syndrome

- Also called rapid gastric emptying.
- Occurs when food moves from stomach to intestine too quickly.
- It is one of the major complications of patients who underwent partial or complete resection of stomach.
- The symptoms occur because of the rapid distention of jejunal loop anastomosed to stomach.
- Hypertonic content in the intestine draw fluids from extracellular circulating volume to dilute the contents in it.
- **Manifestations:** Sensation of fullness, weakness, faint, dizziness, palpitation, diaphoresis, cramping pain, diarrhea and borborygmi (loud gurgles indicating hyperperistalsis)

Patient education to prevent dumping syndrome

- **Avoid sugar, salt and milk**
- **Eat high protein, high fat low carbohydrate food items**
- **Eat small meals and avoid consuming fluids along with meal.**
- **Lie down after eating**

Appendicitis

- Appendix is a small finger like projection attached to cecum below ileo-cecal valve. Inflammation of this projection is known as appendicitis.
- Fecalith is the most common cause of appendicitis.
- Most commonly occur in adolescents

Clinical Manifestation

- Low grade fever, nausea and vomiting
- **Rebounding tenderness on palpation at Mc Burney's point** (it is a point 2/3rd of the way umbilicus to Anterior Superior Iliac Spine)
- **Rovsing sign:** Palpation of left lower quadrant paradoxically elicit pain in the right lower quadrant.

Figure 30 ■ McBurney's point

Assessment and diagnosis

- **Blood test:** Elevation of WBCs
- Abdominal X-ray, USG, CT

Complication

- Perforation of appendix which leads to peritonitis

Management

- Appendectomy

Scanned with CamScanner

Key Points

- **Enema, laxatives and hot applications are contraindicated in** case of appendicitis. It may lead to rupture of appendix and peritonitis.
- Fowler's position to minimize pain.
- **After surgery,** place the client in a **semi fowler's position.** This will help to reduce tension in suture and abdominal organ.

Peritonitis

- **Inflammation of peritoneum,** the serous membrane covering the abdominal cavity.
- Content of abdominal organ leaks into the abdominal cavity as a result of trauma, perforation, infection, or inflammation
- Immediate response of intestinal tract in peritonitis is **hyper motility** followed by **paralytic ileus.**
- **Manifestations:**
  - Diffused pain in the abdomen which becomes constant and localized.
  - Movement may aggravate the pain.
  - Rebound tenderness and paralytic ileus may be present.
  - Elevated leukocyte count and electrolyte abnormalities.
- **Diagnosis**
  - X-ray shows air and fluid levels and distended bowel loops.
  - Culture and sensitivity of peritoneal fluid to identify the cause.
- **Management**
  - Fluid, colloid and electrolyte replacement is the major focus of management.
  - **Lung expansion is compromised** due to the compression of intra-abdominal fluid over the lung. So oxygen therapy or intubation is often necessary for airway management.
  - Massive **antibiotic therapy.**
  - **Surgical management** is needed if peritonitis occurred as a result of appendicitis, perforation etc.
  - **Peritonitis patients placed on side with knee flexed. This position will reduce the tension on the abdominal organs.**

Inflammatory Bowel Disease (IBD)

IBD mainly refers two disease conditions:

1. Regional enteritis (Crohn's disease or granulomatous colitis)
2. Ulcerative colitis.

These two diseases have been summarized as follows:

Table 2: Comparison of regional enteritis and ulcerative colitis

Regional enteritis (Crohn's disease or granulomatous colitis)	Ulcerative colitis
Commonly occur among adolescents and young adults. But can occur at any age.	Peak incidence age is 30-50 years.
It can occur anywhere along the GI tract, but **most commonly affecting ileum and colon.**	Disease process **starts at rectum and affects continuous the entire colon.**
Lesions or ulcers occurring in Crohn's disease are not in continues (Separated by normal tissue). It's also known as cobblestone appearnce	Lesions or ulcers are continues and occur one after another
Rectal involvement, bleeding and diarrhea are less	Rectal involvement, bleeding and diarrhea are common.
Patient with Crohn's disease are at increased risk for colon cancer.	**Risk for colon cancer is as** less compared to Crohn's disease.

Contd...

Key Points

In patients with ulcerative colitis, use of cathartics are contraindicated because it may lead to megacolon, perforation and death.

Management of IBD

- ***Nutritional therapy: Low residue, high protein, high calorie diet with supplementary vitamin and iron therapy.*** Food items contributing to diarrhea are often avoided.
- ***Pharmacological therapy: Sedatives, anti-diarrheal and anti-peristaltic to give rest to the inflamed bowel.***
- Aminosalicylate and sulfasalazine to manage inflammation
- Corticosteroid preparations are used to manage inflammation

Surgical management

- **Strictureplasty:** Blocked narrowed section of the bowel is widened, leaving intact.
- **Total colectomy with ileostomy:** Colon is completely removed and an opening is created in the ileum as a stoma on the abdominal wall.
- **Total colectomy with continent ileostomy:** Colon is completely removed and ileal reservoir (kock pouch) is created. Need for external reservoir is eliminated. 30 cm of the ileum is created as pouch with nipple valve. A catheter is inserted via nipple valve to empty the pouch.
- **Total colectomy with ileoanal anastomosis:** Colon is completely removed and ileum is connected to anus. No external stoma. Voluntary defecation is preserved through intact anus.

Note

After colostomy or creation of stoma, purple black color of the stoma indicate compromised blood supply and it needs immediate attention.

Key Points

Colostomy Care

- Output from the colostomy is known as **effluent.**
- Skin barrier and colostomy pouch should be of right size to fit the stoma well.
- Small opening may obstruct and make the stoma swell, and large opening may cause leakage of effluent.
- Try to perform colostomy irrigation at that time when the patient usually had bowel movement before colostomy surgery
- Colostomy irrigation works well if performed after a hot drink.
- Colostomy irrigation is preferably performed at the same time on every day.
- Avoid food items producing gas such as eggs, broccoli, cabbage, onions, fish, beans, milk, cheese, carbonated drinks, and alcohol.
- Food items causing odor to be avoided. e.g. eggs, cabbage, cheese, cucumber, onion, garlic, fish, dairy foods, and coffee.

Scanned with CamScanner

Intestinal Obstruction

It's the blockage or obstruction in the intestinal tract which prevents the normal flow of content via intestine.

Two types of obstruction can be there as follows:

- **Mechanical obstruction:** Intraluminal obstruction due to pressure on the intestinal wall, e.g. tumor, adhesions, stricture, stenosis, intussusception etc.
- **Functional obstruction:** Intestinal musculature cannot propel the content through the bowel.

Table 21 Mechanical causes of intestinal obstruction

Type	Description
Adhesions	Loops of intestine adhere to a slowly healing area or scar after the abdominal surgery
Intussusceptions	Telescopic movement of one part of intestine to another part of intestine which is located below
Volvulus	Bowel twist and turn around itself
Hernia	Protrusion of intestine through a weakened area of abdominal wall

Figures 31 A to D (A) Anatomy of hernia; (B) Compression of bowel by other organ; (C) Volvulus; (D) Intussusception

Hernia

Protrusion of an organ through weakened wall containing it.

Table 22 Types of hernia

Type	Description
Reducible	Content in the hernia sac can be pushed back
Irreducible	Content in the hernia sac can't be pushed back
Incarcerated	Adhesion between hernia sac and its content. Reduction is difficult. There is no obstruction of blood supply.
Obstructed	Herniation leads to obstruction of the bowel. Blood supply remains intact.
Strangulated	Blood supply to the hernia sac is compromised. If surgical repair is not done, hernia sac will become gangrenous.
Inguinal hernia	Content in the abdominal cavity protrude through the inguinal canal (abdominal wall).
Femoral hernia	Content protrudes through the weak portion in the inner thigh.
Umbilical hernia	Protrusion of content occurs at the umbilicus.

Contd...

Bariatric Surgery

It's a surgery performed to reduce gastric capacity and thereby it helps in weight loss among client with morbid obesity.

Two types of surgeries are there:

- **Gastric restrictive surgery:** Vertical banded gastroplasty or Circumgastric banding. This allows normal digestion without any risk for nutritional deficiency.
- **Gastric restriction combined with malabsorption:** Stomach is stapled to reduce the capacity. Duodenum and a portion of ileum are bypassed to reduce the calories absorbed.

Dietary education to client following bariatric surgery

- Avoid food high in protein, fat and sugar.
- Eat slowly and chew well
- Take nutritional supplements such as calcium, iron, multivitamin and Vitamin B12 as prescribed.

Scanned with CamScanner

Hemorrhoids

Hemorrhoids are swollen veins in the anal canal caused by chronic excess pressure from straining during a bowel movement, persistent diarrhea, or pregnancy.

Types

There are two types of hemorrhoids: Internal and external

- **Internal hemorrhoids:** Internal hemorrhoids are usually with painless. There may be bright red rectal bleeding during or following a bowel movement. The fresh blood typically covers the stool (a condition known as hematochezia), is on the toilet paper, or drips into the toilet bowl.
  - **Treatment**
    - Avoiding constipation, not straining during bowel movements, using elastic bands to pull the internal hemorrhoids back into the rectum.
    - Surgery is needed only for a small number of patients with very large, painful, and persistent hemorrhoids.
- **External hemorrhoids:** External hemorrhoids are veins that lie just under the skin, on the outside of the anus. When thrombosed, hemorrhoids may be very painful.
  - Treatment
    - Removing the clot in vein under local anesthesia known as hemorrhoidectomy.
    - Assist the client to assume prone or side lying position following surgery to minimize the bleeding.

Key Points

After hemorrhoidectomy, Sitz baths should be done 3 times a day and after every bowel movement.

Hypertrophic Pyloric Stenosis

It is the gastric outlet (pyloric) obstruction that occurs as a result of hypertrophy and hyperplasia of the muscular layers of the pylorus.

Figures 32 A and B ■ (A) Normal anatomy; (B) Pyloric stenosis

- Major clinical manifestation
  - Non-bilious **projectile vomiting**
  - Dehydration and electrolyte imbalance
  - **Olive like mass on palpation** of right upper quadrant of the abdomen
  - **Left to right peristaltic movement** across the abdomen
- Investigations
  - Physical examination and radiological investigations (USG, X-ray)
  - X-ray film of patient with hyper-pyloric stenosis shows string sign in the X-ray.
- Management
  - **Pyloromyotomy known as Ramstedt's procedure:** Dividing the muscle of the pylorus to open up the gastric outlet.

Diverticular Disease

- Pouch like bulging in the GI tract is known as diverticular disease.
- Surgical resection of the affected part is the management.
- Colostomy is the temporary management of the condition.

Colorectal Cancer

- It is a type of adenocarcinoma.
- It affects more than twice as many people as rectal cancer.
- **Clinical manifestation** include bowel pattern changes and malena
- **Diagnosis:** Abdominal and rectal examination. Biopsy, barium enema or cytology smears.
- **Treatment**
  - Supportive therapy includes chemotherapy, radiation therapy, immunotherapy
  - Surgery is the primary treatment
  - Bowel resection with anastomosis and possible temporary or permanent colostomy or ileostomy.

HEPATIC BILIARY SYSTEM

Anatomic and Physiological Review of Hepatic Biliary System and Pancreas

Liver

- Liver is the largest gland in the body, located in the right upper quadrant. It weighs about 1500 gm and divided into 4 Lobes
- Lobes are further divided into lobules.
- Kupffer cells are the phagocytic cells present in the liver.
- Smallest bile duct called canaliculi are located between the lobules of liver.
- Canaliculi carry bile secreted by hepatocytes to larger bile duct, which eventually become hepatic duct.
- Hepatic duct from liver and cystic duct from gallbladder join to form common bile duct which empties bile into the duodenum of small intestine.

Figure 33 ■ Biliary tree

Functions of Liver

- **Glucose metabolism:** After digestion, glucose is converted to glycogen and whenever the body requires, glycogen is converted to glucose:
  - **Glycogenesis:** Glucose is converted and stored as glycogen
  - **Glycolysis:** Glycogen is converted back to glucose
  - **Gluconeogenesis:** Glucose is synthesized from non-carbohydrate substances such as protein and amino acids.
- **Ammonia conversion:** Protein and amino acid metabolism leads to ammonia generation. Liver converts this highly toxic ammonia to urea for excretion.

Scanned with CamScanner

- **Protein metabolism:** Liver synthesizes all plasma protein (except gamma globulin) such as albumin, alpha and beta globulins.
- **Fat metabolism:** When glucose is not available fatty acids are broken down for the production of energy.
- **Vitamin and iron storage:** Liver store large amount of vit A, D, E, K and vit. B12 and it also store iron and copper.
- **Drug metabolism:** Liver is a major site for drug metabolism
- **Bile formation:** Hepatocytes synthesizes bile and store in gallbladder. Bile salts are formed from cholesterol

Enterohepatic Bilirubin Circulation

- Bilirubin is released from the breakdown of RBCs in reticuloendothelial system
- Hepatocytes convert this bilirubin (unconjugated) to conjugated bilirubin by mixing it with glucuronic acid which is more soluble in aqueous solution.
- Later conjugated bilirubin in the hepatocytes will be secreted along with bile into the duodenum.
- In the small intestine bilirubin is converted as urobilinogen.
- A part of urobilinogen is excreted via feces, another part is reabsorbed in the small intestine. It reaches the liver via portal vein and the remaining part enters the systemic circulation and is excreted via kidneys in urine.

Figure 34 ■ Production and enterohepatic circulation of bilirubin

Gallbladder

- It is a pear shaped organ of 7.5-10 cm in size.
- Capacity of gallbladder is 30-50 ml.
- Gallbladder is connected to common bile duct by the cystic duct.
- Function of gallbladder are:
  - To store bile
  - Water content of the bile is absorbed by gallbladder wall during storage and the bile becomes 5-10 times concentrated.

Pancreas

- It has both endocrine as well as exocrine functions in the body.
- Secretion of pancreatic juice via pancreatic duct represents exocrine function
- Alpha cells of pancreas produce **glucagon** and beta cells of pancreatic islets produce **Insulin.**
- Pancreatic enzymes are given as follows:

Table 23 Pancreatic enzymes

Pancreatic enzyme	Substrate
Trypsin, Chymotrypsin Carboxy Peptidase	Protein
Pancreatic amylase	Carbohydrate
Pancreatic lipase, Cholesterol esterase, Phospholipase	Fats

Scanned with CamScanner

Diagnostic Tests

Table 24 Description of diagnostic tests

Name of the tests	Description	Points to keep in mind
Liver function test (LFT) (Please refer Synopsis of FON For normal ranges of LFT) (Page 372)	It is a blood serum test which assesses liver functions in terms of serum enzymatic activity	• Serum enzymes monitored are: ▪ Alkaline phosphate ▪ Lactic dehydrogenase ▪ Serum aminotransferase • Albumin • Globulin • Bilirubin • Ammonia
Liver biopsy	Removal of small amount of liver tissue, usually through needle aspiration	• Coagulation study has to be obtained before biopsy • Informed written consent • **Left lateral or supine position during the procedure** • Ask the patient to exhale and hold the breath then introduce the needle • Immediately after the procedure, place the client in right side and place pillow under right costal margin. This is to prevent bleeding. • Instruct the patient to avoid coughing and straining.

Disorders and Diseases of Hepatobiliary System

Jaundice

- When the bilirubin level in the blood is elevated, all the body tissues such as sclera and skin becomes yellowish or greenish yellow.
- This discoloration occurs when bilirubin is >2.5mg/dl.

Table 25 Comparison of hemolytic, hepatocellular and obstructive jaundice

Hemolytic jaundice (Prehepatic)	Hepatocellular jaundice	Obstructive jaundice (Post hepatic)
• Hemolysis (destruction of RBCs) results in increased bilirubin in the blood • Liver is unable to conjugate excessive bilirubin from hemolysis • **Elevated unconjugated bilirubin is seen in serum** • It is seen in patients with hemolytic transfusion reaction and other hemolytic disease • Normal prothrombin time	• Damaged hepatic cells can't clear the bilirubin in the blood. • **Both conjugated and unconjugated bilirubin elevated.** • Abnormal prothrombin time; not corrected with Vit K.	• Impaired excretion of bilirubin due to mechanical obstruction of biliary tract • Extrahepatic obstruction occurs as a result of occlusion of the bile duct by gall stone. • Intrahepatic obstruction resulting from stasis of bile within the canaliculi. • **Mainly (>50%) elevated levels of Conjugated bilirubin is seen in serum.** • Abnormal prothrombin time; corrected with Vit K.

Portal Hypertension

- Obstructed blood flow through the liver resulting in increased blood pressure is known as portal hypertension.
- Splenomegaly is a common manifestation in portal hypertension.
- Consequences of portal hypertension include ascites and varices.

Ascites

- Fluid accumulates in the abdominal cavity.
- Fluid moves from vascular system into peritoneal space due to
  - Sodium and water retention
  - Increased intravascular blood volume
  - Decreased albumin synthesis
- **Signs and symptoms**
  - Increased abdominal girth
  - Rapid weight gain
  - Short of breath
  - Striae (stretch marks) and distended veins
- **Management**
  - Sodium restriction
  - Diuretics
  - **Paracentesis:** Needle is inserted into peritoneal cavity to remove fluid from the abdominal cavity.
    - Patient is placed in supine position during procedure
    - Slightly rotated to the side of the procedure (to minimize the risk of perforation
    - Left lateral approach is preferred (cecum is relatively fixed on right)

Key Points

Rapid removal of fluids from the abdominal cavity during paracentesis leads to decreased abdominal pressure which can cause vasodilation and shock.

Scanned with CamScanner

Figure 35 ■ Paracentesis

Esophageal Varices

- Esophageal varices are dilated tortuous veins usually found in submucosal layer of lower esophagus.
- **Cause**
  - In case of portal obstruction, blood from intestinal tract and spleen seek a new pathway via esophageal plexus.
  - Esophageal plexus are not elastic so they become tortuous, fragile and bleed easily.
- **Clinical manifestations**
  - Hematemesis, melena and symptoms of shock are the common manifestations.
- **Management**
  - Vasopressin, somatostatin, octreotide are the drug of choice to decrease the bleeding.
  - **Balloon tamponade: It is done with sengstaken-blackmore tube.**
  - **Endoscopic sclerotherapy:** Sclerosing agent is injected into the bleeding varices to promote healing.
  - **Esophageal banding therapy/variceal band ligation:** Elastic rubber band is slipped over (through endoscope) the bleeding varices, which causes necrosis of the bleeding varices.
  - **Trans jugular intrahepatic portosystemic shunt (TIPS):** Intrahepatic shunt is created between portal circulation and hepatic vein.
  - **Surgical management:** Surgical ligation of bleeding varices and esophageal transection and devascularization.
  - **Surgical bypass procedures:** These procedures help to drain a portion of portal blood and there by help to reduce portal pressure.
  - Spleno-renal shunt, Mesocaval shunt and Portocaval shunt

Sengstaken-blakmore tube

- Sengstaken-blackmore tube has got 3 lumens (ports for gastric and esophageal balloon and gastric aspiration)
- Minnesota tube has 4 lumens and two balloon (has an esophageal aspiration port in addition to the gastric aspiration port).
- Purpose of lumens are gastric aspiration, esophageal aspiration, gastric balloon inflation, esophageal balloon inflation.
- Stomach balloon is inflated with 100-200 ml of air. X-ray confirms the position of gastric balloon. Then gastric balloon is pulled against cardiac part of stomach.
- Irrigation of the tube is done to detect bleeding. If return from irrigation is clear esophageal balloon will not be inflated.
- If bleeding is present, then esophageal balloon will be inflated.

Figure 36 ■ Sengstaken-blakmore tube

- Pressure in the esophageal balloon is – 25 mmhg
- Pressure in gastric balloon is – 40 mm Hg.
- Once the bleeding varices stop, first esophageal balloon will be deflated. After several hours without bleeding, gastric balloon will be deflated.
- If several bleeding free hours are there then the tube will be removed.

Liver Abscess

- **Pyogenic and amebic abscesses are the most common type of abscess**
- Amebic abscess is caused by ***entamoeba histolytica***
- **Clinical manifestations:** Fever, right upper quadrant pain, anorexia, nausea, vomiting, hepatomegaly, jaundice
- **Diagnosis:** CT, MRI, aspiration and analysis of liver abscess under CT and MRI guidance.
- **Management:** Antibiotics, drainage of cyst.

Hepatic Encephalopathy and Coma

- Failed liver cells are unable to convert ammonia to urea, as a result ammonia accumulates in the blood stream.
- Hepatic encephalopathy occurs due to accumulation of ammonia (toxic to brain cells) and other metabolites in the blood.
- Hepatic coma is the most advanced stage of hepatic encephalopathy.
- **Earliest symptoms of hepatic encephalopathy**
  - Minor mental changes and motor disturbances
- **Asterixis** flapping tremors of the hands occur in this condition and simple tasks like writing becomes difficult.
- **Inability to reproduce a simple image is known as constructional apraxia.**
- In the initial stage of hepatic encephalopathy, deep tendon reflexes are hyperactive and with the worsening of disease these reflexes disappear and extremity becomes flaccid.
- **Foetor hepaticus:** A sweet, slightly fecal odor of the breath can be there which is intestinal in origin.

Scanned with CamScanner

- **Management**
  - Lactulose is administered to reduce serum ammonia level. It helps in excretion of ammonia through bowel.
  - Eliminate protein from diet to reduce serum ammonia.
  - Administration of neomycin sulfate reduces the number of intestinal bacteria which are capable of converting urea to ammonia.

Viral Hepatitis

The viruses which are responsible for viral hepatitis and their modes of remission have been tabulated as:

Table 26 Types of virus hepatitis

Types of virus	Type of virus	Incubation period	Mode of transmission
Hepatitis A (Infectious hepatitis)	RNA Virus	15–45 days	Fecal-oral route
Hepatitis B (Serum hepatitis)	DNA Virus	28–180 days	Parenteral, serum, saliva, semen and vaginal secretion
Hepatitis C	RNA Virus	15–160 days	Parenteral Commonly associated with Blood Transfusion.
Hepatitis D	RNA Virus	28–180 days	Parenteral. It requires Hep B surface antigen for its replication. So it is seen in only those who are affected with Hep B
Hepatitis E	RNA virus	14–63 days	Fecal-oral route

- **Investigations**
  - Hepatitis A: Antibody, IgM
  - Hepatitis B: IgM and HBSAg
  - Hepatitis C: Antibody
- **Management**
  - Supplementation of vitamins
  - Fat digestion will be affected so need to have diet control
  - Antiviral drugs are used in treatment of this condition.

Hepatic Cirrhosis (cirrhosis of liver)

- Replacement of normal liver tissue with fibrotic tissue that disrupts normal structure and function of liver. It can be classified as:
  - **Alcoholic cirrhosis (micronodular):** Chronic consumption of alcohol leads to cirrhosis and is the **most common type of cirrhosis**
  - **Post-necrotic cirrhosis (macronodular):** Cirrhosis occur as a result of any infection or inflammation to liver such as hepatitis
  - **Biliary necrosis:** Scarring occurs around the bile duct. As a result of chronic biliary obstruction and infection
  - **Cardiac:** Caused by right-sided heart failure
- **Incidence**
  - It is twice as common in men as compared to women, peak incidence at 40 – 60 years of age.
- **Signs and symptoms**
  - Anorexia, nausea, vomiting, weight loss, constipation or diarrhea
  - Jaundice and hepatic encephalopathy may occur
  - **Complications:** Ascites, esophageal varices, portal hypertension and peripheral edema may occur
  - Decreased synthesis of bile affects the absorption of fat soluble vitamins.
  - **Coagulation abnormalities** due to deficiency of vitamin K and clotting factors II, VII, IX and X.
- **Treatment**
  - Paracentesis to remove ascetic fluid (if present); Peritoneovenous shunt may be used
  - Potassium-sparing diuretic to treat ascites and peripheral edema
  - Vitamin K—to reduce bleeding tendency
  - Lactulose—to treat hepatic encephalopathy
  - Vasopressin—to treat bleeding esophageal varices
  - Blood transfusions may be required if excessive bleeding exists.

Cholecystitis

- Inflammation of gallbladder
- **Most common cause** is stone in the biliary tract.
- **Clinical Manifestations**
  - Right upper quadrant pain mainly after the ingestion of fatty food
  - Acute pain, tenderness and rigidity over Right Upper Quadrant associated with mid-sternal and right shoulder pain.
  - **Positive Murphy's sign:** Patient can't take deep breath when examiner's hand passed below the hepatic margin because of the pain (painful inspiration).
- Chronic cholecystitis occurs because of the inefficient emptying of gallbladder and gallbladder muscle wall disease
- Acalculous cholecystitis occur in the absence of gall stone disease and is caused by bacterial invasion via lymphatic and vascular system.
- Dark orange and foamy urine
- Steatorrhea, clay colored stool and pruritus.
- **Management**
  - Anticholinergic to decrease the spasm of the bile duct
  - Analgesics for pain control
  - Gallbladder and gallstones are surgically removed if pain persists.
  - Cholecystectomy is the surgical procedure performed to remove gallbladder.
  - **Choledocholithotomy:** Requires incision in the common bile duct to remove stone.

Cholelithiasis

- Calculi or stones are formed in the gallbladder from the solid constituents of the bile.
- **There are two types of stones:**
  - **Pigment stone:** Unconjugated pigment in the bile precipitate to form stone. It can't be dissolved. Surgical removal is the treatment of choice.
  - **Cholesterol stone:** Cholesterol is a natural component of bile. Its solubility depends upon bile acid and lecithin. Cholesterol precipitates to form stones when bile acid synthesis is less than cholesterol synthesis.

Scanned with CamScanner

- **Signs and symptoms**
  - Pain in the right upper quadrant, radiating to back and right shoulder (biliary colic).
  - Obstructive jaundice
  - Color of the urine becomes dark and **stool becomes clay colored.**
  - Bleeding manifestations
- **Investigations**
  - Abdominal X-ray: USG, cholescintigraphy, cholecystography, ERCP and percutaneous transhepatic cholangiography
- **Management**
  - **Ursodeoxycholic acid (UDCA)** and **chenodeoxycholic acid** (CDCA) to dissolve cholesterol stones.
  - **Dissolving gall stones:** Solvent such as **mono-octanoin or methyl tertiary butyl ether** is infused into gallbladder through a catheter.
  - **Stone removal by instrumentation:** A catheter and an instrument with basket threaded through t tube, or through a fistula is created and stones are removed.
  - **Extracorporeal shock wave lithotripsy:** Non-invasive procedure
  - **Intracorporeal shock wave lithotripsy:** Under fluoroscopy, laser pulse is directed towards gall blabber and stones are fragmented.
  - **Laparoscopic cholecystectomy:** Removal of gallbladder through a small incision in the umbilicus
  - **Cholecystectomy:** Gallbladder is removed via an abdominal incision
  - **Choledochostomy:** Incision in the common bile duct to remove stone

Key Points

- Low fat diet is recommended for the patients of cholelithiasis.

Pancreatitis

- Inflammation of pancreas. It is often described as auto digestion of pancreas.
- **Causes**
  - **More common:** Obstruction of biliary tract, long-term alcohol use.
  - **Less common:** Viral or bacterial infections.
- **Types**
  - **Acute pancreatitis**
    - It occurs suddenly as one attack or recurrent with resolutions.
    - Sudden onset of abdominal pain or left upper quadrant pain radiating to the back.
    - **Pain is aggravated by alcohol or a fatty meal**
    - Abdominal tenderness, guarding, decreased bowel sounds, elevated WBCs, glucose, bilirubin, alkaline phosphatase, and urinary amylase.
    - Elevated **serum amylase and lipase level** are seen.
  - **Chronic pancreatitis**
    - Its continuous inflammation and destruction of pancreas with scar tissue replacing the pancreatic tissue.
    - Abdominal pain and tenderness, steatorrhea, weight loss, sign and symptoms of diabetes mellitus.

- **Diagnosis**
  - Increased pancreatic hormones such as serum amylase, lipase, glucose and bilirubin.
  - Increase in the count of white blood cells because of infection
  - Cullen's sign and Grey Turner's sign are the characteristic of this condition

Cullen Sign and Turner's Sign

- **Cullen's sign** is superficial edema and bruising in the subcutaneous fatty tissue around the umbilicus. It is a sign of intraperitoneal hemorrhage. It is also a sign of rupture of fallopian tube or ectopic pregnancy.
- **Grey Turner's** sign refers to bruising of the flanks, the part of the body between the last rib and the top of the hip. It is a sign of retroperitoneal hemorrhage, or bleeding behind the peritoneum. **Gray turner's sign (flank ecchymosis)** may also be seen in rupture of aneurysm.

- **Signs and symptoms**
  - Severe epigastric pain that worsens after meals
  - Fever and malaise
  - Bulky, fatty and foul-smelling stool
  - Abdominal tenderness and distension.
- **Management**
  - Limit fat and protein intake, avoid alcohol, and heavy meals.
  - **Acute Pancreatitis: NPO; Total Parenteral Nutrition (TPN)**
  - Administer pancreatic enzyme as prescribed to aid in digestion
  - **Surgical Interventions:**
    - **Pancreaticojejunostomy:** Anastomosis of pancreatic duct to jejunum.
    - **Whipple resection** (Pancreaticoduodenectomy)
      - The head of the pancreas, the first part of the small intestine (duodenum), the gallbladder and the bile duct will be removed. The remaining organs are reattached to allow digestion of food normally after surgery.

Wilsons's Disease

- It is a disorder of copper metabolism
- Characterized by deposition of Copper in liver, brain and other tissues (known as Hepatolenticular degeneration)
- Copper gets deposited in basal ganglia leading to tremors, chorea, dystonia and rigidity
- ***Kayser – Fleischer ring*** *(brownish color ring on sclera-cornea junction of eye) and* ***sunflower cataract*** *are seen in this condition.*
- **Management:**
  - Lifelong zinc and penicillamine/trientine
  - Ammonium tetrathiomolybdate is a chelating drug used as initial treatment

Target High Extra Edge

- The average distance from the incisor teeth to the top of the stomach is 38 to 40 cm in men and 36 to 38 cm in women.
- The microorganism closely associated with dental cavities is Streptococcus sanguis.
- **Parotid** is the largest salivary gland.
- **Submaxillary gland** is the gland with longest duct.
- **Glossitis** is inflammation of the tongue.
- Inflammation of mouth is called **Stomatitis**.
- **Iron absorption** occurs in **duodenum**.
- **Leiomyoma** is the most common type of benign esophageal tumor.
- **Adenocarcinoma** is the most common type of malignant tumor of esophagus.
- Strongest layer of gut is **Submucosa**.
- **Caecum** is the thinnest muscular wall; most vulnerable for perforation; least vulnerable for obstruction.
- Caecum is the widest portion of the colon.
- Narrowest part of large intestine is Sigmoid colon.
- Ascending colon is the shortest part of colon.
- Area of colon least visualized by barium studies is Sigmoid colon.
- First organ to be affected in CA stomach is Liver.
- H. Pylori is a risk factor for intestinal type of CA stomach.
- Urea breath test in exhaled breath is used to detect the presence of **Helicobacter pylori**.
- **Murphy's sign** → acute cholecystitis (Pain in inspiration)
- **Cullen's sign** → hemorrhagic pancreatitis
- **Mirizzi's syndrome:** gallstone gets impacted in the cystic duct or neck of the gallbladder and causes compression of the Common Bile Duct.
- **Hematemesis** is blood in vomitus.
- **Icterus (jaundice)** is a sign that is present if a patient is experiencing hepatic coma.
- SGOT/SGPT (AST) ratio >3:1 is highly suggestive of alcoholic liver disease.
- AST> ALT is seen in Cirrhosis.
- **CAGE** questionnaire is used in the clinical diagnosis of alcohol dependence and abuse.
- **Normal portal vein pressure is:** 5 - 10 mm Hg or 10-15 cm of water.
- Ground glass hepatocytes are seen in Chronic viral hepatitis.
- Wilson's disease is a disorder of copper metabolism.
- Hemochromatosis refers to abnormal accumulation of iron in various organs.
- Waist to hip ratio <0.8 is normal, if greater, it indicates high risk or obesity.
- **Curling's ulcer** is a complication of **burn**. It is a type of gastroduodenal ulcer caused by a generalized stress response resulting in decreased production of mucus and increased gastric acid secretion.
- Hallmark finding in acute **pericarditis** is the **pericardial friction rub**.
- The causative agent for pericarditis is **coxsackievirus B group**.
- Catheter is placed in subclavian and jugular vein for providing parenteral nutrition.
- The complication of GERD is **Barrett's esophagus**. It is considered precancerous lesion for esophageal cancer.
- Distended abdomen and absence of bowel sound after abdominal surgery indicates **paralytic ileus**.
- **Nissen** and **Toupet fundoplications** are common surgical procedures for the treatment of GERD.
- **Halitosis** is foul smelling of breath.
- **McBurney's point** is located in right lower quadrant of abdomen. It is situated at one-third of the distance from the anterior superior iliac spine to the umbilicus (navel).
- The patient with appendicitis usually exhibits the **Rebound tenderness at the McBurney's Point**, it is also called as Blumberg's sign.
- Heartburn regurgitation and dysphagia are classical signs of GERD (gastroesophageal reflex disease).
- **Helicobacter pylori** is the causative agent for chronic gastritis.
- **Dumping syndrome** is the complication of **subtotal gastrectomy**.
- **Zollinger-Ellison syndrome** is rare condition characterized by severe peptic ulceration, gastric acid hyper secretion, elevated gastrin level and gastrinoma of pancreas.
- Antacid neutralizes the hydrochloric acid secreted in stomach.
- **Billroth I Surgery (Gastroduodenostomy)** involves partial gastrectomy with removal of the distal two-third of the stomach and anastomosis of the gastric stump to the duodenum.
- **Billroth II surgery (Gastrojejunostomy)** involves partial gastrectomy with removal of the distal two-third of the stomach and anastomosis of the gastric stump to the jejunum.

Contd...

Scanned with CamScanner

- Pernicious anemia is a long-term complication of total gastrectomy.
- **Rovsing's sign** is elicited by palpation of the left lower quadrant, causing pain to be felt in the right lower quadrant. Positive Rovsing's sign is associated with appendicitis.
- **Inflammatory bowel disease (IBD)** is an autoimmune disease includes Crohn's disease and ulcerative colitis.
- **Ulcerative colitis** is a disease of colon and rectum, it starts in the rectum and moves in a continual fashion toward the cecum.
- **Crohn's disease** involves all layer of the bowel wall and can occur anywhere in the GI tract from mouth to the anus.
- **Hematochezia is** passage of fresh blood through rectum.
- **Malena** is dark tarry stools containing occult blood. It is associated with upper GI bleeding.
- **Oral erythromycin and neomycin** are given in preoperative time of gastric surgery to reduce the number of bacteria and prevent post-operative complication.
- A barium enema is used to determine narrowing or obstruction of the colonic lumen.
- Clinical manifestation of fat malabsorption is **Steatorrhea**. It is a bulky, foul smelling, yellow, gray, greasy stools with putty like consistency.
- Celiac disease is treated with lifelong avoidance of dietary **gluten**.
- The hallmark of **Wilson** disease is corneal **Kayser–Fleischer rings**.
- **Grey Turner sign and Cullen's sign** are signs of pancreatitis.
- **Whipple procedure** (radical pancreaticoduodenectomy) is classic surgery for pancreatic cancer.
- **Rapid removal of fluids** from the abdominal cavity during **paracentesis** leads to decreased abdominal pressure which can cause **vasodilation and shock**.
- **Scissors is an emergency bedside article** needs to be kept in a client with **Sengstaken-Blakmore tube** because rupture of balloon or migration of balloon to the oropharynx can cause life-threatening airway obstruction and asphyxiation.
- In case of airway obstruction tube needs to be cut to relieve pressure in the oropharynx.
- **Gastric balloon is the first inflating balloon** in Sengstaken-Blakmore tube and esophageal balloon is the first deflating balloon.
- Patient receiving lactulose for the management of hepatic encephalopathy and coma should be closely monitored for watery stool which indicates medication overdose.
- Hepatitis B is caused by **DNA virus** and all other hepatitis is caused by RNA virus.
- **Pain in the right upper quadrant** of the abdomen which is radiating to back and right shoulder suggestive of **cholecystitis**.
- **Murphy's sign:** Patient can't take deep breath when examiner's hand passed below the hepatic margin because of the pain the patient felt in cholecystitis.
- **Morphine** causes spasm of **Sphincter of oddi** so it is **contraindicated** in client with **cholecystitis** and **pancreatitis**.
- Elevated serums amylase and lipase are suggestive of pancreatitis.
- **Cullen sign** is discoloration of abdomen and periumbilical area visible in pancreatitis.
- **Turner's sign** is bluish discoloration of the flank visible in pancreatitis.
- Majority of the **pancreatic cancer** arises at the head of the pancreas.
- **Clay-colored stools** indicate the sign of obstructive jaundice.
- **Adhesion** is the union of two opposing tissue surfaces.
- **Volvulus** refers to abnormal twisting of a part of the large or small intestine.
- **Intussusception** is a condition in which one segment of intestine slips into another portion located below it, just like telescope.
- Currant jelly-like stools are feature of **Intussusception** (intestine telescopes into itself).
- **Meckel's diverticulum** is an outpouching or bulge in the lower part of the small intestine. The bulge is congenital (present at birth) and is a leftover of the umbilical cord.
- **Hernia** is a condition in which part of an organ is displaced and protrudes through the wall of the cavity.
- Surgical repair of hernia is known as **herniorrhaphy**.
- **Hirschsprung's disease** is an **aganglionic disease**. It is a congenital defect of the intestinal tract which causes inadequate motility.
- **Phenylketonuria (PKU)** is an inborn error of metabolism that results in decreased metabolism of the amino acid phenylalanine.
- **Kupffer cells** are specialized macrophages located in the liver.
- **In the liver,** bacteria that found their way into portal circulation are destroyed by **Kupffer cells**.
- Low-residue, low-fiber diet is recommended for a patient with **ulcerative colitis**.

Most Common

- **Most common cause of Portal HTN in Adults:** Cirrhosis
- **Most common cause of Cirrhosis:** Alcoholic liver disease
- **Most common cause of diarrhea in children of age 6-24 months:** Rotavirus
- **Most common pathogenic parasitic infection in the human:** Giardia
- **Most common site for Amoebiasis:** Caecum
- **Most common site of intestinal TB:** Ileum
- **Most common symptom CA pancreas:** Painless jaundice
- **Most common site of CA Stomach:** Antrum
- **Most common site of Peptic ulcer:** First part of duodenum
- **Most common site of Typhoid ulcer:** Terminal ileum
- **Most common site of Amoebic colitis:** Sigmoid colon
- **Most common site of Colonic diverticula:** Sigmoid colon
- **Most common site of Ulcerative colitis:** Rectum
- **Most common site of Hirschsprung disorders:** Rectum

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

ANATOMY AND PHYSIOLOGY OF GI AND LIVER AND BILIARY SYSTEM

299. The process of taking food into the digestive system is: *(RRB SSNE 2015)*
   a. Ingestion b. Propulsion
   c. Digestion d. Elimination

300. Gallbladder is located: *(ESIC Chennai May 2012)*
   a. Upper right part of abdomen
   b. On right side of liver
   c. On the left side of liver d. Below the liver

301. The pancreas produces which two hormones: *(LNJP H D 2012)*
   a. Insulin and glucagon b. Epinephrine and insulin
   c. Melatonin and glucagon d. Glucagon and epinephrine

302. Go through the following statements regarding salivary glands and identify the correct statement
   a. Parotid glands are located on each side of the face just below the external acoustic meatus
   b. Parotid, sublingual and submandibular are the various type of salivary glands
   c. Parotid is the largest salivary gland
   d. All of the above

303. Mr Hari was complaining about the pain at his right hypochondriac region which refers to a region of the
   a. Head b. Thorax
   c. Abdomen d. Upper limb

304. Cardiac sphincter is situated at
   a. Heart b. Cardiam
   c. End of esophagus d. End of stomach

305. Which of these parts in the digestive system constitute the gastrointestinal or alimentary tract?
   a. Salivary glands b. Gallbladder
   c. Pancreas d. Anal canal

306. The serous membrane that lines the organs of the digestive system is called
   a. Parietal peritoneum b. Visceral peritoneum
   c. Abdominal peritoneum d. Pelvic peritoneum

307. Which one of the following structures holds the small intestine in its position?
   a. Mesentery b. Mesocolon
   c. Lesser omentum d. Greater omentum

308. The basic general layout of the gastrointestinal tract wall from inside to outside follows this sequence:
   a. Submucosa → mucosa → muscular → serosa
   b. Muscular → serosa → mucosa → submucosa
   c. Mucosa → submucosa → muscular → serosa
   d. Serosa → muscular → submucosa → mucosa

309. The group of nerves that is located in the submucosal layer to regulate the secretory activities of the intestine is called
   a. Meissner's plexus b. Auerbach's plexus
   c. Vagal nerve d. Sympathetic nerve

310. Stimulation of the parasympathetic nerve on the digestive system results in
   a. Decreased gastrointestinal motility
   b. Decreased dilatation of portal veins branches
   c. Increased gastrointestinal secretions
   d. Increased tone of anal sphincters

311. The presence of amylase in the saliva serves the purpose of
   a. Washing away food particles to cleanse the mouth
   b. Lubricating the food to minimize friction with oral mucosal
   c. Destroying harmful bacteria to prevent oral infection
   d. Catalyzing the chemical reaction for the digestion of starch

312. The structure that is located near the laryngopharynx to prevent a food bolus from entering the airway during deglutition is the
   a. Cricoid b. Epiglottis
   c. Palate d. Tongue

313. The chief cells of the gastric glands secrete
   a. Pepsinogen b. Trypsinogen
   c. Intrinsic factors d. Hydrochloric acid

314. The secretion and motility of the stomach can be stimulated by this hormone.
   a. Secretin b. Cholecystokinin
   c. Gastrin d. Gastric gelatinase

315. The surface area for absorption is enlarged by the following structures of the small intestine except
   a. Crypts of Lieberkuhn b. Plicae circularis
   c. Villus d. Microvillus

316. Which type of gastrointestinal motility thoroughly mixes the chyme in the small intestine?
   a. Propulsion b. Churning
   c. Segmentation d. Peristalsis

317. The part of the large intestine that is joined to the rectum is called
   a. Ascending colon b. Transverse colon
   c. Descending colon d. Sigmoid colon

318. Defecation reflexes are set by
   a. The gastro-ileal reflex
   b. The stretch receptors in the wall of the rectum
   c. The relaxation of the external anal sphincter.
   d. Release of gastrin

319. The flow of pancreatic juice into the duodenum is controlled by the
   a. Ampulla of Vater b. Duct of Wirsung
   c. Sphincter of Oddi d. Pyloric antrum

320. The synthesis of bile occurs in the
   a. Liver b. Gallbladder
   c. Pancreas d. Duodenum

Scanned with CamScanner

321. Bilirubin conjugation occurs in
a. Liver b. Duodenum
c. Spleen d. Pancreas

322. Nutmeg liver is seen in
a. Chronic venous congestion liver
b. Infarction of liver
c. Amyloidosis
d. Budd Chiari syndrome

323. One of the end products of carbohydrate digestion in the small intestine is
a. Sucrose b. Maltose
c. Lactose d. Fructose

324. Which of these substances hydrolyses the dietary proteins into amino adds?
a. Amylase b. Trypsin
c. Lipase d. Bile

325. Most of the absorption of fats occurs in the
a. Duodenum b. Jejunum
c. Ileum d. Caecum

326. In intestinal absorption, the chylomicron is transferred to the lymph capillaries of the villus by
a. Reverse osmosis b. Facilitated transport
c. Active transport d. Passive diffusion

327. The main source of body fuel is
a. Carbohydrates b. Amino acids
c. Proteins d. Fat

328. Encik Ali is at risk of diuretic-induced hypokalaemia. Which of the following food that has the highest content of potassium would you advise him to consume?
a. Chicken b. Potatoes
c. Banana d. Soya milk

329. The rate of a reaction catalysed by an enzyme will reach its optimum level in the human body when
a. Blood pH is between 10 and 12
b. There is an enzyme antagonist
c. The body temperature reaches 32°C
d. The enzyme activator acts on the enzyme precursor

330. The energy exchange molecule that stores and releases energy as required by the body is the
a. Nicotinamide-adenine dinucleotide
b. Flavin-adenine dinucleotide
c. Adenosine triphosphate
d. Adenosine diphosphate

331. The breakdown of glycogen storage for more glucose occurs in a biochemical process called.
a. Glycolysis b. Glycogenolysis
c. Gluconeogenesis d. Glycogenesis

332. Lactose intolerance is a condition that occurs because of the deficiency of enzyme known as .....
a. Lactase b. Maltase
c. Gluten d. Pepsin

Explanation: In lactose intolerance inability to tolerate the sugar found in dairy products as a result of an absence or deficiency of lactase.

333. One of the key molecules in the metabolism of carbohydrates, proteins and fats to produce energy output is
a. Pyruvic acid b. Citric acid
c. Keto acids d. Fatty acids

334. The catabolic reaction of proteins to produce energy is called
a. Transamination b. Deamination
c. Beta oxidation d. Oxidative phosphorylation

335. Order of using stored energy sources during starvation is
a. Carbohydrate, Amino acids, and Lipoproteins
b. Glycogen, fat and skeletal protein
c. Glycogen, Skeletal protein, and fat
d. Protein, fat, and glycogen

336. Capacity of stomach of newborn
a. 20 mL b. 30 mL
c. 50 mL d. 100 mL

337. Length of esophagus in adults is
a. 25 cm b. 10 cm
c. 15 cm d. 20 cm

338. Narrowest part of the esophagus is
a. Cricopharynx
b. Esophagogastric junction
c. At the level of arch of aorta
d. Level of tracheal bifurcation

339. Esophagus enters through
a. Central tendon of diaphragm
b. Along aortic opening
c. Muscular part of diaphragm
d. Right crus

340. Foot drop is caused by damage to
a. Interosseous nerve
b. Superficial peroneal nerve
c. Deep peroneal nerve
d. Deltoid ligament of the ankle joint

341. Pouch of Douglas is between
a. Rectum and Sacrum
b. Uterus and Urinary bladder
c. Bladder and pubis symphysis
d. Rectum and Uterus

342. Meckel's diverticulum arises from
a. The foregut b. Caecum
c. Colon d. Ileum

343. Short gastric arteries are branches of
a. Celiac artery b. Splenic artery
c. Left gastroepiploic artery d. Right gastroepiploic artery

344. Portal vein is formed by splenic vein and
a. Superior mesenteric vein
b. Portal vein
c. Inferior mesenteric vein
d. Hepatic vein

345. Sphincter of Oddi consists of
a. 2 sphincters b. 3 sphincters
c. 4 sphincters d. 5 sphincters

346. Commonest position of appendix
a. Pelvic b. Retrocecal
c. Subcecal d. Promontoric

347. Superior rectal vein drains into
a. Superior mesenteric vein
b. Inferior mesenteric vein
c. Inferior vena cava
d. Portal vein

348. Veins draining into portal vein are all except
a. Renal vein b. Splenic vein
c. Left gastric vein d. Superior mesenteric vein

349. The length of the large intestine is about
a. 1.5 meters b. 3 meters
c. 4.5 meters d. 6 meters

350. The liver is kept in position by
a. Hepatic veins b. Intra-abdominal pressure
c. Hepatic artery d. A and B

Scanned with CamScanner

1. The right suprarenal vein drains into
a. Left renal vein
b. Right renal vein
c. Inferior vena cava
d. Right phrenic vein

2. The portal vein is formed
a. By the superior mesenteric vein
b. By the splenic vein
c. At the level of 2nd lumbar vertebra
d. All of the above

3. Foramen of Morgagni refers to an opening in
a. The brain b. The lesser omentum
c. The skull d. The diaphragm

4. The narrowest part of the small intestine
a. 60 cm proximal to ileocecal valve
b. 60 inches proximal to ileocecal valve
c. 90 cm proximal to ileocecal valve
d. 90 inches proximal to ileocecal valve

5. The levator ani is composed of all EXCEPT
a. Pubococcygeus b. Puborectalis
c. Iliococcygeus d. Transverse peronei

6. Branch of internal iliac artery
a. Ovarian artery b. Testicular artery
c. Superior vesical artery d. None

7. Smallest abdominal muscle is
a. External oblique b. Internal oblique
c. Transversalis d. Rectus abdominis

8. Portal vein supplies
a. Spleen b. Liver
c. Pancreas d. Colon

9. Blood supply of Hindgut
a. Coeliac trunk b. Splenic artery
c. Superior mesenteric artery
d. Inferior mesenteric artery

10. Bile duct opens into
a. Second part of duodenum
b. Third part of duodenum
c. Pyloric end of stomach d. Ileocecal junction

11. Venous blood of liver is drained by
a. Portal vein b. Hepatic artery
c. Sinusoids d. Hepatic veins

12. Shortest part of colon
a. Ascending colon b. Transverse colon
c. Descending colon d. Sigmoid colon

13. Posterior gastric artery is a branch of:
a. Left gastric artery b. Right gastric artery
c. Splenic artery d. Hepatic artery

14. Blood supply to the proximal large intestine is supplied by?
(AIIMS Bhopal Grade-I 2018)
a. Inferior mesenteric b. Celiac trunk
c. Superior mesenteric d. Anterior mesenteric

Explanation: Unlike the other branches of abdominal aorta, there are three unpaired branched arteries that supply the intestine. Superior mesenteric artery supplies the whole small intestine and proximal large intestine. Whereas the branched celiac trunk supplies the spleen by splenic (lineal) artery, stomach by gastric artery (further branched as gastroduodenal arteries supplies blood to pylorus and duodenum of small intestine) and liver by common hepatic artery. Inferior mesenteric artery is responsible for supplying blood to the descending colon and sigmoid colon.

365. Which of the following is false about portal vein?
a. Formed behind the neck of pancreas
b. Bile duct lies anterior and right to it
c. Gastro duodenal artery lies to the left and anterior to it
d. Ascends behind the 2nd part of duodenum

366. Shortest part of the colon is
a. Ascending colon b. Transverse colon
c. Descending colon d. Sigmoid colon

367. Inferior mesenteric artery is a branch of
a. Internal iliac artery b. External iliac artery
c. Abdominal aorta d. Superior mesenteric artery

368. Gland of Brunner's is found in
a. Jejunum b. Duodenum
c. Ileum d. All

369. Peyer's patches are present in
a. Jejunum b. Ileum
c. Colon d. Duodenum

370. Iron is absorbed almost entirely in
a. Stomach b. Duodenum
c. Jejunum d. Ileum

371. Normal pH of gastric HCl is
a. 0.2 – 1.5 b. 1.5 – 3.5
c. 3.5 – 5.5 d. 5.5 – 6.5

372. All of the following stimulate secretion from parietal cells in stomach except
a. Acetylcholine b. Somatostatin
c. Gastrin d. Histamine

373. Vitamin K synthesis is done by
a. Liver b. Colonic bacteria
c. Skin d. Blood vessels

374. In Zollinger-Ellison Syndrome, the main manifestation is
a. Peptic ulceration b. Watery diarrhea
c. Hyperglycemia d. Hypocalcemic tetany

375. Iron absorption is increased by
a. Vitamin-C b. Phytic acid
c. Fiber diet d. Phosphates

376. Intrinsic factor is secreted by
a. Chief cells
b. Delta cells
c. Parietal cells
d. Enterochromaffin like cells

377. In the stomach, H+ are secreted in exchange for
a. Na+ b. K+
c. Ca+ d. Cl–

378. Dumping syndrome is characterized by which one of the following
a. Hypertension
b. Hypervolemia
c. Hyperglycemia
d. Generalized weakness dizziness and sweating after meals

379. Gastric motility is increased in
a. Acid in duodenum
b. Tryptophan in duodenum
c. Distension of stomach
d. Fatty food in stomach

380. Salivary amylase is activated by
a. Sodium Ion b. Chlorine Ion
c. Potassium Ion d. Bicarbonate Ion

381. Intestinal motility is increased by
a. Secretin b. Gastrin
c. Cholecystokinin d. None

380.	b
381.	c

Scanned with CamScanner

382. Intrinsic factor in stomach is secreted by
a. Parietal cells b. Chief cells
c. Zymogen cells d. Enterochromaffin cells

383. Vitamin deficiency seen in short bowel syndrome is?
a. Vitamin A b. Vitamin B 12
c. Vitamin D d. All of the above

384. Vitamin B12 is absorbed in
a. Duodenum b. Jejunum
c. Ileum d. Colon

385. Pepsinogen is secreted by
a. Parietal cells b. Mucus cells
c. Chief cells d. Oxyntic cells

386. A man cannot digest carbohydrate. The enzyme deficient is
a. Lipase b. Amylase
c. Pepsin d. Trypsin

387. Iron absorption takes place in which part of intestine
a. Duodenum b. Ileum
c. Jejunum d. Colon

388. Chyme is formed by
a. Esophagus b. Stomach
c. Duodenum d. Jejunum

389. Unconjugated hyperbilirubinemia is seen in
a. Neonatal hepatitis
b. Gilbert syndrome
c. Dubin-Johnson syndrome
d. Rotor syndrome

390. Stimulation for gastric emptying
a. Secretin b. CCK
c. Gastrin d. Distension

391. Diet devoid of carbohydrates causes
a. Ketosis
b. DM
c. No effect
d. Obesity

392. In the liver, bacteria that found their way into portal circulation is destroyed by_____ *(ESIC 2019)*
a. Cilia b. Hydrochloric acid
c. Leukocytosis d. Kupffer cells

Explanation: Kupffer cells are also known as stellate macrophages Kupffer–Browicz cells. They are specialized **macrophages located in the liver,** lining the walls of the sinusoids. It helps in clearance of blood bacteria which enters from guts into the portal circulation.

393. Mallory's degeneration seen in alcoholic liver disease is a form of: *(Safdarjung NO 2018)*
a. Hyaline degeneration b. Amyloid degeneration
c. Hydropic degeneration d. Fatty degeneration

Explanation: Mallory's degeneration seen in alcoholic liver disease is a form of Hyaline degeneration. Histologically, Mallory bodies are irregular, rope-like amorphous eosinophilic intracytoplasmic structures found in hepatocytes.

394. Function of Kupffer cells in liver is
a. Phagocytic b. Lytic
c. Secretory d. Excretory

395. Kupffer cells are a type of
a. Dendritic cells b. Macrophages
c. B cells d. T cells

396. Kupffer cells are seen in
a. Duodenum b. Gastric mucosa
c. Liver d. Spleen

397. Entero-hepatic circulation is necessary for the secretion of
a. Bile
b. Intestinal juice
c. Pancreatic juice
d. Gastric juice

398. Epinephrine action in liver
a. Glycogenolysis
b. Gluconeogenesis
c. Glycolysis d. Lipolysis

399. Which of the following taste buds is NOT correctly matched with the area of the tongue where it is most abundant?
a. Sweet-tip of the tongue
b. Bitter-back of the tongue
c. Salty-posterior side of the tongue
d. Sour-side of the tongue

400. Which of the following is NOT one of the four primary taste sensations?
a. Bitter b. Sour
c. Salty d. Spice

401. Which part of the tongue senses bitterness?
a. Anterior one third of the tongue
b. Lateral aspect of the tongue
c. Posterior one third of the tongue
d. All of the above

402. Safety muscle of tongue is
a. Styloglossus b. Genioglossus
c. Hyoglossus d. Palatoglossus

403. Taste buds of tongue are supplied by
a. Abducent nerve b. Glossopharyngeal nerve
c. Hypoglossal nerve d. Facial nerve

404. Taste sensation form tongue is carried out by all of the following cranial nerves EXCEPT
a. V b. VII
c. IX d. X

405. Where is cardiac sphincter located? *(Staff Nurse GII 2014)*
a. Lungs b. Liver
c. Stomach d. Heart

406. Which among the following is a part of small intestine?
a. Cardia b. Duodenum
c. Transverse colon d. Sigmoid colon

407. Gastric acid secretion phase include .....
a. Cephalic phase b. Gastric phase
c. Intestinal phase d. All of the above

408. Content in gastric secretion includes .....
a. HCl b. Pepsinogen
c. Mucus d. All of the above

409. Which artery supplies oxygenated blood to the stomach? *(RRB SSNE 2015)*
a. Carotid artery b. Gastric artery
c. Celiac artery d. Cephalic artery

ASSESSMENT AND INVESTIGATIONS

410. While palpating a male client's right upper quadrant (RUQ), the nurse can palpate
a. Spleen b. Liver
c. Kidney d. Appendix

411. Normal GI system findings in adults include .....
a. Non-palpable liver and spleen
b. Liver in the right upper quadrant
c. Tenderness over McBurney's point
d. Both A and B

Ans.

382.	a
383.	d
384.	c
385.	c
386.	b
387.	a
388.	b
389.	b
390.	c
391.	a
392.	d
393.	a
394.	a
395.	b
396.	c
397.	a
398.	a
399.	c
400.	d
401.	c
402.	b
403.	b
404.	a
405.	c
406.	b
407.	d
408.	d
409.	c
410.	b
411.	d

Scanned with CamScanner

412. Direct serum bilirubin range is .....
a. 0.1 to 0.4 mg/dl b. 0.2 to 0.8 mg/dl
c. 0.3 to 1.6 mg/dl d. 0.4 to 0.8 mg/dl

413. Indirect serum bilirubin level is
a. 0.1 to 0.6 mg/dl b. 0.2 to 0.8 mg/dl
c. 0.3 to 1.2 mg/dl d. 0.4 to 1.4 mg/dl

414. Which among the following is a basic diagnostic test to assess the liver function?
a. Serum bilirubin b. ALT enzyme
c. Serum proteins d. All of the above

415. Diagnostic test for pancreatitis is .....
a. Serum amylase b. Serum lipase
c. Ultrasound d. All of the above

416. Microscopic stool examination techniques involve .....
a. Saline mount causes b. Iodine mount
c. Concentration techniques
d. All of the above

417. Preprocedural investigation required for a client who is scheduled for ERCP is .....
a. Bilirubin level b. Hemoglobin level
c. Bile amount d. Lipase level

418. In a client with dark complexion icterus will be checking at .....
a. Nasal bridge b. Hard palate of the mouth
c. Nail beds d. Skin

419. Most accurate method for confirming the NG tube placement is .....
a. X-ray
b. Auscultation
c. Observing patient for coughing aspiration of content and pH monitoring
d. Dip in a bowel of water

420. Ioudogram is one of the diagnostic test in: *(JIPMER 2012)*
a. Pyloric stenosis b. Intussusception
c. Anorectal anomalies d. Diverticulum

421. Which of the following diagnostic tests would be used initially to assess a client with acute upper GI bleeding?
a. Upper GI series b. Barium X-ray
c. Endoscopy d. Arteriography

422. Which of the following diagnostic test is useful in diagnosis of diverticulosis?
a. Endoscopy b. Barium swallow
c. Barium enema d. USG abdomen

423. Preprocedural preparation for sigmoidoscopy is .....
a. NPO
b. Enema before the procedure
c. Insertion of NG tube
d. Ask about iodine allergy

Explanation: Enema before the procedure helps to clean the colon, NPO is required for upper GI procedure. In this there is no use of dye, so question related to iodine allergy is least important.

424. Sigmoidoscopy is done in which position: *(Safdarjung NO 2018)*
a. Lithotomy position
b. Jack knife position
c. Fowler's position
d. Knee chest position

Explanation: Sigmoidoscopy is done in knee chest or left sims position. These positions aids in easy movement of sigmoidoscope in the colon, and better visualization.

For a sigmoidoscopy, the nurse should place the patient in the knee-chest position or Sims' position, depending on the physician's preference

425. Double bubble sign in the X-ray is the characteristic of which disease condition?
a. Pyloric stenosis b. Duodenal atresia
c. Hirschsprung's disease d. Trachea esophageal fistula

Explanation: Radiography shows a distended stomach and distended duodenum, which are separated by the pyloric valve, a finding described as the double-bubble sign.

426. Priority nursing intervention in the immediate post-gastroscopy period will be:
a. Administer oxygen
b. Assess gag reflex prior to administration of fluids
c. Administer ordered fluid and drugs
d. Replace NG drainage every 2 hourly

Explanation: Gag reflex assessment before the administration of fluid is the priority nursing intervention. Usually these patients are conscious and not have any respiratory difficulty.

427. Best disinfectant for endoscope is: *(AIIMS Bhuvneshwar LP 2017)*
a. Hypochlorite b. Formaldehyde
c. Glutaraldehyde d. Chlorohexidine

Explanation: Glutaraldehyde is used to disinfect the endoscope.

428. Which of the following diagnostic test is NOT used to investigate dysphagia?
a. Laryngoscopy b. Manometry
c. Barium swallow d. Colonoscopy

Explanation: A colonoscopy is a visual examination of the entire large intestine (colon) using a lighted, flexible colonoscope. It is not used to investigate dysphagia which is associated with upper GI. Barium swallow, esophageal manometry and laryngoscopy are used to investigate dysphagia as these procedures helps in visualization of upper GI structures.

RISK FACTORS, COMMON SIGNS AND SYMPTOMS

429. Frequent vomiting put the patient at risk of
a. Metabolic acidosis with hyperkalemia
b. Metabolic acidosis with hypokalemia
c. Metabolic alkalosis with hyperkalemia
d. Metabolic alkalosis with hypokalemia

Explanation: Excessive vomiting results in expulsion of gastric acid and potassium form gastric content which leads to metabolic alkalosis and hypokalemia.

430. Inflammation of salivary gland is .....
a. Salpingitis b. Sialadenitis
c. Oophoritis d. Rhinitis

Ans.

412.	a
413.	b
414.	d
415.	d
416.	d
417.	a
418.	b
419.	a
420.	c
421.	c
422.	c
423.	b
424.	d
425.	b
426.	b
427.	c
428.	d
429.	d
430.	b

Scanned with CamScanner

431. Inflammation of oral cavity is .....
a. Stomatitis b. Gastritis
c. Glossitis d. Gingivitis

432. Inflammation of tongue is .....
a. Stomatitis b. Gastritis
c. Glossitis d. Gingivitis

433. Inflammation of gum is .....
a. Stomatitis b. Gastritis
c. Glossitis d. Gingivitis

434. Stone in the salivary gland is known as .....
a. Cholelithiasis b. Sialolithiasis
c. Nephrolithiasis d. Xanthelasma

435. Inflammation of stomach is .....
a. Stomatitis b. Gastritis
c. Glossitis d. Gingivitis

436. Hematemesis is .....
a. blood in vomitus b. Blood in sputum
c. Fresh blood in stool d. Occult blood in stool

437. Hemoptysis is .....
a. Blood in vomitus b. Blood in sputum
c. Fresh blood in stool d. Occult blood in stool

438. All of the following factors increases gastric motility, EXCEPT: *(DSSSB 2006)*
a. Abdominal distension b. Fear
c. Stress d. Vagotomy

Explanation: Fear, anger, stress and vagotomy increases peristalsis (gastric motility). Abdominal distension diminishes peristalsis.

439. Obesity is one of the risk factors for
a. Esophageal adenocarcinoma
b. Renal carcinoma
c. Endometrial carcinoma d. All of the above

440. Weight loss is seen in .....
a. Hyperthyroidism b. Anorexia nervosa
c. Pulmonary TB d. All of the above

441. Bluish discoloration or ecchymosis around the umbilicus is known as
a. Homan's sign b. Kernig's sign
c. Cullen's sign d. Osiander sign

442. True about Reye's syndrome is .....
a. Has occurred in children who were given aspirin when they had chickenpox or the flu
b. Fatty infiltration of liver and then degeneration
c. The syndrome often begins with vomiting then quickly followed by irritable and aggressive behavior
d. All of the above

443. Hematochezia is .....
a. Blood in vomitus b. Blood in sputum
c. Fresh blood in stool d. Occult blood in stool

444. Melena is .....
a. Blood in vomitus b. Blood in sputum
c. Fresh blood in stool d. Occult blood in stool

445. Melena suggests which of the following? *(AIIMS BPL SNO 2018)*
a. Head injury b. Injury to the upper bowel
c. Miscarriage d. Injury to the lower bowel

Explanation: Melena is the presence of digested blood pigments in feces, causing a dark, tarry appearance and a foul odor as a consequence of oxidized iron derived from hemoglobin which usually occurs as a result of upper gastrointestinal bleeding.

446. Dark red/black color stool can be seen after .....
a. Beet roots and Blueberriesb. Bleeding
c. Iron supplements d. All of the above

447. Particular smell of fecal matter is due to .....
a. Hydrogen sulfide b. Indole
c. Biliverdin d. Both A and B

448. Condition in which excess gas accumulates in the gastrointestinal tract and causes abdominal distension is known as .....
a. Flatulence b. Infestation
c. Meteorism d. Bloating

449. Tenesmus is .....
a. A rumbling or gurgling noise made by the movement of fluid and gas in the intestines
b. Difficulty in passing stool
c. Fat in stool
d. Ineffectual straining of stool

Explanation: Option D is the correct answer. Option A is the definition of Borborygmus, option B is the definition of constipation and option C is the definition of Steatorrhea

450. Which of the following characteristics indicates protein deficiency in a client?
a. Spoon-shaped nails b. Increased bleeding time
c. Negative nitrogen balance
d. Positive nitrogen balance

Explanation: Negative nitrogen balance indicates that there is more protein catabolism than anabolism. This indicates output exceeds intake (negative nitrogen balance).

UPPER GI DISORDERS

451. Urea breath test in exhaled breath is used to detect the presence of: *(AIIMS BBS NO 2018)*
a. Escherichia coli b. Streptococcus
c. Helicobacter pylori d. Staphylococcus

Explanation: Helicobacter pylori bacteria produces enzyme called Urease. In Urea breath test, a tablet containing urea is given to patient to swallow. If patient having infection of H pylori in stomach, it breaks urea into ammonia and carbon dioxide with presence of enzyme urease. Carbon dioxide is measured after swallowing the tablet. If patient is infected there will be rise in carbon dioxide level. If patient is not infected, urea will be excreted by kidneys.

452. Which medical diagnosis can the nurse expect when collecting a health history from a client who is scheduled for antrectomy? *(RAK MSc 2018)*
a. Cataract b. Gastric ulcers
c. Otosclerosis d. Trigeminal neuralgia

Explanation:
- The nurse expects a client to have Gastric ulcer when collecting a health history from a client who is scheduled for antrectomy. Stomach ulcers, also known as gastric ulcers, are common in lesser curvature near incisura and antrum of the stomach.
- An antrectomy is the resection, or surgical removal, of a part of the stomach known as the antrum.

453. A canker sore of the oral soft tissues is known as:
a. Aphthous stomatitis b. Angular stomatitis
c. Infectious stomatitis d. Oral thrush

Ans.

431.	a
432.	c
433.	d
434.	b
435.	b
436.	a
437.	b
438.	a
439.	d
440.	d
441.	c
442.	d
443.	c
444.	d
445.	b
446.	d
447.	d
448.	c
449.	d
450.	c
451.	c
452.	b
453.	a

Scanned with CamScanner

Explanation: Aphthous stomatitis is a common condition characterized by the repeated formation of benign and non-contagious mouth ulcers (aphthae or canker sore) in otherwise healthy individuals.

454. Carcinoma of acinic cell is associated with .....
a. Parathyroid gland b. Salivary gland
c. Lacrimal duct d. Sebaceous gland

455. Meaning of Barrett's esophagus is .....
a. Lower esophagus lined by columnar epithelium
b. Upper esophagus lined by columnar epithelium
c. Lower esophagus lined by cuboidal epithelium
d. Upper esophagus lined by cuboidal epithelium

456. Cause of esophageal varices is .....
a. Change in oncotic pressure
b. Damage to the vein valves
c. GERD
d. Portal hypertension

457. Identify correct about gastroesophageal reflux disease (GERD)
a. GERD often involves relaxation of the lower esophageal sphincter
b. Nissen's fundoplication is the surgical management for the condition
c. Lying in supine position is helpful
d. Both A and B

458. Health education to a client with GERD includes .....
a. Avoid lying down immediately after food
b. Avoiding heavy lifting
c. Have small frequent meal
d. All of the above

459. All are the nursing management for a person who is suffering from gastroesophageal reflex disease EXCEPT:
a. Provide supine position after feeding
b. Burp in between
c. Use thickened feed
d. Serve small frequent diet

Explanation: The cardiac sphincter and lower portion of the esophagus are weak, allowing regurgitation of gastric contents back into the esophagus. Except option A, all other managements indicated in a person who is suffering from GERD because all these measure reduces the chance of GERD. Neissan Fundoplication is the surgical management of choice for a child who is suffering from GERD.

460. Heartburn refers to an uneasy burning sensation in the: *(RRB Feb 2012)*
a. Jejunum b. Duodenum
c. Esophagus d. Stomach

461. Dysphagia for fluids but not for solids is seen in
a. Carcinoma oesophagus b. Achalasia
c. Reflux oesopagitis d. Stricture

462. Achalasia cardia results in absence of _____
a. Esophageal peristalsis b. Gastric acid
c. Cardiac sphincter of stomach
d. Pyloric sphincter

463. A patient who has Sengstaken-Blakemore tube inserted, suddenly experiences difficulty in breathing. Which of the following actions should the nurse take first? *(DSSSB 2013)*
a. Administer oxygen with oxygen mask
b. Cut and remove the tube
c. Elevate the head end of the bed
d. Listen to the client's lung sound

Explanation: A Sengstaken–Blakemore tube is a medical device inserted through the nose or mouth and used occasionally in the management of upper gastrointestinal hemorrhage due to esophageal varices. Difficulty in breathing is an indication of airway obstruction in the oropharynx caused by inflated balloon of the Sengstaken-Blakemore tube. The immediate action is to cut and remove the tube.

464. Causes of gastritis is .....
a. H. Pylori infection b. Over use of NSAIDs
c. Alcohol and smoking d. All of the above

465. Most common viral cause of gastritis
a. H. Pylori b. CMV
c. Hepatitis A d. Enterovirus

466. Identify the cause of gastritis among the following:
a. Over use of aspirin and NSAIDs
b. Excessive alcohol intake
c. Infection by H. pylori d. All of the above

467. Decrease in the production of HCl acid in the stomach is known as
a. Achlorhydria b. Hypochlorhydria
c. Hyperchlorhydria d. Anaplasia

468. Absence in the production of HCl acid in the stomach is known as
a. Achlorhydria b. Hypochlorhydria
c. Insomnia d. Anaplasia

Explanation: Achlorhydria is absence of HCl. Hypochlorhydria means decreased amount of acid secretion. Hyperchlorhydria is high level of acid.

469. Which of the following is a manifestation of pyloric stenosis? *(DSSSB 2013)*
a. Projectile vomiting b. Regurgitation
c. Steatorrhea d. Tenesmus

Explanation: Vomiting with the material ejected with great force; seen commonly in congenital pyloric obstruction.

470. The erosion of mucosal layer of stomach is termed: *(DSSSB PHN, 2015)*
a. Duodenal ulcer b. Gastric ulcer
c. Chron's disease d. Diverticulitis

471. Cause of dumping syndrome include .....
a. Gastrectomy b. Esophagectomy
c. Both A and B d. None of the above

472. Dumping syndrome is a complication of *(DSSSB 2013)*
a. Nephrectomy b. Subtotal gastrectomy
c. Ileostomy d. Hysterectomy

Explanation: Dumping syndrome is common after gastric surgery. It is a group of symptoms, including weakness, abdominal discomfort, and sometimes abnormally rapid bowel evacuation, occurring after meals in some patients who have undergone gastric surgery.

473. Which among the following complication will be present in a client following gastrectomy?
a. Anemia
b. Deficiency of fat soluble vitamin
c. Peptic ulcer
d. Pancytopenia

474. Gastroenterostomy is creation of connection between .....
a. Stomach and the jejunum
b. Stomach and distal ileum
c. Stomach and proximal ileum
d. Esophagus and duodenum

Ans.

454.	b
455.	a
456.	d
457.	d
458.	d
459.	a
460.	c
461.	b
462.	a
463.	b
464.	d
465.	b
466.	d
467.	b
468.	a
469.	a
470.	b
471.	c
472.	b
473.	a
474.	a

Scanned with CamScanner

475. In which surgery part of stomach is removed and remaining portion is anastomosed to duodenum? *(LNJP H D 2012)*
   a. Gastrectomy
   b. Endoscopic mucosal resection
   c. Gastrojejunostomy
   d. Gastroduodenostomy

476. Best position that can be given to a client after gastrectomy is .....
   a. Lateral b. Low fowlers
   c. Supine d. Prone

477. Vitamin supplementation needed after gastrostomy is ....
   a. Vit B12 b. Vit A
   c. Vit D d. Vit E

478. Malabsorption syndrome features include all, except
   a. Anemia b. Constipation
   c. Tetany d. Steatorrhea

479. Other name for Vitamin B12 is .....
   a. Ascorbic acid b. Cyanocobalamin
   c. Thiamine d. Riboflavin

480. Increased gastrin is seen in
   a. Zollinger-Ellison syndrome
   b. Iron deficiency anemia
   c. Duodenal ulcer
   d. Gastric cancer

481. Which of the following is correct regarding Zollinger-Ellison syndrome:
   a. Increased secretion of gastrin
   b. Increased production of gastric acid
   c. Gastric and duodenal ulcer formation
   d. All of the above

482. Which of the following is NOT true regarding gastric ulcer?
   a. Long term use of NSAIDs causes gastric ulcer
   b. Intake of spicy food causes gastric ulcer
   c. Food may cause pain and vomiting may relieve it
   d. Helicobacter pylori infection causes gastric ulcer

483. Contraindicated medication in a patient with acute gastritis is .....
   a. Naproxen sodium b. Calcium carbonate
   c. Azithromycin d. Furosemide

484. GI irritability increase with the use of .....
   a. Sugar products b. Dairy products
   c. Cola drink and coffee d. Both b and c

485. Risk factors for peptic ulcer include .....
   a. Taking NSAIDs b. Smoking
   c. Alcohol consumption d. All of the above

486. Which of the following statement is NOT true about peptic ulcer disease?
   a. Peptic ulcer is more likely to occur in the first part of duodenum than in the stomach
   b. Gram negative H-pylori bacteria causes peptic ulcer
   c. Avoid food items like coffee and caffeinated beverages
   d. Milk and cream is encouraged to take

487. The most common site of occurring peptic ulcers in stomach: *(JIPMER 2012)*
   a. Pyloric portion
   b. Cardiac portion
   c. Esophageal junction d. Body of the stomach

488. Most common site/location of peptic ulcer is
   a. At gastroesophageal junction
   b. Gastric antrum
   c. 1st part of duodenum
   d. Lesser curvature of stomach

489. The main action of ranitidine in treating peptic ulcer is: *(JIPMER 2012)*
   a. Increase gastric motility
   b. Neutralize gastric acidity
   c. Inhibit gastric acid secretion
   d. Increase histamine release

490. A major causative organism for peptic ulcer is: *(DSSSB 2013, ESIC Chennai May 2012)*
   a. Escherichia coli b. Streptococci
   c. Staphylococci d. Helicobacter pylori

Explanation: H. pylori is gram-negative bacteria that grow in the digestive tract and have a tendency to attack the lining of the stomach. Individuals infected with H. pylori have a 10–20% lifetime risk of developing peptic ulcers and a 1–2% risk of acquiring stomach cancer.

491. Best test for determining eradication of H. pylori infection
   a. Urease test b. Serum ELISA
   c. Tissue biopsy d. Breath urea test

492. Peptic ulcer caused by helicobacter pylori is treated with:
   a. Ranitidine and antibiotics
   b. Ranitidine and omeprazole
   c. Ranitidine and pantoprazole
   d. Surgical intervention

Explanation: Anti H. pylori therapy to treat gastric ulcer consists of combination of antimicrobials like amoxycillin or clarithromycin and nitroimidazoles (Metronidazole, Tinidazole and Ornidazole). Eradication of H. pylori concurrently with H_2 blocker (ranitidine) has been associated with faster ulcer healing and lower relapse rate.

493. Raju is suffering from peptic ulcer disease and during his discharge counseling educate him to avoid .....
   a. Coffee and cola b. Alcohol
   c. Milk d. All of the above

Explanation: Peptic ulcer disease refers to painful sores or ulcers in the lining of the stomach or first part of the small intestine, called the duodenum. Frequent milk ingestion as previously prescribed is not encouraged. This is owing to the transient buffering effect and significant gastric acid secretion effect of milk. Currently, studies indicate that it is prudent to avoid alcohol. This is especially true for the concentrated forms, such as 40% alcohol. Coffee should be avoided on the basis of its strong acid secretagogue property. Some fiber-containing foods may possess factors that are protective against ulcer disease.

494. Gastric ulcer occurs due to .....
   a. GERD
   b. Hyperacidity
   c. Decreased mucosal resistance
   d. Microorganisms

495. Common site for stress induced gastric ulcer is
   a. Greater curvature b. Antrum
   c. Lesser curvature d. Anywhere in stomach

Explanation: The gastric body and fundus is a common location for stress ulcerations but can also be seen in antrum and duodenum.

496. Most common site of curling's ulcer
   a. Proximal Duodenum
   b. Esophagus
   c. D. jejunum
   d. Distal duodenum

Ans.

475.	d
476.	b

494.	c
495.	d
496.	a

Scanned with CamScanner

Explanation: Curling's ulcer is an acute gastric erosion resulting as a complication from severe burns when reduced plasma volume leads to ischemia and cell necrosis (sloughing) of the gastric mucosa. It commonly occurs in proximal duodenum.

497. Identify the clinical manifestation of duodenal ulcer among the following
a. Hematemesis will be present
b. Patient is generally malnourished
c. Pain occurs 1-2 hours after eating
d. Food may relieve pain

498. Which of the following is the initial symptom of perforated duodenal ulcer?
a. Hyperpyrexia
b. Mid-epigastric pain
c. Projectile vomiting
d. Heart burn

Explanation: A hole that goes all the way through the duodenum is called a perforated duodenal ulcer. A perforation is a medical emergency. Sudden, sharp pain, begins mid-epigastric is the initial symptom of perforation.

499. The passage of bloody stools, where the blood appears fresh and red to maroon in color is known as
a. Melena
b. Hematochezia
c. Hemorrhoid
d. Hematemesis

500. Hematochezia is seen in all except
a. Piles
b. Anal fissure
c. Upper Gi bleeding
d. Lower GI bleeding

501. Melena is black, tarry stool and typically indicates_____
a. Upper GI bleeding
b. Lower GI bleeding
c. Bleeding from hemorrhoids
d. Bleeding from anal fissures

502. Which of the following is the appropriate diet plan for first 24 hours for a patient with active upper GI bleeding?
a. Regular diet
b. Bland diet
c. Clear liquids
d. NPO

Explanation: Bleeding must be brought under control before oral intake of food.

503. Which of the following is most appropriate diet for a patient with active upper GI bleeding in the first 24 hours of admission?
a. Regular diet
b. Bland diet
c. BRAT diet
d. Nothing by mouth

504. Cystic fibrosis leads to .....
a. Poor nutrition
b. Infertility
c. Lack of fat soluble vitamin
d. All of the above

Explanation: Cystic fibrosis is an inherited disorder that causes severe damage to the lungs, digestive system and other organs in the body. Cystic fibrosis affects the cells that produce mucus, sweat and digestive juices. Client with cystic fibrosis have impaired fat digestion and iron absorption. This leads to fatigue, susceptible for infection and shorter life span

505. Thiamine deficiency cause .....
a. Beriberi
b. Pellagra
c. Dermatitis
d. Scurvy

506. Patient with abdominal trauma presents with hypotension, tachycardia, pallor and restlessness which among the following organ is most likely to be ruptured?
a. Liver
b. Spleen
c. Intestine
d. Gallbladder

507. Which of the following is a complication of splenectomy? *(DSSSB 2013)*
a. Cholecystitis
b. Pancreatitis
c. Appendicitis
d. Gastritis

Explanation: Bleeding, blood clots, infection, injury to nearby organs, including stomach, pancreas and colon are the complication of splenectomy. Pancreatitis is the complication associated with splenectomy.

508. Which of the following is a cause of acute pancreatitis?
a. Alcohol consumption
b. Gall-stones
c. High triglyceride levels
d. All of the above

509. Most common cause of Chronic Pancreatitis:
a. Gallstones
b. Alcoholism
c. Trauma
d. ERCP

Explanation: Heavy alcohol consumption is the most common cause of chronic pancreatitis (70% to 80% of cases)

- However, only 3% to 7% of heavy drinkers develop chronic pancreatitis suggests that alcohol is only a cofactor and that other factors are required for development of this complication.
- Mutations in the cationic trypsinogen gene, also known as protease serine 1 *(PRSS1)* gene, are common in hereditary chronic pancreatitis. *PRSS1* is located on chromosome 7
- In up to 20% of patients, a clear cause cannot be documented and cases are considered to be idiopathic.
- Ref: Sabiston 20th page 1532

510. Most common cause of Viral pancreatitis
a. Coxsackie virus
b. Mumps
c. CMV
d. HIV

511. Which of the following laboratory findings is a primary indicator of pancreatitis?
a. Elevated AST
b. Elevated ALT
c. Elevated serum lipase
d. Elevated BUN

512. Elevation of which of the following laboratory value indicates the presence of pancreatitis? *(DSSSB 2013)*
a. Serum amylase
b. Serum lipase
c. Aspartate aminotransferase (AST)
d. Both A and B

Explanation: A normal serum lipase level is 0–160 U/L. A normal blood amylase level is 23–85 U/L. Pancreatitis—also known as inflammation of the pancreas, can cause amylase and lipase levels to be increased up to 3 times normal. Both values should be increased, in order to carry the diagnosis of pancreatitis.

513. Grey Turner's sign is seen in
a. Myocarditis
b. Cholecystitis
c. Pancreatitis
d. Pleural effusion

514. All of the following are the complications of acute pancreatitis, Except:
a. Irritable bowel syndrome
b. Pseudocyst
c. Colitis
d. Splenic vein thrombosis

Ans.

497.	d
498.	b
499.	b
500.	c
501.	a
502.	d
503.	d
504.	d
505.	a
506.	b
507.	b
508.	d
509.	b
510.	b
511.	c
512.	d
513.	c
514.	a

Scanned with CamScanner

515. Which of the following is NOT a complication of acute pancreatitis?
a. Increased ICP b. Ascites
c. Splenic vein thrombosis d. Renal dysfunction

516. Fluid volume deficit is most likely associated with which of the following conditions
a. Pancreatitis b. Congestive heart failure
c. Gastritis d. Appendicitis

517. Nursing management of the patient with acute pancreatitis includes
a. Assess for hypocalcaemia
b. Treat hyperglycemia based on insulin sliding scale
c. Both A and B
d. Provide enzyme replacement

518. Complication of chronic pancreatitis include the following
a. Deficiency of fat soluble vitamin
b. Pseudocyst
c. Diabetes mellitus d. All of the above

519. Pancreatitis client manifest with .....
a. Midepigastric pain b. Abdominal blotting
c. Nausea and vomiting d. All of the above

520. Drug of choice for pain control in acute pancreatitis?
a. Morphine b. Diclofenac sodium
c. Meperidine d. Indomethacin

Explanation: Meperidine (Demerol) is the drug of choice for pain control in acute pancreatitis. Diclofenac and indomethacin are NSAID and less efficient to control severe pain caused by irritation and edema of the inflamed pancreas. Morphine also an effective analgesic but likely to cause spasm of sphincter of oddi.

521. Purpose of continuous low NG drainage in a client with pancreatitis is to prevent .....
a. GERD b. Abdominal distention
c. Pancreatic stimulation d. Intestinal obstruction

522. Which among the following food type needs to be restricted in a client with pancreatitis?
a. Carbohydrate b. Fat
c. Protein d. Vitamins and mineral

Lower GI Disorders

523. All the following are causes of constipation EXCEPT: *(AIIMS BBS NO 2018)*
a. Inadequate fiber intake
b. Decreased fluid intake
c. Laxative abuse
d. Decreased gastrointestinal motility

Explanation: Laxatives (e.g. Bisacodyl, liquid paraffin) are drugs that relieve constipation by loosening stools or inducing a bowel movement. It does not cause constipation. All other given factors are associated with constipation.

524. A client is scheduled for a hemorrhoidectomy. The nurse should observe the client for the presence of which common clinical indicator associated with hemorrhoids.
a. Pruritis b. Flatulence *(RAK MSc 2018)*
c. Anal stenosis d. Rectal bleeding

Explanation: The nurse should observe for rectal bleeding in case of hemorrhoids. Hemorrhoids are perianal varicose vein which are characterized by bleeding and prolapse of the engorged veins. These engorged veins may rupture and produce bright red blood. So, it is important to observe for rectal bleeding in a client posted for hemorrhoidectomy.

525. Which of these patient's dietary habits does the nurse understand may increase the risk for development of colon cancer? *(RAK MSc 2018)*
a. High fat, low fiber intake
b. High intake of milk and milk products
c. Low meat and protein intake
d. Low fat, high carbohydrate intake

Explanation:
- Colon cancer is cancer of the large intestine. High fat, low fiber intake may contribute to an increased risk of colorectal cancer.
- The levels of *Fusobacterium nucleatum*, a bacteria that predisposes to cause colon cancer by inducing inflammation or irritating the colon tissue. These mechanism increases if an individual switches from a low-fat, high fiber diet to a high-fat, low-fiber diet, which is usually characterized by a high intake of red and processed meats.

526. The nurse is reinforcing patient teaching. Which of the following foods would. The nurse reinforces that the patient with ulcerative colitis should avoid? *(RAK MSc 2018)*
a. Fresh fruits b. White bread
c. Sweet desert d. Meat

Explanation:
- Fresh fruits are high in fiber and notable for causing gas which further result into increases diarrhea and abdominal pain; so, the patient with ulcerative colitis should avoid fresh fruits and vegetables.
- White bread is not rich in fiber so it can be taken. Sweet desert doesn't aggravate the sign and symptom of ulcerative colitis. Meat in less quantity can be taken by the patient with ulcerative colitis.

527. Which of the following statement regarding diverticulitis is TRUE
a. Abdominal pain, fever, nausea and a change in bowel habits are the sign and symptoms
b. Diverticulitis is most common in Sigmoid colon
c. Treatment can include rest, a liquid or high-fiber diet and antibiotics
d. All of the above

528. As compared to diverticulitis, patient with diverticulosis has .....
a. Rectal bleeding b. No symptoms
c. Localized cramping pain d. Abdominal distention

529. An abnormal sac or pouch formed at a weak point in the wall of the alimentary tract is .....
a. Aneurysm b. Diverticulum
c. Hernia d. Protrusion

530. Inflammatory bowel disease results in .....
a. Perforation b. Stricture
c. Obstruction d. Paralytic ileus

531. After a surgery for an ileal conduit a nurse should closely evaluate client for which complication?
a. Peritonitis b. Infection
c. Thrombophlebitis d. Hematuria

532. Following fiberoptic colonoscopy patient reports increasing abdominal pain, fever, and chills, which among the following complication need to suspect by the nurse?
a. Bowel perforation b. Pneumoperitoneum
c. Paralytic ileus d. Diverticulitis.

Ans.

529.	b
530.	a
531.	b
532.	a

Scanned with CamScanner

533. **Correct information regarding colonoscopy is .....**
   a. Informed consent is necessary
   b. Sedation may be used during the procedure.
   c. NPO status is needed
   d. All of the above

534. **In gastrointestinal perforation nurse need to suspect .....**
   a. Paralytic ileus
   b. McBurney's point pain
   c. Sudden, severe abdominal pain
   d. Diarrhea

535. **Aganglionic disease of the intestinal tract which causes inadequate motility is termed as:** *(ESIC 2019)*
   a. Ulcerative colitis b. Crohn's disease.
   c. Hirschsprung's disease d. Diverticular disease

Explanation: Aganglionic disease is a congenital defect of the intestinal tract which cause inadequate motility. It is termed as Hirschsprung's disease. The nerve supply is absent from parts of the intestine, therefore called aganglionic. The most common symptom is failure to pass meconium followed by 24-48 after birth.

536. **The corrective surgery for Hirschsprung's Disease is:** *(Staff Nurse G II 2014)*
   a. Pyloroplasty b. Kasai procedure
   c. Duhamel procedure d. Pyeloplasty

537. **Currant jelly stool is a manifestation of:** *(Staff Nurse G II 2014)*
   a. Trachea esophageal fistula
   b. Intussusception
   c. Oesophageal atresia
   d. Anorectal malformation

538. **Currant jelly-like stools containing and mucus among 3 months to 3 years old child is suspected to have.** *(ESIC 2019)*
   a. Hirschsprung's disease b. Abdominal hernia
   c. Meckel's diverticulum d. Intussusception

Explanation: Currant jelly-like stools is a feature of intussusception. It is a condition in which part of the intestine telescopes into itself. Later signs of intussusception include rectal bleeding often with 'red currant jelly' stool (stool mixed with blood and mucus) and lethargy.

539. **Crohn's Disease most commonly affects the**
   a. Stomach b. Rectum
   c. Ileum d. Duodenum

540. **Which of the following is earliest manifestation of Crohn's disease?**
   a. Deep ulcers involving GI mucosa
   b. Aphthous ulcers
   c. Cobblestone appearance
   d. Discontinuous involvement of ileum

Explanation: The earliest gross manifestations of Crohn's disease are the development of small mucosal ulcerations call aphthous ulcers.

541. **Which of the following bowel disorder is commonly associated with fistulas?**
   a. Diverticulitis
   b. Appendicitis
   c. Irritable bowel syndrome
   d. Crohn's disease

542. **The development of diverticulitis is associated with which of the following type of diet**
   a. High-fiber diet b. Low-fiber diet
   c. Low-fat diet d. Protein rich diet

543. **A 55-year-old male is admitted with a diagnosis of Crohn's disease. The nurse knows that the most common location of digestive tract affected by Crohn's disease is**
   a. Jejunum b. Terminal Ileum
   c. Ascending column d. Sigmoid column

544. **Which of the following symptoms is likely to be exhibited by a patient with Crohn's disease?**
   a. Ribbon like stools b. Steatorrhea
   c. Hematochezia d. Malena

545. **Pain associated with irritable bowel disease can be treated with**
   a. Paracetamol b. Opioids
   c. Laxatives d. Steroids

546. **Rectal bleeding is the predominant symptom in which of the following conditions?**
   a. Crohn's disease b. Ulcerative colitis
   c. Appendicitis d. Diverticulitis

547. **Purpose of ileostomy in ulcerative colitis is .....**
   a. Prevent possible perforation from colitis
   b. Prevent fecal impaction
   c. To decrease abdominal distention
   d. To prevent peritonitis

548. **The nurse is aware that the most common assessment finding in a child with ulcerative colitis is-**
   a. Intense abdominal cramps
   b. Profuse diarrhea
   c. Anal fissures
   d. Abdominal distention

549. **All are true about ulcerative colitis EXCEPT**
   a. Smoking may prevent the disease
   b. Male: female ratio is 1:1
   c. Presents with bloody diarrhea
   d. Highly associated with infertility

550. **All are true about ulcerative colitis: EXCEPT**
   a. Lesions are continuous and superficial and limited colon and rectum
   b. Anal lesions are less
   c. Risk for cancer is more
   d. Rectal bleeding is less as compared to Crohn's disease

Explanation: Ulcerative colitis and Crohn's disease are two type of inflammatory bowel disease (IBD). Crohn's disease is a chronic inflammatory process of any part of GI from the mouth to anus but most often affects the terminal ileum. Ulcerative colitis is a disease characterized by remitting and relapsing inflammation of the large intestine. The inflammation is limited to colon and rectum. Rectal bleeding is more common in ulcerative colitis as compared to Crohn's disease. So the statement mentioned in D is incorrect.

551. **What is true about ulcerative colitis**
   a. Skip lesions seen b. Involves only colon
   c. Ileum not involved
   d. Involves rectum and then whole colon backwards

552. **A client is admitted to the hospital with a bowel obstruction. Which of the following is the priority nursing diagnosis?**
   a. Fluid volume deficit
   b. Deficient knowledge
   c. Ineffective tissue perfusion
   d. Pain related to abdominal distention

Explanation: Bowel obstruction results in accumulation of feces, fluid and gas above the obstructed part. This causes decreased fluid absorption, hence fluid volume deficit.

Ans.

533.	d
534.	c
535.	c
536.	c
537.	b
538.	d
539.	c
540.	b

542.	b
543.	b
544.	b
545.	d
546.	b
547.	a
548.	b
549.	d
550.	d
551.	d
552.	a

Scanned with CamScanner

553. **Absence of bowel sounds and abdominal distension after abdominal surgery indicates** *(DSSSB 2013)*
   a. Hemorrhage
   b. Paralytic Ileus
   c. Intussusception
   d. Flatulence

Explanation: Paralytic ileus is the occurrence of intestinal blockage in the absence of an actual physical obstruction. A temporary paralysis of a portion of the intestines occurs typically after an abdominal surgery.

COLOSTOMY, ILEOSTOMY

554. **To perform colostomy irrigation, the catheter should be inserted into the stoma up to:** *(Safdarjung NO 2018)*
   a. 5 cm
   b. 10 cm
   c. 15 cm
   d. 20 cm

Explanation: To perform colostomy irrigation, insert catheter gently 2" to 4" (5 cm to 10 cm) into the bowel to instill the irrigant fluid. So the catheter can be inserted up to 10 cm.

555. **Most common site for intestinal obstruction is**
   a. Duodenum
   b. Ileum
   c. Jejunum
   d. Cecum

556. **Which among the following is a treatment option for intestinal obstruction?**
   a. Decompress the bowel
   b. Resection and anastomosis
   c. Both A and B
   d. None of the above

557. **Leading cause of small intestinal obstruction is .....**
   a. Volvulus
   b. Intussusception
   c. Adhesions secondary to previous pelvic surgery
   d. Congenital causes

558. **While doing colostomy irrigation, the irrigation bag should be hung _____ above the level of the stoma.**
   a. 8–12 inches
   b. 12–18 inches
   c. 18–24 inches
   d. 24–36 inches

Explanation: The irrigation bag should be hung 12–18 inches. Irrigation bag above this level can create increased pressure and sudden intestinal distention to the patient.

559. **There is no drainage from colostomy after 24 hours of its creation. Nurse should aware that it is because of .....**
   a. Absence of gastrointestinal motility
   b. GERD
   c. Low fluid intake
   d. Enema

560. **Maximum normal functioning of the bowel will be present in .....colostomy**
   a. Sigmoid colostomy
   b. Ascending colon
   c. Descending colon
   d. Transverse colon

561. **Solution of choice for colostomy irrigation is .....**
   a. Distilled water
   b. Lactated Ringer's
   c. Luke warm water
   d. Tap water

562. **Among the following which must be there in the discharge teaching plan of a permanent colostomy client**
   a. Diet restriction
   b. Frequent emptying of stoma bag
   c. Importance of stool softeners
   d. Dilation of the stoma

563. **Patient with colostomy should be advised to eat:**
   a. Bland diet so that the intestines do not become irritated
   b. Everything they ate before the surgery but will avoid those foods that produce gas
   c. Food low in fiber
   d. Soft foods that are more easily digested

Explanation: Patient with colostomy can eat a regular diet. There is no special dietary restrictions, however, the patient is advised to avoid gas-forming foods which in turn can cause distention and discomfort.

GI INFECTIONS AND WORM INFESTATIONS

564. **Patient complaining of pain in lower abdomen with malaise, semi-solid stools with an offensive odor, blood and mucous, organism responsible is .....**
   a. Hook worm
   b. Entamoeba histolytica
   c. Tape worm
   d. Plasmodium

565. **Dark ground illumination technique is used in the diagnosis of _____**
   a. Tetani
   b. S. typhi
   c. Treponema pallidum
   d. Herpes

566. **Which of the following statement is NOT TRUE regarding Taenia solium infestation?**
   a. It is also known as round worm
   b. Transmitted by eating improperly cooked pork
   c. Adults worms are big in length and eggs are passed in feces
   d. Adults worms have hooks and suckers

567. **Which of the following is correct regarding hookworm infestation .....**
   a. Adults are found in small intestine
   b. Causes iron-deficiency anemia
   c. Larvae pass through blood circulation
   d. All of the above

568. **All are true about Giardia lamblia infection, EXCEPT .....**
   a. It is a type of gram-positive bacteria
   b. Water borne infection
   c. Pear-shaped trophozoites are seen
   d. Causes watery diarrhea

Explanation: Giardia lamblia, also known as Giardia intestinalis, is a flagellated parasitic microorganism. G. lamblia trophozoites are pear-shaped cells and motile by way of four pairs of flagella. It causes the diarrheal illness known as Giardiasis.

569. **Which of the following statement is NOT true regarding typhoid fever is .....**
   a. Rose spots, leucopenia, fever and diarrhea are the important features
   b. Low grade fever
   c. Ceftriaxone is the drug of choice for treatment of typhoid fever
   d. Widal test is used to diagnose the condition

570. **Correct option regarding a typhoid ulcer is .....**
   a. Terminal ileum will be affected
   b. Longitudinal orientation
   c. Bleeding
   d. All of the above

571. **Finding suggestive of peritonitis is .....**
   a. Rebound abdominal pain
   b. Pain at McBurney's point
   c. Guarding of abdomen
   d. Cullen's sign

Ans.

553. b
554. b
555. b
556. c
557. c

Scanned with CamScanner

572. **Which among the following is a clinical manifestation of peritonitis?**
   a. Icterus
   b. Abdominal rigidity
   c. Umbilical hernia
   d. Increased bowel sounds

573. **Correct option regarding a tuberculous ulcer is .....**
   a. Transverse orientation
   b. Stricture formation
   c. Presence of caseous necrosis on cut surface
   d. All of the above

574. **Travelers diarrhea is most commonly caused by**
   a. Enterotoxigenic E. coli
   b. Exogenic E. coli
   c. EIEC
   d. Shigella

575. **Most common cause for diarrhea in adults associated with intake of Shell fish?**
   a. Norwalk virus
   b. Calicivirus
   c. Rotavirus
   d. Filovirus

HERNIA

576. **Hiatal hernia present with .....**
   a. Dysphasia
   b. Regurgitation
   c. Heart burn and chest pain
   d. All of the above

577. **Main clinical symptom of hiatal hernia is**
   a. Heartburn
   b. Vomiting
   c. Abdominal distention
   d. Dysuria

578. **The type of hernia that is more prone to become strangulated is _____.**
   a. Inguinal hernia
   b. Femoral hernia
   c. Hiatal hernia
   d. Umbilical hernia

HEMORRHOIDS

579. **Clinical manifestation of hemorrhoids includes .....**
   a. Rectal bleedings
   b. Extreme itching around the anus
   c. A painful bowel movement
   d. All of the above

580. **Correct regarding hemorrhoids is .....**
   a. Swollen blood vessels of the rectum.
   b. Hemorrhoidal veins are located in the lowest area of the rectum and the anus
   c. Internal hemorrhoids "prolapse," or enlarge and protrude outside the anal sphincter.
   d. All of the above

APPENDICITIS

581. **Vermiform appendix is the part of which organ?**
   a. Duodenum
   b. Ileum
   c. Cecum
   d. Ascending colon

582. **Which of the following is the most common cause of acute appendicitis?**
   a. Fecalith
   b. Tumor of the appendix
   c. Bowel kinking
   d. Foreign body

583. **McBurney's point is associated with:**
   a. Appendix *(Kerala PSC, Nov 2014)*
   b. Stomach
   c. Spleen
   d. Larynx

584. **Location of McBurney's point is .....**
   a. Midway between umbilicus and anterior superior iliac spine on right side
   b. Midway between umbilicus and anterior superior iliac spine on left side
   c. Midway between umbilicus and pubic symphysis
   d. Midway between umbilicus and coccyx

Explanation: McBurney's point is the name given to the point over the right side of the abdomen that is one-third of the distance from the anterior superior iliac spine to the umbilicus (navel). This point roughly corresponds to the most common location of the base of the appendix where it is attached to the cecum.

Figure ■ McBurney point

585. **The patient with appendicitis usually exhibits the following clinical manifestations.** *(ESIC 2019)*
   a. Rebound tenderness at the McBurney's Point
   b. Pain occurs immediately after eating
   c. Heartburn regurgitation and dysphagia
   d. Hematemesis or melena

Explanation: The patient with appendicitis usually exhibits the **Rebound tenderness at the McBurney's Point**, it is also called as Blumberg's sign or rebound tenderness. It refers to pain upon removal of pressure rather than application of pressure to the abdomen. It is positive in appendicitis.

586. **All are correct regarding appendicitis, EXCEPT**
   a. Pain at McBurney's point is an important symptom of appendicitis
   b. Positive Homan's sign suggest appendicitis
   c. Rovsing's sign is the characteristic sign of appendicitis
   d. Appendix is usually located in the lower right quadrant of the abdomen

587. **A 45-year-old patient with the complaints of pain in the right lower quadrant of abdomen was admitted in the ward. Assessment findings revealed tenderness on palpation at McBurney's point. Which one of the following additional laboratory findings is suggestive of appendicitis in this patient?**
   a. WBC of 13, 000
   b. RBC of 4. 7 million
   c. Platelet count of 250,000
   d. All of the above

Explanation: In appendicitis, WBC count is elevated. The RBC and Platelet values given above are within normal limits.

Ans.

572.	b
573.	d
574.	a
575.	a

Scanned with CamScanner

588. **Clinical sign in which pressure on the left lower quadrant of the abdomen causes pain in the right lower quadrant is known as .....**
   a. Rovsing's sign b. Cullen sign
   c. Homan's sign d. Kerning's sign

589. **Preoperative preparation for appendectomy NOT includes:** *(DSSSB 2013)*
   a. Enema STAT b. Consent
   c. Skin preparation d. Removal of jewelries

Explanation: Administration of enema cause increased pressure in the colon, which may lead to rupture of appendix and infection such as peritonitis. So enema is contraindicated in a person who is suffering from appendicitis. Hot application is also contraindicated in this condition as it leads to inflammation and rupture of appendix.

590. **Laxatives are not given to patients with possible appendicitis because it:**
   a. Could spread infection
   b. Could cause constipation
   c. Could cause flatulence
   d. Could cause a rupture of the appendix

Explanation: The increased motility of the intestine caused by laxatives could result in rupture of appendix.

Liver and Biliary System

591. **The nurse is collecting data for a patient who develops jaundice and dark, amber-colored urine. The nurse recognizes that which of the following is most likely the cause of these manifestations?** *(RAK MSc 2018)*
   a. Encephalopathy b. Pancreatitis
   c. Bile duct obstruction d. Cholecystitis

Explanation:

- When one or more of the *ducts* that transport *bile* become blocked, it is known as a *bile duct obstruction*. It is also commonly referred to as *biliary obstruction*.
- When the bile ducts get blocked, bile builds up in the liver and the symptoms such as jaundice and amber colored urine develops because of increasing level of bilirubin in the blood. The other clinical manifestation includes itching, abdominal pain usually in the upper right side.

592. **Identify the toxic substance to neuron among the following**
   a. Conjugated bilirubin b. Urobilinogen
   c. Unconjugated bilirubin d. Urea

593. **Causes of unconjugated hyper bilirubinemia includes all EXCEPT**
   a. Increased production of bilirubin
   b. Impaired conjugation of bilirubin
   c. Impaired hepatic uptake of bilirubin
   d. Biliary obstruction

594. **Hypoalbuminemia is present in .....**
   a. Cirrhosis b. Malnutrition
   c. Nephrotic syndrome d. All of the above

595. **Major types of galls stones include**
   a. Cholesterol and calcium stone
   b. Pigmental and calcium stone
   c. Cholesterol and pigmental stone
   d. Pigmental and xanthine stone

596. **Organism most commonly responsible for cholecystitis is**
   a. Meningococci b. Klebsiella
   c. Staphylococci d. Pneumococci

597. **Choledocholithiasis is .....**
   a. Stone in pancreatic duct
   b. Stone in common biliary duct
   c. Stone in cystic duct
   d. Stone In urethra

598. **Stone in the bile duct is known as**
   a. Choledocholithiasis b. Cholelithiasis
   c. Cholangitis d. Jaundice

599. **Identify risk factor for cholelithiasis**
   a. Obesity b. Change in weight
   c. Hormonal therapies d. All of the above

600. **Clinical manifestation of Choledocholithiasis is .....**
   a. Icterus b. Obstructive jaundice
   c. Clay colored stools d. All of the above

601. **Which of the following assessment findings in client with hepatic disease indicates inadequate vitamin K absorption?**
   a. Ascites and restless leg syndrome
   b. Orthopnea and tachycardia
   c. Shortness of breath and fatigue
   d. Purpura and petechiae

CIRRHOSIS OF LIVER

602. **The nurse is planning care for a patient with cirrhosis. For which condition would the nurse place the patient on bleeding precautions?** *(RAK MSc 2018)*
   a. Encephalopathy b. Low vitamin K
   c. Elevated liver enzymes d. Hepatorenal syndrome

Explanation:

- One of the factors implicated in the pathogenesis of the coagulopathy of liver disease is vitamin K deficiency. Vitamin K is an essential fat-soluble vitamin that is important in maintaining normal coagulation. The body stores of vitamin K are not high, and its absorption is highly dependent upon bile.
- For these reasons, patients with cholestatic liver disease, cirrhosis and small bowel malabsorption may develop vitamin K deficiency. Insufficient vitamin K can lead to excessive bleeding and easy bruising.

603. **Which of the below-mentioned signs indicates obstructive jaundice?** *(Daman and Diu NO 2018)*
   a. Straw-colored urine b. Clay-colored stools
   c. Reduced hematocrit d. Elevated urobilinogen in urine

Explanation: Obstructive jaundice occurs due to the intra and extra hepatic obstruction of bile ducts. The liver releases bile salts into the stool, giving it a normal brown color. In obstructive jaundice conjugated bilirubin does not reach the gut, no stercobilin or urobilin and the stools are devoid of yellow color. This makes the stool pale white, or look like clay or putty.

604. **Increased level of unconjugated bilirubin is because of the problem with .....organ**
   a. Liver b. Small intestine
   c. Bone marrow d. Spleen

605. **One of the major causes for Cirrhosis of liver is:** *(DSSSB 2013)*
   a. Alcohol abuse b. Drug abuse
   c. Smoking d. Hepatitis A

Explanation: Alcohol is reported as the most common cause of cirrhosis of liver in India. The other common etiologies include Hepatitis B and C infections, autoimmune, and non-alcoholic fatty liver.

Scanned with CamScanner

606. **Hepatic cirrhosis is characterized by**
a. Atrophy of hepatic cell
b. Degeneration and destruction of liver cells
c. Necrosis of hepatic cell
d. Stricture in hepatic cell

607. **The inflammation and degeneration of liver parenchyma is referred to as:** *(DSSSB PHN, 2015)*
a. Cirrhosis b. Jaundice
c. Colitis d. Cystitis

608. **Pathophysiology behind edema in cirrhosis is .....**
a. Liver is unable to neutralize the toxic substance
b. Fall in oncotic pressure due to low albumin and portal hypertension
c. Due to paralytic ileus
d. More blood volume causes edema

609. **Which among the following sign will be present in a client who is suffering from cirrhosis of liver and hepatic coma?**
a. Elevated creatinine level b. Decreased SGOT/SGPT
c. Icterus d. Hypervitaminosis

610. **Hepatic coma is manifested by all the following EXCEPT:**
a. Respiratory alkalosis
b. EEG abnormalities
c. Elevation of blood ammonia
d. Flapping tremor

611. **When the nurse is assessing a patient who has cirrhosis of the liver, which of the following findings would indicate that the patient's condition is worsening?** *(LNJP HD 2012)*
a. Positive Babinski sign b. Bilateral basal lung creps
c. Visual field loss d. Flapping hand tremors

612. **Which is the best test for detecting Liver dysfunction?** *(RRB SSNE 2015)*
a. Serum albumin b. Serum bilirubin
c. SGPT d. Prothrombin time

613. **Right side lying position given to a client following liver biopsy is**
a. For hemostasis b. For comfort
c. To decrease pain d. For observing easily

614. **Common location of liver abscess is .....**
a. Right lobe of liver b. Left lobe of liver
c. Middle lobe d. All the lobes

615. **If ascitic fluid is obtained via paracentesis in a client, what is the immediate complication expected in this client .....**
a. Vascular collapse b. Peritonitis
c. Respiratory arrest d. Cardiac arrest

Explanation:
- Ascites is one of the most common complication of cirrhosis of liver. Ascites refers to accumulation of fluid in the peritoneal cavity.
- Abdominal paracentesis is a procedure in which fluid from peritoneal cavity is removed by inserting a needle. The rapid decrease in abdominal pressure during the procedure may lead to vasodilation and vascular collapse (distributive shock).
- Peritonitis due to infection is also an expected complication but not an immediate complication.
- Respiratory arrest and cardiac arrest may be possible but are secondary to vascular collapse.

616. **Dietary management of ascites is .....**
a. Restrict water intake b. Restrict sodium intake
c. Both a & b d. None of the above

617. **In a cirrhosis patient administration of neomycin helps to prevent the formation of .....**
a. Urea b. Ammonia
c. Creatinine d. Ketone

LIVER FAILURE

618. **Mr. Ravi, a 45-year-old male was admitted into HDU with liver failure due to chronic alcohol abuse. Close monitoring of the blood pressure was advise**
d. Which change that is associated with liver failure affects the blood pressure of this patient?
a. Increased capillary permeability
b. Peripheral vasodilation
c. Increased renin release from kidney
d. Hypoalbuminemia

Explanation: Albumin maintains oncotic pressure of the plasma. Hypoalbuminemia is one of the characteristics of liver failure. So blood pressure decreases as the body is unable to maintain normal oncotic pressure due to hypoalbuminemia which necessitate close monitoring of BP.

619. **Use of lactulose in hepatic encephalopathy is to:**
a. Increase lactase level in the blood
b. Decrease serum ammonia level
c. Increase the breakdown of bilirubin
d. Decrease the production of bilirubin

Explanation: The presence of a carbohydrate and the acidic environment caused by the production of organic acids also act to reduce the breakdown of other nitrogen-containing compounds to ammonia and other potential cerebral toxins. The administration of lactulose to humans causes an increase in fecal nitrogen, but very little increase in ammonia nitrogen. Most of the nitrogen is contained in the fecal bacterial and the soluble fractions of stool. The administration of lactulose causes a reduction in the urea production rate consistent with a reduced entry of ammonia into portal blood.

620. **Food item needs to be avoided in a client with hepatic dysfunction to prevent hepatic coma is .....**
a. Carbohydrate b. Protein
c. Vitamins d. Minerals

HEPATITIS

621. **Which hepatitis is often seen as outbreaks in camps and institutions?** *(AIIMS-BBS SNO 2019)*
a. Hepatitis A b. Hepatitis C
c. Hepatitis D d. Hepatitis B

Explanation: The *hepatitis A* virus (HAV) is transmitted through feco-oral route. Contaminated food and water are the major source of infection. This is the reason why it is often seen as outbreaks in camps and institutions.

622. **The common route of transmission of Hepatitis-A is:** *(Safdarjung NO 2018; NCFL 2019)*
a. By blood transfusion b. Oro-fecal
c. By sexual intercourse d. By droplet

Explanation: The common route of transmission of Hepatitis-A is orofecal route. Hepatitis A and hepatitis E spreads through oral-fecal route. Hepatitis C, hepatitis B and hepatitis D spreads through blood and blood products, sexual intercourse and needle prick incidences.

623. Identify DNA virus among the following
a. Hepatitis A virus b. Hepatitis B virus
c. Hepatitis D virus d. Hepatitis G virus

624. In which hepatitis ground glass appearance of the hepatocytes can be seen?
a. Hepatitis A virus b. Hepatitis B virus
c. Hepatitis D virus d. Hepatitis G virus

625. Hepatitis is highly infectious during ..... period
a. Convalescent period b. Remission period
c. Incubation period d. Relapse period

626. Risk of ..... is more after blood transfusion
a. Hepatitis A b. Hepatitis B
c. Hepatitis C d. Hepatitis D

627. Mode of transmission of hepatitis A is .....
a. Sexual contact b. Contaminated food
c. Blood transfusion d. Mosquito bite

628. Hepatitis-A mostly occurs among .....
a. Immunocompromised person
b. Children between 3 and 12 years
c. Teenagers
d. Older adult

629. Identify the type of Hepatitis that is transmitted through non-parenteral route
a. Hepatitis A b. Hepatitis B
c. Hepatitis E d. Hepatitis A and E

630. Identify the type of Hepatitis that is transmitted through parenteral route
a. Hepatitis A b. Hepatitis E
c. Hepatitis A and Hepatitis E d. Hepatitis B

631. Mode of transmission of Hepatitis E virus is: *(AIIMS Bhopal Grade-I 2018)*
a. Sexual b. Blood transfusion
c. Injections d. Fecal–oral

641.	c
642.	d
643.	d
644.	d
645.	b

Explanation: Mode of transmission of different types of hepatitis is as follows

Type of hepatitis	Mode of transmission	Source of virus
Hepatitis A	Fecal-oral	Feces
Hepatitis B	Percutaneous, permucosal	Blood/blood derived body fluids
Hepatitis C	Percutaneous, permucosal	Blood/blood derived body fluids
Hepatitis D	Percutaneous, permucosal	Blood/blood derived body fluids
Hepatitis E	Fecal-oral	Feces

632. Which among the following condition has highest levels of serum transaminases?
a. Acute hepatitis b. Chronic hepatitis
c. Acute pancreatitis d. Chronic pancreatitis

633. Hepatitis-B Virus carrier stage duration is .....
a. 3 months b. 6 months
c. 9 months d. 12 months

634. Common problem in the acute phase of hepatitis A
a. Pruritis b. Nutritional deficiency
c. Steatorrhea d. Melena

635. Which of the following is a complication of acute hepatitis?
a. Fulminant hepatic failure b. Cirrhosis
c. Both A and B d. None of the above

636. Discharge teaching to a client with hepatitis B is .....
a. Use lotions to get relieve from itching
b. Practice safe sex with condom
c. Take hepatitis B vaccination
d. Follow low carbohydrate, low protein and low fat diet

637. In a hepatitis B patient which activity order would the nurse expect to be prescribed.....
a. Bed rest b. Encourage ambulation
c. Strenuous activity d. Sedentary activity

638. Which is not prehepatic jaundice?
a. Hemolysis b. Ineffective erythropoiesis
c. Obstructive jaundice d. Both A and B

639. Most common cause of obstructive jaundice in children:
a. Biliary atresia b. Crigler-Najjar syndrome
c. Byler disease d. Caroli cyst

640. Vitamin to be corrected in obstructive jaundice is
a. Vitamin K b. Vitamin B 12
c. Vitamin D d. Vitamin C

641. Wilson's disease is diagnosed by?
a. Increased serum ceruloplasmin
b. Decreased liver copper
c. Increased urinary copper excretion
d. Decreased urine copper excretion

642. Correct option regarding Wilson's disease is .....
a. Kayser-Fleischer rings are present in this condition
b. An autosomal recessive genetic disorder
c. Copper accumulation manifests as neurological symptoms and liver disease
d. All of the above

INTERVENTIONS AND DRUGS

643. In Gluten Intolerance, the following is not recommended: *(Safdarjung NO 2018)*
a. Wheat b. Rye
c. Oats d. All of the above

Explanation: In Gluten Intolerance, wheat, rye, oats are not recommended to eat, as all these have gluten protein. The person can consume rice, millets, legumes (beans, lentils, peas, peanuts), nuts and seeds, red meat (fresh beef, pork, lamb, bison), poultry (fresh chicken, turkey), seafood (fresh fish, scallops, shellfish) and Traditional soy foods (tofu etc.)

644. The nurse is caring for a patient who is receiving a parenteral nutrition infusion. The nurse should perform blood glucose monitoring every 6 hours to detect which complication? *(RAK MSc 2018)*
a. Hyponatremia b. Hyperkalemia
c. Hypocalcemia d. Hyperglycemia

Explanation: Elevation of blood glucose occurs as the result of increased hepatic glucose production and reduced glucose utilization by peripheral tissues during the stress of hospitalization. Also, excessive delivery of glucose and gluconeogenic substrates via enteral or parenteral route in hospitalized patients also contributes to hyperglycemia. Hence the nurse should **measure blood glucose levels every 6 hours.**

645. A low-residue diet contain all EXCEPT:
a. Roast beef
b. Fresh peas
c. Mashed potatoes
d. Baked chicken

Scanned with CamScanner

Explanation: Fresh peas is high residue all others are low residue diet. A low residue diet is a diet designed to reduce the frequency and volume of stools while prolonging intestinal transit time. It is similar to a low-fiber diet, but typically includes restrictions on foods that increase bowel activity, such as milk, milk products, and prune juice.

646. Position used while inserting NG tube is .....
a. Supine
b. High Fowler's
c. Low Fowler's
d. Orthopneic

Explanation: High fowler's position facilitate the entry of tube easily. So it is the indicated position.

647. Nurse is about to insert Ryle's Tube for a patient. Before this act, she must be aware of the distance between incisor teeth and gastro esophageal junction. Which of the following is correct distance? *(NCFL 2019)*
a. 30 cm
b. 40 cm
c. 50 cm
d. 60 cm

Explanation: Measurements obtained during endoscopic examination reveal the average distance from the incisor teeth to the gastroesophageal junction to be 38 to 40 cm in men and 36 to 38 cm in women. 40 cm is the closest answer to both the ranges.

648. Rapid effect of antacid medication will be there if they are taken _____
a. At bedtime
b. On an empty stomach
c. After food
d. Every 4 hourly

649. A 45-year-old male patient is on total parenteral nutrition (TPN). Which of the following assessment is important for this patient?
a. Assess the bowel sound
b. Assess the peripheral IV site for extravasation injury
c. Confirmation that the tube is in the stomach
d. Fluid and electrolyte monitoring

Explanation: Total parenteral nutrition (TPN) is a method of feeding that bypasses the gastrointestinal tract. Fluids are given into a vein to provide most of the nutrients the body needs. Because of the nutritional composition of TPN, it is important to monitor the patient's fluid status, electrolytes, blood glucose and weight.

650. Abdominoplasty is .....
a. Removal of the larger skin wrinkles and folds from the face and neck
b. Removal of excess abdominal skin and fat
c. Smoother appearance of photo damaged and wrinkled skin
d. Improve the appearance of photo damaged and acne scarring

651. Following inguinal herniorrhaphy scrotal edema can be reduced by .....
a. Providing Trendelenburg position
b. Hot water fomentation
c. Restrict fluid intake
d. Scrotal support with ice bag

652. All of the following activities promotes Valsalva's maneuver, EXCEPT:
a. Enema administration
b. Gagging while toothbrushing
c. Lifting heavy objects
d. Use of stool softeners

Explanation: Stool softeners prevent constipation and straining at stool and prevents the patient to perform Valsalva maneuver. Gargling while tooth brushing, lifting heavy objects and enema administration promotes Valsalva's maneuver.

653. Which among the following diet will be helpful for maintaining positive nitrogen balance?
a. High-protein, high-carbohydrate, low-fat diet
b. High calorie low protein diet
c. Low calorie low protein and low fat diet
d. High calorie low protein and high fat diet

654. Best vein for total parenteral nutrition is:
a. Subclavian vein
b. Femoral vein
c. Brachial vein
d. Saphenous vein

Explanation: Subclavian vein is commonly used to administer Total Parenteral Nutrition (TPN) through Peripherally Inserted Central Catheter (PICC) line.

655. Nursing education of a client with oral iron therapy include
a. Take medicine on empty stomach
b. Citrus fruits enhance the iron absorption
c. Don't take medication along with milk and milk products
d. All of the above

656. Peritoneovenous shunt move fluid from
a. Abdomen to peritoneum
b. Peritoneum to abdomen
c. Peritoneum to veins
d. Pulmonary vein to peritoneum

657. Side effect of omeprazole is .....
a. Heart burn
b. Constipation
c. Itching
d. Icterus

658. Combination of omeprazole, clarithromycin and metronidazole regimen is the treatment of choice for .....
a. Food poison
b. Irritable bowel syndrome
c. Helicobacter pylori infection
d. Celiac disease

659. Postoperatively after the initiation of feed following esophagectomy client develops increasing pain, fever and dyspnea. These are suggestive of
a. Feed intolerance
b. Anastomosis leakage into mediastinum
c. Gastritis
d. GERD

660. Important management of diarrhea is .....
a. More intake of liquids
b. Start metronidazole
c. Isolate the client
d. Start antibiotic based on stool culture and sensitivity

661. In a patient with decreased or absent gag reflex, side lying position is given to .....
a. Prevent aspiration
b. Prevent bed sore
c. Stimulate gag reflex
d. Maintain nutritional status

662. Activation of ..... leads to increase in peristalsis
a. Sympathetic stimulation
b. Parasympathetic stimulation
c. RAAS activation
d. ACE inhibition

Ans.

646. b
647. b
648. b
649. d
650. b
651. d
652. d
653. a
654. a
655. d
656. c
657. b
658. c
659. b
660. a
661. a
662. b

Scanned with CamScanner

663. Identify clear fluid diet among the following .....
a. Black tea or black coffee
b. Apple juice
c. Gelatin
d. All of the above

664. Gastric aspiration can leads to .....
a. Water and electrolytes imbalances
b. Bicarbonate imbalance
c. Protein and fat imbalances
d. Micronutrient deficiency

665. Pantoprazole is .....
a. H2 receptor block
b. Proton pump inhibitor
c. Beta agonist
d. Adrenergic

666. Ranitidine (zantac) is .....
a. H2 receptor block
b. Proton pump inhibitor
c. Beta agonist
d. Adrenergic

667. Gastric acid is neutralized in the intestine due to the action of .....
a. Pepsinogen
b. Bicarbonate
c. Erythropoietin
d. Calcium carbonate

668. Richest source of energy among the following is .....
a. Cereals
b. Rice
c. Glass of orange juice
d. Glass of milk

669. The best dietary choice for an obese person is
a. Carbohydrate rich diet
b. Carbohydrate and protein rich diet
c. High protein, low-fat diet
d. Low calorie diet

670. Which of the following is considered to be a clear liquid diet
a. Pasteurized milk
b. Ice cream
c. Plain gelatins
d. Fresh orange juice

Explanation: Milk, ice cream (contains milk) and freshly squeezed orange juices are not considered to be clear liquid diet. Plain gelatins (Jello) can be given to a patient who is on a clear liquid diet.

671. True about hepatocellular carcinoma (HCC) is:
a. They are usually nonresectable because of rapid growth and metastasis
b. Cirrhosis, hepatitis B and C and certain chemicals are the causative factors
c. HCC most commonly metastasizes to lungs, adrenals, lymph nodes, or bone
d. All of the above

Ans.
663. d
664. a
665. b
666. a
667. b
668. c
669. d
670. c
671. d

ENT SYSTEM

ANATOMY OF EAR

Figure 37 ■ Anatomy of ear

- Ear is an organ of hearing and equilibrium.
- Three divisions of ear are:
  - Outer (external) ear
  - Middle
  - Inner (Internal) ear

Outer (External) Ear

- Consists of pinna and the external auditory meatus.
- Pinna is made up of elastic cartilage.
- Pinna collects and reflects the sound waves into external auditory canal.
- External auditory meatus extends from pinna to the tympanic membrane. Its length is about 2.5 cm and 0.7 cm in diameter.
- It secretes wax from the ceruminous glands and oil from sebaceous glands.

Middle Ear

- It is also known as tympanic cavity
- It includes:
  - Tympanic membrane
  - Eustachian tube
  - Ear ossicles
  - Windows and muscles
- Tympanic membrane is a cave shaped structure. Concavity is directed towards the external auditory meatus.
- Eustachian tube connects the middle ear with pharynx. It is approximately 35 mm long and 3 mm in diameter.
- There are three ear ossicles:
  - Malleus (Connected to inner surface of the tympanic membrane)
  - Incus (Middle ossicle; articulates with head of Malleus)
  - Stapes (Smallest bone of the body; head articulates with incus; oval footplate contacts the membrane of the oval window of cochlea)
- Windows
  - Oval window (fesnestra vestibule) is present above; it transmits the sound vibrations of ossicles to the perilymph.
  - Round window is present in the lower part. It accommodates the pressure waves transmitted to the perilymph.
- Muscles: middle ear consists of two muscles:
  - Tensor tympani and Stapedius.
  - Stapedius is the smallest muscle of the body

Inner (Internal) Ear

- It contains organs of sense of hearing and balance.
- It consists of the bony labyrinth. Three parts of bony labyrinth are:
  - The vestibule
  - The semicircular canals
  - The cochlea
- Perilymph is the fluid present in the scala tympani and scala vestibule compartments of cochlea. It resembles ECF (high in Na^+ and low in K^+).
- Endolymph is the fluid present in the scala media or the membranous cochlea. It resembles ICF (High in K^+ and low in Na^+).
- **Organ of Corti is the sense organ of hearing.**

Auditory Pathways

- Afferent fibers supplying the hair cells constitute the cochlear division of VIII cranial nerve.
- The cochlear nerve ends in the cochlear nuclei in medulla.

Scanned with CamScanner

- Major areas constituting auditory cortex present in the temporal lobes are:
  - Primary auditory cortex (Areas 41 and 42)
  - Auditory association areas (Areas 20, 21, and 22)

PHYSIOLOGY OF HEARING

- Sound waves are the stimuli for the receptors of sound waves.
- The range of human hearing is approximately 20 – 20,000 Hz.
- Range of average speaking voice is approximately 2000 – 5000 Hz.
- External ear captures the sound waves and conducts (via external auditory meatus) the sound waves to tympanic membrane → The sound waves causes Tympanic membrane to vibrate → The vibrating tympanic membrane causes ear ossicles to vibrate → vibration of basilar membrane → Stimulation of hair cells → movement of hair cells of organ of corti causes their depolarization leading to generation of actional potential in neuron → Neural transmission of signals from hair cells to the auditory cortex → Neural processing of Auditory information

Key Points

- **Myringotomy** is a surgical incision of tympanic membrane. Commonly done to drain pus present in the middle ear
- **Otosclerosis:** Bony fusion between the foot plate of the stapes and the margins of the fenestra vestibule. This leads to loss of hearing (deafness)
- **Acoustic neuroma** is a tumor of Schwann cells of VIII cranial nerve.

Diagnostic Tests

Table 27 Description of diagnostic tests for ear disorders

Name of the test	Description	Points to remember
Otoscopic examination	• Examiner holds otoscope in the right hand and the pinna with left hand • The color of the healthy tympanic membrane is pearly grey. • It is positioned obliquely at the base of canal.	• To straighten the external auditory canal • **In adult:** Pinna has to be grasped upward and back ward • **In children:** Pinna has to be grasped downward and backward
Whisper test	• One ear is tested at a time, the untested ear is covered with palm of hand • Examiner stands 1-2 feet away from the client and stay outside the visual field. • The examiner whispers in the ear to be tested. • A person with normal hearing can repeat what examiner said.	
Weber test	• It is a bone conduction test to assess lateralization of sound. • Examiner vibrates a tuning fork and places it on the forehead or head of the client. • A person with normal hearing will hear sound equally in both ears or says that sound originates from the center of head.	• **Conductive hearing loss:** Client will hear better in the affected ear. This is because the affected side will be free from external noises, so it will hear the bone conduction loudly than the normal ear. • **Sensorineural hearing loss:** Hearing is better in the unaffected ear or in the ear with least problem.
Rinne test	• Vibrating tuning fork is placed in the mastoid bone (bone conduction) of the patient. When no longer sound is audible it will be taken two inches from the opening of ear canal (air conduction). • In a normal person when tuning fork is taken to the front of ear canal, usually sound will be audible. • This test helps to **differentiate between conductive hearing loss and sensory neural hearing loss.**	• **Conductive hearing loss:** Longer duration (or equal) of sound conduction when the tuning fork is placed behind the ear at mastoid process than tuning fork in the front of ear. • **Sensory-neural hearing loss:** Longer duration of sound conduction when the tuning fork is in front of the ear than at the mastoid process. • In a person with normal hearing ear air conduction sound is louder than bone conduction.
Audiometry	• Most important test in determining hearing loss. • Two types of sounds are used (1) Pure or musical tone (2) Speech • Frequency, pitch and intensity are assessed • Normal human ear can perceive **frequency ranging from 20-20,000 Hz.**	• Audiometric evaluation needs to be done in sound proof room. • Response plotted in a graph is known as audiogram.
Tympanogram Or Impedance audiometry	• A graphic representation of the relationship between the air pressure in the ear canal and the movement of tympanic membrane, and the tiny bones in the middle ear.	

Contd...

Scanned with CamScanner

Name of the test	Description	Points to remember
Electronystagmography	• Measurement of electrical potential evoked by eye movements • Occulomotor and vestibular system and its interaction is also assessed.	• Used to diagnose Meniere's disease, internal auditory canal tumor and posterior fossa tumors.
Platform posturography	• To analyze the postural control capabilities	• Patient may be exposed to stationary platform and moving screen, moving screen and moving platform etc.

Weber's and Rinne's test are the tests done to assess hearing loss. The interpretation of the tests is:

Figures 38 A and B (A) Weber Test; (B) Rinne's Test

Interpretation of Weber's and Rinne's tests given as follows:

Table 28

	Normal	Conductive hearing loss	Snhl
Rinne	AC > BC Rinne +ve	BC > AC Rinne -ve	AC > BC Rinne +ve
Weber	«	Lateralized to poor ear	Lateralized to better ear

Abbreviations: BC, bone conduction; AC, air conduction; Snhl, sensorineural hearing loss

DISORDERS OF ENT

Otitis Media

- Inflammatory disease of the middle ear
- Types
  - **Acute otitis media (AOM):** Less than 3 weeks
  - **Sub-acute otitis media:** 3 weeks to 3 months
  - **Chronic otitis media:** 3 months or longer
- **Acute suppurative otitis media**
  - Common among children due to shorter Eustachian tube
  - **Signs and symptoms:** Heaviness in the ear, severe ear pain at night, tinnitus, cart wheel appearance of ear drum and deafness
  - Otorrhea with mucopurulent discharge occurs during suppurative stage
  - Pulsatile discharge occurs (lighthouse sign)
  - Pneumatic otoscopy is the gold standard diagnostic test
- **Treatment**
  - Tetracycline, erythromycin, penicillin or ampicillin for 6 days
  - Glycerin carbolic ear drops or warm olive oil to reduce pain
  - Antibiotic drops such as Chloramphenicol, spirit boric drops (to be used after perforation of tympanic membrane)
- **Surgical interventions**
  - **Myringotomy:** TM is incised to drain the middle ear cavity.
  - **Myringo-puncture:** Puncture the middle ear with a long needle to aspirate the middle ear contents
- **Chronic otitis media (COM)**
  - Chronic infection of middle ear cleft mucosa
  - Three types of COM includes:
    - **Chronic suppurative otitis media (CSOM):** Most common type; intermittent of continuous otorrhea present
    - **Chronic nonsuppurative otitis media (CNSOM):** No otorrhea
    - **Chronic specific otitis media:** TB OM or Syphilitic OM

Scanned with CamScanner

Otosclerosis

- **Autosomal dominant hereditary disorder** of labyrinthine capsule of middle ear
- Characterized by **bony overgrowth around the ear ossicles.**
- Fixation of ear ossicles leads to **conductive hearing loss**
- If the condition is affecting inner ear (cochlear sclerosis) it will lead to sensory-neural hearing loss.
- **Manifestation**
  - Gradual onset of hearing loss which may be severe in one ear.
  - Tinnitus, a constant ringing in the ears with no external source.
- **Diagnosis**
  - Otoscopy shows **Schwartze's sign** (reddish blue color of the tympanic membrane which suggests vascular changes).
  - Pneumo otoscopy to rule out other reasons for hearing loss.
  - **Audiometry**, weber test (sound is heard more in the ear with conductive hearing loss), Rinne test (negative)
- **Management**
  - Removal of bony overgrowth surrounding the ear ossicles
  - A partial or complete stapedectomy with prosthesis (fenestration).
- **Post-operative care following fenestration**
  - Inform the client that initially hearing will be poor and it will be improved as edema resolves
  - Assist the client in ambulation as there is a chance of vertigo
  - Instruct the patient to slowly move the head in order to prevent vertigo.
  - Instruct the client to avoid sneezing, coughing, sudden change in position, nose blowing, straining and high altitude because these may increase the pressure in the middle ear and cause prosthesis dislodgement

Tympanic Membrane Perforation

- Rupture or perforation of tympanic membrane is caused by infection or trauma.
- **Causes:** Foreign body such as pointed objects, skull fracture, trauma, removal of ear wax
- **Manifestations:** Otalgia, fullness, discomfort, blood stained discharge from ear, hearing loss, vertigo, tinnitus.
- **Diagnosis:** Otoscopy, tympanogram, audiometry
- **Management:**
  - Usually perforated tympanic membrane heals spontaneously
  - Lesions which do not heal need to be treated surgically with tympanoplasty.

Meniere Disease (Meniere Syndrome or Idiopathic Endolymphatic Hydrops)

- Malabsorption of the endolympahtic fluid causes inner ear fluid imbalance.
- **Clinical manifestation:** Hearing loss, tinnitus, vertigo along with nausea and vomiting, pressure in the ear
- **Diagnosis:** Audiogram shows ear with sensory neural hearing loss, weber test will report sound is better heard in the unaffected ear.
- **Management**
  - Sodium restriction helps to control the fluid balance in endolymphatic sac
  - Symptomatic management for nausea, vomiting and vertigo.
- **Surgical management:** Endolymphatic sac decompression, infusion of ototoxic medication to inner and middle ear, vestibular nerve dissection, intraotologic catheter.

Key Points

Ensuring client safety and environment safety is the priority nursing intervention while caring for a client with Meniere's disease.

Labyrinthitis

- Bacterial or viral inflammation of the inner ear
- **Clinical manifestation:** Hearing loss, tinnitus, vertigo, nausea and vomiting
- **Management:** Antibiotic therapy for bacterial labyrinthitis, viral labyrinthitis needs symptomatic management.

DISORDERS OF NOSE

Epistaxis

- It is also known as nose bleed
- Anterior septum is the most common site of nose bleed.
- **Causes:** Nasal blowing, trauma, insertion of any object etc
- **First aid management**
  - Pinch the nose and apply direct pressure over the area to control bleeding
  - Ask the client to attain sitting position with leaning forward to avoid secretions to not to go down the throat.
- **Treatment**
  - Vasoconstrictor medications are the drug of choice, e.g. **adrenaline 1:1000, phenylephrine** etc.

Key Points

Most of the nasal bleed occur from Kiesselbach's plexus or little's area of the nose

Rhinitis

- Inflammation of nasal mucosa is caused by bacteria, virus or allergen
- **Clinical manifestation:** Running nose, sneezing, nasal congestion, headache
- **Management**
  - **Viral rhinitis:** Symptomatic management
  - **Allergic rhinitis:** Anti-histamine are the drug of choice.
  - **Bacterial rhinitis:** Anti-microbial therapy
  - Nasal decongestant may also be prescribed.

Sinusitis

- Inflammation of paranasal sinus caused by bacteria, virus or allergens
- **Clinical manifestation:** Fever, headache, nasal congestion, purulent nasal discharge, otalgia, and facial pain
- **Management:** Antimicrobial therapy and nasal decongestant are the drugs of choice
- **Complication:** Meningitis, abscess, ischemic infraction, osteomyelitis

Nasal Obstruction

- Obstruction of nasal passage due to polyp like growth, deviated nasal septum, neoplasm, turbinate hypertrophy, congenital obstruction (choanal atresia) etc
- Obstruction cause difficulty in passage of air through one or both nostrils.

Scanned with CamScanner

- **Management**
  - Often surgery is required to remove the obstruction.
- **Nursing Responsibility following surgery**
  - Provide upright position to promote drainage
  - Provide frequent mouth care to prevent dryness of oral mucosa.

Deviated Nasal Septum

- Deviated nasal septum is a condition in which nasal septum deviate to one side and makes the air flow through the passage more difficult.

Nasal Polyps

- Non-cancerous growth on the nasal mucosa and sinus which leads to loss of sense of smell and frequent infection.

DISORDERS OF THROAT

Pharyngitis

- Inflammation of pharynx
- **Causes:** Bacteria or virus. If caused by group a beta hemolytic streptococci then it will be known as strep-throat.
- **Clinical manifestation:** fever, red swollen pharynx, sore throat
- **Viral pharyngitis:** only symptomatic management.
- **Pharyngitis caused by bacteria:** Penicillin or erythromycin. If allergic or resistant to these drugs then **cephalosporin** group is needed.
- **Complication associated with step-throat** are rheumatic fever, nephritis, otitis media, mastoiditis.

Tonsillitis

- Tonsils are the lymphatic tissue
- Inflammation of tonsil is known as tonsillitis
- **Clinical manifestation:** Red swollen tonsils, fever, dysphagia and sore throat
- Tonsillectomy is the surgical treatment of choice in case of recurrent infection and fails to respond to antibiotic therapy.

Adenoiditis

- Adenoid is the lymphatic tissue
- Inflammation of adenoid is known as adenoiditis.
- **Clinical manifestation:** Mouth breathing, snoring, foul smell in the mouth, fever
- **Complications:** Otitis media and mastoiditis.
- **Adenoidectomy** is the surgical treatment of choice in case of recurrent infection and fails to respond to antibiotic therapy.

Post-operative care following tonsillectomy and adenoidectomy

- Place the client in prone position to promote drainage of secretion from the oral cavity and to prevent aspiration
- Observe the client for major complication associated with the surgery i.e. hemorrhage. Frequent swallowing among the client indicate hemorrhage.
- Repeated bright red color vomiting indicates hemorrhage
- Client should avoid activities which cause strain in surgical site such as coughing, gargling and vigorous brushing
- Client should avoid food items which are spicy, hot, acidic, milk and milk products.

Peri-Tonsillar Abscess

- It is also known as **quinsy**
- Collection of pus in the peri-tonsillar space
- It occurs as a complication of tonsillitis
- **Clinical manifestation:** Fever, malaise, odynophagia, dysphagia, dyspnea, dysphonia, severe throat pain, bad odor from mouth
- **Management:** Antibiotic therapy, analgesics and oral hygiene.
- **Surgical management** involves incision and drainage of abscess.

Laryngitis

- Inflammation of larynx is characterized by hoarseness of voice or aphonia.
- **Causes:** Exposure to smoke, dust, allergens and other pollutants.
- **Management:** Antibiotic therapy, voice rest and avoid agents such as smoke, chemical, dust etc.

Key Points

Increased fluid intake and warm humidified environment is recommended to loosen the secretions in these clients.

Golden points to remember

- Normal hearing frequency of child and adult is **16–20,000 Hz.**
- Organ most damaged in bomb explosion is **Ear**.
- **Myringotomy** involves an incision in the tympanum to release the increased pressure and exudates from the middle ear.
- **Cholesteatoma** is a complication of chronic otitis media. It is a mass of epithelial cells and cholesterol in the middle ear.
- **Schwartz's sign** is reddish bluish of tympanum mainly present in **otosclerosis**.
- **Flamingo pink sign** or Schwartz sign is visible in otosclerosis.
- Meniere's disease **(Endolymphatic hydrops)** is a disease of the inner ear characterized by recurring episodes of vertigo, tinnitus and deafness.
- **Acoustic Neuroma or Vestibular Schwannoma** is a benign tumor that occurs where the acoustic nerve (CN VIII) enters the internal auditory canal.
- Normal hearing is **0 -15 dB** range, the profound deafness occurs due to the sound level reaches above 91dB.
- Normal conversation sound level is 60 dB.
- Permissible level of noise in industries in India:
- 90 dB for 8 hours a day × 5 days a week.
- Syringing is done in Posterosuperior direction to remove wax.
- Ototoxicity is due to damage to Outer hair cells of cochlea.
- Least toxic aminoglycoside is Natilmycin.
- Viral infections associated with hearing loss is MMR.
- Tubercular Otitis Media → Painless otorrhea, fails to respond to usual antimicrobial, multiple TM perforation, pale granulation tissue present.
- Fluctuating deafness is seen in Meniere's disease.
- Stapedectomy/Stapedotomy is the surgical management of otosclerosis.
- Average length of male vocal cord is 18-23 mm.
- Average length of female vocal cord is 16-17 mm.
- All muscles of larynx are supplied by recurrent laryngeal nerve (except cricothyroid which is supplied by external division of SLN).
- A nurse caring for a patient subjected to total laryngectomy should plan for **alternate communication method**.
- **Mulberry mucosa** is seen in Hypertrophic rhinitis.
- The beta-2 transferrin assay is the test of choice for **Confirmatory test**.
- Most of the nasal bleeds occur from Kiesselbach's plexus or little's area of the nose.
- Weber's and Rinne's test are the tests done to assess hearing loss.
- In **Rinne's test**, bone conduction if better than air conduction indicates conductive hearing loss.
- In **Weber's test**, lateralization of sound to affected side indicates unilateral conductive hearing loss.
- In **Weber's test**, lateralization of sound to normal or better-hearing side indicates unilateral sensorineural loss.

Most Common

- Most common cause of hearing loss is Impacted wax.
- Most common cause of hearing loss in children is Secretory otitis media.
- Most common complication of Chronic Suppurative Otitis Media (CSOM) is Mastoiditis.
- Most common tumor of middle ear is Glomus tumor.
- Most common histopathological variety of CA larynx is Squamous cell carcinoma.
- Most common sinusitis in children is Ethmoid.
- Most common sinusitis in Adult is Maxillary.
- Most common benign tumor of sinus is Osteoma.
- Most common fracture of bone of face is Nasal bone.

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

ANATOMY AND PHYSIOLOGY

672. All are sinuses and belong to paranasal sinuses, except: *(Safdarjung NO 2018)*

a. Maxillary b. Ethmoid
c. Sphenoid d. Mastoid

Ref: BD Chaurasia's, Human Anatomy, 7th edition, 2016, Vol. 3, PP. 254–255

Explanation: Mastoid is a bone present in the ear. The remaining others are paranasal sinuses. Paranasal sinuses are a group of air-filled spaces that surround the nasal cavity. There are four paranasal sinuses named after the bone where it is located.

Ethmoidal: Located between the eyes
- **Sphenoidal:** Located behind the eyes
- **Maxillary:** Located under the eyes
- **Frontal:** Located above the eyes

The functions of the sinuses are:
- Lighten the skull
- Improve our voices
- Produce mucus that moisturizes the inside of the nose. This mucus layer protects the nose from pollutants, microorganisms, dust and dirt.

Figures: A and B ■ Paranasal sinuses

673. Ear pinna develops from?

a. Ectoderm b. Endoderm
c. Mesoderm d. All

Explanation:

Development of Ear
- Developmentally, the internal ear appears first from an ectodermal vesicle, the otocyst.
- The middle ear develops next from the endoderm of the tubotympanic recess.
- The external ear appears last from the ectodermal first branchial cleft.

674. Which of the following attains adult size before birth?

a. Parietal bone b. Mastoid
c. Maxilla d. Ear ossicles

675. Function of ear ossicles is

a. Amplification
b. Equilibrium
c. Impedance matching
d. None of the above

676. Type of joint between the ear ossicles:

a. Primary cartilaginous b. Synovial joint
c. Secondary cartilaginous d. Fibrous joint

677. Nerve supply of the tympanic membrane is by

a. Lesser occipital b. Parasympathetic ganglion
c. Auriculotemporal d. Greater occipital

678. Concha present in the nasal cavity helps to .....

a. Divide the nose into right and left
b. Helps in immunological reaction
c. Filter the air and dust in the inhaled air
d. They increase the surface area

Ans.

672.	d
673.	a
674.	d
675.	c
676.	b
677.	c
678.	d

Scanned with CamScanner

679. All of the following are blood supply of tonsils except
a. Facial artery b. Maxillary artery
c. Lingual artery d. Middle meningeal artery

680. Primary auditory area is
a. Inferior temporal gyrus b. Occipital cortex
c. Superior temporal gyrus
d. Frontal cortex

681. Ear structure is enclosed by .....bone
a. Frontal b. Parietal
c. Occipital d. Temporal

682. Length of tympanic membrane
a. 10 mm b. 8 mm
c. 6 mm d. 4 mm

683. The length of Eustachian tube is
a. 16 mm b. 24 mm
c. 36 mm d. 40 mm

684. Cranial Nerve VIII exits through which of the following?
a. Foramen ovale b. Foramen rotundum
c. Internal acoustic meatus d. Stylomastoid foramen

685. Number of muscles in middle ear
a. 1 b. 2
c. 3 d. 4

686. Ear lobule is made-up of
a. Elastic cartilage b. Hyaline cartilage
c. Fibrocartilage d. All of the above

687. The auditory ossicles are
a. The malleus, incus and stapes
b. Located in the inner ear
c. Structures that decrease the vibrations from the tympanic membrane
d. Connected to the round window

688. Auditory tube is also known as
a. Middle ear b. External ear
c. Inner ear d. Eustachian tube

689. The structure that opens into the pharynx and enables air pressure to be equalized between the middle ear and the outside is the
a. Oval window b. Round window
c. Eustachian tube d. Auditory ossicles

690. Auditory tube opens into
a. Oropharynx b. Nasopharynx
c. Trachea d. Esophagus

691. Nasopharynx is lined by which epithelium
a. Ciliated columnar
b. Stratified squamous keratinized
c. Stratified squamous nonkeratinized
d. Cuboidal

692. VIII cranial nerve affects
a. Taste b. Equilibrium
c. Touch d. Smell

693. Labyrinth is also known as.....
a. Ear pinna b. Middle ear
c. Inner ear d. Semicircular canal

694. Oval window is adjacent to .....ear ossicle
a. Malleus b. Incus
c. Cochlea d. Stapes

695. The organ of Corti is
a. Located in the scala tympani
b. Made up of specialized sensory cells with hair-like projections
c. Located in the Eustachian tube
d. Afferent nerve fibers that form the tectorial nerve

696. Semicircular canals are present in .....
a. Outer ear b. Middle ear
c. Cochlea d. Inner ear

697. Tonsils reach their maximum size by
a. 1 years b. 3 years
c. 5 years d. 12 years

698. Nerve supply of tonsil is
a. Facial nerve b. Hypoglossal nerve
c. Glossopharyngeal nerve d. Vagus nerve

DISORDERS OF ENT

699. Epistaxis management includes the following actions, EXCEPT: *(AIIMS BBS NO 2018)*
a. Applying pressure by pinching the nose
b. Applying ice over the nose
c. Allowing the patient to sneeze
d. Keeping the patient in sitting position with the neck flexed

Explanation: Allowing the patient to sneeze as may worsen the bleeding. All other interventions are recommended in the management of epistaxis.

700. Vertigo is due to problem in: *(Daman and Diu NO 2018)*
a. External ear b. Tympanic membrane
c. Inner ear d. Middle ear

Explanation: Vertigo refers to a sense of spinning dizziness. Vertigo that is caused by problems in the inner ear is known as peripheral vertigo, or problems in the brain or nervous system is known as central vertigo. External ear, tympanic membrane and middle are not the causes of vertigo.

701. Examination of external ear and tympanic membrane is done with the help of .....
a. Otoscope b. Ophthalmoscope
c. Proctoscope d. Tuning fork

702. Which of the following is an unexpected finding during an otoscopic examination of the ear? *(AIIMS-BBS SNO 2019)*
a. Malleus visible behind the tympanic membrane
b. Pearl grey tympanic membrane
c. Flaky skin in the external canal near the tympanic membrane
d. Black cerumen occluding the tympanic membrane

Explanation: Normally tympanic membrane is pearly grey and shiny. Cerumen (ear wax) is normally of yellow to brown color. Black colored cerumen is not present normally, it indicates abnormality.

703. The ear bones that transmit the vibrations to cochlea are situated in: *(JIPMER 2012)*
a. Middle ear b. Inner ear
c. Outer ear d. Eustachian tube

704. Infection of middle ear is called: *(LNJP H D 2012)*
a. Otitis media b. Labyrinthitis
c. Sinusitis d. Mastoiditis

705. Otosclerosis is also known as
a. Otofibrosis b. Otospongiosis
c. Otophysis d. Otorrhea

706. Otosclerosis commonly presents with?
a. Fluctuating hearing loss b. Conductive deafness
c. Mixed hearing loss d. Sensorineural deafness

Ans.

679.	d
680.	c
681.	d
682.	a

Scanned with CamScanner

707. **Which of the following procedure is used to correct otosclerosis?** *(Staff Nurse G II 2014)*
a. Myringotomy b. Mastoidectomy
c. Stapedectomy d. Myringoplasty

708. **How to hold pinna in children younger than 3 years of age while observing the ear canal?**
a. Pull the pinna downward and backward
b. Pull the pinna upward and backward
c. Pull pinna backwards
d. Pull pinna upwards

709. **While instilling ear drops to an adult client, the ear canal is straightened by pulling the pinna** *(DSSSB 2013)*
a. Straight backward b. Downwards and backwards
c. Straight downward d. Upwards and backwards

Explanation: With the non-dominant hand, straighten the external ear canal by gently pulling up and back on the ear for an adult, or down and back for a child.

710. **Which of the following diet is suitable for a patient with Meniere's syndrome**
a. High-fiber diet b. Low sodium diet
c. High-protein diet d. Iodine rich diet

711. **All of the following conditions are contraindicated for irrigation of ear EXCEPT**
a. Otitis externa
b. Tympanic membrane perforation
c. History of middle ear infection before 6 months
d. Repaired cleft palate

Explanation: Contraindications for irrigation of ear includes
- Complications following previous ear irrigation
- A current ear infection or an infection within the last 6 weeks.
- Any previous ear surgery (apart from grommets which have come out 18 months ago)
- Grommets in situ
- A current perforation or history of ear perforation
- A cleft palate (even if it has been repaired)
- Recurrent otitis externa

712. **Method of choice to remove ear wax is .....**
a. Mineral oils b. Cotton swab applicator
c. Warm normal saline irrigation
d. Otoscope

713. **Which among the following needs to include in the nursing health teaching plan following tympanoplasty?**
a. Maintain NPO
b. Ask the patient to walk around
c. Provide fowlers position
d. Avoid forceful nose blowing

714. **Age related hearing loss is known as:** *(AIIMS-BBS SNO 2019)*
a. Otosclerosis b. Otitis media
c. Presbycusis d. Presbyopia

Explanation: **Presbycusis is the hearing loss that gradually occurs in older people. It is the most common type of sensorineural hearing loss caused by natural aging of the auditory system.**

715. **Profound hearing loss is described as greater than:** *(AIIMS BBS NO 2018)*
a. 20 dB b. 60 dB
c. 80 dB d. 40 dB

Explanation:

Degree of hearing	Decibels (dBs)
Normal hearing	0-20 dB
Mild hearing loss	24-39 dB
Moderate hearing loss	40-69 dB
Severe hearing loss	70-89 dB
Profound deafness	90 dB+

The options which is closest to profound hearing loss is 80 db.

716. **Maximum audible tolerance is?**
a. 90 db for 6 hours b. 90 db for 8 hours
c. 85 db for 6 hours d. 85db for 8 hours

Explanation:
- Permissible exposure in cases of continuous noise or a number of short term exposures. [Government of India, Ministry of Labour, Model Rules under Factories Act 1948 (corrected up to 31.3.87)]
- Noise level* (dBA) Permitted daily exposure (hours)

Nose level (dB)	Permitted daily exposure (hrs)
90	8.0 hrs
92	6.0 hrs
95	4.0 hrs
97	2.0 hrs
100	2.0 hrs
102	1 ½ hrs
105	1.0 hrs
110	30 mins
115	15 mins

5 dB rule of time-intensity states that "any rise of 5 dB noise level will reduce the permitted noise exposure time to half"

717. **Conductive hearing loss is caused by all EXCEPT**
a. Foreign body obstruction in auditory canal
b. Perforation of the tympanic membrane
c. Freezing of the ossicles
d. Damage to 8th cranial nerve

718. **Which among the following is a cause for sensorineural hearing loss?**
a. Foreign body obstruction in auditory canal
b. Perforation of the tympanic membrane
c. Freezing of the ossicles
d. Damage to 8th cranial nerve

719. **The risk factors of sensorineural impairment includes the following:** *(AIIMS Raipur Grade II 2017)*
a. Family history of sensorineural impairment
b. Congenital malformations of the cranial structures
c. Chronic exposure to loud noise
d. Recurrent ear infection
a. A, B, C b. B, C, D
c. A, B, D d. A, C, D

Explanation: The risk factors include ototoxic medication, hyperbilirubinemia, in utero infections (including CMV, rubella, syphilis, herpes, and toxoplasmosis), craniofacial anomalies,

Ans.

717.	d
718.	d
719.	c

Scanned with CamScanner

syndromes associated with Sensory neural hearing loss, low birth weight (<1, 500 g), low Apgar score, mechanical ventilation lasting for 5 days or longer, bacterial meningitis, family history of hereditary childhood SNHL, endocranial hemorrhage, hypoxic ischemic encephalopathy, convulsions, and sepsis

720. The patient who has a conductive hearing loss
a. Hears better in a noisy environment
b. Hears murmur
c. Often speaks loudly speaks loudly because his or her own voice seems low.
d. Hear sounds less than 30 db

721. Risk associated with long term use of Lasix (frusemide) is
a. Renal failure
b. Tinnitus and hearing loss
c. Hypervolemia
d. Hyperkalemia

722. Which among the following techniques can be used by a nurse while communicating with a client who has hearing impairment?
a. Do face to face conversation
b. Speak normally and slowly
c. Use non-verbal clues
d. All of the above

723. Test used to compare the bilateral hearing of a client is .....
a. Allen's test
b. Weber's test
c. Rinne's test
d. Romberg's test

724. Test used to check whether air conduction or bone conduction is more .....
a. Allen's test
b. Weber's test
c. Rinne's test
d. Romberg's test

725. Test used to assess whether the patient will be able to maintain equilibrium even after the eyes are closed is known as .....
a. Allen's test
b. Weber's test
c. Rinne's test
d. Romberg's test

726. In Weber's test, lateralization of sound to diseased ear indicates: *(AIIMS BBS NO 2018)*
a. Conductive deafness
b. Sensorineural deafness
c. Tympanic deafness
d. Combination of both sensorineural deafness and conductive deafness

Ans.

720.	a
721.	b
722.	d
723.	b
724.	c
725.	d
726.	a

729.	d
730.	a
731.	a
732.	b
733.	b
734.	d
735.	c

Explanation:

727. A client has painless purulent exudate, along with nausea, vomiting and dizziness, the nurse suspects the following condition:
a. Chronic otitis media
b. Otorrhea
c. Meniere's disease
d. Tympanic perforation

728. Complications of chronic suppurative otitis media (CSOM) is .....
a. Cholesteatoma
b. Meningitis
c. Both A and B
d. Conductive hearing loss

729. Commonest intracranial complication of CSOM is
a. Conductive deafness
b. Cholesteatoma
c. Temporal lobe abscess
d. Meningitis

730. Blue ear drum is seen in
a. Serous otitis media
b. CSOM
c. Perforation
d. None

731. Hemorrhagic otitis externa is caused by
a. Influenza
b. Streptococcus
c. Staphylococcus aureus
d. Proteus

732. Malignant otitis externa is caused by
a. Staphylococcus aureus
b. Pseudomonas
c. Staphylococcus epidermidis
d. Klebsiella

Explanation:

Malignant otitis externa

Malignant otitis externa (MOE) is an aggressive and potentially life-threatening infection of the soft tissues of the external ear and surrounding structures, quickly spreading to involve the periosteum and bone of the skull base.

- Pseudomonas aeruginosa is the most common pathogen and is responsible in >95% of cases of MOE.
- The treatment of choice for MOE is systemic anti-Pseudomonas antibiotics.

733. Meniere's disease affects _____
a. Stomach
b. Ear
c. Liver
d. Lungs

734. Clinical manifestation of Meniere's disease is .....
a. Vertigo
b. Tinnitus
c. Deafness
d. All of the above

735. Drugs used in relieving symptoms of Meniere's disease includes all EXCEPT
a. Antiemetics
b. Diuretics
c. Atropine
d. Diazepam

Scanned with CamScanner

736. **Excess endolymph in the vestibular and semicircular canal will lead to .....**
   a. CSOM
   b. Tympanitis
   c. Meniere's disease
   d. Vertigo

737. **Selective low frequency sensorineural hearing loss occurs in**
   a. BPPV
   b. Glomus tumor
   c. Schwannoma
   d. Meniere's disease

738. **Fluctuating deafness is seen in**
   a. Meniere's disease
   b. Otosclerosis
   c. CSOM
   d. ASOM

739. **The most common complaint of patients with disorder in the inner ear is**
   a. Hearing loss
   b. Burning of the ear
   c. Pruritis
   d. Tinnitus

740. **A condition caused by calcification of tissues in the middle ear, sometimes resulting in a detrimental effect to hearing is known as .....**
   a. CSOM
   b. Otosclerosis
   c. Tympanosclerosis
   d. Meniere's disease

741. **Tympanosclerosis is also known as .....**
   a. Myringosclerosis
   b. Otosclerosis
   c. Meniere's disease
   d. CSOM

742. **Postoperative position given after stapedectomy is .....**
   a. The affected side
   b. The unaffected side
   c. Prone
   d. Lateral

743. **Characteristic symptom in Meniere's disease is .....**
   a. Epistaxis
   b. Otalgia
   c. Sensory neural hearing loss
   d. Tinnitus

744. **Pansinusitis refers to inflammation of**
   a. All sinuses on only one side of the nose
   b. All sinuses on both sides of the nose
   c. All sinuses on one or both sides of the nose
   d. Only one sinus on either side of the nose

745. **Acute hemorrhage (bleeding) from the nasal cavity is termed as** *(DSSSB 2013)*
   a. Epistaxis
   b. Hemoptysis
   c. Hematemesis
   d. Rhinorrhea

Explanation: Epistaxis is defined as acute hemorrhage from the nostril, nasal cavity, or nasopharynx. It is otherwise known as nose bleed. There are two types: Anterior (the most common), and posterior (less common, more likely to require medical attention). The vast majority of nose bleeds occur in the anterior (front) part of the nose from the nasal septum. This area is richly endowed with blood vessels (Kiesselbach's plexus). This region is also known as Little's area.

746. **The most common cause of epistaxis is associated with** *(AIIMS Jodhpur Nursing Tutor 2016)*
   a. Rhinorrhea
   b. Infection
   c. Sinusitis
   d. Little's area

Explanation: The vast majority of nose bleeds occur in the anterior (front) part of the nose from the nasal septum. This area is richly endowed with blood vessels (Kiesselbach's plexus). This region is also known as Little's area.

747. **Most common site of nose bleed in a child**
   a. Little's area
   b. Woodruff area
   c. Brown area
   d. None

748. **Epistaxis in elderly person is commonly due to**
   a. Allergic rhinitis
   b. Foreign body
   c. Hypertension
   d. Nasopharyngeal carcinoma

749. **Commonest cause of epistaxis in children is**
   a. Enlarged adenosis
   b. Foreign body
   c. Nasal diphtheria
   d. Trauma

750. **Watery otorrhea is seen in**
   a. CSOM
   b. Glomus tympanicum
   c. Otitis media with effusion
   d. Fracture of temporal bone

751. **A nurse is caring for a 9-year-old child who underwent tonsillectomy. Which of the following observation by the nurse is most concerned?**
   a. 30 mL of dark brown secretions
   b. A heart rate of 90 beats per minute
   c. Expectorating bright red secretions
   d. Infrequent swallowing

Explanation: Spitting out bright red secretions by the child indicates active bleeding. Frequent swallowing also indicates of bleeding.

752. **Which of the following nursing intervention is appropriate while caring for child postoperatively after tonsillectomy and adenoidectomy?**
   a. Allow the child to drink through a straw
   b. Observe swallowing patterns
   c. Offer ice cream every 2 hours
   d. Place the child in a supine position

Explanation: Observing swallowing pattern of the child will help to determine if there is active bleeding from site of surgery. The more the child swallows the more bleeding happens.

OPHTHALMOLOGY

ANATOMY AND PHYSIOLOGY OF EYE

Figure 39 ■ Anatomy of eye

Extraocular Structures

a. **Eye orbit**
- It is the bony socket (4 cm in diameter) of skull and protects the eye by pads of fat.

b. **Eye lids**
- These are composed of thin elastic skin and are responsible to protect anterior portion of eye. Eyelids are covered by palpebral conjunctiva.
- Lid margins contain meibomiam glands (responsible to provide lipoid component to tears) and eye lashes.
- **Upper eyelid movement** is controlled by muscle called levator palpebrae superioris which is innervated by **cranial nerve-III** (Occulomotor nerve).

c. **Conjunctiva**
- It is a thin transparent mucous membrane that nourishes the eye. It is of two types.
- **Bulbar conjunctiva:** It covers sclera.
- **Palpebral conjunctiva:** It covers the inner surface of eyelids.

d. **Lacrimal glands**
- It is an almond shaped exocrine gland.
- Situated in upper and lateral region of each orbit in frontal bone's fossa.
- Responsible to produce tears (Tear has 3 components- mucoid, Lipoid and aqueous).
- Tears produced by lacrimal glands washes sclera, cornea and flows through lacrimal canal → Lacrimal sac → Nasolacrimal duct.

e. **Extra ocular muscles**
- There are 6 extra ocular muscles and these muscles are innervated by three cranial nerves.
- These muscles are responsible to move eyeball.

Table 29 Nerve supply to eye muscles

Cranial nerve-III (Occulomotor nerve)	• Superior rectus muscle • Inferior rectus muscle • Inferior oblique muscle
Cranial nerve-IV (Trochlear nerve)	• Superior oblique muscle
Cranial nerve-VI (Abducent nerve)	• Lateral rectus muscle

Ocular Structures

a. **Eye ball**
- It is 1 inch (2.5 cm) in diameter and is located in orbit.
- It consists of 3 layers:
  - External layer (sclera and cornea)
  - Middle layer (Uveal tract)
  - Inner layer (Retina)

b. **Layers of Eye**
- **External layer (Sclera and Cornea)**
  - **Sclera** is the white part of eye are comprises posterior 5/6 of external layer of eye.
  - **Cornea** is the anterior 1/6 part of external layer of eye. It is transparent, avascular and dome like structure.
- **Middle layer (Uveal tract)**
  - Uveal tract consists of choroid, ciliary body and iris.

- **Choroid**
  - Choroid is the vascular layer (1mm thick) and lies between retina and sclera.
  - Choroid provides nourishment to outer layer of retina
- **Ciliary body**
  - Ciliary body consists of ciliary muscles and ciliary process and it connects the choroid and iris.
  - It has two functions: **Production of aqueous humor** and **Accommodation reflex.**

Scanned with CamScanner

- **Accomodation** is a process of adjustment of lens thickness as per the distance of the object from eye.
- **For focus on closer objects:** Ciliary muscles contract → lens convexity increases (controlled by **parasympathetic nervous system**).
- **For focus on distant objects:** Ciliary muscles relax → flattens the lens (controlled by **sympathetic nervous system**).

- **Iris**
  - It is colored, highly vascularized part of eye behind cornea.
  - Pupil is a space through which light enters into eye. It dilates and constricts in response to light (**Pupillary reflex**).
  - Bright light → stimulates sphincter muscles of iris → pupils constrict (controlled by **parasympathetic nervous system**).
  - Dim light → stimulates dilator muscles of iris → pupils dilate (controlled by **sympathetic nervous system**).
- **Inner layer (Retina)**
  - It is the innermost layer of eye and contains photoreceptors – **Cones and Rods**
  - **Cone cells:** Responsible for central, night and color vision, functions in bright light
  - **Rod cells:** Responsible for peripheral vision, functions in dim light.
  - It is the layer which converts light into nerve impulses.
  - Optic pathway starts from retina and ends with occipital lobe of cerebrum.
  - **Optic disc:** This is where the optic nerve enters the eyeball. It is also known as **blind spot** because it does not contain any photoreceptors.

c. Segments and chambers

Figure 40.1 Segments and chambers of eye

- Eye is divided into anterior and posterior segments.
- **Anterior segment** (contains aqueous humour) is a cavity between cornea and lens which is further divided into anterior and posterior chambers.
- Anterior chamber is a space between cornea and iris.
- Posterior chamber is a space between iris and lens.
- **Aqueous humour is secreted by ciliary body** in posterior chamber and it enters into anterior chamber through pupil.
- **Aqueous humour is a transparent watery fluid similar to** plasma. It provides nourishment to cornea and lens, maintains intraocular pressure (**10 to 21 mm Hg**).
- **Posterior segment** (contains vitreous body) is a cavity between lens and retina.
- Vitreous body is a transparent, colorless, gelatinous mass which makes up 4/5th volume of eye ball and helps to **maintain** shape of eye.

d. Lens
- It is colorless, transparent, biconvex structure
- It is held in position by **zonular fibres** and lies behind iris and pupil.
- Lens has no blood and nervous supply.
- It provides refractive power to eye (**20 diopter**)

ASSESSMENT AND DIAGNOSTIC TESTS

External Eye Examination

Patient is examined for:
- **Ptosis:** Drooping eyelid
- **Ectropion:** Outward turning of eyelid
- **Entropion:** Inward turning of eyelid
- **Nystagmus:** Oscillating movement of eyeball
- **PERRLA:** Pupils Equally Round and Reactive to Light and Accommodation
- Intactness of extraocular muscles is assessed by following the examiner's finger in six cardinal positions of gaze.

Visual Acuity

a. Snellen chart
- It is used to test distance vision from 20 feet or 6 metres and is composed of series of progressively smaller rows of letters.
- If the patient is able to read all the lines then visual acuity (VA) is recorded as 6/6 or 20/20.
- **Abbreviations used**
  - **OD (Ocular dexter):** Right eye
  - **OS (Ocular sinister):** Left eye
  - **OU (Ocular uterque):** Both eyes.

- If the patient is unable to read the largest letter, patient should be moved toward the chart till a distance of 3 m and if still unable to read, examiner should determine if patient can count fingers (CF) at 1 m.
- If patient cannot count fingers then vision can be determined by hand movement (HM).
- A patient who can perceive only light is described as having light perception (LP). Unable to perceive light is documented as no light perception (NLP).
- Near vision is assessed by a hand held card at a distance of 14 inches (35 cm).
- **Legal blindness:** It is defined as the visual acuity in better eye is 20/200 or less or visual field 20 degrees or less

Ishihara Chart for Color Vision

- This test is consisted of a booklet with number of colored plates (38 plates).
- Only 3 sec are given to answer.

Perimetry

- It measures the visual field and helps to identify scotomas (blind areas in visual field).
- Average extent of visual field in a healthy eye during its primary gaze is 65 degrees upward, 75 downward, 60 inward and 95 outward.

Ophthalmoscopy (Fundoscopy)

Direct Ophthalmoscopy

- It is a hand held instrument with various plus and minus lenses.

Scanned with CamScanner

- Examiner holds the ophthalmoscope in right hand and visualizes right eye of patient with his right eye and vice versa.
- Dilation of pupil (Mydriasis by 1 to 2 drops of Tropicamide 0.5%) is done before doing this test for proper visualization.
- This test should be performed in dark room and examiner uses red reflex (red light) through pupil, lens and focuses on retina.
- Macula should be examined in the last because it is highly sensitive to light.
- **Inferences**
  - Papilledema (swelling in optic disc) indicates raised intracranial pressure.
  - Cupped optic disc (Optic cupping) indicates glaucoma (raised intra-ocular pressure).
  - Flame shaped red smudges can be a manifestation of hypertension.
  - Cotton wool spots (caused by micro-infarcts) may indicate diabetic retinopathy, or hypertension.
  - Drusen (tiny, yellowish spots) indicates macular degeneration

Indirect Ophthalmoscopy

- This test should be performed in dark room

Figure 41 ■ Indirect ophthalmoscope

- Ophthalmoscope consists of a light source, which is affixed with a pair of binocular lenses, mounted on examiner's head with a hand held 20 diopter lens.

Slit-lamp Examination

- Slit lamp is a binocular microscope mounted on a table.
- Patient is asked to place the chin in chin rest and forehead against the forehead band to keep the head steady.
- This is used to assess for scleritis, conjunctivitis (pink eye), corneal dystrophy, corneal abrasion, cataract, retinal detachment, and glaucoma.

Tonometry

- Tonometry is done to measure intraocular pressure (IOP) and is of two types:
  - **Contact tonometry:** Done with help of slit lamp, hand held prism and indentation tonometry. Local topical anesthetic and fluorescein dye are instilled into the eye before the test.
  - **Non contact tonometry (NCT):** Air-puff tonometry; helps to calculate IOP by using rapid air to flatten the cornea

Gonioscopy

- It is performed by using slit lamp and special contact lens prism.
- It visualizes the angle between cornea and iris for the proper drainage of aqueous humour.

Amsler Grid

- Used to screen macular degeneration.

Corneal Staining

- It is done to detect corneal abrasions or lesions.
- A piece of blotting paper containing fluorescein (orange) dye is touched to surface of eye and then the patient is instructed to blink which spreads the dye.
- Cornea is looked for any abrasion (appear in green color) by shining a blue light.

Fluorescein Angiography

- It is done to visualize retinal vasculature by taking a series of photographs after administering fluorescein dye into a vein.
- Patient is assessed for any allergy and mydriatic eye drops are administered 1 hour before the test.
- Dye may cause yellowish discoloration of skin, urine and patient may experience nausea, vomiting, weakness of tongue and pain at injection site.
- Reaction to dye is rare but is usually manifested as hives on skin.
- Encourage fluid intake after the procedure for elimination of dye.

DISORDERS OF EYE

Refractive Errors

Refraction is the bending of light rays by cornea and lens, so that the image is formed on the retina (emmetropia).

Myopia (Near Sightedness)

- In this condition, convexity of the lens increases, which increases the refractive power of lens and hence the image falls in front of retina.
- These patients can see the near objects clearly, but distant vision is impaired.

Scanned with CamScanner

Aqueous humour production - Ciliary body
Absorption in - Trabecular meshwork

Hyperopia (Far Sightedness)

- In this condition, convexity of the lens decreases, which decreases the refractive power of lens and hence the image falls behind the retina.
- These patients can see the far objects clearly, but near vision is impaired.

Presbyopia

- This condition is age related, there is loss of lens elasticity and the image falls behind the retina.
- These patients can see the far objects clearly, but near vision is impaired.

Astigmatism

- It occurs because of irregular curvature of cornea.
- Acuity of distance and near vision can be decreased.

Assessment and Diagnostic Tests for Refractive Errors

Refractive errors are assessed by snellen chart for myopia and by near vision test card at a distance of 14 inches or 35 cm for hyperopia.

Table 30 Medical management

Condition	Management
Myopia	• Concave eye glasses or contact lenses. • Negative number (e.g. –2 diopter) of glasses or contact lenses in order to decrease the refractive power of lens.
Hyperopia	• Convex eye glasses or contact lenses. • Positive number (e.g. +2 diopter) of glasses or contact lenses in order to supplement the refractive power of lens.
Astigmatism	• Eyeglasses with cylindrical correction.

Surgical Interventions

Indications: Age >18 years, stable number.
Contraindications: Autoimmune disorders, keratoconus, herpes simplex infection

a. LASIK (Laser in situ keratomileusis)
   - A very thin flap is created and lifted in central part of cornea with laser.
   - Underlying cornea is reshaped according to the refractive error.

b. PRK (Photorefractive keratomy)
   - Corneal surface is reshaped with the help of laser.

Glaucoma

- It is a group of ocular conditions characterized by optic nerve damage due to raised IOP (more than 21 mm Hg).
- Normal IOP (10 to 21 mm Hg) is maintained by aqueous humour in anterior segment of eye.
- There is a 45 degrees angle present between cornea and iris where trabecular meshwork is present and hence drainage of aqueous humour takes place from anterior chamber → Trabecular meshwork → canal of schelmn → Episcleral veins.
- Over-production or inhibition of drainage of aqueous humour leads to raised IOP which can damage optic disc.
- **Glaucoma has two types:** Open angle glaucoma and Close angle glaucoma.
  - **Open angle glaucoma:** It occurs due to occlusion of flow of aqueous humour because of clogging of trabecular meshwork.
  - **Close angle glaucoma:** It is an ocular emergency and occurs due to occlusion of flow of aqueous humour because of narrowing of angle between cornea and iris.

Table 31 Clinical manifestations of glaucoma

Condition	Clinical manifestations
Open angle glaucoma	• Blurred vision • Loss of peripheral visual field • Headache • Halos round light
Close angle glaucoma	• Periocular pain • Hyperemia (Red eye) • Nausea/Vomiting • Bradycardia • Profuse sweating • Pupils fixed and semi dilated • Pupils non- reactive to light and accommodation

Table 32 Diagnostic tests

Diagnostic test	Purpose	Findings of Glaucoma
Perimetry	To assess visual field	Peripheral visual field loss or localized areas of visual loss (scotomas)
Ophthalmoscopy	To assess optic disc	Pallor and cupping of optic disc
Tonometry	To assess IOP	Raised IOP
Gonioscopy	To assess angle between cornea and iris	

Medical Management

- Mitotic (eg. Pilocarpine) works by increasing the drainage of intraocular fluid.
- Carbonic anhydrase inhibitors (e.g. acetazolamide) works by decreasing the production of intraocular fluid.
- Instruct the patients not to take anticholinergics.

Surgical Management

- **Laser trabeculoplasty:** It opens the intra-trabecular spaces and widen the canal of schelmn and hence increases the outflow of aqueous humour.
- **Laser Iridotomy:** An opening is made in the iris.
- **Drainage implants or shunts:** Open tubes are implanted between anterior chamber to conjuctival space.

Cataract

- It is a condition of lens opacity and cloudiness.
- It is usually manifested as three types-
  - Nuclear (Opacity at centre of lens)
  - Cortical (Opacity at periphery of lens)
  - Posterior subcapsular (front of posterior capsule).
- Slit lamp examination is used to establish the degree of cataract.

Scanned with CamScanner

Table 33 Risk factors and clinical manifestations

Risk factors	Clinical manifestations
• Aging • Myopia • Retinal detachment • Long term use of corticosteroids • Ultraviolet radiations • Diabetes Mellitus	• Blurred vision • Decreased color perception • Reduced visual acuity • Sensitivity to glare • Diplopia in affected eye • Absence of red reflex during opthalmoscopy

Surgical Management

- **Intracapsular cataract extraction (ICCE):** The entire lens (nucleus, cortex and capsule) is removed.
- **Extra-capsular cataract extraction (ECCE):** In this surgery nucleus, cortex and portion of anterior capsule is removed. Posterior capsule and zonular fibres are kept intact.
- **Phacoemulsification:** This method liquefies and suctions the nucleus and cortex of lens with the help of ultrasonic device.
- **Lensreplacement:** Insertion of Intraocular lens (IOL) is done during cataract surgery. After ICCE surgeon usually puts anterior chamber IOL (in front of iris).

Nursing Management

- To avoid retro-bulbar haemorrhage anticoagulant therapy should be stopped before surgery.
- Prescribed mydriatics should be administered before surgery.

Instructions for patients after surgery:

- Wear eye shield/glasses.
- Wash hands before touching the operated eye and clean eye from inner to outer canthus.
- Do not lie down on affected eye.
- Do not do any activity which can increase IOP (lifting, pushing, pulling, bending, stooping,vigorous coughing or sneezing, rubbing eye, tight closing of eye, valsalva maneuver, constipation).
- Follow the prescribed topical medications regimen- Antibiotics, Corticosteroids, NSAIDs.

Retinal Detachment

It is a condition of separation of Retinal pigment epithelium(RPE) from sensory epithelium. It has 4 types:

- **Rhegmatogenous detachment:** A tear develops in sensory retina and vitreous fluid seeps through tear and separates it from RPE.
- **Traction detachment:** Pulling force is responsible for detachment.
- **Rhegmatogenous and traction detachment:** Combination of first two types.
- **Exudative detachment:** Conditions like uveitis causes the production of fluid which can cause detachment.

Table 34

Signs and symptoms	Diagnostic test
• Sensation of shade or curtain • Cobwebs • Flashing lights • Floaters • Usually painless	• Indirect opthalmoscopy • Slit lamp examination • Fluorescein angiography • Eye ultrasound • Optical coherence tomography

Surgical Management

- **Scleral buckle:** Sclera is compressed with the help of scleral buckle to hold sclera, choroid and retina.
- **Pneumatic Retinopexy:** A gas bubble or silicon oil is injected into vitreous cavity which pushes the retina against RPE.
- **Cryo-surgery/Laser therapy/Diathermy:** These procedures help to initiate inflammatory response and scar formation to seal the retinal tears.

Immediate Nursing Management

- Cover both eyes to minimize stress,further detachment and damage.
- Prevent the patient from any jerky movements of head.

Postoperative Nursing Management

- Provide bed rest, dark glasses (for day time) eye patches (for night time) and assist with daily activities.
- Monitor for bleeding, sudden eye pain and notify to physician.
- After pneumatic retinopexy, provide prone position to allow the gas bubble act as a tamponade for the retina.
- Reading, watching television or computer is limited for 3 to 5 weeks.
- Restrict patient from any activity, which can increase IOP (lifting, pushing, pulling, bending, stooping,vigorous coughing or sneezing, rubbing eye, tight closing of eye, valsalva maneuver, constipation).

Age Related Macular Degeneration (AMD)

- It is a condition of deterioration of macula and has two types-
  - **Dry AMD:** It occurs due to clogging of arteries/capillaries supplying to macula(ischemia) and it becomes thin.
  - **Wet AMD:** Blood vessels grow under retina (Choroidal neovascularization-CNV) and leak at macula.

Table 35

Signs and symptoms	Risk factors	Diagnostic test
• Central vision loss (central scotomas) • Difficulty in adapting to low light. • Difficulty in recognizing faces. • Decreased ability to recognize colors. • Straight lines look wavy (earliest sign). • Missing letters in words	• Age • Family history and genetics • Smoking • Obesity • Cardio-vascular disease. • Hypertension	• Amsler grid- wavy lines • Opthalmoscopy- Drusen • Optical coherence tomography

Scanned with CamScanner

Management

a. **Photodynamic therapy**
   - A photo-sensitive dye (verteporfin) is infused I/V which is retained by abnormal blood vessels under retina and then diode laser (for 83 seconds) is used. This dye takes up/ activated by the energy from laser and abnormal vessels gets closed.
   - Instruct patient to bring dark sunglasses, hat, full sleeved shirt, gloves, socks and avoid exposure to sunlight, bright light for 5 days which can cause blisters and sun burn.

b. **Macular translocation:** Retinal detachment of 360 degrees is surgically created and retina is gently lifted and replaced by moving macula away from CNV.

Orbital and Ocular Trauma

Table 36

Type of injury	Signs and symptoms	Management
Soft tissue Injury	• Ecchymosis • Lid swelling • Tenderness • Black eye • Pain • Photophobia	• Cold compress in early phase followed by warm compress. • Complete eye examination.
Foreign bodies	• Redness • Irritation • Discomfort • Blurred vision	• Use a cotton applicator dipped in NS to remove foreign body if it is superficial and blunt. • Slit lamp or indirect opthalmoscope may be needed to visualize the foreign body. • Surgical assistance may be required.
Penetrating object	• Visible penetrating object in to the eye	• Do not try to remove the object. • Limit patient's movement. • Cover the affected eye with a paper or plastic cup. • Notify the physician immediately • Prepare patient for radiological examination-X-rays/CT scan (MRI may be contraindicated due to metallic nature of penetrating object). • If cornea is perforated, Inj TT and antibiotics should be given.
Hyphema (Hemorrhage within anterior chamber)	• Blurred vision • Signs and symptoms of raised IOP.	• Hospitalization and activity limitation may be required. • Provide eye shield and instruct the patient to avoid sudden eye movements.
Chemical burns (Acid/ Alkali/ Active organic substance)	• Spotty or complete damage of cornea • Subconjunctival hemorrhage	• Check pH of eye and assess for the type of chemical splashed. • Immediately flush the eye (irrigation from inner to outer canthus) with water/NS/RL for 20 minutes. • Check pH of eye after irrigation (should be between 6 and 7). • If pH is not attained, irrigation should be continued.

Infectious and Inflammatory Conditions

Conjunctivitis

Table 37

Causes	Signs and symptoms	Management
Bacterial- Streptococcus pneumonia, Haemophilus influenza, staphylococcus aureus	• Redness of eye • Burning • Discharge (exudate)	• Topical Antibiotics
Chlamydial conjunctivitis (Trachoma)	• Purulent exudate • Ocular pain • Periauricular lymphadenopathy • Trichiasis (Inward turning of hair follicles) • Entropian • Corneal erosion and ulceration.	• Broad spectrum antibiotics. • Surgical correction of trichiasis • Assessment and treatment of genital chlamydial infection.

Contd...

Scanned with CamScanner

Causes	Signs and symptoms	Management
Viral-Adenovirus, Herpes simplex	• Watery discharge • Extreme tearing • Discomfort • Lid edema • Photophobia	• Cold compress for 10 min (5 times in a day) • Frequent hand hygiene. • Do not share towels, eye drops. • May use artificial tears(lubricants). • Do not visit public places till redness or discharge is cleared. • Every time use new tissue to wipe the eyes. • Do not apply makeup till symptoms subside. • Wear dark glasses.
Allergic	• Rhinitis • Itching • Excessive tearing	• Lubricants • Corticosteroids

Enucleation, Evisceration, Exenteration

- **Enucleation:** It is a surgical procedure of removal of entire eye and part of optic nerve.
- **Evisceration:** Removal of ocular contents but sclera,optic nerve, extra-ocular muscles are kept intact.
- **Exenteration:** Entire orbital contents and soft tissue are removed.

Figure 42 ■ Ocular prosthesis

Indications

- Severe injury
  Intraocular tumors (Ocular melanoma, Retinoblastoma etc.)
  A disfigured, deformed eye.

Ocular Prostheses

- After enucleation, a conformer (shell) is placed to prevent contracture of eye socket.
- After 4 to 8 weeks of surgery, patients are referred to ocularist for prosthetic fitting.

Table 38 Insertion and removal of prosthesis

Steps of insertion of prosthesis	Steps of removal of prosthesis
• Clean eyes with NS dipped gauze. • Moisten the prosthesis with NS. • Hold prosthesis b/w thumb and fore-finger with indentation uppermost and convex surface outermost. • Lift upper eyelid with other hand. • Insert upper part of prosthesis in upward, backward and inward direction. • Remove hand from upper eyelid and pull lower eyelid. • Slip lower part of prosthesis inside lower eyelid. • Eyelids closure should be comfortable after insertion.	• Clean eyes with NS dipped gauze. • Pull down the lower eyelid to see the edges of prosthesis. • Gently push the eyelid under prosthesis and exert fingertip pressure on upper eyelid. • Prosthesis slips out into cupped hand. • Place it in NS.

Administration of Eye Medications

- Wash hands, read label and shake the suspension
- Do not touch the tip of medication dropper in the eye.
- By putting gentle pressure on cheek bone, pull lower lid down with the help of a finger.
- Instil eye drops (if prescribed) before administration of ointment.
- Apply ointment (as half inch ribbon) in lower conjunctival sac.
- Ask the patient to keep eyelids closed and gently put pressure on inner canthus for 1 min.
- Use clean tissues to remove excess medicine or tears.

Golden points to remember

- Pupil contracts in response to bright light and relaxes in dim light.
- **Presbyopia** is a form of hyperopia, or farsightedness that occurs as a normal process of aging, usually around 40.
- **Presbycusis** is the most common type of sensorineural hearing loss caused by natural aging of the auditory system.
- **Function of the iris** is to regulate the size of pupil and allow light to pass only through the center of the lens, which is optically most effective part.
- Three **cranial nerves** that are related to eye movements are Oculomotor, Trochlear and Abducens.
- **Anisocoria** is unequal pupil size.
- **Ptosis** is dropping of eyelids.
- **Amblyopia** is reduced vision in the affected eye.
- **LASIK** (Laser assisted in situ keratomileusis) is the treatment for myopia, hyperopia and astigmatism.
- **Hordeolum (stye)** is an infection of the sebaceous glands in the lid margin.
- **Keratoconjunctivitis** is the inflammation of cornea and conjunctiva.
- **Keratoconjunctivitis sicca** is otherwise known as dry eye.
- Major signs of retinal detachment are **photopsia (light flash), floater sand** and **hairnet**.
- **Enucleation** is the removal of eye. Indications are blind patient and painful eye.
- Normal intraocular pressure is 12–21 mm Hg.
- Emmetropia is a condition in which the eye is relaxed and focused on an object more than 6 meters or 20 feet away.
- **Arcus senilis** is a sign of high cholesterol, manifested by presence of a white or gray opaque ring in corneal margin.
- **Macropsia** is an illusion in which objects appear larger than their actual size.
- **Fleischer rings** are pigmented rings in the peripheral cornea, due to iron deposition.
- **Proptosis** is a bulging of the eye anteriorly out of the orbit.
- Most common type of bacterial conjunctivitis is Acute Mucopurulent conjunctivitis.
- Most common cause is S. aureus
- Complication – Marginal corneal ulcer
- Ethambutol causes impairment of Red and Green color vision.
- Most common cause of Acute Hemorrhagic Conjunctivitis – Enterovirus (70%).
- Most common cause of cataract is Senility (age related).
- Painless peripheral loss of vision in an elderly diabetic patient is associated with **Open-angle glaucoma**.
- **Macular degeneration** is the most common cause of irreversible central vision loss.
- Color blindness is due to the problem with **cones**.
- Frequent visual examination is suggested for a patient on **Ethambutol** due to the risk of ocular toxicity (decreased red-green color discrimination).

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

ANATOMY AND PHYSIOLOGY

753. Color blindness is due to the problem with: *(Daman and Diu NO 2018)*

a. Lens b. Aqueous humor
c. Cones d. Rods

Explanation: Cones are photoreceptor cells in the retina that respond differently to light of different wavelengths and are thus responsible for color vision and function best in relatively bright light, as opposed to rod cells, which work better in dim light. So color blindness is due to problems with cones

754. The anterior transparent part of the eye is: *(DSSSB PHN, 2015)*

a. Pupil b. Conjunctiva
c. Cornea d. Sclera

755. Thinnest part of lens is?

a. Anterior pole b. Apex
c. Posterior capsule d. Posterior pole

756. A thin, transparent mucous membrane that covers the inner surface of the eyelids and the anterior surface of the eye is the

a. Sclera b. Conjunctiva
c. Choroid d. Glabella

757. Cranial nerve responsible for sensation of smell is

a. Facial nerve b. Hypoglossal nerve
c. Olfactory nerve d. Trigeminal nerve

758. The smallest cranial nerve is

a. Olfactory b. Oculomotor
c. Trochlear d. Accessary

759. Loss of sense of smell is called as

a. Anhedonia b. Anosmia
c. Anoxia d. Aphasia

760. The nasal cavity is divided into right and left sides by the

a. Conchae b. Paranasal sinuses
c. Nasal septum d. Hard palate

761. Muscles of the eye are supplied by all of the following cranial nerves EXCEPT?

a. Abducent nerve b. Hypoglossal nerve
c. Oculomotor nerve d. Trochlear nerve

762. Which of the following artery supplies the eye?

a. Internal carotid artery
b. External carotid
c. Facial artery
d. Right and left subclavian artery

763. Which cranial nerve is responsible for movement of eye ball?

a. Oculomotor b. Vagus
c. Trigeminal d. Olfactory

764. The fluid found in posterior segment of eye is known as

a. Aqueous fluid b. ICF
c. ECF d. Vitreous body

765. The firm, opaque and white outer connective tissue layers of the posterior five-sixths of the eye is the

a. Sclera b. Cornea
c. Vascular tunic d. Choroid

766. The anterior segment of eye is filled with

a. Aqueous fluid b. ECF
c. Ocular fluid d. Vitreous body

767. Ophthalmic artery is a branch of

a. Vertebral artery
b. Basilar artery
c. Internal carotid artery
d. External carotid artery

768. The blind spot of eye is known as

a. Cons b. Rods
c. Pupil d. Optic Disc

769. Rod cells and con cells are associated with ..... sensation

a. Smell b. Vision
c. Hearing d. Touching

770. To focus on objects closer than 20 feet,

a. The lens must become flatter
b. The ciliary muscles must contract
c. The suspensory ligaments must increase tension on the lens
d. The cornea must move inward

771. Rod cells are

a. More sensitive to light than cone cells
b. Able to produce sharper images than cone cells
c. Sensitive to red, blue and green colors
d. Found in greatest quantity in the fovea centralis

772. Number of extrinsic muscles involved in movement of the eyeball is

a. 4 b. 6
c. 7 d. 9

773. Myopia is a condition in which

a. The image is focused behind the retina
b. The cornea or lens is not uniformly curved
c. There is a decrease in the ability of the eye to accommodate for near vision
d. Correction is possible with a concave lens

774. Hypoglossal nerve is

a. 6th nerve b. 7th nerve
c. 12th nerve d. 9th nerve

775. Eye ball movements are controlled by all of the following cranial nerves except

a. Optic nerve b. Abducens nerve
c. Trochlear nerve d. Oculomotor nerve

Scanned with CamScanner

776. Ophthalmic artery is a branch of
a. Vertebral artery b. Basilar artery
c. Internal carotid artery d. External carotid artery

777. The light-sensitive and pigmented layer of tissue in the eye is known as *(Karnataka PSC 2001)*
a. Lens b. Retina
c. Cornea d. Iris

Explanation: The retina is a light-sensitive layer at the back of the eye that covers about 65% of its interior surface. Photosensitive cells called rods and cones in the retina convert incident light energy into signals that are carried to the brain by the optic nerve.

778. Which of the following structure alters the size of the pupil
a. Ciliary muscle b. Iris
c. Cornea d. Lens

Explanation: The iris is a thin, circular structure in the eye, responsible for controlling the diameter and size of the pupil and thus control the amount of light reaching the back of eye

779. The size of which part of the eye contributes to the controlling the amount of light entering the eye. *(ESIC 2019)*
a. Pupil b. Lens
c. Optic disc d. Macula lutea

Explanation: The size of pupil of the eye contributes to the controlling the amount of light entering the eye, pupil contracts in response to bright light and it relaxes in dim light.

780. Which of the following structures control the amount of light rays entering the eye? *(RRB 2002)*
a. Pupil b. Iris
c. Lens d. Both A and B

Explanation: The iris and the pupil control how much light to let into the back of the eye. When it is very dark, our pupils are very large, letting in more light. The pupil size is controlled by the dilator and sphincter muscles of the iris.

781. The process of automatic adjustment of retinal sensitivity when person move from light to dark is known as:
a. Dark adaptation b. Light adaptation
c. Dark accommodation d. Light accommodation

Explanation: Adaptation is an automatic adjustment of retinal sensitivity to the amount of light present when a person moves from dark to light or light to dark. Dark adaptation occurs when going from a well lit area to a dark area, rods become active. Light adaptation occurs when we move from dark to light, cones become active.

782. The most common cause of myopia is
a. The viscosity of aqueous humor is increased
b. The thickness of lens is increased
c. The viscosity of vitreous humor is increased
d. Antero-posterior diameter is increased

783. The refractive error caused by the differences in the curvature of the cornea and lens is called: *(AIIMS Raipur Grade II 2017)*
a. Emmetropia b. Astigmatism
c. Myopia d. Hypermetropia

Explanation: Astigmatism is a type of refractive error in which the eye does not focus light evenly on the retina which results in distorted or blurred vision. Emmetropia is a state in which the eye is relaxed and focused on an object more than 6 meters or 20 feet away. Near-sightedness or myopia is a condition of the eye where light focuses in front of instead of on the retina. Hypermetropia is a defect of vision that causes the impossibility for rays of light to be focused on the retina, but behind it.

784. Presbyopia occurs because of .....
a. Lens becomes elongated
b. The lens becomes inflexible
c. Lens becomes opaque
d. Retinal curvature will vary

785. Treatment of presbyopia
a. Radial Keratotomy b. LASIK
c. Convex lens d. Both b and c

Explanation:
- Both presbyopic LASIK and convex lens are used for correction of presbyopia.
- Apart from this multifocal IOL implant, multifocal contact lens and surgically implanted corneal inlays can be used to correct presbyopia.

786. Enophthalmos is due to palsy of
a. Levator palpebrae superioris
b. Superior tarsal muscle
c. Orbitalis muscle d. Inferior tarsal muscle

787. Ptosis results from trauma to which nerve?
a. III b. VI
c. VII d. VIII

INTRODUCTION

788. Vitamin important for the normal functioning of eye is...
a. Vitamin A b. Vitamin D
c. Vitamin E d. Vitamin K

789. Hypervitaminosis of ..... cause sign and symptoms such as headache, vomiting, vertigo, diplopia and skin desquamation
a. Vitamin - A b. Vitamin - D
c. Vitamin - E d. Vitamin - K

790. Diabetic cataract occurs due to accumulation of
a. Fructose
b. Galactitol
c. Glucose
d. Sorbitol

791. Typical appearance of diabetic cataract is
a. Sunflower type
b. Polychromatic lustuer
c. Breadcrumb type
d. Snow flake appearance

792. Most common cause of blindness in India is: *(NCFL 2019)*
a. Cataract a. Glaucoma
b. Refractive index c. Vitamin A deficiency

Explanation: As per the National Programme for control of Blindness in India, the leading causes of blindness in India includes cataract (62%), refractive errors (20%), glaucoma (6%), surgical complications/corneal opacities(1%) and others (10%).

793. Most common form of conjunctivitis in newborn at birth is caused by
a. Chlamydia b. Neisseria
c. Trachoma
d. Staphylococci

Scanned with CamScanner

Explanation:

Ophthalmia Neonatorum

- Ophthalmia neonatorum is a purulent conjunctivitis occurring during the first four weeks of life.
- Also called neonatal conjunctivitis
  - Chlamydial ophthalmia (caused by **Chlamydia trachomatis**) is the most common bacterial cause; it accounts for up to 40% of conjunctivitis in neonates <4 weeks of age.
  - Hyperacute cases are usually caused by Neisseria gonorrhoeae or N. meningitidis.

ASSESSMENT, DIAGNOSIS AND INVESTIGATIONS

794. Tonometry is the method of measuring *(ISRO)*

a. Blood pressure in children
b. Blood pressure in elderly
c. Foot pressure
d. Intraocular pressure

795. Intraocular pressure is measured with an instrument called: *(LNJP H D 2012)*

a. Tonometer b. Manometer
c. Oculomotor d. Perimeter

796. Which of the following test is used to assess distance (long-sightedness) vision? *(DSSSB 2013)*

a. Rinne's test b. Hirschbergs test
c. Optometry d. Snellen chart

Explanation: A Snellen chart is an eye chart that can be used to measure visual acuity. Snellen charts are named after the Dutch ophthalmologist Herman Snellen who developed the chart.

797. First assessment needs to be done in a client with ophthalmic problem is .....

a. Visual acuity b. Intra ocular pressure
c. Intra ocular hemorrhage d. Opacity of lens

798. Fluorescein angiography (FA) of eye allows study of the circulation of the

a. Choroid b. Retina
c. Both a & b d. Iris

DISORDERS OF EYE

799. Myopia is corrected by: *(AIIMS Nagpur NO 2018)*

a. Bifocal lens b. Biconvex lens
c. Cylindrical lens d. Biconcave lens

Explanation:

Figure ■ Myopia and its correction

800. Which statement about glaucoma is true and accurate: *(Safdarjung NO 2018)*

a. Acute angle-closure glaucoma is an ocular emergency
b. Bubbles are implanted to protect the retina from the glaucoma
c. Acute angle-closure glaucoma results in loss of peripheral vision and tunnel vision
d. Primary open-angle glaucoma leads to eye pain, nausea and vomiting, blurry vision and halos

Explanation:

- Acute angle-closure glaucoma is an ocular emergency, characterized by opposition of iris to the trabecular meshwork, which results in raised intra ocular pressure. It cause sudden dramatic onset of symptoms as blurred vision, red eye, pain, headache, nausea and vomiting, sudden elevations in the IOP that may lead to optic nerve damage.
- Compressive gonioscopy is done to push down the cornea and then easing upon it.

801. Pinpoint pupil is a characteristic of: *(AIIMS BBS NO 2018)*

a. Barbiturate poisoning b. Pontine hemorrhage
c. Glaucoma d. Cocaine abuse

Explanation: Pinpoint pupil (or miosis) is contraction of pupil under normal lighting conditions. Barbiturate poisoning and cocaine abuse leads to dilation of pupil. Glaucoma alone does not affect pupil size. Pontine hemorrhage causes pinpoint pupil which was due to a disorder of the sympathetic pupillary pathways in the pontine tegmentum.

Strategy: Use the elimination rules to find the correct answer.

802. Xanthelasma refers to

a. Dryness of conjunctiva
b. Dry mouth
c. Yellowish plaques that occur most commonly near the inner canthus of the eyelid
d. Fatty growths develop underneath the skin

803. Which of the following refers to dryness of conjunctiva

a. Xerophthalmia b. Xanthelasma
c. Xanthoma d. Xerostomia

Explanation:

- Xerophthalmia-Dryness of Conjunctiva
- Xanthelasma-Yellowish plaques that occur most commonly near inner canthus of the eye lid
- Xanthoma-Fatty growths develop underneath the skin
- Xerostomia-Dryness of mouth

804. Trachoma is a disease related to: *(NCFL 2015)*

a. Eyes b. Ears
c. Nose d. Throat

Explanation: **Trachoma** is contagious disease caused by Chlamydia trachomatis and affects the conjunctiva of the eye, cornea and eyelids. It occurs due to poor hygiene primarily. It is preventable as well as curable.

805. Drug of choice for mass treatment of trachoma is

a. Sulfonamide b. Chloramphenicol
c. Tetracycline d. Penicillin

806. The inability to read small words held at usual distance is a primary feature of: *(DSSSB PHN, 2015; ISRO)*

a. Myopia b. Astigmatism
c. Presbyopia d. Cataract

804. a
805. c
806. c

Scanned with CamScanner

807. A cataract is: *(JIPMER 2012)*
a. Crystallization of the pupil
b. Opacity of lens
c. Thin film over the cornea
d. Opacity of conjunctiva

808. After cataract surgery, the nurse should notify the physician if the client is complaining of .....
a. Headache b. Eye pain
c. Lacrimation d. Edema

809. Discharge teaching given to client following cataract surgery is .....
a. Wear sunglass to protect eyes from sun light
b. Avoid vigorous brushing of teeth and hair
c. Both a and b d. None of the above

810. Following cataract surgery how long sunglass need to be used?
a. 4 weeks after operation b. 6 weeks after operation
c. 8 weeks after operation d. 10 weeks after operation

811. Causes of cataract include .....
a. Exposure to ultraviolet light
b. People who work in bright sunlight
c. Welders without eye protection
d. All of the above

812. Management of cataract include all EXCEPT
a. Intra capsular cataract extraction
b. Extra capsular cataract extraction
c. Phacoemulsification d. Scleral buckling

813. Correct option regarding intracapsular cataract extraction is ....
a. Removing the lens including the lens capsule
b. Removing the lens and the anterior portion of the lens
c. Enucleation of eyes
d. Removing the lens of the eye

814. Correct option regarding extracapsular cataract extraction is ...
a. Removing the lens including the lens capsule
b. Removing the lens and leaving the elastic capsule partially intact
c. Enucleation of eyes
d. Removing the lens of the eye

815. Complications related to cataract extraction include .....
a. Secondary glaucoma b. Infection
c. Bleeding d. All of the above

816. Which of the following is true regarding macular degeneration? *(AIIMS-BBS SNO 2019)*
a. It is the central loss of vision
b. Wet macular degeneration is more common in this.
c. Dry macular degeneration is less common in this.
d. It affects the cornea of the eye

Explanation: Macular degeneration is the most common cause of irreversible central vision loss. It is of two types: (1) dry and (2) wet type. Dry type is the more common type and it is a slowly progressive and painless vision loss. Wet macular degeneration is rapid in onset. **Strategy:** Eliminate Option b and c as both are essentially same statement. If wet macular degeneration is more, then dry has to be less. So both are similar statement. So use the strategy, "if two options are similar then both cannot be answer".

817. Normal range of IOP is .....
a. 8-10 mm Hg b. 10-12 mm Hg
c. 12-22 mm Hg d. 15-15 mm Hg

818. Which of the following condition is associated with increased intraocular pressure? *(DSSSB 2013)*
a. Cataract b. Conjunctivitis
c. Retinitis d. Glaucoma

Explanation: Intraocular pressure (IOP) is the fluid pressure inside the eye. Elevated intraocular pressure is an important risk factor for glaucoma. Normal Intraocular Pressure (IOP) ranges from 10 mm Hg to 21 mm Hg. Tonometry is the method eye care professionals use to determine this. The two main types of glaucoma are open-angle and angle-closure glaucoma.

819. An aged client with diabetes mellitus complaining of a painless peripheral loss of vision is at risk for: *(AIIMS-BBS SNO 2019)*
a. Cataract b. Uveitis
c. Angle-closure glaucoma d. Open-angle glaucoma

Explanation:
- **Open angle glaucoma** means that the angle where the iris meets the cornea is as wide and open as it should be. Loss of peripheral or side vision is usually the first sign of glaucoma.
- **Angle-closure glaucoma** presents with eye pain with nausea and sudden visual disturbance.

820. The first line treatment of open angle glaucoma is
a. Pilocarpine b. Carbonic anhydrase inhibitor
c. Timolol d. Epinephrine

821. Drug of choice for acute congestive glaucoma is
a. Atropine b. Timolol
c. Levobunonol d. 1-2% pilocarpine

822. Management of angle closure glaucoma is .....
a. Laser iridotomy b. Phacoemulsification
c. Trabeculoplasty d. Corrective lenses

823. Components of granulation tissue is .....
a. Angiogenesis
b. Fibroblasts
c. Chronic inflammatory cells
d. All of the above

824. Clinical manifestation of glaucoma includes.....
a. Blurred and loss of vision
b. Headache
c. Halos around lights d. All of the above

825. Earliest sign of glaucoma is .....
a. Double vision b. Halos around lights
c. Blurred vision d. Headache

826. Commonest type of glaucoma is .....
a. Primary open angle glaucoma
b. Secondary open angle glaucoma
c. Primary angle closure glaucoma
d. Secondary angle closure glaucoma

827. Glaucoma management focuses upon .....
a. Increase inflow of aqueous humor
b. Increase outflow of aqueous humor
c. Increase production of aqueous humor
d. Increase the production and inflow of aqueous humor

828. Characteristic findings in a client with acute angle-closure glaucoma includes .....
a. Severe pain
b. Decreased vision with halos around lights
c. Erythematous conjunctiva
d. All of the above

829. Narrow angle glaucoma management medications include
a. Miotics b. Topical beta blockers
c. Oral carbonic anhydrase inhibitors
d. All of the above

830. Action of miotics in narrow angle glaucoma is .....
a. Constriction of pupils
b. Increase the production of aqueous humor
c. Increase the inflow of aqueous humor
d. Decrease the outflow of aqueous humor

831. Medications used during open angle glaucoma includes
a. Mydriatics b. Miotics
c. Cycloplegic agent d. beta blockers

832. Management of glaucoma includes all EXCEPT
a. Laser trabeculoplasty b. Trabeculectomy
c. Iridectomy d. Scleral buckling

833. All of the following are the causes of increased Intra Ocular Pressure (IOP), EXCEPT
a. Poor drainage of aqueous humor
b. Decreased reabsorption of aqueous humor
c. Use of beta-blockers
d. Increased production of aqueous humor

834. Chemical exposure of eye is initially treated with
a. Antibacterial drops for 24 ± 36 hours *(RML 2004)*
b. Flushing of the lids, conjunctiva and cornea with tap or preferably sterile water
c. Local anesthetics
d. Cleansing the conjunctiva with a cotton-tipped applicator

Explanation: Immediate and thorough irrigation of the eye with tap water should be performed in case of chemical exposure to eye.

835. Chemical burn in the eye can be managed with .....
a. Rub the eyes and apply patch dressing
b. Administer ciliary muscle constricting medication
c. Instill a topical anesthetic, then irrigate the eye with saline solution.
d. Instil topical antibiotic solution

836. Aphakia is .....
a. Absence of ciliary body b. Absence of the lens
c. Absence of conjunctiva d. Absence of pinna

837. Aphakia is treated with .....
a. Intraocular lens b. Extra ocular lenses
c. Pupil dilation d. Laser therapy

838. Keratitis is the inflammation of
a. Retina b. Cornea
c. Conjunctiva d. Keratin

839. In posterior cavity hemorrhage of the eye, blood accumulates between
a. The lens and conjunctiva
b. The lens and the retina
c. Between the cornea and the lens
d. Lens and optic disc

840. Advices given to a client after dilating the eyes for regular examination include .....
a. Vision will be blurry for several hours.
b. Eyes will be sensitive
c. Protect your eyes from the sun by wearing sunglasses
d. All of the above

841. Risk for retinal detachment is more among patients with
a. Refractive error like myopia
b. Diabetic retinopathy
c. Previous cataract surgery
d. All of the above

842. Important intervention to a client with retinal detachment is .....
a. Admitting him to the hospital and strict bed rest
b. Patching both of his eyes
c. Use sunglass
d. Use topical antibiotic and analgesics

843. Priority nursing management after the surgery for retinal detachment is .....
a. Prevent increase in IOP b. Decrease pain
c. Promote rest d. Maintain nutritional status

844. Main symptom associated with retinal detachment is .....
a. Flashing lights and floaters
b. Pain and tenderness
c. Increased IOP
d. Ptosis

845. Surgical management related to retinal detachment is all EXCEPT
a. Cryopexy
b. Scleral buckling
c. Intraocular injection of air or SF6
d. Phacoemulsification

846. The drug used for dilation of pupil in children is ____
a. Atropine b. Gentamycin
c. Betamethasone d. Levofloxacin

Explanation: Dilating drops (also called "mydriatics") are used to enlarge the pupil for eye examinations to allow the ophthalmologists to visualize the eye in detail. Atropine drops available as 0. 5% or 1% (0. 5% recommended for infants less than 1 year old), ointment 1%. Duration of action: 1–2 weeks.

847. Timolol eyedrops should be used with caution if the patient has history of
a. Gastric ulcers b. Pancreatitis
c. Glaucoma d. Emphysema

848. Drug used to dilate the pupil is .....
a. Mydriatics b. Miotics
c. Sulfonamide d. Glycoside

849. Drug of choice to induce pupillary dilation in children?
a. Atropine b. Adrenaline
c. Adenosine d. Steroids

850. Drug used to constrict the pupil is .....
a. Mydriatics b. Myotics
c. Sulfonamide d. Glycoside

851. What all are the important nursing intervention while instilling eye drops to a client?
a. Pinch the nose while instilling the drop
b. Ask the client to look up and away
c. Be careful to avoid touching the tip of the dropper bottle to the eye
d. All of the above

852. Purpose of eye padding in an unconscious client is to prevent
a. Dryness of eye b. Photosensitivity
c. Corneal ulcer d. Lacrimation

853. Copper deposition in cornea leads to
a. Keratoglobus
b. Siderosis
c. Kayser-Fleischer ring (KF ring)
d. Keratoconus

854. Golden period of eye donation
a. 6 hours b. 12 hours
c. 18 hours d. 24 hours

INTEGUMENTARY SYSTEM AND BURNS

Figure 43 ■ Skin

INTEGUMENTARY SYSTEM

Anatomy and Physiology

- Largest organ of the body
- Surface area: 15-20 sq. ft
- Weight = 4 kg or 9 pounds (approx)
- It is composed of epidermis, dermis and subcutaneous tissue

Epidermis

- Outermost layer of the skin
- Composed predominantly of keratocytes.
- Four layers of epidermis from outer to inner are:
  - Stratum corneum
  - Stratum lucidum
  - Stratum granulosm
  - Stratum germinativum.
- Melanocyte in epidermis produces the pigment melanin.
- Melanin is the substance responsible for color of the skin and hairs.
- Epidermis is thickest over palms of hands and soles of feet
- The junction between epidermis and dermis is known as rete ridges.
- The interlocking rete ridges produce ripples on the surface of skin (finger prints).

Dermis

- It is the largest part of the skin and is often called true skin.
- It is made up of two layer:
  - Papillary dermis (dermis beneath the epidermis)
  - Reticular dermis
- Dermis has its own blood supply, nerve, lymph, sweat, sebaceous and hair root.

Subcutaneous Tissue/Hypodermis

- It is also known as hypodermis and is made up of fat.
- It produce cushion between skin layers, muscles and bones.

Epidermal Appendages

- These are the down growth of epidermis into the dermis - **glands, nails and hairs**

Glands

- **Eccrine gland**
  - These are sweat producing glands found all over the body except at lips, nail bed, ears, penis and labia minora.
  - Highest density of eccrine glands is found on palms and soles of the body.
  - Eccrine glands exit the body independently on hair shaft
- **Apocrine glands**
  - Seen in axillae, breast, anal region, ear canal and labia majora.
  - Apocrine gland become active on puberty.
  - Activity of apocrine gland needs high output of sex hormones
- **Sebaceous Gland**
  - Found abundantly in face, scalp, upper back and chest
  - Sebaceous glands are absent over palms and soles.
  - Secretion of sebaceous gland is known as sebum.

Nail

- Hard transparent plate of keratin cover the dorsal surface of fingers on hands and feet.
- Nail roots are covered by a thin layer of skin called **cuticle**.
- Average growth of nail is **0.1mm per day** and it grows throughout the life.
- Finger nail grows faster than toe nails, complete renewal of finger nail takes 170 days where as toe nail takes 12-18 months.

Hairs

- Hair are distributed all over the body except palms and soles.
- Hair follicles usually occur along with sebaceous gland and together they contribute to **pilosebaceous unit.**
- **Arrector pili** are the muscles attached to hair follicles and are responsible for goose bumps.
- **Hair color is determined by melanin** present in the hair shaft.

Functions of Skin

- Protection
- Homeostasis
- Thermoregulation
- Sensory function
- Vitamin D production

Scanned with CamScanner

Diagnostic Evaluation

Table 39 Diagnostic tests

Name of the test	Description
Skin biopsy	• Skin biopsy is obtained through scalpel excision or through punch biopsy. • Biopsy is performed over skin nodule, plaque, blisters and other skin lesions
Immunofluorescence	• This test combines antigen or antibody with fluorochrome dye • Antibody can be conjugated to fluorochrome by attracting them to the dye • Direct immunofluorescence tests on the skin are techniques to detect autoantibodies directed against portion of the skin • Indirect immunofluorescence test detects specific antibodies in patient's serum
Patch testing	• This test is to determine substance to which the patient has allergy • In this selected allergens are applied over the skin as patches • Patient wears the patches for 48 hours and skin is assessed after 72 hours. • Redness, fine elevation and itching over the skin is considered as mild reaction • Fine blisters, papules and severe itching is considered as moderate reaction • Blisters, pain and ulceration indicates severe reaction.
Skin scrapings	• Suspected fungal lesions are scraped with oil moistened scalpel blade and then transferred to a glass slide covered with cover clip and examined microscopically for fungal growth
Tzanck smear	• This smear test is to examine the blistering skin condition such as herpes, varicella and all forms of pemphigus. • The secretions from the suspected lesion are applied over a slide, stained and then examined.
Wood's light examination	• It's a special lamp which produces long wave ultraviolet rays which become blue to dark purple in color • These lights can be well seen in darkened room • These lights help to differentiate hyperpigmented skin lesions from normal skin. • The lesion that contains melanin will disappear under light and lesion without melanin can be well seen in the light • Reassure the client that light is not harmful for eyes and skin

Disorders of Skin

Table 40 Primary and secondary skin lesions

Lesion	Description
Macule	Skin color changes without elevation, e.g.: vitilgo
Papule	Elevated solid lesion of skin less than 1cm
Plaque	Raised lesion formed by merging papules.
Nodule	Larger than papule. Raised skin lesion extends into dermis. A large nodule is called as tumor.
Wheal	Elevations on the skin that are irregularly shaped
Vesicle	Elevated lesion usually containing fluid and is less than 1cm
Bulla	Elevated fluid filled lesion usually more than 1 cm
Cyst	Elevated thick walled lesion containing fluid or semi-solid matter
Pustule	Elevated lesions less than 1cm containing purulent material
Scale	Dried fragments of epidermal layers, irregular in shape white, tan, yellow or silver in color
Erosion	Moist, demarcated depressed area due to partial or full thickness loss of epidermis
Deep ulcer	Irregularly shaped exudate, depressed lesion in which all epidermis and all or part of dermis is lost

Contd...

Lesion	Description
Scar	Mark left on the skin after healing
Excoriation	Superficial linear abrasion of epidermis is visible sign of itching caused by rubbing or scratching
Fissure	Deep linear split through epidermis and extends into dermis
Keloid	Irregularly shaped elevated progressively enlarging scar extends beyond the boundaries of wound.

Pruritus

- In common man's term it is known as itching.
- Most common symptom in patient with dermatological problem.
- Antipruritic agents are useful to manage the condition.

Seborrheic Dermatoses

- **Seborrhea:** Excessive production of sebum
- **Seborrheic dermatitis:** Inflammatory disease of the skin in which bacterial counts are more in the area with large amont of sebaceous gland secretion.
- It can be of two forms oily and dry:
  - Oily form appear moist and greasy and appear over forehead, nasolabial fold, beard area, scalp etc.
  - Dry forms appear like flaky desquamation of the scalp with profuse amount of white, fine, powdery scales.

Scanned with CamScanner

Acne Vulgaris

- It is a condition affecting susceptible hair follicles.
- Most commonly seen over face, neck and upper trunk.
- This condition is characterized by comedones, both opened and closed, papules, pustules, nodules and cyst.
- During puberty, under the influence of androgen sebaceous gland produce more amount of sebum and this sebum will plug the pilosebaceous gland and cause acne.
- Comedones are the major clinical manifestations for this condition.
- Salicylic acid and benzyl peroxide preparations are effective against acne.
- Vitamin A preparations are also useful for removing keratin plug. Patient should be cautioned that these preparations are sensitive to sunlight, so avoid exposure to sun.

Impetigo

- Superficial infection of the skin
- Caused by Staphylococci, Streptococci or other bacteria
- Bullous impetigo is caused by *Staphylococcus* aureus.
  - Characterized by bullae.
- Exposed areas of the body are most commonly affected (face, neck and extremities)
- It is contagious and can spread via sharing towels, touching skin of the patients etc.
- Impetigo is a risk factor for **glomerulonephritis**.
- Treatment
  - For small lesions: Topical antimicrobial agents (e.g. Mupirocin, Retapamulin)
  - Wide spread lesions: Systemic antibiotics (e.g. Augmentin, Cloxacillin)

Herpes Zoster (Shingles)

- It is a viral infection of skin caused by Varicella-zoster virus (same virus that causes Chicken pox)
- Major manifestation: Painful vesicular eruption along the area of distribution of the sensory nerves.
- Treatment: Antiviral agents (e.g. Acyclovir, Valacyclovir)

Table 41 Summarized content of herpes zoster

Phases of manifestations	Duration	Manifestations
Preeruptive phase	1 to 10 days	Pain, pruritis and paresthesia
Eruptive phase	10 to 15 days	Unilateral patchy erythematous areas, vesicles develops
Postherpetic neuralgia	Variable (30 days to 60 days)	Residual and itching

Pediculosis

infestation of hairy part

Table 42 Summarized description of pediculosis

Condition	Description
Pediculosis capitis	• Infestation of scalp with louse. • Head lice are seen behind the back and ears. Bite of the insect causes intense itching.
Pediculosis corporis	• Infestation of the body by the louse. • Body lice are seen in the area of skin that comes in close contact with the underclothings (neck, trunk and thighs). • It bites and causes characteristic minute hemorrhagic points.
Pediculosis pubis	• Infestation is in the genital area and is transmitted chiefly by sexual contact. • Pruritus especially at night is the characteristic. • Reddish-brown dust can be seen in patient's underclothing.

Contd...

Treatment

- Washing the affected area with shampoo which contains pyrethrin and piperonyl butoxide.
- All co-habitants should take the medicine on same day and avoid sharing combs, brushes and hats.

Scabies

- Infestation of skin with an itch mite called *Sarcoptes scabiei*.
- Seen among people who live in unhygienic condition and people who all are sexually active
- Infestation is commonly seen in fingers and therefore hand contact may cause spread of infection.
- Intense itching is the complaint by the client
- Magnifying glass and pen light examination shows small raised burrows created by itch mites.
- Classic signs of scabies is increased itching during overnight because of the hyperactivity of the mite due to increased body temperature.
- Skin scrapings from the area of itching are placed on a slide and examined under microscope.
- 5% permethrin is the medicine of choice.
- Instruct the client to take a warm soapy shower to remove scaling and debris then pat dry the skin and allow it cool and then apply the scabicide.
- Patient is instructed to apply scabicide all over the body except over face and scalp and let it be there for 24-48 hours. Usually one application may be effective but it is advisable to repeat it after 1 week.
- Patient is instructed to clean all clothing and to dryclean them.

Psoriasis

- Psoriasis is a chronic, noninfectious skin inflammation that involves keratin synthesis.
  - Silvery scales are found over elbow, knee, scalp, buttock and lower back
  - Psoriasis vulgaris being most common.
  - Koebner phenomenon is development of psoriasis lesions at the site of injury, like sunburn area
- **Management**
  - Gentle removal of the scales is the main management
  - Taking bath with added oils (olive oil, mineral oil) and use of soft brush.
  - Application of alpha hydroxyl acid and salicylic acid after bathing helps to soften the thick scales.
  - Topical corticosteroid along with occlusive dressing.
  - **Phototherapy** for clients who are not responding to topical therapy. psoralen and ultraviolet A (PUVA) is effective treatment.

Scanned with CamScanner

- **Methotrexate and cyclosporine** are useful systemic corticosteroids/cytotoxic preparations but side effects associated with each therapy are more.

Pemphigus Vulgaris

- It is an autoimmune disease
- IgG antibodies are directed against specific cell surface antigen on epidermis
- **Manifestations**
  - Characterized by varying sizes of bullae on the skin and mucous membrane.
  - Oral lesions are of irregular shape which, bleed easily and healing slowly and are painful.
  - Specimen from blisters and surrounding skin shows acantholysis (separation of epidermal cells from each other).
- **Management**
  - Corticosteroid and immunosuppressive agents

Stevens Johnson Syndrome (SJS) and Toxic Epidermal Necrolysis (TEN)

- Both are potentially fatal skin conditions
- Characterized by widespread erythema and macule formation with blistering resulting in epidermal detachment.
- TEN is more severe than SJS.
- **Cause**: Adverse reaction to drug in use
- In Children, SJS is usually triggered by viral infections, e.g. Mumps, flu, Coxsackie virus, Herpes-simplex virus, Epstein-Barr virus.
- **Management**
  - Immediate management is discontinuation of drug
  - Treatment has to be provided similar to that of burn [discussed later in this chapter].

Skin Tumors

Benign Tumors of Skin

Table 43

Condition	Description
Cyst	• Epithelium lined cavities that contain fluid or solid material. • Epidermal cyst most frequently occur over face, neck, upper chest and back.
Seborrheic and actinic keratosis	• Benign warts like lesion of varying size and color vary from light to dark. • Excision is the treatment of choice
Warts	• These are caused by **infection with HPV virus** (DNA virus). • **Treatment:** Laser, liquid nitrogen, salicylic and electro-dessication.
Angiomas	• Benign vascular tumors involving skin and subcutaneous tissue. • They present at birth as patches or raised bright red, nodular lesions.
Pigmented nevi-mole	• Moles are of varying size and shape ranging from yellowish brown to black. • It can be flat or elevated and occasionally containing hair.
Keloids	• Fibrous tissue that grow over the site of scar or trauma. • They are harmless but cause cosmetic concern
Dermato-fibroma	• Benign tumor of connective tissue occurs predominately on extremities. • Excisional biopsy is the treatment of choice

Contd...

Malignant Skin Tumors

- Exposure to the sun is a **leading cause for skin cancer.**

Basal Cell Carcinoma (BCC)

- Most common type of skin cancer
- It appears over the area of sun exposure
- Frequently appear over the areas of face.
- Metastasis is rare but recurrence is common.
- **Management:** Excision of the tumor

Squamous Cell Carcinoma (SCC)

- Malignant proliferation arising from epidermis
- It can occur in sun damaged area, in a normal skin or a skin with previous lesion
- SCC can metastasis by blood and lymphatic system.
- **Management:** Excision of the tumor

Melanoma

- Neoplastic melanocytes are present in the epidermis and dermis
- It is the most lethal skin cancer
- **Diagnosis:** Biopsy results confirm the melanoma
- **Treatment:** Surgery and chemotherapy

Skin Grafts

- Skin graft is a technique in which skin is detached from its own blood supply and transferred to other (recipient) site.
- **Auto graft**: Tissue is obtained from patient's own skin
- **Homograft / Allograft**: Tissue is obtained from donor of the same species.
- **Xenograft/heterograft:** Skin tissue is obtained from other species.

Graft Application

- Recipient site must have adequate blood supply
- Recipient site must be in close contact with its bed to avoid accumulation of blood
- Graft must fix firmly so that it remains in place

Flap

In this type one end of the tissue remain attached with its own blood supply and the other end moves to cover the wound.

Hair Loss/Alopecia

- Most common type of alopecia is male pattern of alopecia (androgenic alopecia).
- It is associated with aging, hereditary and androgen
- Hair loss starts at frontal temporal area and gradual thinning and complete loss of hair over the scalp.
- **Drug of choice:** Minoxidil and finasteride

Scanned with CamScanner

Irritant Contact Dermatitis

- It is also known as eczema.
- It is the inflammatory reaction of the skin to physical, chemical and biological agents.
- **Primary cause** of contact dermatitis is **allergy**.
- **Manifestations:** Pruritus, burning, erythema, edema, papules, vesicles
- **Management:** Cool and wet dressing, thin layer of cream containing corticosteroids

Systemic Lupus Erythematous (SLE)

- It is an autoimmune disease.
- **Discoid lupus:** Affects face
- **Drug induced lupus:** Affects kidney or brain
- **Neonatal lupus:** It passes into newborn during delivery
- **SLE** affects almost all systems of the body.
- **Characteristic feature:** Butterfly shaped erythematous, patches.
- **Other manifestations:** Alopecia, splinter hemorrhage, Raynaud's phenomenon, arthralgia/osteoarthritis, joint swelling and tenderness.
- **Diagnosis:** Antinuclear antibody test
- **Management:** NSAIDs, corticosteroids, anti-malarial agents are the drug of choice.

Figure 44 ■ Systemic lupus erythematous (SLE)

Cellulitis

- Skin infection caused by bacteria
- Bacteria invade and release toxin into the subcutaneous tissue
- **Manifestations:** Local edema, redness and pain
- **Management:**
  - Local and systemic
  - Elevation of the affected area and warm moist pack application

BURNS

It is the transfer of energy from one source to another which leads to tissue damage, destruction, protein denaturalization and ionization of content.

Classification of Burn Injury Based upon the Depth

- **First degree burns (Superficial partial-thickness burns)**
  - Mainly involves epidermis layer of the skin, e.g. sun burn
    - Pink in color
    - Painful
- **Second degree burns (Deep partial-thickness burns)**
  - Epidermis along with upper and deeper portion of the dermis e.g. Scald
    - White to pink or red in color
    - Very painful
- **Third degree burns (Full-thickness burns):**
  - Epidermis, dermis, subcutaneous tissue and even deeper tissue will be affected. It is painless because nerves are completely destroyed, e.g. burn from flame and electric burn.
    - White to charred
    - Little or no pain

Extent of Body Surface Area Burned

- **Rule of Nines:** A method used to estimate the total body surface area of burn by assigning percentages in multiples of nine to major body surfaces.

Table 44 Percentage of body surface area burnt

Adult body area	%
Arm x 2 x 9%	18%
Head	9%
Groin	1%
Leg x 2	36%
Anterior trunk	18%
Posterior trunk	18%

Rule of Nine

Figure 45 ■ Rule of nines for adult

Scanned with CamScanner

Figure 46 ■ Rule of nines for child

Figure 47 ■ Rule of nines for infant

Lund and Browder Chart

The chart, if used correctly, is the most accurate method to assess burned area. It compensates for the variation in body shape with age and therefore can give precise estimation of body surface area burnt.

Palmar Method

Palmar method in a patient with scattered burn is useful. Patient's own palm is considered as 1% of the total body surface area.

Body Response to Burn Injury

- Because of hypovolemia, there is significant decrease in cardiac output and fall in BP occurs.
- Loss of capillary integrity leads to shift of fluid and **edema around the burn injuries.**
- In case of circumferential burn, edema cause pressure on small blood vessels and nerves which obstruct the blood flow to distal part and is known as **compartment syndrome.**
- **Escharotomy** is the surgical procedure of choice to maintain blood supply.
- Due to tissue death serum **potassium will be elevated** and **sodium will level of fall.**
- Due to hypovolemia and blood loss **hematocrit value will be elevated.**
- Due to decreased blood flow to the kidney **urine output will be reduced.**
- Loss of skin integrity leads to **impaired thermoregulation.**

Phases of Burn Care

Table 45

Phase	Duration	Priority care
Emergent phase or resuscitative phase	Onset of injury to completion of fluid resuscitation	• First aid • Patent airway • Prevent shock • Initial wound assessment and care
Acute phase	Starts with completion of fluid resuscitation and ends with wound closure	• Wound care and closure • Provide adequate nutrition • Prevent infection
Rehabilitation phase	Starts with wound closure to return of patient to the optimal activities of daily living	• Psychological counselling • Cosmetic surgeries • Prevention of contracture

Key Points

- **Silver nitrate:** Produce stains, mafenide acetate–may cause temporary burning or stinging sensation.
- Urine output is the indicator to assess the effectiveness of fluid resuscitation

Formulas for Fluid Replacement in Burn Victim

Consensus Formula

- **RL solution:** 2-4 ml × body weight in kilogram × percentage of total body surface area burned
- Half of the fluid has to be given in 8 hours and remaining half in 16 hours

Evans Formula

- **Colloids:** 1ml x body weight in kilogram x percentage of total body surface area burned
- **Electrolyte (saline):** 1 ml × body weight in kilogram × percentage of total body surface area burned
- **Glucose (5% in water):** 2000 ml for insensible water loss
- **Day 1:** Half of the fluid has to be given in 8 hours and remaining half in 16 hours
- **Day 2:** Half of the previous day's electrolyte and colloids and all of the insensible water loss

Brooke Army Formula

- **Colloids:** 0.5 ml × body weight in kilogram × percentage of total burned surface area

Scanned with CamScanner

- **Electrolyte (RL):** 1.5 ml × body weight in kilogram x percentage of total body surface area burned
- **Glucose (5%water):** 2000 ml for insensible water loss
- **Day 1:** half of the fluid has to be given in 8hours and remaining half in 16 hours
- **Day 2:** half of the previous day's electrolyte and colloids and all of the insensible water loss

Parkland/Baxter Formula

- **Ringer lactate:** 4 ml × body weight in kilogram × percentage of total body surface area burned
- **Day 1:** Half of the fluid has to be given in 8 hours and remaining half in 16 hours
- **Day 2:** Varies, colloid is added

Wound Debridement

- It means removal of devitalized tissue and dead tissue, removal of bacteria and other foreign bodies.

Types

- **Natural debridement:** Dead tissue gets separated from underlying viable tissue by the action of natural proteolytic enzyme.
- **Mechanical debridement:** Dead tissues are removed with the help of scissors and forceps.
- **Surgical debridement:** Surgical excision of the devitalized tissue.

Target High Extra Edge

Golden points to remember

- Carotenemia (carotenosis) is yellow discoloration of skin most noticeable on palms and soles, no yellowing of sclera, caused by increased intake of vegetable containing carotene.
- Methods used for determining the extent of burn are **Rule of Nines** and **Lund Browder method**.
- The Brook and **Parkland** formulas are used for fluid calculation of burn patient.
- **Dapsone** is used in treatment of leprosy, pneumocystis pneumonia, and dermatitis herpetiformis.
- **Butterfly rash** is a sign of systemic lupus erythmatosis.
- **EUSOL** (Edinburgh University Solution of lime Composition): Antiseptic solution contains 12.5 g boric acid +12.5 g bleaching powder in 100 mL of water; used in treating wound and burn area.
- **Erythromelalgia** is caused by an increased platelet count that results in formation of tiny clots in vessels of the extremity. It is characterized by sudden severe pain in hand and feet with reddish or bluish coloration of skin.
- **Erythromelalgia** is a classic symptom of **polycythemia vera**.
- **Hamartoma** is an excess of normal tissue in a normal situation, e.g. **birth mark on skin**.
- **Pachyderma** means thick skin caused by dysregulation of mesenchymal cells.
- **Basal cell carcinoma** (BCC) is the most common type of skin cancer.
- **Melanoma** is the most lethal skin cancer.
- For assessment of stage of pressure ulcer, the eschar and slough must be removed before assessment.
- **Dapsone** or Diaminodiphenylsulfone is drug of choice for **Leprosy**.

Scanned with CamScanner

"A man with a cough cannot conceal himself."

—African proverb

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

ANATOMY AND PHYSIOLOGY

855. Primary function of the skin is .....
a. Vit D synthesis b. Protection
c. Sensation d. Temperature regulation

856. Tunica adventitia is a layer of: *(Staff Nurse GII 2014)*
a. Blood vessels b. Uterus
c. Testis d. Lungs

857. The outermost layer of the skin is known as
a. Cutaneous b. Subcutaneous
c. Dermis d. Epidermis

858. The layers of epidermis from outer side to inner side is
a. Corneum – granulosum – germinative – lucidum
b. Corneum – lucidum – germinative – granulosum
c. Corneum – lucidum – granulosum – germinative
d. Lucidum – Corneum – granulosum – germinative

859. Sweating is mediated by
a. Norepinephrine b. Epinephrine
c. Acetylcholine d. Histamine

860. Insensible water loss per day is
a. 100 mL b. 300 mL
c. 700 mL d. 100 mL

861. The Eccrine gland secrets
a. Sebum b. Sweat
c. Melanine d. Hormones

862. Skin color is given by the pigment known as .....
a. Sebum b. Carotenes
c. Melanin d. Keratin

863. Melanocytes secretes
a. Sebum b. Melanin
c. Sweat d. All of the above

864. Diaphoresis means
a. Excessive production of sebum
b. Excessive production of sweat
c. Excessive skin shedding
d. Excessive production of tears

865. Healthy hair receives a good blood supply from the
a. Hair follicle b. Hair shaft
c. Hair papillae d. Hair bulb

866. Which vitamin is synthesized when skin exposed to the ultraviolet rays of the sun?
a. Vitamin A b. Vitamin B
c. Vitamin C d. Vitamin D

867. When one is having fever, the excessive heat is removed by the
a. Constriction of skin blood vessel
b. Active production of sweat
c. Contraction of arrector pili
d. Erection of the hair shaft

868. Sebaceous glands are NOT found in
a. Palm of the hand b. Sole of the feet
c. Back of the hand d. Option A and B

869. Rule of nine is _____
a. A tool used to assess eye sight of a person
b. An allergy identification test
c. A chart used to assess the area of body burned
d. A tool used to assess nutritional deficiency

870. Majority of melanomas are caused by
a. Exposure to ultraviolet ray
b. Excess fatty tissues
c. Lack of exposure to sunlight
d. Lack of vitamin D

871. Receptors for touch is
a. Meissner's b. Merkel's disc
c. Free nerve terminal d. All of the above

872. Non-shivering thermogenesis in adults is due to
a. Thyroid hormone
b. Brown fat between the shoulders
c. Noradrenaline
d. Muscle metabolism

873. Main mechanism in thermoregulation-heat loss is
a. Radiation b. Evaporation
c. Conduction d. Convection

874. Vasoconstriction in skin is _____ function
a. Sympathetic b. Parasympathetic
c. Wheal and flare d. Warm climate

875. The procedure for collecting sample of skin for biological examination is called
a. Surgical shave b. Biopsy
c. Aspiration d. Injection

876. Which of the following term refers to a fungal infection of the foot (Athlete's foot)
a. Impetigo b. Acne vulgaris
c. Tinea pedis d. Scabies

877. Functions of epithelial tissue includes
a. Absorption b. Protection
c. Secretion d. All of the above

878. Aldosterone directly regulates the concentration of ____
a. Sodium b. Potassium
c. Calcium d. Phosphate

879. Eschar refers to
a. Loss of skin elasticity
b. A dry scab or slough formed on the skin as a result of burn
c. An area of red skin
d. Excessive sweating

880. Which of these layers has shedding of cells occurring continuously due to wear and tear?
a. Stratum corneum b. Stratum lucidum
c. Stratum granulosum d. Stratum spinosum

881. Glands present in the skin is .....
a. Sebaceous gland b. Apocrine gland
c. Sweat gland d. All of the above

Ans.

855.	b
856.	a
857.	d
858.	c
859.	c

878.	a
879.	b
880.	a
881.	d

Scanned with CamScanner

882. Skin glands activated by increase in temperature is:
a. Sebaceous gland b. Apocrine glands
c. Sweat glands d. Bartholin's glands

883. Which among the following is the characteristic of protective epithelium?
a. Regeneration of membrane
b. Melanin production
c. Thinness
d. Phagocytic vesicle

884. Receptors for touch is
a. Meissner's b. Merkel's disc
c. Free nerve terminal d. All of the above

885. In human, skin accounts for approximately _____ percentage of an adult's total body weight? *(RML 1998)*
a. 7% b. 9%
c. 12% d. 14%

Explanation: In humans, the skin accounts for about 7% of the total body weight.

COMMON SIGNS AND SYMPTOMS

886. Inflammation of tissues surrounding the nail is known as *(DSSSB 2013)*
a. Clubbing b. Koilonychia
c. Onycholysis d. Paronychia

Explanation: An infection that develops along the edge of the fingernail or toenail is called a paronychia. More specifically, it is a superficial infection of epithelium lateral to the nail plate that begins as cellulitis.

Tips: Use the key word "Para" (side of beside) from option D which will help you to connect the key term in the stem "tissues surrounding".

887. Characteristic feature of skin in a dehydrated patient include
a. Warm and dry b. Loss of elasticity
c. Pigmented skin d. Both A and B

888. Lyme disease produces a characteristic annular or circular rash known as
a. Plaques b. Papules
c. Bullae d. Bull's eye rash

889. Xanthoma refers to
a. Dryness of conjunctiva
b. Dry mouth
c. Yellowish plaques near the inner canthus of the eyelid
d. Fatty growths develop underneath the skin

890. The benign changes in elderly skin includes the following, EXCEPT *(AIIMS Raipur Grade II 2017)*
a. Cherry angiomas b. Telangiectasis
c. Spider angiomas d. Pseudoxantoma elasticum

Explanation: Telangiectases are dilated capillaries that appear as red linear streaks or punctate lesions. Telangiectasia may represent a benign condition or a marker of a much more serious internal or cutaneous malignancy.

All other given conditions are benign skin conditions. Spider angioma, also known as spider naevus or spider telangiectasia, is a vascular lesion characterized by anomalous dilatation of end vasculature found just beneath the skin surface. Spider angiomas are seen in young adults, pregnant women and in patients with cirrhosis, alcoholic hepatitis, and hepatopulmonary syndrome. Spider angioma are more likely in older persons because ageing causes value in veins to weaken.

Cherry hemangiomas, also known as Campbell de Morgan spots and senile angiomas, are found commonly in elderly patients.

Pseudoxanthoma elasticum (PXE) is a progressive disorder that is characterized by the accumulation of deposits of calcium and other minerals (mineralization) in elastic fibers. In PXE, mineralization can affect elastic fibers in the skin, eyes, and blood vessels.

891. Commonest form of skin cancer is .....
a. Basal cell carcinoma
b. Squamous cell carcinoma
c. Malignant melanoma
d. Hemangioma

892. Blue-gray birthmark on the forehead and eye of a person indicate .....
a. Vitiligo b. Impetigo
c. Scabies d. Nevus of Ota

893. A common site for the lesions associated with atopic dermatitis is .....
a. Buttocks b. Shoulder
c. Antecubital space d. Thigh

894. Skin manifestation commonly seen after 2 days of radiotherapy is?
a. Atrophy b. Dermatitis
c. Erythema d. Hyperpigmentation

895. The complications of Steven - Johnson Syndrome include: *(AIIMS Raipur Grade II 2017)*
A. Untreated sepsis B. Keratoconjunctivitis
C. Conjunctival retraction D. Corneal lesions
a. A, B, C b. B, C, D
c. A, C, D d. A, B, C, D

Explanation: Steven Johnson syndrome is a disorder of skin and mucus membrane. The signs and symptoms include fever, unexplained widespread skin pain, a red or purple skin rash that spreads, blisters on skin and the mucous membranes of mouth, nose, eyes and genitals and shedding of skin within days after blisters form. The complications include cellulitis, sepsis, eye problems, Lung involvement and permanent skin damage. The drugs which cause this syndrome include allopurinol, penicillin, pain relievers like acetaminophen, ibuprofen and naproxen sodium, anticonvulsants and antipsychotics.

SKIN DISORDERS

896. Dark skinned people are more likely to develop .....
a. Keloids b. Crust
c. Melanoma d. Skin cancer

897. Keloid is made up of.....
a. Dense collagen b. Fibrinogen
c. Dead tissues d. Dermis and epidermis

898. Systemic lupus erythematosus (SLE) affects .....
a. Connective tissue b. Liver
c. Kidney d. Retina

899. Most common and life-threatening complication of SLE is
a. Arthralgia b. Nephritis
c. Butterfly rashes d. Sydenham's chorea

900. Clinical manifestation related to neurological involvement of SLE is .....
a. Delirium b. Psychosis
c. Anxiety d. Convulsion

Ans.

882.	c
883.	a
884.	d
885.	a
886.	d
887.	d
888.	d
889.	d
890.	b
891.	a
892.	d
893.	c
894.	c
895.	d
896.	a
897.	a
898.	a
899.	b
900.	b

Scanned with CamScanner

901. Most appropriate medication for treating SLE is .....
a. Fentanyl b. Prednisolone
c. Hydroxychloroquine d. Adrenaline

Explanation: Antimalarial remain the first-line treatment for SLE along with NSAIDs. The two types of antimalarials most often prescribed today for SLE are hydroxychloroquine and chloroquine. Antimalarials combined

902. All of the following are the clinical features of systemic lupus erythematosus (SLE) EXCEPT
a. Arthralgia b. Butterfly rashes
c. Portal hypertension d. Myalgia

903. Blood dyscrasias present in a client with systemic lupus erythematosus (SLE) is .....
a. Disseminated intra vascular coagulopathy
b. Polycythemia
c. Essential thrombocytopenia
d. Thalassemia

PRESSURE ULCER

904. All of the following scales are used to assess risk for pressures sore in patients EXCEPT
a. Waterlow scale b. Broset scale
c. Norton scale d. Braden's scale

905. Type of healing occurs in a decubitus ulcer which is treated with debridement and moist gauze dressing is .....
a. Tertiary intention b. Secondary intention
c. Regeneration of cells d. Remodeling of tissues

906. The Braden Scale score of a client is 16. Most appropriate nursing action is .....
a. Change position every 2 hours
b. High fowlers position
c. Apply moisturizer on the affected skin
d. Administer oxygen via mask

907. Decubitus ulcer on scapula measures 1 × 2 × 0.8 cm and pink subcutaneous tissue is completely visible on the wound bed, identify the stage
a. Stage I b. Stage II
c. Stage III d. Stage IV

908. To properly stage a pressure ulcer: *(ESIC 2019)*
a. The patient must be supine
b. The skin must be completely dry
c. Natural light must be used
d. Eschar must be removed

Explanation: For assessment of stage of pressure ulcer, the eschar and slough must be removed before assessment. Position of the patient depends upon the site of pressure ulcer (not necessarily supine). A completely dry skin is not expected before assessing for staging. Day light may be preferred but not mandatory.

PSORIASIS

909. Silvery scales plaques that are mildly itchy on the patient's knees and elbows are known as .....
a. Scabies b. Vitiligo
c. Impetigo d. Psoriasis

910. Which of the following statement is correct about psoriasis?
a. Showering with antiseptic soap will prevent transmission to other family members
b. Washing clothes separately from the rest of the family are necessary
c. Psoriasis is not contagious, so no special precautions are necessary
d. Psoriasis is transmitted primarily by direct contact with the skin

Explanation: Psoriasis is a skin condition that causes red, flaky, crusty patches of skin covered with silvery scales. Psoriasis is not contagious so it will not spread from one person to other person.

911. Psoriasis affects .....
a. Scalp, knees and elbows b. Nails
c. Joints d. All of the above

SKIN INFECTIONS

912. Clinical manifestation of scabies includes all, EXCEPT
a. Severe itching usually worse at morning
b. Presence of burrows
c. Erythematous papules
d. irregular burrow tracks made up of tiny blisters

913. In scabies, burrows are present over
a. Interdigital webs b. Flexor surface of wrist
c. Anterior axillary fold d. All of the above

914. Drug of choice to treat scabies is .....
a. Permethrin b. Calamine lotion
c. Tincture benzoate d. Povidone iodine

915. Sensational loss that occurs first in leprosy is .....
a. Temperature b. Pain
c. Touch d. Pressure

916. Pemphigus neonatorum or Ritter's disease is caused by
a. Streptococci b. Staphylococcus
c. Meningococci d. Gonococci

917. Identify granulomatous diseases among the following?
a. Tuberculosis b. Leprosy
c. Syphilis d. Both a and b are correct

INTERVENTIONS

918. Lindane is a: *(NCFL 2019)*
a. DDT b. BHC
c. Malathion d. Fenthion

Explanation: Lindane, also known as gamma-hexachlorocyclohexane, and sometimes incorrectly called benzene hexachloride (BHC) is widely used in the control of pests of agricultural crops. It is used as a second-line pharmaceutical treatment for lice and scabies though it has an adverse effect on human health.

919. Which among the following is the medication of choice for a patient with red and irritated skin following diarrheal episode?
a. Silver sulfadiazine
b. Zinc oxide
c. Mafenide acetate
d. Actiot

920. What medication is most likely to be administered to the client with diagnosis of herpes zoster?
a. Penicillin b. Acyclovir
c. Doxycycline d. Fluconazole

Explanation: Herpes zoster is usually treated with orally administered acyclovir, an antiviral agent. Adults with herpes zoster can be treated with oral acyclovir at a dose of 800 mg five times daily. Other antiviral medications include famciclovir and valacyclovir.

Ans.

Scanned with CamScanner

921. **Health education to a client after chemical peeling is .....**
a. Avoidance of sun exposure
b. Drink plenty of water
c. Use cold application at the site
d. Use scrubber while taking bath

922. **Rhytidectomy is .....**
a. Removal of the larger skin wrinkles and folds from the face and neck
b. Removal of excess abdominal skin and fat
c. Smoother appearance of photo damaged and wrinkled skin
d. Improve the appearance of photo damaged and acne scarring

923. **Microdermabrasion is .....**
a. Removal of the larger skin wrinkles and folds from the face and neck
b. Removal of excess abdominal skin and fat
c. Smoother appearance of photo damaged and wrinkled skin
d. Improve the appearance of photo damaged and acne scarring

924. **Chemical peel is .....**
a. Removal of the larger skin wrinkles and folds from the face and neck
b. Removal of excess abdominal skin and fat
c. Smoother appearance of photo damaged and wrinkled skin
d. Improve the appearance of photo damaged and acne scarring

925. **Graft from identical twin is .....**
a. Allograft b. Isograft
c. Xenograft d. Autograft

926. **Autograft is between -**
a. Different species b. Same individual
c. Twins d. Same species

927. **Xenograft is between .....**
a. Different species b. Same individual
c. Twins d. Same species

928. **Which of the following is not advised for a patient with pruritus?**
a. Daily baths with scented soap
b. Wearing cloths made of 100% cotton
c. Increasing fluid intake
d. Apply moisturizer after bath

Explanation: Use of scented soap (with aromatic oils) lead to dryness of skin. This may cause aggravation of pruritus.

929. **Which among the following is the medication of choice for a patient with red and irritated skin following diarrheal episode** *(AIIMS Raipur Staff Nurse Grade I-2018)*
a. Silver sulfadiazine b. Zinc oxide
c. Mafenide acetate d. Actiot

Explanation: Zinc oxide is the medication of choice for a patient with red and irritated skin following diarrheal episode

930. **Which of the following information should be included in a health teaching regarding 'how to reduce the risk of skin cancer'?**
a. Avoid prolonged exposure to the sun
b. After being in the woods or in tall grass, check for ticks
c. Avoid strong deodorants, perfumes and body lotions
d. Shower immediately after being outdoors

Explanation: Prolonged exposure to ultraviolet rays is the major risk factor for skin cancer.

BURNS

931. **If a patient has severe burns on the upper torso, which would be a primary concern:** *(Safdarjung NO 2018)*
a. Administering antibiotics
b. Debriding and covering the wounds
c. Frequently observing for hoarseness, stridor and dyspnea
d. Establishing a patent IV line for fluid replacement

Explanation: Burns on the upper torso may have inhalational burns. Upper torso burns have a potential threat to burns in upper respiratory tract that necessitates, the frequent monitoring of respiratory function and sounds. So, the primary concern is to frequently observe for hoarseness, stridor and dyspnea. The patient may need early intubation and ventilatory support.

Antibiotics and wound debridement are common for all kind of burns. If upper torso is burnt, central venous access can be taken through femoral vein.

932. **Which type of burn is painless?** *(LNJP H D 2012)*
a. Third degree b. None of the above
c. First degree d. Second degree

933. **Which among the following burn is characterized by no pain?** *(AIIMS Raipur staff nurse grade I-2018)*
a. Superficial partial thickness
b. Deep partial thickness
c. Full thickness burn
d. All of these

Explanation: In full thickness burn, nerve endings are also damaged and patient will not perceive pain

934. **First degree partial thickness burn is characterized by**
a. Involvement of epidermis and dermis
b. Burn site appears red, blistered
c. Superficial and painful burn
d. Surface of the wound is leathery and may be brown

935. **Which of the following observation best describes the characteristics of a second degree partial thickness burn?**
a. Redness in the skin without blisters
b. Redness in the skin with clear blister
c. Stiff and white/brown skin
d. All of the above

936. **Third degree full thickness burn is characterized by**
a. Epidermis dermis and subcutaneous tissue is affected
b. Painless burn
c. Appears dry and may be black and white
d. All of the above

937. **A patient is admitted with burns on his right lower extremity. Client states that he has minimal pain. The burned area appeared as white and leather-like. Observation showed no blister or bleeding. This burn injury is categorized as:**
a. Full thickness
b. Partial thickness-deep
c. Partial thickness-superficial
d. Superficial

Explanation: White skin (also black/brown or yellow) and no or minimal pain are the characteristic of full thickness burn.

938. **Least risk for full thickness burn is associated with .....**
a. Sunburn b. Thermal injury
c. Chemical burn d. Electrical injury

Ans.

921.	a
922.	a
923.	c

937.	a
938.	a

Scanned with CamScanner

939. Most common type of burn injury is
a. Chemical b. Electrical
c. Thermal d. Inhalation

940. A patient with burn injury will be always complaining of some amount of pain and is known as
a. Resting pain b. Procedural pain
c. Break through pain d. Severe pain

941. A patient with burn injury will be complaining of pain during dressing change. This is known as
a. Resting pain b. Procedural pain
c. Break through pain d. Severe pain

942. A patient with burn injury will always be complaining of some amount of pain as the level of analgesics decreased in the blood and is known as .....
a. Resting pain b. Procedural pan
c. Break through pain d. Severe pain

943. Burn over which part of the body causes risk of life-threatening complications?
a. Lower extremities b. Hands and feet
c. Perineum d. Upper part of the body

Explanation: Burn injury to the upper part of the body causes risk of life-threatening complications due to frequent respiratory involvement.

944. Which of the following is not a possible systemic clinical manifestation of severe burns?
a. Insulin resistance b. Hypermetabolism
c. Sepsis d. Systemic hypertension

945. Mechanism behind the development of edema in burn patient is:
a. Increased capillary permeability
b. Due to renal failure
c. Increased IV fluid administration
d. Decreased urine output

Ans.

939.	c
940.	a
941.	b
942.	c
943.	d
944.	d
945.	a
946.	d
947.	c
948.	b
949.	a
950.	b
951.	b
952.	c
953.	c
954.	b

Explanation: Increased capillary permeability leads to fluid shift from the circulation into burned tissue because of a moderate increase in capillary permeability to fluid and macromolecules and a modest increase in hydrostatic pressure inside the perfusing microvessels.

946. Burn severity is assessed with .....
a. Burned surface area b. Depth
c. Body parts affected d. All of the above

947. Burn injury to which of the following area considered to be largest area as per rule of nine? *(AIIMS Staff Nurse 2016)*
a. Anterior upper chest b. Face and neck
c. Right leg d. Left arm

948. A client is admitted with a burn injury to both of his upper extremities. What is the total body surface area (TBSA) affected for this patient, according to rule of nine?
a. 9% b. 18%
c. 36% d. 27%

Explanation: As per rule of nines, each of the upper limbs is considered 9%. As the patient has burn injury to both of his limbs, the burn affected percentage is 18%.

949. A 25-year-old male patient sustained severe burns of the right lower extremity. Using the rule of nines, which is the best estimate of total body-surface area burned?
a. 18% b. 22%
c. 31% d. 40%

Explanation: Please refer to the explanation of next question.

950. A patient is admitted with burn injury to entire anterior chest and abdomen. The nurse calculates the total body surface area affected by burn using the rule of nine as
a. 9% b. 18%
c. 27% d. 36%

Explanation: Rule of nines a method of estimating the extent of burns. The following image illustrates the calculation of body surface area of burn using rule of nines.

Surface area of affected area:
9 (anterior chest) + 9 (anterior abdomen) = 18%

951. A 32-year-old male patient is admitted to the burn unit with burn injury to anterior chest and abdomen. Which of the following assessment is most important for this client in first 48 hours
a. Assessment of skin color and capillary refill
b. Hourly urine output measurement
c. Hourly blood pressure measurement
d. Frequent assessment for pain

Explanation: Hourly measurement of urine output is necessary to manage fluid replacement therapy. Though other observations also important, measurement of urine output is the priority.

952. Best blood test to assess the fluid status in a burn patient is .....
a. Electrolyte level b. Creatinine level
c. Hematocrit d. Hemoglobin level

953. In post-burn patient, true is:
a. Hypokalemic alkalosis b. Hyperkalemic alkalosis
c. Hyperkalemic acidosis d. Hypokalemic acidosis

Explanation: Hyperkalemic acidosis is seen in acute burns. The combination of potassium shift out of cells and diminished urine K^+ excretion causes hyperkalemia. Tissue destruction also releases K^+ into circulation

954. Hypertrophic scar in a burn victim can be prevented by ...
a. Massaging the body with moisturizer
b. Applying pressure garments
c. Change position every hourly
d. Dressing the wound properly

Scanned with CamScanner

955. What type of room is appropriate to shift a severely burned client from emergency department?
a. General ward with a noninfectious clients
b. A semi-private room with a postoperative client
c. A private room with a private bath
d. An isolation room

Explanation: Burn victims are highly susceptible for infection. They should be preferably kept in an isolation room to protect from infection.

956. First nursing intervention while seeing a burn client is .....
a. Stop further burn
b. Make the client in a safe place
c. Ensure ABC
d. Shift to hospital

957. Which of the following nursing intervention is necessary for a client who has silver nitrate dressings applied to his burns?
a. Restrict fluid intake
b. Change the dressings every two hours
c. Keep the dressings wet
d. Frequently observe for black discoloration

Explanation: Silver nitrate dressings must always be kept wet to be effective. Silver nitrate does cause black discoloration, but this is incidental and not a major nursing consideration.

958. Silver nitrate dressings may cause:
a. Abnormality in blood gases
b. Abnormal blood count
c. Depletion of sodium and potassium
d. Increased blood urea nitrogen (BUN)

Explanation: Silver nitrate can cause depletion of potassium, sodium, and chloride; therefore, assessment of serum electrolytes is essential when the patient has silver nitrate dressings.

959. The best indicator of adequate fluid balance in a client with burn especially in the first 48 hours of care is:
a. Change in level of consciousness
b. Elevated hematocrit levels.
c. Urine output of 30–50 mL/hr
d. Weight of the patient

Explanation: Urine output of 30 mL 50 mL per hour is the best indicator for adequate fluid balance. Urine output of at least 30 mL/hr ensures adequate tissue perfusion to vital organs such as kidney, heart and brain.

960. Cimetidine is administered 6 hourly to client with burn in order to:
a. Prevent secondary infection
b. Maintain fluid-electrolyte balance
c. Promote GFR
d. Prevent Curling's ulcer

Explanation: Stress ulcers (Curling's ulcer) occur frequently in burn victims. Cimetidine is a histamine blocker that reduces gastric acid and helps to prevent the development of gastric ulcers.

961. A severely burned woman had her last tetanus shot a couple of years before. Which of the following should be administered for this patient?
a. DPT booster
b. Tetanus antitoxin
c. Tetanus toxoid booster
d. Hyperimmune human tetanus globulin

Explanation: DPT is not given after the age of six years. Tetanus toxoid booster is required for this patient as the patient had her last tetanus dose two years age. Tetanus antitoxin is administered if considerable time has elapsed from the time of injury. Hyperimmune tetanus globulin is given when the person has not had prior tetanus immunization.

962. Indwelling catheter is inserted in a severely burned client. The major purpose is to:
a. Maintain the bladder tonicity
b. Measure hourly urine output
c. Prevent urinary tract infection
d. Prevent contamination of burned areas

Explanation: Fluid replacement is based on measurement of urine output and it is a high priority for a client with burn injury.

963. Diet advised to a burn victim is .....
a. High calorie diet
b. High fat diet
c. High calorie and low protein diet
d. High protein and high calorie diet

RESPIRATORY SYSTEM

ANATOMY AND PHYSIOLOGY

Figure 48 ■ Respirtoary system and an enlarged cross section of lung

Scanned with CamScanner

CLASSIFICATION OF RESPIRATORY SYSTEM

Nose

- Filters, warms and humidifies the air.
- Internal portion of nose is divided into right and left nasal cavity by septum.
- Lateral walls of the nose has three turbinate bones called **conchae** which increase the surface area of mucous membrane of nasal cavity.

Paranasal Sinuses

- There are **four pairs of nasal sinuses** - frontal, ethmoid, sphenoid and maxillary.
- Nasal sinuses are hollow cavities inside the bones and help in resonation of speech.
- Sinuses are lined with nasal mucosa (**ciliated pseudo-stratified columnar epithelium**).

Pharynx

- Nasopharynx
  - Extends from base of the skull to the upper surface of soft palate.
  - Adenoids (pharangeal tonsils) are located in nasopharyngeal posterior wall.
  - **Eustachian tube starts from middle ear and opens into nasopharynx.**
  - Nasopharynx is lined with respiratory epithelium (**ciliated pseudo-stratified columnar epithelium**).
- Oropharynx
  - Extends from uvula to the hyoid bone.
  - Palatine tonsils are located in lateral wall of oropharynx.
  - It serves as a **passageway for both air and food.**
  - Oropharynx is lined with **non-keratinized squamous stratified epithelium**
- Laryngopharynx
  - Extends from hyoid bone (inferior to epiglottis) to cricoid cartilage (point where common pathway divides into larynx and esophagus).
  - It is lined with stratified squamous epithelium.

Larynx

- It is also known as **voice box.**
- It consists of epiglottis, glottis, vocal cords, thyroid cartilage, Cricoid cartilage, arytenoid cartilage.
- Angle of thyroid cartilage forms a protrusion on neck which is known as **Adam's apple.**
- **Cricoid cartilage** is the only complete **cartilaginous ring** in larynx.

Trachea

- It is also known as **windpipe** and formed of C-shaped rings which are posteriorly incomplete.
- It extends from larynx and branches into two main stem bronchi.

Lungs

- Lungs are the paired structures in thoracic cage.
- Right lung is divided into three lobes- upper, middle and lower.
- Left lung is divided into two lobes- upper and lower.
- Two main bronchi (left and right main bronchus) enter the lung through an opening called **hilum.**

- Bronchi and bronchioles are lined with cilia which help in removing secretions and foreign particles from lungs toward upper respiratory tract.
- Conducting airway contains 150 ml of air which does not participate in gas exchange (**physiological dead space**).
- Each lung contains approximately **300 million alveoli** with a surface area of 50 to 100 m^2.
- Alveolar cells has three types:
  - **Type-I:** These cells make up the alveolar epithelium
  - **Type-II:** These cells produce surfactant (which reduces the surface tension and prevents alveoli from collapsing).
  - **Type-III:** Alveolar macrophages.
- Lungs are covered by pleural cavity which contains small amount of pleural fluid between visceral and parietal pleura.
- Respiration occurs due to excitation of respiratory muscles by **phrenic nerve.**
- **Apneustic** and **pneumotaxic center** present in **pons and medulla** control respiration.
- Central chemoreceptors in medulla respond to chemical changes (pH).
- Peripheral chemoreceptors in carotid arteries and aorta respond to PaO_2 and $PaCO_2$.

Scanned with CamScanner

Lung Volumes and Capacities

Figure 49 ■ Lung volume and capacities

Lung Volume Along with Normal Values

Table 46 Lung volume along with normal volumes

Lung volume	Description	Normal Volume
Tidal volume (TV)	Amount of air inhaled during a normal, relaxed breathing.	500 mL
Inspiratory reserve volume (IRV)	Quantity of the air that can be forcibly inspired after a normal tidal inspiration	3,000 mL
Expiratory reserve volume (ERV)	Quantity of air that can be forcibly exhaled after a normal tidal expiration	1,200 mL
Residual volume (RV)	Amount of air that is still left in the lungs after the expiratory reserve volume is exhaled	1,200 mL

Lung Capacities

Table 47 Lung capacities

Named	Volume	Definition
Total lung capacity (TLC)	6,000 mL	Quantity of air that can fill the lungs (TLC = TV + IRV + ERV + RV).
Vital capacity (VC)	4,800 mL	Quantity of air that can be expired after fully inhaling (VC = TV + IRV + ERV = approximately 80% TLC). The value varies according to age and body size.
Inspiratory capacity (IC)	3,600 mL	It is the maximum quantity of air that can be inspired (IC = TV + IRV).
Functional residual capacity (FRC)	2,400 mL	It is the amount of air left in the lungs after a normal expiration (FRC = RV + ERV).

Pulmonary Pressure

- Systolic blood pressure in pulmonary artery is 20 to 30 mm Hg.
- Diastolic blood pressure in pulmonary artery is 5 to 15 mm Hg.

Ventilation/Perfusion Ratio (V/Q)

- Normal ratio- 1:1
- Low Ventilation perfusion ratio (V/Q): <1
  - Perfusion exceeds than ventilation.
  - Occurs in conditions of obstruction of distal airways (**pneumonia, atelectasis** etc)
- High Ventilation perfusion ratio (V/Q): >1
  - Ventilation exceeds than perfusion which leads to dead space.
  - Occurs in conditions like pulmonary embolism, pulmonary infraction, cardiogenic shock.
- **Silent unit**
  - It occurs when there is limited ventilation and perfusion.
  - It occurs in conditions like pneumothorax and ARDS (Acute respiratory distress syndrome).

Scanned with CamScanner

Partial Pressure of Gases

Atmospheric air	Alveoli air
Total pressure is 760 mm Hg at sea level. • Nitrogen (78.6% = 597 mm Hg) • Oxygen (21% = 158 mm Hg) • Water vapor (0.05%)	Total pressure is 760 mm Hg • Nitrogen (74.9% = 569 mm Hg) • Oxygen (13.6% = 104 mm Hg) • CO_2(5.3% = 40 mm Hg) • Water vapor (47 mm Hg)

Effect of Pressure on Oxygen Transport

- PaO_2 (partial pressure of arterial oxygen): It represents the volume of oxygen dissolved in plasma.
- At PaO_2 100 mm of Hg, each 100 ml of arterial blood carries-
  - 20 ml of oxygen by oxy-hemoglobin.
  - 0.3 ml of oxygen dissolved in plasma.
- Amount of oxygen combines with hemoglobin is measured as saturation (SpO_2)
- At PaO_2 of 100 mm of Hg, 97% of Hb is saturated with oxygen.
- When PaO_2 is 150 mm of Hg, then Hb is fully saturated with oxygen (100%).
- When Hb is fully saturated, then 1gm of Hb combines with 1.34 ml of O_2.

ASSESSMENT AND DIAGNOSTIC TESTS

- **Clubbing of Nails**
  - It is a change in normal nail bed. It is present in chronic hypoxic conditions.
  - Schamroth's window is absent.
- **Cyanosis**
  - It is the bluish discoloration of skin
  - It is determined by deoxygenated hemoglobin in blood. It is manifested when at least 5 gm/dL of blood gets deoxygenated.
  - **Central cyanosis** is observed in **lips, tongue**.
  - Peripheral cyanosis is **NOT** a reliable indicator of hypoxia.
- **Chest Configuration**
  - Normal ratio of antero-posterior to lateral diameter of thorax is 1:2.
  - **Barrel chest**- Sign of **COPD** and **emphysema**. Antero-posterior to lateral diameter of thorax is 1:1.
  - **Funnel chest** (Pectus excavatum)- In this, there is a depression in lower part of sternum that compresses heart and great vessels. It occurs in rickets or **marfan's syndrome**.
  - **Pigeon chest** (Pectus Carinatum)- It occurs due to displacement of sternum anteriorly which increases antero-posterior diameter.

Breathing Patterns

Table 48

Condition	Assessment	Associated with
Normal respiratory rate in an adult	14 to 20 breaths/min	
Bradypnea	<10 breaths/min	Raised ICP, brain injury.
Tachypnea	>24 breaths/min	Pneumonia, metabolic acidosis, hypoxia.
Hyperpnea	Deep breathing	During and after exercise, High altitude, severe sepsis
Hypoventilation	Shallow breathing	Muscle weakness, decrease in ventilator drive
Hyperventilation (Kussmaul's respiration)	Increased rate and depth of breathing	Decreased $PaCO_2$, anxiety, metabolic acidosis
Apnea	Transient cessation of breathing	
Obstructive sleep apnea	Pause of breathing during sleep with transient upper airway obstruction.	Most common cause is excess weight and obesity
Cheyne stokes	Rate and depth of breathing increase and then decrease until apnea	Usually associated with heart failure or stroke

Scanned with CamScanner

- **Pulmonary Function Tests- PFTs are Performed with the Help of Spirometer**

- **Pulmonary angiography**
  - It is a procedure to visualize pulmonary vasculature
  - Informed consent should be taken
  - Assess the patient for allergy to radio-opaque dye
  - Keep patient NPO for 6 to 8 hours before investigation.
  - Inform patient about warm, flushed feeling after insertion of dye.
  - After procedure, closely monitor vital signs, SaO_2, bleeding, hematoma at puncture site.
- **Ventilation/Perfusion Scan**
  - It is performed to assess Ventilation/Perfusion (V/Q) ratio with the help of radioactive agent.
  - Perfusion to the lungs is assessed by administering radioactive agent through peripheral vein with a mask fitted over nose of the patient.
  - It is followed by ventilation scan by asking the patient to take a deep breath of mixture of oxygen and radioactive gas.
- **Bronchoscopy**
  - It is the direct visualization of trachea-bronchial tree by flexible fiberoptic bronchoscope or rigid bronchoscope.
  - Purposes:
    - To directly visualize the extent or location of lesion, tumour etc.
    - To collect secretions for diagnosis.
    - To assess site of bleeding (Hemoptysis).
    - To take biopsy
    - To remove foreign body.
  - Nursing responsibilities:
    - Obtain informed consent.
    - Keep patient NPO 4 to 8 hrs before the test.
    - Remove dentures or any oral prosthesis.
    - Administer topical lidocaine spray over the posterior wall of pharynx.
    - After procedure, keep patient NPO until gag reflex appears.
    - Start with ice chips followed by clear fluids.
    - Monitor patient for hypoxia, tachycardia, dyspnea, haemoptysis etc.
- **VATS (Video assisted thoracoscopy)**
  - A fiberoptic mediastinoscope is inserted into pleural cavity which is visualized on a screen.
- **Thoracocentesis**
  - It is the procedure of aspiration of fluid or air from pleural cavity.
  - Nursing responsibilities
    - Obtain informed consent.
    - Inform patient to remain immobile during procedure. Ask the patient to refrain from coughing during procedure.
    - Obtain baseline chest X-ray, vital signs, pain level and SaO_2.
    - **Position:** Sitting on edge of bed with arms supported on padded cardiac table/Sitting on chair with arms and head resting on back of chair/lying on unaffected side either 30 to 45 degrees elevated head end.
    - For **pneumothorax location** for needle insertion is **2nd or 3rd intercostal space in mid-clavicular line.**
    - Strict aseptic precautions should be taken during the procedure.
    - Post-procedure X-ray should be obtained.
    - Closely monitor vital signs, pain level and SaO_2 after procedure.

DISORDERS OF RESPIRATORY SYSTEM

Acute Respiratory Distress Syndrome (ARDS)

- Also called as shock lung, wet lung etc.
- Acute respiratory distress syndrome (ARDS) is a severe form of acute lung injury characterized by sudden and progressive pulmonary edema, hypoxemia unresponsive to oxygen supplementation, and the absence of an elevated left atrial pressure.
- ARDS occurs due to diffuse alveolar damage and lung capillary endothelial injury.
- Lungs fail to maintain balance between oxygen and carbon dioxide.
- Neutrophils play a key role in the pathogenesis of ARDS, as suggested by BAL
- ARDS was recognized as the most severe form of acute lung injury (ALI)
- **Signs and symptoms:** Tachycardia, tachypnea, increased blood pressure, accessory muscle use for respiration, crepitus, diminished breath sounds, cyanosis, diaphoresis, bibasilar crackles, dyspnea, and hypoxia.
- **Management**
  - Mechanical ventilation may be necessary
  - Vasopressors and diuretics as ordered.

Acute Respiratory Failure

- Respiratory failure is called when
  - PaO_2 <60 mm Hg
  - $PaCO_2$ >50 mm Hg
- **Etiology**
  - Collection of secretion in the lungs due to cough suppression, bronchospasm, and airway irritants
  - Central nervous system depression, disorders of respiratory muscles, peripheral nervous system, and chest wall

Scanned with CamScanner

- Endocrine or metabolic disorders
- Heart failure, gas exchange failure, MI, and pulmonary embolism
- **Signs and symptoms**
  - Absent breath sounds
  - Rhonchi, Crackles, and Wheezes
  - Yawning and use of accessory muscles for breathing.
- **Treatment:** Oxygen therapy, mechanical ventilation.
- Bronchodilators such as terbutaline, albuterol, theophylline and ipratropium bromide.

Asthma

- Asthma is a chronic disease characterized by recurrent attacks of breathlessness and wheezing, shortness of breath, and chest tightness.
- During an asthma attack, the lining of the bronchial tubes (airways) swells, causing the airways to narrow, turn more sensitive to irritants in the environment, and thus reducing the flow of air into and out of the lungs.
- It is probably caused by interplay of hereditary and environmental factors like an inherited tendency to develop allergies, called atopy.
- Children with eczema or food allergy are more likely to develop asthma than other children.
- **Diagnosis:** Medical history, chest X-ray, physical examination, LFT and lab tests.
- **Salbutamol, levo-salbutamol and terbutaline** are utilized in stopping asthma attacks.
- Short courses of corticosteroid and other drugs (oral or injectable) may be required during acute attacks and are to be used after medical advice only.

Acute Severe Asthma/Status Asthmaticus

- **Acute severe asthma (Status asthmaticus)** is an acute exacerbation of asthma that remains unresponsive to initial treatment with bronchodilators.
- Manifestations: Tachypnea and significant wheezing.
- Normally, the difference in SBP between inspiration and expiration does not exceed 15 mm Hg. In patients with severe asthma, a difference of greater than 25 mm Hg may be noted which is known as pulsus paradoxus.
- **First line treatment:** Bronchodilator treatment with a β2-agonist, typically salbutamol. The inhaled route is most effective.
- **Anticholinergic agents:** Ipratropium bromide does not cross the blood-brain barrier and is the recommended agent of choice.
- Glucocorticoids are the most important treatment for status asthmaticus. Action usually requires at least 4-6 hours to occur because protein synthesis is required before the initiation of its anti-inflammatory effects.

Bronchitis

- Bronchitis is an inflammation of the mucous membranes of the bronchi.
- Bronchitis can be divided into: Acute and Chronic
  - **Acute bronchitis** is characterized by the feeling of cough or small sensation in the back of the throat. It can be with or without the sputum. **Acute bronchitis is one of the most common types of lung infection.** It can occur at any age.
  - **Chronic bronchitis** is a type of COPD, which involves a cough that produces sputum for 3 months for 2 consecutive years.
- **Main symptom:** Bronchitis is persistent cough with thick yellow gray mucous, though it may not always be present.
- **Other symptoms of bronchitis may include:** A tight feeling in chest, breathlessness, wheezing, sore throat, slight fever and chills, headache, blocked nose and sinuses, body ache and pains.
- **Causes:** Virus or bacteria; **viral bronchitis** is much more common.
- Bronchitis can also be caused by breathing irritant substances, such as smog, chemicals in household products or tobacco smoke.
- **For managing acute bronchitis:** Advise the patients to take rest, drink plenty of fluids. Headaches and body aches can be treated with pain relievers like paracetamol or ibuprofen. Stop smoking or inhaling irritant.
- **For managing chronic bronchitis:** There is no cure for chronic obstructive pulmonary disease (COPD), but management can help slow the progression of the condition and reduce the symptoms. Smoking should be stopped to avoid further damage to lungs.

Chronic Obstructive Pulmonary Disease (COPD)

COPD is a life threatening lung disease. It causes chronic obstruction of airway in the lungs. emphysema, Asthma

In some cases the air sacs (alveoli) get damaged gradually leading to a condition called emphysema (**pink puffers**). In other cases the airways get inflammed (irritation) leading to a condition called chronic bronchitis (**blue bloaters**).

Key Points

- **Pink puffers:** Puffing to breathe (hyperventilation) and pink complexion (maintain oxygen level with rapid breathing) Emphysem
- **Blue bloaters:** Cyanosis (blue) and edema (bloating) due to chronic bronchitis Bronchit

- **Risk Factors of COPD**

- **Symptoms of COPD:** Shortness of breath (Dyspnoea), wheezing (Whistling sound while breathing), chest tightness, cough with mucus often called smoker's cough, Unintended weight loss (in later stages)
- **Diagnosis:** Detailed history, chest X-ray and pulmonary function tests.

Key Points

- **Signs and Symptoms:** Remember LUNG DAMAGE
  - **L – Lack of energy**
  - **U – Unable to tolerate (shortness of breath)**
  - **N – Nutrition poor (weight loss due to energy utilized for breathing effort particularly in emphysema)**
  - **G – Gases abnormal (Low PO_2 and High PCO_2)**

Scanned with CamScanner

- **Management:** Inhaled bronchodilators, nebulization and inhaled or oral steroids; antibiotics, oxygen therapy, steam inhalations, chest physiotherapy and pulmonary rehabilitation program.
- **Complications:** Respiratory infections such as cold, flu and pneumonia; high blood pressure, heart problems including heart attack, right sided heart failure (corpulmonale), lung cancer, depression etc.

Key Points

- Teach the patient about pursed-lip and diaphragmatic breathing to manage shortness of breath
- Low amount of oxygen delivery is advised (1-2 L/min)
- Maintain oxygen saturation at 88-93% (Low oxygen is the respiratory stimulant in patients with COPD....Not CO_2)

Pneumonia

- Pneumonia is inflammation (swelling) of tissue in one or both lungs.
- It is a condition which primarily affects the lung parenchyma (Alveoli, alveolar ducts and bronchioles).
- **Causes:** infection with viruses or bacteria and less commonly other microorganisms, certain drugs. **Most common cause is *Streptococcus pneumonia*.**
- Types:
  - **Hospital acquired pneumonia:** Developed 48-72 hours after admission into hospital
  - **Community acquired pneumonia:** Most commonly occuring
- **Risk factors:** Previous flu or cold, weakened immunity (elderly or immunosuppressant therapy), COPD, Cough depression (post-op), immobility etc.
- **Common symptoms: Difficulty in breathing, tachycardia,** fever, sweating and shivering, loss of appetite, pain in chest. Person may also have hemoptysis, headache, fatigue, nausea or vomiting.
- **Diagnosis:** Auscultation may reveal coarse crackles, rhonchi. Chest X-ray and sputum culture.
- Physical examination may sometimes reveal **low blood pressure and low oxygen saturation.** Increased **respiratory rate and heart rate** may be found.
- **Management:** Simple painkillers (analgesics) like ibuprofen, and antibiotics.
- **Complications associated** with pneumonia are pleurisy and septicemia.

Key Points

- ***CURB -65*** is used as a predictor of severity of pneumonia
  - **C:** Confusion
  - **U:** BUN > 20 mg%
  - **R:** RR > 30
  - **B:** SBP < 90; DBP < 60
  - **65:** Age > 65
- Productive cough and pleuritic pain is characteristic feature
- Abnormal breath sounds (coarse crackles, rhonchi) in peripheral lung fields
- Encourage incentive spirometer for deep breathing
- Encourage coughing and deep breathing
- 2-3 L of fluid intake (except patients with heart failure)

Sputum Color

Note

Color of sputum	Agent
Rusty brown	Pneumococcal
Red currant jelly	Klebsiella
Green	Pseudomonas
Black	Allergic Bronchopulmonary Aspergillosis (ABPA)

Swine Flu

- Swine flu also known as swine influenza or pandemic influenza is a respiratory disease.
- Cause: **H1N1 virus** (introduced in 2009). This virus infects the wind pipe (respiratory tract) of pigs and later it gets transmitted to human beings.
- **Manifestations:** Nasal secretions, cough, decreased appetite, and restless behavior.
- **Incubation period:** 1–4 days.
- **Symptoms:** Similar to influenza (flu). Fever, headache, running nose, sore throat, shortness of breath or cough, loss of appetite, diarrhea or vomiting.
- Swine flu can spread to others up to about 6 feet away. The flu viruses are spread mainly by droplets when people with flu cough, sneeze or talk.
- **Diagnosis:** Through patient's history and symptoms.
- **Confirmatory test:** Reverse transcription polymerase chain reaction (RT-PCR).
- **Management: Zanamivir** (Relenza) and **oseltamivir** (Tamiflu).
- The most effective way to prevent the spread of infections is to practice good hygiene. Vaccination against influenza also has some role.

Atelectasis

- **Atelectasis:** A collapsed or airless state of the lung, which maybe acute or chronic and may involve all or part of the lung
- It may be from imperfect expansion of pulmonary alveoli at birth (congenital) or as the result of disease or injury
- **Features:** Crackles, tachycardia, tachypnea and fever
- **Management:** Bronchodilator and antibiotics are used for treatment.

Emphysema

- The abnormal presence of air in tissues or cavities of the body.
- **Pulmonary emphysema:** A chronic disease of the lungs. Distension of alveoli causes intervening walls to broken down and bullae to form on the lung surface. It also causes distension of the bronchioles and eventual loss of elasticity so that inspired air cannot be expired, making breathing difficult.
- **Surgical emphysema:** The presence of air or any other gas in the subcutaneous tissues, introduced through a wound and evidenced by crepitation on pressure.

Corpulmonale

- Corpulmonale is defined as an alteration in the structure and function of the right ventricle caused by a primary disorder of the respiratory system.

Scanned with CamScanner

- Pulmonary hypertension is common link between lung dysfunction and the heart in corpulmonale.
- Corpulmonale usually presents chronically, but 2 main conditions can cause acute corpulmonale: pulmonary embolism (more common) and acute respiratory distress syndrome (ARDS).

Influenza

- ***Condition caused by RNA virus and is commonly called as flu.***
- There are 3 types of influenza virus that can all infect humans: Influenza A, influenza B, and influenza C.
- **Signs and symptoms:** Cold and cough, muscle pain, respiratory distress.

Pleural Effusion

- Accumulation of fluid in the pleural space.
- Accumulation of blood is known as hemothorax and accumulation of air is known as pneumothorax.
- Chest tube insertion is the management

Pulmonary Edema

- Excess of fluid in the lungs and alveoli
- **Causes:** Left-sided heart failure, mitral stenosis, ARDS, fluid overload, Myocardial Infarction, or pulmonary emboli.

Pulmonary Embolism (PE)

- **Definition:** Obstruction of pulmonary artery or its branches by thrombus, tumor, air or fat that originated elsewhere in the body
- **Acute PE:** In massive PE, there is reduction of BP below 90/40 in less than 15 minutes
- **Saddle PE:** Embolus lodges at the main pulmonary artery bifurcation
- **Signs and Symptoms:** Tachypnea, tachycardia, crackles, loud second heart sound (S2), Raised Jugular venous pressure (JVP), Dyspnea at rest or with exertion, pleuritic pain, calf or thigh pain, cough, orthopnea, wheezing
- **Management:** Anticoagulation (Heparin), Warfarin

Tuberculosis (TB)

- Tuberculosis, or TB, is an infectious bacterial disease caused by ***Mycobacterium tuberculosis***, which most commonly affects the lungs.
- It is transmitted from person to person via droplets from the throat and lungs of people with the active respiratory disease.
- **Risk factors:** Immunosuppression, HIV infection, alcoholism, living in crowded areas, malnutrition, lower socio economic status, and older adults
- **Mode of spread:** Droplet
- **Incubation period:** 2–12 weeks
- Active TB infection occur years after the exposure or when the person becomes immune compromised is known as latent infection.
- **Clinical manifestation**
  - Cough, fever, increased weight loss, night sweat and hemoptysis
  - Anorexia, weight loss, chills, fever, chest pain
- **Diagnosis:**
  - **Mantoux TB skin test:** A standard dose of 5 tuberculin units is injected intradermally. The reaction is read (48–72 hours later) by measuring the diameter of induration (palpable, raised, hardened area).
  - Chest X-ray (but not a confirmatory test)
  - Sputum smear for acid fast bacilli
  - A positive culture of *M. Tuberculosis*
- **Treatment:** (Refer Community Health Nursing synopsis for details on ATT drugs)
  - Postexposure prophylaxis is with isoniazid for 9–12 months
  - Inactive TB case, isoniazid with rifampicin is usually the first choice; other antituberculotics include ethambutol, and pyrazinamide.

Lung Abscess

- Aspiration or entry of infectious material in the lung causes collection of purulent material in the lung parenchyma and leads to cavity formation
- **Causes:** Aspiration, following pneumonia, chest trauma
- In a bedridden patient lung abscess most commonly occurs in the posterior segment of upper lobe and superior part of the lower lobe.
- **Clinical manifestation:** Productive cough, foul smelling sputum, fever, anorexia, weakness, weight loss
- **Diagnosis:** CT, x-ray, physical assessment shows pleural friction rub, crackles
- **Management:** Antibiotic therapy, chest physiotherapy and postural drainage, lobectomy is the surgery of choice.

Chest Injuries

- Blunt or penetrating injury to chest, lung, ribs, heart, great vessels, trachea and esophagus.
- Rib fracture, hemothorax, flail chest, pulmonary contusion and cardiac tamponade are different types of chest injuries.

Rib Fracture

- Most common type of chest injury which causes pneumothorax and pulmonary contusion.
- **Clinical manifestation:** Splinting of chest. Pain increases with inspiration, shallow respiration, and tenderness at injury site.
- **Management:** Pain management, fowler's position to the client

Hemothorax

- Blood in the pleural space
- Chest tube insertion is the management

Flail Chest

- Occurs as a result of chest trauma, one portion of the chest looses its connection with remaining part of rib cage.
- Paradoxical respiration can be seen in this condition, which means the detached segment move inward during inspiration and move outward during expiration and interfere with normal breathing process.
- **Clinical manifestation:** Severe pain, dyspnea, cyanosis, tachycardia, hypotension
- **Management:** Fowler's position, oxygen administration, respiratory support if needed, pain management.

Pulmonary Contusion

- Leakage of blood and fluid into alveoli and interstitial space.
- **Clinical manifestation:** Decreased breath sound, dyspnea, hypoxemia, hemoptysis, restlessness
- **Management:** Fowler's position, oxygen administration

Scanned with CamScanner

Target High - Fifth Premium Edition

Pneumothorax

- Trapping of atmospheric air in the pleural space which leads to increased intra-thoracic pressure and decreased vital capacity
- **Management:** Fowler's position, oxygen administration, chest tube insertion.

Key Points

Management of Chest Tube/ICD

- Never lift the chest drain (under water seal) drainage bottles above the level of chest
- Never clamp the ICD unless it is ordered by the physician because clamping causes tension pneumothorax.
- ICD tubing and bottles should be below the level of patient to facilitate drainage
- Tubing should be unobstructed and without kink.
- Suction is not needed always, if needed it should be prescribed by medical staff. If suction is applied it will cause light bubbling in the suction chamber.
- Milking of the ICD should not be done—without written order because it will create negative pressure—further trauma.
- Intermittent bubbling (during exhalation and cough) is expected in a client with ICD for pneumothorax. Continuous bubbling indicates, air leakage. In this case, check the tubing for disconnection and inform the physician.
- Oscillation or swing of the water is a normal finding in a client with ICD. As the pneumothorax resolves, swing will also reduce. Unexpected cessation of the oscillation or swing of water indicates kink or blockage of tubes.
- If accidental disconnection of the system occurs then clean it and reconnect the drain.
- If accidental dislodgement of chest tube occurs, then the nurse should cover the insertion site with sterile pressure dressing.
- ICD can be removed if there is no more air leakage in case of pneumothorax there is diminished amount of secretions. X-ray shows expansion of lungs.
- While removing ICD ask the client to exhale and hold the breath.

Occupational Lung Diseases

Table 49 Occupational lung diseases

Types of dust	Disease
Organic dust	
Cotton dust	Byssinosis
Sugarcane dust	Bagossosis
Grain dust or Hay	Farmer's lung
Tobacco	Tobacossis
Infested wheat	Wheat weevil
Inorganic dust	
Silica	Silicosis
Asbestos	Asbestosis
Iron	Siderosis
Coal dust	Anthracosis

Golden points to remember

- **The** amount of air passing into and out of the lungs during each cycle of breathing is referred to as **Tidal volume**. It is 500 ml for adult.
- **Total lung capacity**: The maximum amount of air contained in lungs after a maximum inspiratory effort is 6000 ml in normal adult.
- **Vital Capacity:** The maximum amount of air that can be expired after a maximum inspiratory effort is 4800 ml in normal adult.
- **Stridor** is a high-pitched, wheezing sound caused by disrupted airflow.
- **Stridor** may also be called musical breathing or **extra thoracic airway obstruction**.
- **Cheyne-strokes respiration:** Progressively deeper, and sometimes faster, breathing followed by a gradual decrease that results in a temporary stop in breathing is called an apnea.
- **The trachea** is a cylindrical tube about 5 inches long and 1 inch in diameter.
- **Surfactant** is a lipoprotein that lowers the surface tension in the alveoli and decreases the tendency of the alveoli to collapse. Deficiency of surfactant leads to alveolar collapse.
- **Single largest risk factor for Asthma:** Atopy/Hereditary
- **Most Important risk factor for COPD:** Cigarette smoking
- **Obstructive lung disease:** Decreased expiratory flow rates
- **Restrictive lung disease:** Decreased in lung volumes
- **Atelectasisrefers** to collapsed alveoli, postoperative patient is at risk for atelectasis because of effect of anesthesia and restricted breathing with pain.
- **Hering-Breuer reflex:** As the lung inflates, pulmonary stretch receptors activate the inspiratory center to inhibit further lung expansion.
- **Epistaxis (nosebleed)** is bleeding from the nose.
- **Cordectomy** is partial removal of one vocal cord.
- **Pneumocystis jiroveci** is an opportunistic pathogen which causes Pneumocystis jiroveci pneumonia in AIDS patient.
- **Tuberculin skin test (Mantoux test):** In this test purified protein derivative (PPD) is used to diagnose TB infection.
- A positive tuberculin test is indicated by induration of **10 mm or more in diameter.**
- **Ethambutol** causes **retrobulbar neuritis** and can result in red-green blindness.
- **Pneumoconiosis** is a group of lung disease caused by inhalation and retention of dust particle.
- **Hemothorax** is the accumulation of blood in the intrapleural space.
- **Pleurodesis** is the artificial production of adhesions between the parietal and visceral pleura, usually done with a chemical sclerosing agent.
- **Flail chest** results from a multiple rib fracture.
- **The ratio** of anteroposterior to transverse diameter is 1:2 in a normal adult.
- **In barrel chest**, the ratio of anterioposterior to transverse diameter is 1:1.
- **Barrel chest** is seen in **emphysema**.
- **Chest tube** is inserted in **sitting and lying position** with the affected side elevated.
- **"Tracheostomy"** is usually performed between the **second and third** cartilage rings of trachea.
- **Thoracotomy** is a surgical opening into the thoracic cavity. There are two types of thoracic incision:
  1. Median sternotomy used for surgery involving the heart.
  2. Lateral thoracotomy used for surgery related to lungs.
- **Pneumonia** is acute inflammation of lung tissue caused by bacteria, viruses, fungi, chemical and other factors.
- **Empyema** is pleural effusion that contains pus.
- **Emboli** are mobile clots that generally do not stop moving until they are lodged at a narrowed part of the circulatory system.
- **Common** symptoms of **pulmonary embolism** are anxiety, sudden onset of unexplained dyspnea, tachypnea and tachycardia.
- **D-dimer test** is done if pulmonary embolism is suspected, its level is increased 8 times in venous thromboembolism.
- **Tidal volume (TV):** It is the amount of air (500 mL) inspired during normal, relaxed breathing.
- **Treprostinil**, a prostacyclin, is used as a continuous subcutaneous injection, which causes vasodilation of the pulmonary arterial system and inhibits platelets aggregation.
- **COPD** is a chronic obstructive pulmonary disease that includes chronic bronchitis and emphysema.
- **Surgical treatment for COPD** includes lung volume reduction therapy, bullectomy and lung transplantation.

Contd...

Scanned with CamScanner

- **Asthma triad** includes nasal **polyps, asthma**, and sensitivity to **aspirin** and **NSAIDs**.
- Drug of Choice for chronic asthma: Inhaled corticosteroid + Long Acting Beta Agonists (LABA)
- Drug of Choice for acute, severe asthma: Inhaled Short Acting Beta Agonists (SABA) + Systemic steroids
- Bronchodilator of choice in COPD: Anticholinergics
- Treatment of Choice in Bronchiectasis: postural drainage
- **Chest physiotherapy (CPT)** has no role and is not recommended for asthma because it is too stressful for breathless patient.
- **Pursed lip breathing (PLB)** is effective in acute state of asthma it keeps the airway open by maintaining positive pressure.
- **Cigarette smoking** is the major risk factor for developing COPD.
- Environmental tobacco smoke or second-hand smoke is the exposure of nonsmoker to cigarette smoke.
- **α1–Antitrypsin (AAT)** deficiency is the genetic risk factor that leads to COPD.
- Removal of an entire lung is called pneumonectomy.
- **Pulmonary Function Test (PFT)** is the confirmatory test for COPD.
- For detection of air under diaphragm most suitable X-ray is chest PA view.
- High concentration of O2 can be delivered through non-rebreather mask.
- Pursed lip breathing is to prolong exhalation and thereby prevent bronchiolar collapse and air trapping.
- **CPT** consists of percussion, vibration and postural drainage.
- Postural drainage uses the **principle of gravity** to assist in bronchial drainage.
- There are 18 segments in the lungs so **18 positions** are used for drainage.
- **Morphine** is contraindicated in bronchial asthma and pancreatitis.
- **Cystic fibrosis** is an autosomal recessive multisystem disease characterized by altered function of the exocrine glands, involving lungs, pancreas, and sweat glands.
- **Sweat chloride test** is performed to diagnose cystic fibrosis, sweat chloride is found four times higher than normal.
- The hallmark of **bronchiectasis** is persistent or recurrent cough with production of large amount of purulent sputum that may exceed 500 mL/day.
- The most appropriate time for the nurse to obtain a sputum specimen for culture is **early in the morning.**
- Venturi mask is a medical device used to deliver known oxygen concentration to patient on controlled oxygen therapy.
- Venturi mask is invented by **Moran Campbell**.
- β-lactam or macrolide antibiotics are the Drug of Choice for Pneumococcal Pneumonia.
- If the chest tube dislodges, immediately it should be reconnected to the water seal. Pressure should be applied over the chest tube insertion site.
- Rifampicin leads to reddish discoloration of urine.
- Culture and Sensitivity test determines whether the prescribed antibiotics will be effective.

Most Common

- **Most common agent to cause drug induced asthma:** Aspirin
- **Most common pneumothorax:** COPD
- **Most common fetal response to acute hypoxia:** Bradycardia
- **Most common site of primary TB:** Middle lobe

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

ANATOMY AND PHYSIOLOGY

964. The functions of nasal cavity in relation to ventilation are following, except: *(Safdarjung NO 2018)*

a. Warming up inspired air to body temperature
b. Humidify the air up to 100% saturation
c. Removal of particulate matter from air
d. Disinfect the air entering in to lungs

Explanation:

- The function of the nasal cavity is to warm, moisturize, and filter air entering the body before it reaches the lungs.
- During inspiration, well-vascularized mucous membranes inside the nose and mouth release moisture to the passing respiratory gas.
- While nose breathing at rest, inspired gases become heated to 36°C and are about **80–90% saturated** with water vapor by the time they reach the carina, largely due to heat transfer in the nose.

965. All the statements are true regarding peripheral chemoreceptors except: *(Safdarjung NO 2018)*

a. Located in carotid body
b. Responds to increased PCO_2
c. Have type II epithelial cells
d. Does not respond to fall in PaO_2

Explanation: Peripheral chemoreceptors are positioned in the carotid and aortic bodies. The main mass of the body consists of islands of epithelial cells (Type I or glomus cells and Type II or glial cells). The peripheral chemoreceptors respond to lowered pO_2, increased pCO_2 and H^+ concentration in the arterial blood. So option D is correct.

966. Which of these body systems is involved in the removal of carbon dioxide?

a. Respiratory system
b. Digestive system
c. Urinary system
d. Reproductive system

967. In human body unoxygenated blood is purified by: *(ESIC Chennai May 2012)*

a. Heart
b. Lungs
c. Lever
d. Kidney

968. The _____ membranes surround the lungs. *(RRB SSNE 2015)*

a. Pericardial
b. Mediastinal
c. Pleural
d. Peritoneal

969. The collapse of the alveoli is prevented by:

a. Cilia
b. Mucus *(DSSSB PHN, 2015)*
c. Surfactant
d. Pleural Fluid

970. The average tidal volume is *(DSSSB PHN, 2015)*

a. 500 mL
b. 250 mL
c. 150 mL
d. 600 mL

971. Atmospheric pressure is important in the process of_____ *(RRB SSNE 2015)*

a. Blood Flow
b. Micturition
c. Reproduction
d. Breathing

972. Normally respiratory center is stimulated by: *(JIPMER 2012)*

a. Oxygen
b. Blood PH
c. Carbon Dioxide
d. Lactic Acid

973. Chemoreceptors in the medulla oblongata are sensitive to the increase in

a. Blood oxygen content
b. Blood carbon dioxide
c. Blood pH
d. Hemoglobin

974. Carina is situated at which level of ..... in adult

a. T3
b. T4
c. T6
d. T9

975. Trachea is lined by

a. Stratified squamous epithelium
b. Cuboidal epithelium
c. Simple columnar epithelium
d. Pseudostratified columnar epithelium

976. Atmospheric pressure is important for

a. Blood Flow
b. Micturition
c. Reproduction
d. Breathing

977. Which substance forms approximately 20% of air?

a. Oxygen
b. Carbon dioxide
c. Nitrous Oxide
d. Carbon monoxide

978. Most common type of diaphragmatic hernia is

a. Bochdalek hernia
b. Morgagni's hernia
c. Hernia through the dome
d. Hiatus hernia

979. Normal Tidal Volume in adult is about

a. 300 mL
b. 500 mL
c. 1200 mL
d. 3600 mL

980. The length of an adult trachea is

a. 6 to 8 cm
b. 10 to 11 cm
c. 14 to 15 cm
d. 16 to 20 cm

981. Tracheal bifurcation occurs at level

a. T1-T2
b. T3-T4
c. T4-T5
d. None

982. Muscles used in respiration are all EXCEPT

a. Internal intercostal muscles
b. External Intercostal Muscles
c. Diaphragm
d. Sternocleidomastoid muscles

983. Relaxation of internal intercostals muscles cause

a. Inspiration
b. Expiration
c. No effect on respiration
d. Both A and B

984. Relaxation of external intercostal muscles cause

a. Inspiration
b. Expiration
c. No effect on respiration
d. Both A and B

Ans.

964.	b
965.	d
966.	a
967.	b
968.	c
969.	c
970.	a
971.	d
972.	c
973.	b
974.	b
975.	d
976.	d
977.	a
978.	d
979.	b
980.	c
981.	c
982.	d
983.	a
984.	b

Scanned with CamScanner

985. **The actual gas exchange with blood occurs in the**
   a. Bronchi
   b. Respiratory bronchioles
   c. Terminal bronchioles
   d. Alveolar ducts and alveoli

986. **Which of the following statements concerning ventilation is NOT correct?**
   a. During inspiration, the pressure in the alveoli is less than atmospheric pressure.
   b. When the diaphragm contracts, the thoracic cavity volume increases.
   c. Contraction of the external intercostal muscles decreases the volume of the thoracic cavity.
   d. During quiet breathing, passive recoil of the lung and thoracic wall causes expiration.

987. **Which of the following factors does NOT influence the exchange of gases across the respiratory membrane?**
   a. The thickness of the membrane
   b. The total surface area of the membrane
   c. The size of the pores in the alveoli
   d. The concentration gradient for gases across the membrane

988. **Most carbon dioxide is transported**
   a. As bicarbonate ions in the blood
   b. In dissolved form in the plasma
   c. In combination with blood proteins
   d. In combination with sodium ions in the blood

989. **When carbon dioxide levels in the blood increase,**
   a. pH of the blood increases
   b. The blood becomes more acidic
   c. The number of hydrogen ions decreases
   d. All of the above occur

990. **The nerve which supplies the diaphragm is**
   a. Diaphragmatic b. Phrenic
   c. Radial d. Sciatic

991. **Blood supply of lungs are**
   a. Pulmonary artery b. Pulmonary vein
   c. Bronchial artery d. All of the above

992. **Normal Inspiration: Expiration time ratio at rest is**
   a. 1:1 b. 2:1
   c. 1:2 d. 1:3

993. **External respiration is**
   a. Exchange of gases between the blood and lungs
   b. Exchange of gases between the blood and the cells
   c. Transportation of oxygen from lung tissues to hemoglobin
   d. Combining oxygen with RBCs to form oxyhemoglobin

994. **Internal respiration is**
   a. Exchange of gases between the blood and lungs
   b. Exchange of gases between the blood and the cells
   c. Transportation of oxygen from lungs to tissues
   d. Combining oxygen with RBCs to form oxyhemoglobin

995. **Stimulation of chemoreceptors occur if .....**
   a. Partial pressure of CO_2 decreases
   b. Partial pressure of CO2 increases
   c. Partial pressure of O_2 is normal
   d. Partial pressure of O_2 decreases

996. **During exercise, the respiration rate increases primarily because of**
   a. Increased blood carbon dioxide levels
   b. Decreased blood oxygen levels
   c. Decreased blood pH levels
   d. Limb movements and input from the cerebrum

997. **Sinuses are .....**
   a. Cavities in nasal bone
   b. Chamber containing vitreous humor in eye
   c. Chamber producing ear wax
   d. All of the above

998. **The artery that supply blood to the diaphragm is called** *(AIIMS Raipur Grade II 2017)*
   a. Inferior mesenteric artery
   b. Suprarenal arteries
   c. Inferior phrenic arteries
   d. Coeliac arteries

Explanation: Inferior mesenteric artery supplies large intestine and upper part of rectum. Suprarenal arteries refers to Superior, middle and inferior suprarenal arteries which supplies adrenal gland. Celiac artery supplies oxygenated blood to liver, stomach, abdominal oesophagus, spleen and superior half of both duodenum and pancreas.

999. **The cartilage that completely encircles the larynx with the narrow part anteriorly and the broadpart posteriorly is called:** *(AIIMS Raipur Grade II 2017)*
   a. Thyroid cartilage
   b. Cricoid cartilage
   c. Arytenoid cartilage
   d. Epiglottis

Explanation: The thyroid cartilage is a hyaline cartilage structure that sits in front of the larynx and above the thyroid gland. The arytenoid cartilages are a pair of small three-sided pyramids which form part of the larynx to which the vocal folds (vocal cords) are attached. The epiglottis is a flap in the throat which keeps food from entering the windpipe and the lungs

ASSESSMENT

1000. **A client is admitted with suspected atelectasis. Which clinical indicator does the nurse expect to identify during the assessment of client?** *(RAK MSc 2018)*
   a. Slow, deep respirations
   b. Diminished breath sounds
   c. A dry, unproductive cough
   d. A normal oral temperature

Explanation: Atelectasis is a condition in which the alveoli collapses or is filled with fluid, as a result there are diminished breath sounds.

1001. **Which of the following assessment findings does the nurse expect in the patient with emphysema?** *(RAK MSc 2018)*
   a. Purulent sputum b. Diminished breath sounds
   c. Generalized edema d. Dull chest pain

Explanation: Emphysema, a lung disease is an irreversible, progressive condition characterized by inflammation and reduced airflow in the lungs. Diminished breath sounds are found in patient with emphysema. The reduction in the generation of sounds is due to the accompanying airflow limitation or due to poor transmission of sounds due to destruction of parenchyma.

1002. **Which laboratory result should alert the nurse to perform further assessment on a patient admitted with respiratory distress?** *(RAK MSc 2018)*
   a. PaCO2< 50 mm Hg b. HCO3< 27 mEq/L
   c. PaO2< 90 mm Hg d. SPO2 less than 90%

Ans.

985. d
986. c
987. c
988. a
989. b
990. b
991. d
992. c
993. a
994. b
995. b
996. b
997. a
998. c
999. b
1000. b
1001. b
1002. d

Scanned with CamScanner

Explanation: The laboratory result which should alert the nurse to perform further assessment on a patient admitted with respiratory distress is SPO_2 less than 90%.

$PaCO_2$ < 50 mm Hg (normal: 35-45 mm Hg), PaO_2 < 90 mm Hg (normal: 75 – 100 mm Hg) and HCO_3 < 27 mEq/L are within normal ranges.

1003. The largest volume of air, which can be expelled from the lungs during maximal expiration is called: *(AIIMS Raipur Grade II 2017)*

a. Tidal volume
b. Residual volume
c. Inspiratory reserve volume
d. Expiratory reserve volume

Explanation: Tidal volume is the measure of amount of air a person inhales during a normal breath. Tidal volume is 500 mL. Residual volume is the amount of air that remains in a person's lung after maximum exhalation. Residual volume is 1200 mL. Inspiratory reserve volume are maximum amount of additional air that can be drawn into lungs. Inspiratory reserve volume is 3100 ml. Expiratory reserve volume is about 1200 mL.

1004. Which of the following lung volume is the base of functioning of Heimlich maneuver (abdominal thrust)?

a. Tidal volume
b. Inspiratory reserve volume
c. Residual volume
d. Total lung capacity

Explanation: Residual volume (RV) is a lung volume representing the amount of air left in the lungs after a forced exhalation; this volume cannot be measured, only calculated. This volume is the base of functioning of abdominal thrust

1005. Tidal volume is .....

a. Normal amount of air move into and out of the lung during respiration
b. Air exhaled after normal inspiration
c. Air inhaled after normal exhalation
d. Air remaining in the lung after forceful exhalation

Explanation: Tidal volume is the lung volume representing the normal volume of air displaced between normal inhalation and exhalation when extra effort is not applied. In a healthy, young human adult, tidal volume is approximately 500 mL per inspiration or 7 mL/kg of body mass.

1006. All the following lung volumes can be measured by a simple spirometer EXCEPT

a. Vital capacity
b. Residual volume
c. Tidal volume
d. Forced vital capacity

1007. The normal mean pulmonary artery pressure is: *(DSSSB 2013)*

a. 5-10 mm Hg
b. 10–20 mm Hg
c. 20–30 mm Hg
d. 30–40 mm Hg

Explanation: Pulmonary blood pressure is normally a lot lower than systemic blood pressure. Normal Pulmonary artery pressure is about 8-20 mm Hg at rest. If the pressure in the pulmonary artery is greater than 25 mm Hg at rest and 30 mm Hg during exercise, it is abnormally high and is called pulmonary hypertension.

1008. While auscultating lung field of a client with respiratory distress best method of auscultation is .....

a. Listen to the apex
b. Begin listening at the lung bases
c. Listen side to side from top to bottom
d. Anterior chest then posterior chest

1009. Test used to assess the arterial oxygen status is .....

a. VBG
b. SPO_2
c. ABG
d. Incentive spirometry

1010. Which among the following is the most accurate method of determining oxygen demand in a COPD client?

a. Check respiratory rate
b. SPO_2
c. X-ray
d. Blood gas analysis

1011. SPO_2 indicate .....

a. Percentage of oxygen in blood
b. Percentage of free hemoglobin
c. Percentage of oxyhemoglobin
d. Respiratory rate

1012. Maximum CO_2 is carried in the blood in which form?

a. Plasma
b. Hemoglobin
c. Bicarbonate
d. Lactate

1013. What is indicated if pH is abnormal along with abnormal $PaCO_2$ and HCO_3-?

a. Compensated condition
b. Partially compensated
c. Uncompensated
d. Equilibrium

1014. What is FiO_2?

a. Fraction of inspired O2 delivered on inspiration to the patient
b. Fraction of O_2 delivered during inspiration and expiration
c. Fraction of O_2 delivered on expiration to the patient
d. Fraction of O_2 needed by the patient

1015. Characteristic respiratory sound in pulmonary edema is ...

a. Crackles
b. Tracheobronchial
c. Bronchial
d. Adventitious

1016. Breath sound auscultated over the lung periphery except over the scapula is .....

a. Vesicular
b. Bronchovesicular
c. Bronchial
d. Tracheal

1017. Breath sound auscultated posteriorly between the scapula and anteriorly over bronchioles lateral to sternum over 1 and 2 ICS.

a. Vesicular
b. Bronchovesicular
c. Bronchial
d. Tracheal

1018. Breath sound auscultated over the trachea is .....

a. Vesicular
b. Bronchovesicular
c. Bronchial
d. Tracheal

1019. Chest auscultation findings in a client with pleural effusion is .....

a. Wheezing
b. Vesicular
c. Diminished breath sounds
d. Grunting

1020. When is the best time for the nurse to collect the sputum specimen?

a. In the morning right after the client awakens
b. Immediately after breakfast
c. Two hours after eating
d. Shortly before the patient retires for the evening

Explanation: Early morning is the best time to collect a sputum specimen because the patient has not yet cleared the respiratory passages. The sputum is most concentrated early in the morning.

1021. Parameter needs to be monitored in a client receiving morphine injection is .....

a. Deep tendon reflexes
b. Respiratory rate
c. Pulse rate
d. Temperature

Ans.

1003. d
1004. c
1005. a
1006. b
1007. b
1008. c
1009. c
1010. d
1011. c
1012. c
1013. b
1014. a
1015. a
1016. a
1017. b
1018. d
1019. c
1020. a
1021. b

Scanned with CamScanner

1022. **The last physiologic function that the client lose during the induction of anesthesia is:**
a. Consciousness b. Cough reflex
c. Respiratory movement d. Voluntary muscle control

1023. **Management of pleural effusion is .....**
a. Paracentesis b. Thoracentesis
c. Lumbar puncture d. Ventriculopleural shunt

1024. **Expected finding in a client with right lung pleural effusion is .....**
a. Tracheal deviation
b. Absence of breath sound in the right side of lung
c. Wheezing
d. Subcutaneous emphysema

1025. **Which among the following blood gas value is most suggestive of pulmonary edema?**
a. Decrease in oxygen
b. Increase in oxygen
c. Decrease in carbon dioxide
d. Increases in carbon dioxide

1026. **Following bronchoscopy and biopsy which among the following sign is of immediate concern?**
a. Hemoptysis b. Bronchospasm
c. Hematemesis d. Pyuria

1027. **Paradoxical respiration can be seen in the following condition**
a. Phrenic nerve damage b. Flail chest
c. Rib fracture d. All of the above

1028. **Types of auscultating sound present over the area of consolidation?**
a. Bronchovesicular b. Adventitious
c. Bronchial d. Vesicular

1029. **Confirmatory test for pneumonia to determine the extent and location of the infection is .....**
a. Bronchoscopy b. Chest X-ray
c. Blood cultures
d. Sputum culture and sensitivity

1030. **A client with left lobar pneumonia is ready to discharge if**
a. Grunting present
b. Fever of 104° F
c. Productive cough
d. Breath sounds are present in left side

1031. **Mantoux test read after 72 hours shows 3mm induration and red color. Then the result is .....**
a. Risk b. Need to do the test again
c. Negative d. Positive

1032. **Well-functioning of an ICD indicated by .....**
a. No tingling movement in the water column
b. Ensure that the drainage system is kept at the chest level.
c. Clamp the ICD every 5th hourly
d. Fluctuation of the fluid level in the water seal chamber.

1033. **Laryngospasm is seen in .....**
a. Hyper responsiveness of air way to varying stimuli
b. Repeated traumatic attempts of endotracheal intubation
c. After GA
d. All of the above

1034. **Definitive diagnostic method for pulmonary embolism is**
a. Pulmonary angiography
b. Pulmonary function test
c. Pulse oximetry
d. Ventilation-Perfusion scan

1035. **Most common clinical sign of pulmonary embolism is**
a. Tachypnea b. Tachycardia
c. Cyanosis d. Sweating

1036. **For the prevention of further pulmonary embolism, which of the following is the correct maintenance infusion dose of intravenous heparin?** *(AIIMS Bhopal Nursing officer, 2018)*
a. 48 m/kg per hour b. 18 m/kg per hour
c. 28 m/kg per hour d. 38 m/kg per hour

Explanation: In pulmonary embolism one or more pulmonary vessel is occluded with blood clot. Fibrinolytic or anticoagulant therapy is needed in this condition. The maintenance infusion dose of intravenous heparin in this condition is 18 m/kg per hour

1037. **Identify correct statement regarding transudates?**
a. Produced because of increased hydrostatic pressure
b. Produced because of reduced oncotic pressure
c. Clear in appearance with Proteins <3 g/dL
d. All of the above

1038. **Identify correct statement regarding exudates?**
a. Produced due to increased capillary permeability occur because of infection
b. Cloudy in appearance with proteins >3 g/dL
c. Specific gravity >1.020
d. All of the above

COMMON SIGNS AND SYMPTOMS

1039. **Early sign and symptom of hypoxia is .....**
a. Cyanosis
b. Apprehension and restlessness.
c. Convulsion
d. Altered level of consciousness

1040. **Which of the following is the earliest sign of poor respiratory function?** *(ESIC Chennai May 2012)*
a. Fast thready pulse
b. Restlessness
c. Cyanosis
d. Faintness

1041. **Classic barrel-shaped chest is seen in patients with:** *(Staff Nurse G II 2014)*
a. Congestive cardiac failure
b. COPD
c. Bronchiectasis
d. Pulmonary effusion

1042. **Barrel chest is seen in:** *(Daman and Diu NO 2018)*
a. Pneumonia b. Rickets
c. Kyphoscoliosis d. Emphysema

Explanation: In a normal adult chest, the ratio of anteroposterior to transverse diameter is 1:2, whereas in barrel chest, it is 1:1 due to the enlargement of anteroposterior diameter. Barrel chest is most often associated with **Emphysema.** It occurs because the lungs are chronically overinflated with air, so the rib cage stays partially expanded all the time.

1043. **Hyperventilation of lungs leads to**
a. Respiratory acidosis b. Respiratory alkalosis
c. Metabolic acidosis d. Metabolic alkalosis

1044. **Which of the following does not cause hyperventilation?**
a. Anxiety b. Psychotic illness
c. Pulmonary hypertension d. High altitude

1045. **Typical sign of pleurisy is .....**
a. Sharp stabbing pain when breathing
b. Hemoptysis
c. Hematemesis
d. Dyspnea

Ans.

1022. c
1023. b
1024. b
1025. d
1026. b
1027. d
1028. c
1029. b
1030. d
1031. c
1032. d
1033. d
1034. a
1035. a
1036. b
1037. d
1038. d
1039. b
1040. b
1041. b
1042. d
1043. b
1044. c
1045. a

Scanned with CamScanner

1046. **DVT emboli most commonly lodges in .....**
a. Heart b. Lung
c. Kidney d. Brain

1047. **Common cause of pulmonary embolism is .....**
a. Fat emboli b. Air emboli
c. Septic thrombi d. Venous thrombi

1048. **Drug ordered in pulmonary embolism is .....**
a. Warfarin b. Heparin
c. Streptokinase d. Vitamin K

1049. **Identify correct statement regarding pleural fluid?**
a. Very minimal amount is present
b. Helps to reduce friction between visceral and parietal pleura
c. Act as a lubricant
d. All of the above

1050. **Pleural effusion is present in all of the following EXCEPT**
a. Congestive heart failure b. Cirrhosis
c. Nephrotic syndrome d. Angina Pectoris

1051. **Most common early clinical manifestations of ARDS are ...**
a. Dyspnea and tachypnea
b. Restlessness and grunting
c. Bradypnea and tachycardia
d. Cyanosis

1052. **Which among the following is necessary for the maintenance of fluid balance in the patient with ARDS?**
a. Hydration using hypertonic solution
b. Provide humidified oxygen
c. Fluid restriction and diuretics
d. Daily electrolyte monitoring

1053. **Identify the correct statement regarding acute respiratory distress syndrome (ARDS)**
a. Alveoli are over expanded
b. Alveoli lost elasticity
c. Alveolar spaces are filled with fluid
d. Alveoli are collapsed

1054. **Which of the following is NOT a sign of respiratory distress in a newborn?** *(AIIMS-BBS SNO 2019)*
a. Cyanosis b. Expiratory grunting
c. Sternal retractions
d. Respiratory rate varying according to the newborn's activity

Explanation: Respiratory rate normally varies with newborn's activity. So, it is not a sign of respiratory distress.

1055. **Identify the signs of pulmonary consolidation among the following**
a. Dullness b. Increased fremitus
c. Crackles d. All of the above

Explanation: A pulmonary consolidation is a region of (normally compressible) lung tissue that has filled with liquid, a condition marked by induration (swelling or hardening of normally soft tissue) of a normally aerated lung. All of the above-mentioned signs will be present in that condition.

UPPER RESPIRATORY TRACT DISEASES/ DISORDERS

1056. **Upper airway illness that results from swelling of the epiglottis and larynx is broadly called:** *(AIIMS BPL NO 2018)*
a. Measles b. Rubella
c. Croup d. Whooping cough

Explanation: Croup, also known as laryngotracheobronchitis, is a type of upper airway infection that is usually caused by a Parainfluenza virus. Obstruction of airway causes a characteristic barking cough.

1057. **Protrusion of mucous membrane of nose and para nasal sinus is known as .....**
a. Nasal polyp b. Nasal proliferation
c. Coryza d. Mucosal hypertrophy

1058. **All are upper respiratory tract infection EXCEPT**
a. Rhinitis b. Coryza
c. Bronchiolitis d. Laryngitis

1059. **Expected color of the drainage in acute rhinitis is**
a. Clear b. Green
c. Yellow d. Greyish

Explanation: The color of nasal drainage in acute rhinitis is normally clear. The drainage will be yellow or green when there is an infection to the sinuses. Gray drainage is a sign of secondary infection.

1060. **Appropriate position to a person with epistaxis is**
a. Sitting up b. Trendelenburg's position
c. Lying down d. Lateral position

1061. **A client comes to the clinic with a bleeding nose. Which of the following instruction to the client is most appropriate?**
a. "Sit up with your head tilted forwar d.Grasp the soft part of your nose firmly between your thumb and forefinger"
b. "Lay down and tilt your head backward. Grasp the end of your nose between your fingers"
c. "Sit up and lean backwards. Put pressure on the side of your nose with your hand"
d. "Lay down and tilt your head to one side and put pressure on the side of your nose with your hand"

Explanation: This position will help to stop bleeding without causing aspiration of any blood dripping down the back of the throat.

1062. **Greenish tinge sputum is seen in ..... infection**
a. Streptococci b. Staphylococci
c. Plasmodium
d. Pseudomonas

1063. **The nutritional management of patient with acute pharyngitis include:** *(AIIMS Raipur Grade II 2017)*
A. Advice for liquid or soft diet
B. Administer IV fluids for hydration
C. Advice to avoid cool beverages and ice creams
D. Advice to drink more fluids.
a. A, B, C b. B, C, D
c. A, C, D d. A, B, C, D

Explanation: The nutritional management include administration of salt water, honey , warm soups and soft foods. Avoid foods such as Dry/fried foods, citrus foods, pickled foods, foods having vinegar, spicy foods, alcohol and caffeine.

LOWER RESPIRATORY TRACT DISEASES/ DISORDERS

1064. **A patient with shortness of breath is being tested for lung cancer. Which of the following diagnostic test will be most conclusive?** *(RAK MSc 2018)*
a. Chest X-ray b. MRI
c. Sputum culture d. Biopsy

Ans.

1046. b
1047. d
1048. b
1049. d
1050. d
1051. a
1052. c
1053. c
1054. d
1055. d
1056. c
1057. a
1058. c
1059. a
1060. a
1061. a
1062. d
1063. c
1064. d

Scanned with CamScanner

Explanation: Biopsy is the most conclusive test in the diagnosis of lung cancer. It is helpful in determining the type of lung cancer as well as the molecular or genetic profile of the tumor, whereas other tests detects the physical variations in the lung.

Chest X-ray and sputum culture are not confirmatory test for diagnosis of lung cancer. Instead of MRI, CT scan is a reliable test for diagnosis of lung cancer

1065. Which among the following activity helps in the production of surfactant?
a. Taking deep breaths b. Coughing exercises
c. Strenuous exercises d. ROM exercises

1066. The destruction of alveolar walls is called: *(RRB SSNE 2015)*
a. Empyema b. Bronchitis
c. Emphysema d. Lung abscess

1067. Collapse of lung is called
a. Atelectasis b. Emphysema
c. Bronchitis d. Bronchiectasis

1068. Collapse of the alveoli is .....
a. Atelectasis b. Asthma
c. Emphysema d. Bronchiectasis

1069. Identify the clinical manifestation of atelectasis among the following?
a. Diminished breaths sound
b. Rapid and shallow respiration
c. Loose productive cough
d. All of the above

Ans.
1065. a
1066. c
1067. a
1068. a
1069. d
1070. d
1071. d
1072. d
1073. b
1074. b
1075. b
1076. a
1077. c
1078. b
1079. d
1080. c
1081. b
1082. a
1083. d
1084. a

Explanation: Atelectasis is the collapse or closure of a lung resulting in reduced or absent gas exchange. It may affect part or all of a lung.

1070. Permanent abnormal dilation and distraction of bronchi and bronchioles is known as
a. Atelectasis b. Asthma
c. Emphysema d. Bronchiectasis

1071. Complication of bronchiectasis is ..... *(JIPMER 2001)*
a. Cerebral abscess b. Lung abscess
c. Amyloidosis d. All of the above

1072. Asbestos-related diseases include .....
a. Diffuse pleural fibrosis
b. Bronchogenic carcinoma
c. Mesothelioma d. All of the above

1073. Monday fever is the other name for: *(AIIMS BPL NO 2018)*
a. Asbestosis b. Byssinosis
c. Silicosis d. Anthracosis

Explanation: **Byssinosis,** also called "brown lung disease" or "Monday fever", is an occupational lung disease caused by exposure to cotton dust in inadequately ventilated working environments.

1074. Which among the following is a risk factor for pneumonia?
a. Seasonal change b. Living in crowded place
c. Mosquito d. Malnutrition

1075. Which of the following nursing diagnosis is a priority for a patient diagnosed with pneumonia?
a. Fluid volume deficit
b. Impaired gas exchange
c. Ineffective coping
d. Risk for infection

Explanation: Pneumonia is an inflammation of the lung parenchyma, associated with alveolar edema and congestion that impair gas exchange.

1076. A 65-year-old male client is admitted to the hospital with a diagnosis of pneumococcal pneumonia. The client has dyspnea. The client's temperature is 101°F, respirations are 34, and pulse is 94. Bed rest is ordered for this client primarily to
a. Decrease metabolic needs
b. Prevent the development of atelectasis
c. Prevent pneumothorax
d. Promote postural drainage

Explanation: The client is having difficulty in breathing and meeting the oxygen needs. Providing bed rest will reduce the metabolic needs of the client, so reduced oxygen need.

1077. What nursing action will most help a client obtain maximum benefits after postural drainage? *(RAK MSc 2018)*
a. Administer PRN oxygen
b. Place the client in a sitting position
c. Encourage the client to cough deeply
d. Encourage the client to rest for 30 minutes

Explanation: Postural drainage is an airway clearance technique that helps people clear mucus from their lungs. Postural drainage helps to dislodge and loosen the secretions. It uses gravity and percussion (clapping on the chest and/or back) to loosen the thick, sticky mucus in the lungs so it can be removed by coughing. Therefore, patient is encouraged to **cough deeply** so that the loosened secretions are easily removed.

1078. A client who smokes two packs of cigarettes per day is most at risk postoperatively for? *(AIIMS Raipur Staff Nurse Grade I-2018)*
a. Infection b. Pneumonia
c. Hypotension d. Cardiac dysrhythmias

Explanation: Smoking affects lungs and respiration, so post operatively client is at risk for developing respiratory complications, so from the given options client is at risk for developing pneumonia.

1079. Causes of lung abscess is .....
a. Aspiration of gastric contents
b. Aspiration of infective materials
c. Complication of pneumonia
d. All of the above

1080. Most common cause of Lung abscess
a. Staph aureus
b. Pneumococcus
c. Aerobic and anaerobic streptococci
d. E. coli

1081. Most common cause of lung abscess in comatose patient?
a. Staph aureus
b. Oral anaerobes
c. Klebsiella
d. Tuberculosis

1082. First stage of pneumonia is
a. Congestion b. Red hepatization
c. Gray hepatization d. Resolution

1083. Final stage of pneumonia is
a. Congestion b. Red hepatization
c. Gray hepatization d. Resolution

1084. Pus in the pleural cavity is .....
a. Empyema b. Hemothorax
c. Pleural effusion d. Pneumothorax

Scanned with CamScanner

1085. **After chest tube placement it started to drain dark red color secretions. It suggests of .....**
a. Pneumothorax b. Hemothorax
c. Pyothorax d. Emphysema

1086. **Which of the following finding during auscultation suggests a right pneumothorax?**
a. Absence of breaths sound in the right thorax
b. Bilateral Rhonchi
c. Bilateral inspiratory crackles
d. All of the above

1087. **Confirmatory diagnostic test for pneumothorax is .....**
a. Auscultating breath sounds
b. Sputum culture
c. Chest X-ray
d. Bronchoscopy

1088. **Chest tube inserted into 2nd or 3rd intercostal space suggestive of .....**
a. Pneumothorax b. Hemothorax
c. Pyothorax d. Emphysema

1089. **Chest tube inserted into 4th or 5th intercostal space suggestive of .....**
a. Pneumothorax b. Hemothorax
c. Pyothorax d. Emphysema

1090. **Clamping of chest tube will lead to**
a. Atelectasis
b. Tension pneumothorax
c. Emphysema
d. Pneumonia

1091. **Which among the following finding indicates correct chest tube placement?**
a. Respiratory sounds are absent
b. Vesicular sounds heard over upper lung fields
c. Bronchovesicular sounds heard over both lung fields
d. Crackles heard on the affected side

1092. **In a client with chest tube lack of fluctuation of water in a water seal chamber occurs because of .....**
a. Kinking of tube
b. Re-expansion of lung
c. Both a and b
d. None of the above

Explanation: Fluctuation of water will stop in two condition, either because of kinking or obstruction in the tube or because of chest re-expansion is completed.

1093. **A patient had chest tubes on his right chest which were connected to the water seal, during ambulation, the tubes got dislodged from the water seal. Which of the following actions by the nurse would be appropriate?**
(AIIMS Bhopal Grade-I 2018)
a. Instruct the patient to cough forcibly several times
b. Asses the lung sound of the patient
c. Place the patient on bed and provide oxygenation
d. Reconnect the tubes to water seal

Explanation: During ambulation if chest tubes got dislodged from the water seal, the primary step is to reconnect the tubes to the water seal. This is to prevent any entry of air accidently into the chest cavity, after that assist the client to ambulate back to the bed and auscultate breathing sounds bilaterally to determine any type of air entry. Client is never ne instructed to cough when chest tubes get dislodged because it promotes air entry into the chest cavity.

1094. **How do you know that intercostal drainage tube is functioning?**
(RAK MSc 2018)
a. Continuous bubbling in water seal bottle
b. Continuous bubbling from suction tube
c. Oscillation of water column in drainage bottle
d. No bubbling in the drainage bottle

Explanation:
- The functioning of intercostal drainage tube is confirmed by observing oscillation of water column in drainage bottle which occurs due to change in pressure during respiration. The intrapleural pressure is decreased during inspiration and it increases during expiration.
- Continuous bubbling in water seal bottle and suction tube is considered abnormal as it is due to air passing out of the pleural space.
- No bubbling in the drainage bottle indicates that the intercostal drainage tube is not functioning properly or if its patency is endangered.

COPD

1095. **Which term should be used to document the musical sounds generated by airflow through narrowed airways?**
(RAK MSc 2018)
a. Crackles b. Wheezes
c. Friction rub d. Stridor

Explanation: Wheezes are musical sounds caused by air movement through constricted small airways, such as bronchioles. This high-pitched whistling noise happens during breathing in or out. Stridor is a high-pitched sound originating from the upper airway and occurring on inspiration. Like wheezes, stridor is produced by airway narrowing, but only in the upper airways.

1096. **Deep vein thrombosis renders a person at a risk of:**
(AIIMS Nagpur NO 2018)
a. Shock b. Pulmonary embolism
c. Heart attack d. Stroke

Explanation: Deep vein thrombosis (DVT) occurs when a blood clot (thrombus) forms in one or more of the deep veins in body, usually in legs. Thrombus dislodged from legs can travel to the lungs, which obstruct the pulmonary artery and produce **pulmonary embolism (PE).**

1097. **The two main forms of COPD are**
a. Asthma and chronic bronchitis
b. Asthma and Emphysema
c. Chronic bronchitis and atelectasis
d. Chronic bronchitis and emphysema

1098. **Respiratory drive is maintained in a COPD client by .....**
a. Oxygen b. Carbon dioxide
c. Nitrogen d. Oxyhemoglobin

1099. **Respiratory drive in COPD patient is**
a. Oxygen b. Carbon dioxide
c. PO_2 d. pH of the blood

Explanation: The hypoxic drive is a form of respiratory drive in which the body uses oxygen chemoreceptors instead of carbon dioxide receptors to regulate the respiratory cycle. Hypoxic stimuli is the respiratory drive in COPD patient. When there is an increase in oxygen levels the body will decrease the rate of respiration. To maintain this respiratory drive in patient with COPD Oxygen at 1–2 L/min is given.

Ans.
1085. b
1086. a
1087. c
1088. a
1089. b
1090. b
1091. c
1092. c
1093. d
1094. c
1095. b
1096. b
1097. d
1098. a
1099. a

Scanned with CamScanner

1100. Long term outcome of COPD includes .....
a. Hypoxemia b. Hypercapnia
c. Leukopenia d. All of the above

1101. Nursing care for a COPD client include .....
a. High flow rate of O_2
b. Cholinergic agents
c. Use spacer
d. Breathing exercise such as pursed-lip breathing that focus on exhalation

1102. In a patient with COPD, best management option is?
a. Quit smoking b. Bronchodilators
c. Low flow oxygen d. Mucolytics

1103. A 52-year-old male client is admitted with chronic obstructive pulmonary disease (COPD). The nurse notes that he has neck vein distention and slight peripheral edema. These signs indicate the onset of:
a. Cardiogenic shock b. Cor pulmonale
c. Left-sided heart failure d. Pneumothorax

Explanation: Cor pulmonale is a condition that causes the right side of the heart to fail. It is manifested by jugular venous distention (distended neck vein) and peripheral edema.

1104. Characteristic sign of asthma?
a. Cyanosis b. Grunting
c. Wheezing d. Cough

1105. In which condition Charcot-Leyden crystals are seen in sputum?
a. TB b. Bronchial asthma
c. Pneumonia d. Empyema

1106. Advantage of using spacer in MDI is .....
a. Easier for medication to reach the lungs
b. Less medication gets deposited in the mouth and throat
c. Helps to coordinate breathing in and activating an MDI
d. All of the above

Explanation: A spacer (Asthma spacer) is a device used to increase the ease of administering aerosolized medication from a metered-dose inhaler (MDI). It adds space in the form of a tube or "chamber" between the mouth and canister of medication. Spacers can make it easier for medication to reach the lungs, and also mean less medication gets deposited in the mouth and throat, where it can lead to irritation and mild infections

1107. Best for treatment of Exercise induced asthma?
a. Montelukast
b. Salbutamol
c. Ipratropium
d. Low dose Inhaled corticosteroids

1108. Main drug of choice to treat asthma is .....
a. Antibiotics b. Bronchodilators
c. Anticholinergics d. Muscle relaxant

1109. Chronic asthma leads to .....
a. Atelectasis b. Emphysema
c. COPD d. Pneumonia

1110. Blue bloater is known as .....
a. COPD
b. ARDS
c. Chronic obstructive bronchitis
d. Emphysema

1111. Pink puffer is known as .....
a. COPD b. ARDS
c. Chronic obstructive bronchitis
d. Emphysema

1112. A 65-year-old male patient with emphysema and acute upper respiratory infection is admitted. Oxygen is ordered at 2 L/min. The reason for low-flow oxygen is to
a. Compensate for airway resistance
b. Facilitate oxygen diffusion
c. Prevent depression of the respiratory drive
d. Prevent excessive drying of secretions

Explanation: The stimulus to breathe in a person with COPD is a low oxygen level rather than a high carbon dioxide level, as in normal persons. If high-flow oxygen were given, the oxygen level would increase, and the respiratory drive would cease.

1113. Highest nursing priority for a client with status asthmatics is .....
a. Avoiding intubation b. Adherence to treatment
c. Monitor respiratory status d. Prevent complications

1114. The highest risk for respiratory failure is present in .....
a. A client with asthma
b. A client with COPD
c. A client with pericarditis
d. A client with Guillain-Barre syndrome

1115. Which one of the following does not cause respiratory failure?
a. Pneumothorax b. Pulmonary embolism
c. Acute asthma d. Flail chest

1116. An emergency treatment for an acute asthmatic attack is:
a. Adrenaline 1:100 b. Adrenaline 1:1000
c. Betamethasone d. Hydrocortisone

Explanation: Acute asthmatic attack is characterized by severe bronchospasm. An emergency treatment for an acute asthmatic attack is Adrenaline 1:1000 given hypodermically relax the bronchial smooth muscle.

1117. Type II respiratory failure may occur as a result of
a. Ventilation perfusion mismatch
b. Poor respiratory effect
c. Right to left cardiac shunt
d. Fluid in the alveoli

RESPIRATORY INFECTIONS

1118. The common cause for bacterial sore throat is: *(DSSSB PHN, 2015)*
a. Beta-hemolytic streptococcus
b. Mycoplasma pneumonia
c. Corynebacterium
d. Mycobacterium

1119. Most commonly seen organism in tonsillitis is .....
a. Streptococci b. Shigella
c. Flagella d. Staphylococci

1120. Commonest complication of measles in children is .....
a. Septicemia b. Otitis media
c. Meningitis d. Bronchopneumonia

1121. Complication of mumps infection in male is .....
a. Pancreatitis b. Laryngitis
c. Orchitis d. Glomerulonephritis

1122. Organism responsible for community-acquired pneumonia is .....
a. Gonococci
b. E-coli
c. Streptococcus pneumonia
d. Shigella

Ans.

1122. c

Scanned with CamScanner

1123. **Major cause of nosocomial pneumonia is .....**
a. Gram+ve bacilli b. Gram-ve bacilli
c. Gram+ve cocci d. Gram-ve cocci

1124. **A factor predisposing a person to nosocomial pneumonia is:** *(AIIMS Bhopal Grade-I 2018)*
a. Oropharyngeal colonization due to mouth breathing
b. Use of nasogastric tube
c. Endotracheal intubation
d. Use of H2 antagonist

Explanation: Nosocomial Pneumonia remains a common complication in patients treated with endotracheal intubation and mechanical ventilation due to various reasons like endotracheal tube has direct effect on the airway that result in reduction in local host defense mechanism and mucosal injury can reduces the mucociliary function which further reduces effectiveness of the cough.

1125. **A client is suspected to be suffering from histoplasmosis. Which of the following factor is associated with the diagnosis of histoplasmosis?**
a. He drinks raw cow milk
b. He walks bare footed in field
c. He handles fertilizer frequently
d. He cleans chicken houses

Explanation: Histoplasmosis is a disease caused by the fungus histoplasma capsulatum. This fungus grows in chicken and pigeon manure. Person who cleans chicken house is at risk of infection with histoplasma capsulatum.

1126. **Which of the following drug is prescribed for the treatment of histoplasmosis?**
a. Penicillin b. Chloromycetin
c. Streptomycin d. Amphotericin B

Explanation: Histoplasmosis is a fungal infection caused by histoplasma capsulatum. Amphotericin B is an antifungal agent and drug of choice to treat histoplasmosis. Other three drugs are antibiotics.

1127. **Causative agent of Farmer's lung is**
a. Thermophilus actinomycetes
b. Penicillium glabrum
c. Rhizopus d. Aspergillus

PULMONARY TUBERCULOSIS

1128. **Mantoux test is the sensitivity test for:** *(Staff Nurse G II 2014)*
a. AIDS b. Bronchial asthma
c. Allergic disorders d. Tuberculosis

1129. **A positive tuberculin test is indicated by induration of:**
a. 1-3 mm in diameter b. 10 mm or more in diameter
c. 7-9 mm in diameter d. 4-6 mm in diameter

Explanation: Tuberculin skin test is one of the important and widely used test for the diagnosis of Tuberculosis (TB). One ml of Purified Protein Derivative (PPD) will be injected intradermally and will read 48 to 72 hours later. The result will be depending upon the medical risk factors and sites of induration.

5 mm or more is positive in
- HIV positive person
- Recent contact with active TB cases
- Person with nodular or fibrotic changes in chest X-ray
- Organ transplant recipients and other immunosuppressed patients.
- Patient on long-term systemic corticosteroid therapy.
- Patient on long term systemic corticosteroid therapy
- End Stage Renal Disease

10 mm is positive in
- Recent arrival from high prevalence country
- IV drug abusers
- Residence and employers of high-risk congregate settings.
- Mycobacterial lab personnel
- Person with clinical conditions that place them high risk. e.g. diabetes, leukemia, LBW, ESRD.
- Children less than 4 years of age.

15 mm or more is positive in
- Person with no known risk for TB

1130. **The purpose of chest X-ray in a Mantoux positive client is**
a. Determine the category
b. To confirm the diagnosis
c. Determine the extent of lesions
d. Determine the duration of treatment

1131. **Mantoux test performed in a nurse who is working in TB clinic will be .....**
a. Negative skin test b. Suffering from TB
c. Need hospitalization d. A positive skin test

1132. **Typical signs of TB include .....**
a. Night sweats b. Hemoptysis
c. Fever d. All of the above

1133. **Ghon's foci is seen in:**
a. Rheumatic fever b. Measles
c. Renal tumor d. Tuberculosis

1134. **A client with past history of TB infection presently become immunocompromised and suffering from TB, it is known as .....**
a. Latent infection b. Nosocomial infection
c. Opportunistic infection d. Tertiary infection

1135. **Characteristic clinical features of TB include**
a. Cough and chest pain
b. Weight loss, fever, night sweats, and hemoptysis
c. Cough, nausea and vomiting
d. Headache fever and diarrhea

1136. **Definitive diagnostic test for TB is .....**
a. Chest X-ray b. Mantoux test
c. Sputum culture d. Thoracentesis

1137. **In TB hospitalization is to .....**
a. Provide health education
b. Adhere to treatment regimen
c. Prevent spread of the disease
d. Teach proper sputum disposal

1138. **Sites of primary tuberculosis is .....**
a. Skin b. Lung
c. Gastrointestinal tract d. All of the above

1139. **Intestinal TB affects .....part of the intestine**
a. Duodenum b. Ileum
c. Ascending colon d. Sigmoid colon

1140. **For the treatment of tuberculosis, chemotherapy must be continued for _____**
a. 1–3 months b. 6–12 months
c. 3–5 months d. 2 years or more

Explanation: Tuberculosis is caused by tubercle bacilli. Treatment with combination of multiple drugs including rifampicin, isoniazid, pyrazinamide, ethambutol and streptomycin for at least 6 months is essential to eradicate tubercle bacilli.

Ans.
1123. b
1124. c
1125. d
1126. d
1127. a
1128. d
1129. b
1130. c
1131. d
1132. d
1133. d
1134. c
1135. b
1136. c
1137. c
1138. d
1139. b
1140. b

Scanned with CamScanner

1141. Which of the following drug in DOTS therapy can cause deafness? *(AIIMS Raipur Staff Nurse Grade I-2018)*

a. Ethambutol
b. Isoniazid
c. Rifampicin
d. Streptomycin

Explanation: Streptomycin is ototoxic and can cause deafness. Side effect of ethambutol is commonly related to visual changes such as blurred vision/ decreased vision or color blindness or it may be related to liver disease. Rifampicin cause secretions such as urine, saliva etc. in red-orange color. Side effect related to isoniazid include peripheral neuropathy, pellagra like symptoms and pyridoxine deficiency

1142. Frequent visual examination is suggested for a patient on *(AIIMS Raipur NO 2019)*

a. Rifampicin
b. INH
c. Ethambutol
d. Dapsone

Explanation: The patient on ethambutol has increased risk of ocular toxicity (decreased red-green color discrimination), so it is recommended to monitor visual acuity and color discrimination regularly.

1143. Which of the following is seen in sarcoidosis?

a. Hypercalcemia
b. Hypocalcemia
c. Hyperphosphatemia
d. Hypophosphatemia

Explanation: Sarcoidosis is an inflammatory disease that affects multiple organs in the body, but mostly the lungs and lymph glands. Hypercalcemia is a highly prevalent complication of sarcoidosis. Hypercalcemia in sarcoidosis is due to the uncontrolled synthesis of Vitamin D3 by macrophages.

Ans.

1141. d
1142. c
1143. a
1144. b
1145. a
1146. c
1147. c
1148. a
1149. b
1150. c
1151. b

INTERVENTIONS

1144. Principles used in closed chest drainage: *(AIIMS Nagpur NO 2018)*

a. Gravity, positive pressure, suction
b. Gravity, negative pressure, suction
c. Ambulation
d. Posture

Explanation: In closed chest drainage the chest tube is connected to a closed chest drainage system, which allows for air or fluid to be drained, and prevents air or fluid from entering the pleural space. Emphysema, traumatic pneumothorax, pleural effusion, thoracic surgeries are common indications for closed chest drainage. Principles used to drain are Gravity, negative pressure and suction.

1145. "Tracheostomy" is usually performed between the tracheal rings of cartilage of *(AIIMS Raipur NO 2019)*

a. Second and third
b. Third and fourth
c. Fourth and fifth
d. All of the above

1146. The nurse administers oxygen at 5 L/min via nasal cannula to a client with emphysema. For which clinical indicators should the nurse closely observe the client? *(RAK MSc 2018)*

a. Cyanosis and lethargy
b. Anxiety and tachycardia
c. Drowsiness and decreased respirations
d. Hyperemia and increased respirations

Explanation:

- Emphysema is a type of COPD where alveoli are damaged and are unable to receive enough oxygen unless provided in a higher concentration on a long-term basis. As stated above that nasal cannulas are used, they are capable of delivering 24%-44% of oxygen at 1-6 L/min.
- Administering oxygen for long term around 12-15 hrs. a day may also cause a complication called hypercapnia, i.e. carbon dioxide retention due to oxygen toxicity. These causes symptoms such as drowsiness, decreased respirations, headache and sometimes death.

1147. What should the nurse do while preparing the client for thoracentesis?

a. Administer anticholinergics as ordered
b. Keep the patient NPO for six hours
c. Explain the procedure to him
d. Prepare him to go to the operating room

Explanation: The nurse should explain the procedure to the patient to get informed consent. The procedure is usually done at bedside not at operating room. Keeping the patient NPO is not necessary this procedure. Anticholinergics or analgesics are not ordered for thoracentesis.

1148. Complication associated with tracheostomy is .....

a. Damage to the laryngeal nerve
b. Bronchoconstriction
c. Pneumonia
d. Excessive secretions

1149. An adult patient is scheduled for a tracheostomy. Which of the following nursing action is the priority for this client?

a. Insert a Foley catheter
b. Establish a means of communication
c. Prepare the bowel by administering enemas until clear
d. Start an IV line

Explanation: Preoperatively, the priority nursing action for the patient who is undergoing tracheostomy is to establish a means of communication because the patient will not be able to speak after the tracheostomy is performed.

1150. The priority nursing diagnosis for the client with tracheostomy is *(Bihar PSC 2010)*

a. Pain related to tracheostomy
b. Impaired verbal communication related to tracheostomy procedure
c. Ineffective airway clearance related to increased tracheobronchial secretions
d. Risk for impaired skin integrity related to tracheostomy incision

Explanation: Ineffective airway clearance is the priority nursing diagnosis for the patient with tracheostomy tube in place because it is important to maintain airway clear from tracheobronchial secretions. The ABC (airway, breathing and circulation) protocol assists the nurse to prioritize airway clearance.

1151. An adult man has a tracheostomy tube in place. Which of the following actions is appropriate for the nurse to take when suctioning the tracheostomy?

a. Use a sterile tube each time and suction for 20 seconds
b. Use sterile technique and turn the suction off as the catheter is introduced
c. Use clean technique and suction for 15 seconds
d. Discard the catheter at the end of every shift

Scanned with CamScanner

Explanation: Suctioning should be done under sterile technique for no more than 10 seconds. The suction should be off as the tube is inserted and applied intermittently as it is withdrawn.

1152. A thoracentesis was performed on an adult client. After the procedure, the client has hemoptysis and a pulse of 80, respirations of 28, and temperature of 99°F. Which of these is of greatest concern to the nurse?

a. Hemoptysis
b. Pulse of 80
c. Temperature of 99°F
d. Respirations of 28

Explanation: Hemoptysis is the only abnormal finding. All of the others are within normal range for someone who has undergone an invasive procedure.

1153. Injury to ..... nerve cause vocal cord palsy

a. Glossopharyngeal
b. Acoustic nerve
c. Spinal accessory
d. Recurrent laryngeal nerve

1154. Thoracocentesis is contra indicated in .....client

a. Bleeding and clotting disorder
b. Uncooperative patient
c. Cardiac problems
d. All of the above

1155. Nurse Ramya is suctioning a tracheostomy tube of an adult patient. During the procedure, the catheter appears to attach to the tracheal wall and creates a pulling sensation. What is the best action for the nurse to take?

a. Continue suctioning until the obstruction removed
b. Increase the pressure of suction
c. Insert the tube deeper and apply more pressure
d. Release the suction by opening the vent

Explanation: Suction should not be applied as the suction tube is inserted, because this will cause the suction tube to appear to attach to the tracheal wall and create a pulling sensation. If pulling sensation is created during suction, relcase the suction by opening the vent.

1156. Identify the incorrect statement regarding ET suctioning

a. Pre-oxygenate the client
b. Follow aseptic technique
c. Lubricate catheter before insertion
d. Apply negative pressure while inserting the tube

Explanation: All statements are true except option d. Negative pressure need to be applied while withdrawing tube, not on insertion.

1157. Which nursing step helps to maintain cerebral perfusion while doing suctioning?

a. Supine position
b. Close monitoring of SPO2 level
c. Use sterile techniques
d. Hyperoxygenate before and after suctioning

1158. Nursing action while doing tracheostomy suction include

a. Pre-oxygenate the client
b. Strict aseptic technique while doing suctioning
c. Assessing the patient's oxygenation saturation before, during, and after suctioning
d. All of the above

1159. When suctioning the tracheostomy tube we must limit the suctioning to a maximum of:

a. 5 sec
b. 10 sec
c. 15 sec
d. 20 sec

1160. Why rolling movement of catheter is needed while suction catheter is withdrawn?

a. To remove secretion
b. To provide proper pressure
c. To prevent tissue trauma
d. For easy withdrawal of tube

1161. A patient, with portex tracheostomy tube, develops sudden complete blockage of the tube. Which of the following is the best intervention to prevent complication?

(AIIMS Bhopal Grade-I 2018)

a. Ausculate for breath sounds
b. Deflate the tracheostomy cuff and supply high flow oxygen
c. Suction of tube with normal saline
d. Immediate removal of the tracheostomy tube

Explanation: The best intervention to prevent the complication is **immediate removal of the tracheostomy tube** because the most frequent cause of blockage is plugging of the tracheostomy tube with a crust or mucous plug. These plugs can also be aspirated and lead to atelectasis or lung abscess. Deflation of the tracheostomy tube is not appropriate because that will not clear the plug material of the tube.

1162. Removal of an entire lung is called as *(Staff Nurse G II 2014)*

a. Pneumonectomy
b. Segmental resection
c. Wedge resection
d. Lobectomy

1163. Most important nursing intervention while caring a person with artificial airway is .....

a. Maintain the patency of the tube
b. Administer antibiotic as ordered
c. Monitor ventilator parameter
d. Monitor SPO2

1164. What happens if the cuff pressure of ET tube exceeds the normal limit?

a. ET tube dislodge
b. Air leak occurs
c. Mucosal damage occurs
d. Secretions will pool off around the cuff

1165. Ventilator associated pneumonia is defined as pneumonia that occur ____hrs or after ET intubation

a. 12 hours
b. 24 hours
c. 36 hours
d. 48 hours

1166. Position given to prevent aspiration is .....

a. Position the client on the lying side with head flexed forward
b. Fowlers
c. Prone
d. Lithotomy

1167. Appropriate position given to a client experiencing acute pulmonary edema is .....

a. Supine
b. Prone
c. High Fowler's position
d. Left lateral

1168. Position given to patient after laryngectomy is .....

a. Fowler's
b. Sim's
c. Lithotomy
d. Prone

1169. Which of the following nursing intervention is a priority for a patient with laryngectomy

a. Establish means of communication
b. Monitor for signs of infection
c. Monitor for hoarseness of voice
d. Keep trachea free of secretions

Explanation: Keeping the trachea free of secretions will help maintaining the patent airway which is the priority. Use ABC (Airway, breathing and circulation) protocol of prioritization to identify the answer.

Ans.

1152. a
1153. d
1154. d
1155. d
1156. d
1157. d
1158. d
1159. b
1160. c
1161. d
1162. a
1163. a
1164. c
1165. d
1166. a
1167. c
1168. a
1169. d

Scanned with CamScanner

1170. After a laryngectomy, which of the following assessments takes priority? *(RAK MSc 2018)*
a. Airway patency
b. Nutritional status
c. Lung sounds
d. Patient acceptance of surgery

Explanation: After a laryngectomy, the assessment which takes priority is to maintain airway patency. Airway patency is the priority as there is ineffective airway clearance due to excess mucous production secondary to the surgical alterations in the airway. The nurse promotes a patent airway by positioning the patient in the semi- fowler's position after recovering from anesthesia.

1171. Which of the following is the priority nursing action during the preoperative period for a client posted for laryngectomy?
a. Establish a means of communication
b. Prepare the bowel by administering enemas until clear
c. Teach the technique for suctioning a laryngectomy tube
d. Teach the client to use an artificial larynx

Explanation: In laryngectomy, the larynx will be removed and at first the patient will not be able to talk. So establishing a means of communication is the highest priority during preoperative period. Patients will need to know how to communicate with the staff. During hospitalization, they may use pen and paper, picture charts, gestures, and sometimes an electrolarynx. Teaching the client to use an artificial larynx is a postoperative task. Because the laryngectomy tube will be temporary, the client will not need to learn to suction.

Ans.

1170. a
1171. a
1172. c
1173. d
1174. b
1175. d
1176. c
1177. d
1178. d
1179. c
1180. c
1181. d
1182. d
1183. b

1172. A nurse caring for a patient subjected to total laryngectomy should plan for *(Daman and Diu NO 2018)*
a. Keeping tracheostomy cuff fully inflated
b. Oral feeds at intervals
c. Alternative communication method
d. Supine position for patient

Explanation: Total laryngectomy includes removal of larynx (voice box) and the patient won't be able to speak using vocal cords. A patient with a laryngectomy cannot speak, but still needs to communicate. There are different ways of communication after laryngectomy that includes **tracheo-esophageal puncture (TEP), electrolarynx, esophageal speech.** Learning to speak again will take time and effort with the help of speech therapist. Therefore, the nurse should plan to develop an alternative communication method.

1173. On the first day following laryngectomy, the nurse's top priority of care is: *(AIIMS Nagpur NO 2018)*
a. Relieve anxiety
b. Train for speech therapy
c. Maintain communication
d. Maintain patent airway

Explanation: Maintenance of airway is the top priority in a postoperative client with laryngectomy in order to prevent obstruction due to mucus collection in throat. Maintain communication, speech therapy and relieving anxiety can be delayed. **STRATEGY:** Use ABC (Airway, Breathing and Circulation) principle to answer the question.

1174. Which of the following is most suitable method for long term management of airway
a. Endotracheal intubation b. Tracheostomy
c. Nasal prongs d. Oxygen mask

1175. Parts of a tracheostomy tube include .....
a. Outer cannula with cuff
b. Inner cannula
c. Obturator
d. All of the above

1176. Non-traumatic insertion of tracheostomy tube is achieved with the help of ,.....
a. Outer cannula with cuff b. Inner cannula
c. Obturator d. All of the above

1177. Correct option regarding breathing exercise is .....
a. Help to reduce pulmonary complications
b. Use pursed lip breathing techniques
c. Place hand on the abdomen and feel it is rise
d. All of the above

1178. Correct option regarding deep breathing exercise is .....
a. Place hands on abdomen while performing
b. Take deep breaths
c. Exhale in pursed lip manner
d. All of the above

1179. Advantage of a Venturi mask over other oxygen administration method is .....
a. Deliver 100% oxygen
b. Prevent mucosal drying
c. Deliver a precise concentration O2
d. Encourage activity

1180. Highest oxygen concentration will be delivered by
a. Nasal catheter
b. Nasal cannula
c. Partial non-rebreather mask
d. Simple oxygen mask

Explanation: Partial masks are designed to capture the first 150 mL of the exhaled breath into the reservoir bag for inhalation during the subsequent breath. This portion of the breath was initially delivered at the end of inhalation and was therefore delivered to the "deadspace" anatomy where gas exchange did not occur. Therefore, there would be no depletion of oxygen nor gain of carbon dioxide during the rebreathing component. It delivers the highest oxygen concentration from 95% to 100%.

1181. Postoperative pulmonary thromboembolism chances are more in .....
a. Hormonal replacement therapy and obesity
b. Immobility
c. Pregnant women
d. All of the above

1182. ICD is inserted into a client with pneumothorax, but accidently ICD is malpositioned, which among the following is a serious complication associated with malpositioned ICD?
a. Subcutaneous emphysema
b. Worsening of pneumothorax
c. Pneumo-peritoneum
d. Both a and b

1183. The functioning of the ICD chest tube is assessed by
a. Seeing for continuous air bubbles coming out of the underwater drain
b. Seeing the movement of air water column in the tube during respiration.
c. Taking X-ray chest repeatedly
d. Auscultation

Scanned with CamScanner

Explanation:

- Functioning of the Tube can be confirmed by seeing the column of water in the Chest tube moving up and down during respiration.
- Underwater drainage tube if fails to expand a lung of Open pneumothorax we will use 5 cm water low pressure suction.
- Heimlich valve is a special valve used instead of underwater drain only for Pneumothorax cases.

1184. Immediate treatment of tension pneumothorax involves insertion of needle into _____ intercostals space

a. 6th
b. 5th
c. 3rd
d. 2nd

1185. Which among the following devices assists a critical patient in breathing? *(AIIMS Raipur staff nurse grade I-2018)*

a. Camco machine
b. Ventilator machine
c. Defibrillator machine
d. Oxygen humidifier

Explanation: Ventilator is the mechanical device which assist a person in breathing. Defibrillator is the mechanical device used to treat life threatening cardiac dysrhythmias. Oxygen humidifier is a device used to humidify oxygen before supplying to patient.

1186. Which among the following is present in a client receiving positive end-expiratory pressure (PEEP) therapy?

a. Bradypnea
b. Tachycardia
c. Hypertension
d. Reduced cardiac output

1187. Which of the following artificial ventilation mode is best suitable for a patient with respiratory arrest? *(AIIMS Raipur Grade II 2017)*

a. Continuous positive airway pressure
b. Continuous mandatory ventilation
c. Assistant controlled mandatory ventilation
d. Non-invasive positive pressure ventilation

Explanation: Continuous mandatory ventilation (CMV) is a mode of mechanical ventilation in which breaths are delivered based on set variables which is preferred in respiratory arrest.

Continuous positive airway pressure is used in patients with complex underlying respiratory diseases.

Non-invasive positive pressure ventilation is used in patients with COPD who are having exacerbations and patients with hypercapnic respiratory distress.

1188. The priority treatment for a client with spontaneous pneumothorax is

a. High fowlers position
b. Activity restriction
c. Chest tube placement
d. Hyperbaric chamber

1189. A 65 kg patient with a pulmonary embolism is ordered to receive heparin 10 units/kg/hour by I.V. infusion. How many units of heparin should he receive each hour?

a. 500
b. 550
c. 600
d. 650

Explanation:

- Patient has to receive 10 units/kg/hour
- Patient weight = 65 kg
- Dose required per hour = 65 × 10 = 650 units/hour

1190. Which of the following foods should be included in the diet of patient with microcytic hypochromic anemia?

a. Cheese
b. Eggs
c. Citrus fruits
d. Cow milk

1191. Which of the following is the best source of vitamin B12?

a. Green leafy vegetables
b. Broccoli
c. Cauliflower
d. Meats and dairy products

Ans.

1184. d
1185. b
1186. d
1187. b
1188. c
1189. d
1190. b
1191. d

CARDIOVASCULAR SYSTEM

Figure 50 ■ Anatomy of Heart

ANATOMIC AND PHYSIOLOGIC OVERVIEW OF HEART

- Heart is a cone shaped, hollow muscular organ located in the mediastinal space between the lungs and rests on the diaphragm.
- **Size:** 12 cm long × 8 cm width × 6 cm thickness
- **Weight:** About 300 gm

Layers of Heart

Figure 51 ■ Cross section of heart showing its layers

- **Pericardium:** Outer most layer of heart; covering of heart; consists of 3 layers:
  - Fibrous pericardium (outermost layer)
  - Parietal pericardium (middle layer)
  - Visceral pericardium (Epicardium)

Note

Between visceral and parietal pericardium there is pericardial space and it contains approximately 30 ml of pericardial fluid.

- **Myocardium:** Middle layer of heart wall. Thickest layer of the heart wall. It is responsible for pumping action.
- **Endocardium:** Inner most layer of heart wall.

Heart Chambers

- It has four chambers:
  - 2 Atrium (Right atrium and Left atrium)
  - 2 Ventricle (Right ventricle and Left ventricle)
- Left ventricle is the thickest chamber (10-15 mm)
- **Apex of the heart:** Conical area created by left ventricle. The apex is located near the mid-clavicular line in the 5th intercostal space.
- **Base of the heart:** Upper border of the heart is formed by left atrium. Lies just below the 2nd rib.

Figure 52 ■ Schematic diagram of blood circulation in the heart

Note

Right atrium receives blood from superior vena cava (from head, neck and upper extremities), inferior vena cava (from trunk and lower extremities) and coronary sinus.

Scanned with CamScanner

Figure 53 ■ Valves of heart

Heart Valves

- Two Atrio-Ventricular (AV) valves
  - Bicuspid valve (Mitral valve): Between left atrium and left ventricle
  - Tricuspid valve: Between right atrium and right ventricle
- Two Semi-lunar valves (half-moon shaped leaflet)
  - Pulmonary valve: Between pulmonary artery and right ventricle
  - Aortic valve: Between aorta and left ventricle

Key Points

- Rheumatic fever is the most common cause of mitral valve stenosis.
- Valves are affected due to Rheumatic fever in the following order- Mitral, Aortic, Tricuspid and Pulmonic (Remember MAT-P)
- *Streptococcus pyogenes* or Group A beta hemolytic streptococci are the causative organisms for Rheumatic fever.

Coronary Arteries

- Left and right coronary arteries and their branches supply arterial blood to the heart.
- These arteries arise from aorta just above the aortic leaflet.
- Coronary arteries receive blood supply during diastole.
- Left coronary artery has three branches:
  - Left main coronary artery
  - Left anterior descending artery (supply anterior wall of the heart)
  - Circumflex artery (supply lateral wall of the heart).
- Right side of heart receives blood supply from right coronary artery.
- Posterior wall of the heart receives blood from posterior descending artery.
- Venous supply from the heart return blood to the right atrium via coronary sinus located behind the right atrium.

Key Points

- Left Anterior Descending Artery (LAD) is the most commonly occluded artery due to atherosclerosis
- Heart attack due to 100% Occlusion of LAD is often called as 'widow maker heart attack'

Cardiac Conduction System

- Characteristic of cardiac conduction include:
  - **Automaticity:** Ability to initiate an electrical impulse
  - **Excitability:** Ability to respond to an electrical impulse
  - **Conductivity:** Ability to transmit electrical impulse from one cell to another.
- **SA node (Sino-Atrial node)**
  - It is the primary pacemaker of the heart
  - Located at the junction between superior vena cava and right atrium
  - SA node generates impulse at a rate of 60-100 per minute.
  - Electrical impulse is generated at SA node and conducted to AV node via inter nodal pathway.
- **AV node** (Atrio-Ventricular node)
  - Located in the right atrial wall near tricuspid valve
  - AV node coordinates the incoming impulse from SA node
  - After a slight delay, relays the impulses to ventricles.
- **Bundle of His**
  - Present in the septum between right and left ventricle
  - It conducts the impulses received from AV node to purkinje fibers
  - It is divided into right and left bundle branch.
- **Purkinje fibers**
  - Terminal part of conduction system
  - Myocardial cells are stimulated causing cardiac contraction.

Key Points

- Conduction of electrical impulse is fastest in purkinje system (4 m/sec)

Scanned with CamScanner

Cardiac Cycle

- Normal duration of each cardiac cycle = 0.8 sec

Cardiac Output

- Each ventricle ejects approximately 70 ml of blood per beat.
- **Stroke volume (SV):** Volume of blood pumped from the left ventricle per beat. Normal stroke volume is 70 ml.
- **Cardiac output** = Stroke volume (SV) × Heart Rate (HR)
  = 70 × 72

Cardiac output = 5040 ml (Normal range is 4 – 8 ltr/min)

Holter Monitoring

A Holter monitor is a battery-powered portable device that records patient's Cardiac activity (ECG) continuously for 24 to 48 hours or longer depending on the type of monitoring used.

Scanned with CamScanner

Heart Sounds

Normal heart sounds

- **S1 (First Heart sound-LUBB):** Produced by closure of AV valves (Tricuspid and Mitral)
- **S2 (Second Heart sound-DUBB):** Produced by closure of Semilunar valves (Aortic and Pulmonic valve)

Abnormal heart sounds

- **S3** (Third heart sound): Also known as **ventricular gallop**. It corresponds to early ventricular filling (passive filling) when mitral valve opens. It is often associated with **Heart failure**.
- **S4** (Fourth heart sound): Also known as Atrial gallop

Key Points

- Left ventricle is responsible for apex beat. Point of maximum impulse can be auscultated in the **mid-clavicular line in the 5th inter costal space.**
- S3 corresponds with early ventricular filling and S4 corresponds with late ventricular filling.
- The gap between S1 and S2 indicates time for systole.
- The gap between S2 and S1 indicates time for diastole.

Blood Vessels

- Arteries and veins have three layers:
  - Tunica intima (inner layer)
  - Tunica media (middle layer)
  - Tunica adventitia (outer layer)
- Thickest layer of artery is tunica media
- Thickest layer of vein is tunica adventitia
- **Largest artery in the body is Aorta**
- Largest vein in the body is Inferior vena cava

Table 50 Differences between arteries and veins

Characters	Artery	Vein
Direction of blood flow	Heart to the body	Body to the heart
Oxygen concentration	Carry oxygenated blood (except pulmonary artery and umbilical artery)	Carry de-oxygenated blood (except pulmonary vein and umbilical vein)
Anatomy	Thicker walls Narrow lumen	Thinner walls Large lumen
Valve	Absent	Present
Pressure	High	Low

Figure 54 ■ Exchange of blood between arterioles and venules

- Arterioles – Resistant vessels
- Capillaries – Exchange vessels
- Venules – Smallest veins

Blood Pressure

- Normal range of systolic blood pressure (SBP) – 90 -140 mmHg
- Normal range of diastolic blood pressure (DBP) – 60-90 mmHg
- **Pulse Pressure:** Difference between SBP and DBP is known as pulse pressure. The normal range is 30-40 mmHg.

Key Points

- While assessing blood pressure use of:
  - Small/narrow cuff leads to → Falsely high BP
  - Large/wide cuff leads to → Falsely lower BP

Auscultation Sites for Different Areas of Heart

A	Aortic valve area	Second right intercostal space (ICS), right sternal border
P	Pulmonic valve area	Second left intercostal space (ICS), left sternal border
E	Erb's point	Third left ICS, left sternal border
T	Tricuspid valve area	Fourth left ICS, left sternal border
M	Mitral valve area/ apical area	Fifth ICS, left mid-clavicular line
G	Gibson's area	Left 1st intercostal space, PDA is heard here

Scanned with CamScanner

Common Sites for Assessment of Pulse

Table 51

Pulse site	Commonly used for/significance
Carotid	During CPR
Apical	Assessed with Stethoscope
Brachial	For assessment of Blood pressure
Radial	To count pulse
Femoral	For assessment
Popliteal	For assessment
Dorsalis pedis	Used to evaluate the arteriosclerotic diseases

Figure 55 ■ Sites for assessment of pulse

Pulse difference

- The difference between apical and radial pulse is known as pulse difference. Normally pulse difference is ZERO.
- Pulse difference usually occurs in conditions like atrial fibrillation, atrial flutter, premature ventricular contraction and varying degree of heart block.

Note

Do not palpate carotid artery and temporal artery simultaneously because it may reduce cerebral blood flow

DIAGNOSTIC TESTS

Table 52

Name of the test	Description
Cardiac enzyme (CK-MB)	Elevated value indicates myocardial damage. Usually elevation occurs within hours and peaks at 18 hours.
Lactate dehydrogenase (LDH)	Usually elevation occurs in 24 hours following MI and peaks at 48–72 hours. Normally LDH1 is higher than LDH2. If this is reversed that indicates severe myocardial necrosis.
Troponin	Troponin is composed of three proteins troponin I, troponin C and troponin T. Troponin I has highest affinity towards myocardial damage. It rises three hours after injury remains and persistent up to 7-10 days.
Myoglobin	The level rises for two hours after MI and declines after 7 hours

Contd...

Cardiac Markers in MI

Table 53

Cardiac markers	Time of elevation	Peaks	Normalize
Myoglobin	1-4 hrs	8-10 hrs	24 hrs
Troponin I/T	4-6 hrs	12 hrs	3-10 days
CK-MB	4-8 hrs	12-24 hrs	2-3 days

HEMODYNAMIC MONITORING

Table 54

Parameter	Normal range
CVP (Central Venous Pressure)/ Right Atrial Pressure	2 to 6 mm Hg.
Right Ventricular Pressure	
• Systolic	• 15–30 mm Hg
• Diastolic	• 2–8 mm Hg
JVP (Jugular Venous Pressure)	6 to 8 cm H_2O
Portal Venous Pressure	8–12 mm Hg
PAWP (Pulmonary Artery wedge pressure)	6–12 mm Hg.
PAP (Pulmonary Artery Pressure)	
• Systolic	• 15–30 mm Hg
• Diastolic	• 8–15 mm Hg
MAP (Mean Arterial Pressure)	70 to 105 mm Hg
Arterial PO_2	100 mm Hg
Arterial Oxygen Saturation (SaO_2)	95–100%
Central Venous Saturation ($ScvO_2$)	70%
Cardiac output	4–8 L

Note

1 mm Hg = 13.6 mm of H_2O or 1.36 CM of H_2O
1 cm of H_2O = 0.74 mm Hg

Central Venous Pressure

- The central venous pressure (CVP) is the pressure measured in the central veins close to the heart.
- It is also known as right atrial pressure.
- CVP reflects the amount of blood returning to the heart and the ability of the heart to pump the blood into the arterial system.

Scanned with CamScanner

Measurement of CVP

- The CVP can be measured either manually using a manometer or electronically using a transducer.
- It is measured by connecting the patient's central venous catheter to a special infusion set which is connected to a small diameter water column.
- In either case, the CVP must be 'zeroed' at the level of the right atrium.
- The phlebostatic axis is the reference point for zeroing the hemodynamic monitoring device.
- Phlebostatic axis is a point located by drawing an imaginary line from the fourth intercostal space at the sternum and finding its intersection with an imaginary line drawn down the center of the chest below the axillae.

Key Points

CVP is measured at the end of expiration.

Electrocardiogram (ECG)

Electrocardiography (ECG or EKG) is the process of recording the electrical activity of the heart over a period of time using electrodes placed on a patient's body.

Table 55 Placement of electrodes and leads

Electrode name	Electrode placement
V_1	4th intercostal space to the right of the sternum
V_2	4th intercostal space to the left of the sternum
V_3	Directly between leads V_2 and V_4.
V_4	5th intercostal space at left midclavicular line
V_5	Level with lead V_4 at left anterior axillary line
V_6	Level with lead V_5 at left midaxillary line
RA	On the right arm
LA	On the left arm (similar location to RA)
RL	On the right leg
LL	On the left leg (similar location to RL)

Horizontal Plane (Transverse Leads)

- Six chest electrodes (V1, V2, V3, V4, V5, and V6) provide information about the heart's horizontal plane.

Vertical plane (Frontal Leads)

- The **Einthoven's triangle** explains how these 4 limb electrodes provide 6 frontal leads.

Scanned with CamScanner

Figure 56 ■ Einthoven's triangle

- Leads I, II, and III require a negative and positive electrode (bipolarity) for monitoring.
- aVR, aVL, and aVF are unipolar and require only a positive electrode for monitoring.

Normal ECG Pattern

Table 56 ECG reading and cardiac activity

ECG reading	Normal duration	Cardiac activity
P wave	0.11 sec	Atrial depolarization
QRS complex	0.08 – 0.12 sec	Ventricular depolarization
T wave		Ventricular repolarization
ST segment		Time during which ventricles are contracting and emptying
PR interval	0.12 – 0.20 sec	AV Nodal delay

Note

Calculation of heart rate using ECG

Rate = 300/No. of large square between consecutive R wave

Table 57 Interpretation of Changes in ECG

Changes in ECG	Related conditions
Prominent U waves	Hypokalemia (Decreased serum potassium)
Peaked T wave or	Hyperkalemia (Increased serum potassium)
Widening of QRS	Hyperkalemia or tricyclic antidepressant poisoning
Hyperacute T waves (usually precedes ST segment elevation)	Coronary artery occlusion (Acute myocardial infarction)
ST segment elevation	Myocardial ischemia or infarction
Prolonged QT interval	Hypocalcemia
Shortened QT interval	Hypercalcemia, hyperkalemia
Flattened or inverted T waves	Hypokalemia, coronary ischemia

Scanned with CamScanner

Coronary Angiography

Figure 57 ■ Coronary angiography

- Coronary angiography is performed to visualize coronary arteries, branches, vessel bifurcations, anomalies and specific lesions.
- It is performed for the diagnosis of Coronary Artery Disease and to determine patency of CABG.
- Contraindications
  - Coagulopathy, decompensated congestive heart failure, **renal failure**, uncontrolled hypertension, CVA, pregnancy, active infection, and allergy to contrast medium
- Before procedure
  - Blood tests must be done including PTT, INR, BUN, Creatinine, insulin/sugar levels
- During procedure
  - Two 500 ml bags of saline is infused with 2 cc (2000 units) of heparin each for flushing tubings
  - Lidocaine is used as local anesthesia
  - Puncture is generally done via femoral artery; radial and brachial arteries are alternative sites
  - Access is easiest from right side of the patient
  - Movement of catheter is monitored under fluoroscopy
  - Contrast media: Usually, right coronary artery is filled with 3-5 ml and left coronary artery is filled with 6-8 ml of contrast (320-370 mg of iodine/mg).
  - Possible complications
    - Dissection of femoral/iliac artery or aorta
    - Hematoma, coronary embolus
    - Embolus to head and neck vessels
    - Arrhythmia due to catheter wedging.
- Post procedure:
  - Manual pressure must be applied to site of puncture **for 15 minutes**
  - Patient must lie flat and **supine for minimum of two hours.**

DISORDERS OF CARDIOVASCULAR SYSTEM

Hypertension

- Systolic Blood Pressure (SBP) ≥140 mm Hg and/or Diastolic Blood Pressure (DBP) ≥90 mm Hg.
- ***Blood Pressure Classification*** *(According to the criteria of the Joint National Committee on detection, evaluation and treatment of High Blood Pressure).*
- It can be classified as:
  - Essential or idiopathic hypertension (cause is unknown)
  - Secondary hypertension (secondary to renal, vascular diseases, and pregnancy)
  - Malignant hypertension (Diastolic pressure ≥140 mm Hg)

Scanned with CamScanner

Risk Factors

- Non-Modifiable Risk factors for primary or essential hypertension
  - Family history
  - Male > Female
  - Obesity
  - Age
  - Ethnicity
- **Modifiable Risk factors**
  - Sedentary lifestyle
  - Stress
  - Smoking
  - Dietary habits (salt, caffeine etc.)

Clinical Manifestations of Hypertension

- Fatigue, reduced activity tolerance
- Dizziness
- Palpitations, angina
- Dyspnea

Complications

- Target organ diseases (heart, brain, peripheral vasculature, eyes, and kidney)
- Hypertensive heart disease (CAD, left ventricular hypertrophy and heart failure)
- Cerebrovascular disease (Stroke)
- Retinal damage
- Atherosclerosis (Most common cause of cerebrovascular disease)
- Arteriosclerosis

Key Points

- WHO recommends reducing salt intake to less than 5 g/day
- Most important modifiable risk factor for stroke → Hypertension
- Most common cause of Left Ventricular Hypertrophy is: Systolic Hypertension

Classification of Blood Pressure

Table 58

Blood pressure classification	SBP[a] (mm Hg)	DBP[b] (mm Hg)
Normal	120 and	80
Prehypertension	120–139 or	80–89
Hypertension	≥140 or	≥90
Stage 1	140–159 or	90–99
Stage 2	≥160 or	≥100
Hypertensive crisis	>180	>110

[a]SBP: Systolic blood pressure, [b]DBP: Diastolic blood pressure

Types

Postural (Orthostatic Hypotension)

- BP falls significantly after assuming an upright position.
- 15 mm Hg fall in systolic BP and 10 mm Hg fall in diastolic BP termed as postural hypotension.

White Coat Hypertension

- BP rises when assessed by healthcare personnel due to anxiety a otherwise normal individual.

Malignant Hypertension

- Blood pressure rises rapidly. **Diastolic BP > 120 mm Hg.**
- It is a medical emergency. Untreated malignant hypertensio causes target organ damage and death.

Hypertensive Crisis

- SBP > 180 and/or DBP > 120
- It is a medical emergency. Needs emergency treatment
- Sodium nitroprusside is the drug of choice

Cardiac Arrhythmias

Table 59 Description of cardiac arrhythmias

Types of rhythm	Description
Normal sinus rhythm	• Atrial or ventricular rate 60–90 beats per minute
Sinus bradycardia	• HR < 60 BPM. Each P wave is followed by QRS complex • Management: Dopamine, Atropine I.V. (Epinephrine if atropine is not effective) and transcutaneous pacemakers.
Sinus tachycardia	• HR > 100 bpm. Every QRS complex followed by P wave. • **Management:** Calcium-channel blocker and beta blockers
Ventricular tachycardia (VT)	• Ventricular heart rate 100 to 220 BPM. The rate may be regular. • Generally no visible P wave present • Irregular and wide QRS complex, p wave appear as erratic, irregular waves. • **Management:** ▪ CPR and ACLS in pulseless VT ▪ Defibrillation, Vasopressin or IV epinephrine.
Ventricular fibrillation (VF)	• Rapid ventricular rhythm. • There is no visible P wave or QRS complex. • **Management:** CPR following ACLS ▪ Epinephrine, amiodarone, vasopressin, or lidocaine are used for management ▪ Defibrillation

Contd...

Scanned with CamScanner

Types of rhythm	Description
Atrial fibrillation	• Atrial rate will be usually above 400 beats per minute and ventricular rate vary. • Uniform QRS complex at irregular interval. • **Management** ▪ **Patient unstable:** Immediate cardioversion ▪ **Patient stable:** Beta adrenergic blocker, channel blockers, or antiarrhythmics (Amiodarone).
Atrial flutter	Atrial rate is regular but the rate vary from 250 to 400 beats per minute Typically irregular but **uniform QRS complex** **Management:** • **Patient unstable:** Immediate cardioversion • **Patient stable:** Antiarrhythmics (Amiodarone), beta blockers, channel blockers
Paroxysmal supraventricular tachycardia or paraxysmal atrial tachycardia	Characterized by sudden onset and termination of arrhythmia. HR > 140 bpm **Drug of Choice: Adenosine**

Heart Block

- It occurs as a result of delay in conduction of electrical impulses through the conduction pathway.
- It is classified as first degree atrioventricular block, second degree atrioventricular block (further classified as type I and type II) and third degree atrioventricular block.

First Degree Atrioventricular (AV) Block

- Slow conduction of impulses through the AV node, which leads to PR interval > 0.2 seconds.
- Ratio of P: QRS complex is 1:1.
- Usually it is asymptomatic.
- No treatment required.

Second Degree AV Block

Second degree type I

- Also called as Mobitz type I or wenkebach's phenomenon.
- Here AV node is fatigued and fails to conduct an impulse into the ventricles.
- PR interval is progressively lengthened and then one QRS complex is missed.

Second degree type II

- Also called Mobitz Type II
- In this type intermittently AV node does not respond to the impulse from SA node, as a result some of the p waves are not followed by a QRS complex
- QRS complexes are randomly dropped. There is no pattern in the conduction blockade.
- PR interval is constant. There is no progressive lengthening of PR interval.

Third Degree AV Block

- Also known as complete heart block.
- None of the electrical impulses are conducted to the ventricles through the AV node. No relation between atria and ventricles.
- Ventricles make its own impulses at a slower rate.
- All RR interval will be equal and all PP interval are equal.
- Permanent pacemaker is the treatment of choice

Cor Pulmonale

- Lung disorders such as pulmonary artery hypertension which leads to structural and functional alteration of right ventricle is known as cor pulmonale.
- **Clinical manifestation:** Dyspnea, fatigue, peripheral edema, ascites, enlarged neck vein, pleural effusion
- **Management:** Focuses on reducing pulmonary artery hypertension by providing supplemental oxygen, bronchodilators, bed rest, sodium and water restriction

CORONORY ARTERY DISEASES

Arteriosclerosis

- It refers to hardening of the arteries.
- It is one of the most common diseases of arteries.

Atherosclerosis

- It refers to accumulation of lipids in the blood vessels.
- Atherosclerosis mainly affects tunica intima (innermost layer) of the medium-sized and large arteries.
- **Risk factors:** High fat intake, obesity, diabetes, tobacco use, hypertension, sedentary lifestyle with minimum exercises and stress.

Key Points

- Most important modifiable risk factor for atherosclerosis is smoking
- **Most common cause of aortic aneurysm is:** Atherosclerosis
- The coronary artery most commonly involved in atherosclerosis is Left Anterior Descending Artery (LAD).
- Infective agent causing atherosclerosis is *Chlamydia pneumoniae*
- Elevated Low Density Lipoprotein (LDL) is a risk factor for atherosclerosis.
- High Density Lipoprotein (HDL) prevents formation of atheroscelerosis

Angina Pectoris

- Angina pectoris is a condition characterized by pain (often retrosternal) in the anterior chest wall due to insufficient coronary blood flow.
- **Pain often radiates to the shoulders, arms, neck and jaw.**
- Pain is relieved by rest or nitroglycerine.
- **Atherosclerosis** is the most common predisposing factor for angina pectoris.
- Resolving the predisposing factors subsides pain.

Scanned with CamScanner

Table 60 Types of angina pectoris

Stable angina	Variant angina	Unstable angina
Experienced during exercise or increased workload; relieved by rest or nitroglycerin	Unrelated to physical activity. Caused by coronary artery spasm. Rare and episodic. Relieved by nitroglycerin, vasodilators, Ca^{+} channel blockers	Caused by acute plaque change; occurs with increased frequency, intensity and duration. Occurs at lower level of physical activity or rest. It is warning sign for Acute MI

Key Points

Rest and nitroglycerine will relieve the angina pain but not in myocardial infarction (MI).

- In angina, cardiac enzymes level do not rise

Myocardial Infarction (MI)

- Myocardial tissue of heart dies (ischemia) from lack of blood supply.
- **Causes**
  - **Most common:** Blockage (thrombus or lipid) of coronary artery from Coronary artery disease.
  - Most common site of blockage is Left Anterior Descending Artery (LAD).
  - **LAD blockage cause worst damage** because it supplies left ventricle.
  - **Other causes:** Vasospasm of coronary artery, decreased oxygen supply and increased demand for oxygen
- **Clinical manifestations: (Remember – CRUSHING)**
  - **C:** Chest Pain (severe intensity)
  - **R:** Radiating chest pain that moves to left arm, jaw and back
  - **U: Unrelieved pain by rest or nitroglycerin (Hallmark of MI)**
  - **S:** Sweating
  - **H:** Hard to breathe (Shortness of breath)
  - **I:** Increased and irregular Heart Rate, Increased blood pressure.
  - **N:** Nausea and vomiting
  - **G:** Going to be anxious
- **Assessment/diagnosis**
  - Patient history
  - ECG within 10 minutes of arrival in emergency room
  - Echocardiography
- **Cardiac enzyme and biomarkers**
  - **Troponins:** Cardiac marker with highest sensitivity. Best biomarker to find MI as per AHA guidelines. Serum level rises within 3-12 hrs.
  - **CK-MB:** This is a cardiac specific Creatinine Kinase enzyme. It rises 4-6 hrs after heart attack.
  - **Myoglobin:** The early marker for myocardial infarction is myoglobin. Useful for early detection of MI.
- **Management**
  - **To treat suspected acute MI**
    M – Morphine **O – Oxygen**
    N – Nitroglycerin **A – Aspirin**

- **Reperfusion:** Thrombolytic medications (Actilyse, Streptokinase) or percutaneous coronary interventions.
- Reduce myocardial oxygen demand and increase oxygen supply
- Coronary artery bypass graft (CABG).
- **Other Pharmacological therapy:**
  - Anticoagulators (heparin and warfarin) and Aspirin (anti-platelet)
  - ACE (Angiotensin-converting enzyme inhibitors)

Key Points

- **Hallmark of MI is pain unrelieved by rest or medication (nitroglycerine)**
- **Myoglobin is the early marker for MI but Troponin is the most sensitive (superior) marker.**

Intervention for a suspected heart attack (Myocardial infarction/mg)

M — Morphine
O — Oxygen
N — Nitroglycerin
A — Aspirin

Percutaneous Transluminal Coronary Angioplasty (PTCA)

- PTCA is performed to open narrowed or blocked coronary arteries caused by coronary artery disease.
- The catheter has a tiny balloon at the tip and the balloon is inflated once the catheter is placed into the narrowed artery area.
- **Stent placement: A tiny, expandable metal coil is expanded at the newly opened site of the coronary artery to prevent closing again.**

Intra Aortic Balloon Pump (IABP)

- IABP is a volume displacement device (counterpulsation system)
- The balloon must be **inflated at the onset of diastole**
- **Inflation of IABP results in increased coronary perfusion pressure and systemic perfusion pressure**
- **Balloon deflation occurs during systole**
- **Deflation – To reduce left ventricular workload. It results in reduction of after load.**
- **Purposes**
  - Cardiac support for hemodynamically challenged patients
  - Post-surgical myocardial dysfunction
  - For maintenance of graft patency in post CABG client
  - Cardiac support after surgical correction of anatomical defects
  - Support for weaning from cardiopulmonary bypass
- **Insertion technique**
  - Percutaneous (Sheath less)
  - Surgical incision (Femoral cut down or Trans-thoracic)
- **Positioning of balloon**
  - The tip is approximately 1–2 cm below the origin of the left subclavian artery and above the renal arteries
  - On chest X-ray the tip should be visible in the 2nd or 3rd intercostal space.

Scanned with CamScanner

NURSING CARE OF PATIENT UNDERGOING CABG (CORONARY ARTERY BYPASS GRAFT)

- Preoperative Care
  - Obtain history of allergy and hypersensitivity to specific drugs
  - Teach the patient and family about surgery and immediate postoperative period.
- Intraoperative Care
  - Patient placed on a cardiopulmonary bypass machine (Heart lung machine).
  - Bypass graft usually harvested from **saphenous vein in the leg or internal mammary artery.**
- Postoperative Care
  - Hemodynamic monitoring (cardiac output, central venous pressure, etc).
  - ECG evaluations
  - **Swan-Ganz catheterization** is a type of pulmonary artery catheterization procedure (right heart catheterization). It is used to determine whether any hemodynamic abnormalities exist in the heart and lungs.
  - **Change the position 2 hourly** to promote venous drainage.
  - Drainage cessation or sudden red-colored discharge that lasts more than a minute need to be informed to the physician.
  - Inform physician if patient does not wake up 1–3 hours after surgery.

Heart Failure

- Heart is no longer able to pump the blood needed to meet the body's requirement.
- Coronary Artery Disease (CAD) is the most common cause of Heart Failure.
- **Types of heart failure:**
  1. **Left Sided Heart Failure:** Left ventricle is unable to pump out enough blood to the body
     a. Systolic failure (reduced ejection fraction)
     b. Diastolic failure (preserved ejection fraction)
  2. **Right Sided Heart Failure:** Right ventricle is unable to pump enough blood into lungs

Table 61 Differences between left-sided and right-sided heart failure

	Left-sided heart failure	Right-sided heart failure
Cause	Ventricular septal defect Cardiomyopathy Anterior wall myocardial infarction (MI) Cardiac tamponade Constrictive pericarditis Mitral stenosis and insufficiency Aortic stenosis and insufficiency Hypervolemia	Left-sided heart failure Atrial septal defect Right ventricular myocardial infarction Pulmonary hypertension (corpulmonale) Sodium retention and hypervolemia Pulmonary embolism, mitral stenosis Pulmonary outflow stenosis COPD, or thyrotoxicosis
Clinical manifestation	Dysnpnea on exertion, cheyne-stokes respirations, **rhonchi, crackles,** orthopnea, hypoxia, respiratory acidosis, peripheral cyanosis, and abnormal heart sounds (S3 and S4)	Splenomegaly, hepatomegaly, Ascites, Weight gain, anorexia, bounding peripheral pulses, **hepatojugular reflex, Kussmaul's respirations**
	Shortness of breath, chest discomfort, peripheral edema, bloating, paroxysmal nocturnal dyspnea, distended jugular veins, and reduced urine output	
Management	Oxygen administration, activity restriction, **Drug of Choice: Digoxin** **Other Drugs:** ACE inhibitors, diuretics, and beta blockers	

Key Points

- **Left ventricular failure results in blood backing into the pulmonary circulation. This causes PULMONARY EDEMA, a medical emergency.** It is manifested by extreme dyspnea and cough, may lead to Pulmonary edema, a life threatening condition.
- **Management:** High Fowler Position with legs in dependent position and High concentration Oxygen delivery through mask or nasal cannula

OTHER DISEASES OF HEART

For management of Acute Heart Failure or a CHF exacerbation (i.e. a patient presenting with acue pulmonary edema)

LMNOP
- Lasix (Furosemide)/Loop diuretic
- Morphine (narcotic analgesic)
- Nitroglycerin (Vasodilators)
- Oxygen
- Position: Upright

Myocarditis

- Inflammation of myocardium is known as myocarditis.
- It is classified into acute and chronic myocarditis.
- It can lead to congestive heart failure and sudden cardiac death.

Pericarditis

- It refers to inflammation of pericardium which is a protective layer covering the heart
- Chest pain from pericarditis is referred by: **Phrenic nerve**
- Most common cause of constrictive pericarditis in India →TB
- Most common cause of endocarditis: *S. aureus*
- **Dukes Criteria** is used for diagnosis of pericarditis

Scanned with CamScanner

Cardiac Tamponade

- Clinical syndrome caused by accumulation of fluid in the pericardial space.
- It leads to reduced ventricular filling.
- **15 to 50 mL is the normal pericardial fluid volume in adult.**
- **Beck's triad** is a collection of 3 signs associated with Cardiac Tamponade.
  - Hypotension with narrowed pulse pressure
  - Jugular venous distension
  - Muffled Heart Sounds

Key Points

Globular or Flask or Pear Shaped heart is seen in cardiac tamponade

Pulmonary Edema

- It is a life threatening condition that occurs because of the accumulation of fluid in the lungs (alveoli and interstitial space).
- **Clinical manifestation:** Dyspnea, cyanosis, agitation, anxious, tachycardia, tachypnea, crackles over the lung field during auscultation.
- Pink frothy sputum is the characteristic of pulmonary edema.

Acute Rheumatic Fever

Acute rheumatic fever's etiology age preference, sex preference clinical manifestations and management have been given as summarized table.

Table 62

Acute rheumatic fever	
Etiology	• Caused by Group-A beta hemolytic streptococci
Sex	• Female > Male
Age group	• 5-15 years
Clinical Manifestations	• Joint pain and swelling (Most common feature) • **Aschoff's bodies** (On microscopic examination) • **Sydenham Chorea:** Uncoordinated jerky movements of the face and limbs • **Erythema marginatum** (rare symptom)
Management	• Single dose of Inj. Benzathine Penicillin OR Procaine penicillin BD for 10 days • Steroids for 12 weeks (If Carditis present) • Erythromycin for Penicillin allergic patient • DOC for prophylaxis: Benzathine Penicillin/ Erythromycin (in allergic patient)

Key Points

- Elevated ASO (Anti streptolysin 'O') Titre is evident in streptococcal infection. Can be seen in Rheumatic fever/ Rheumatic Heart Disease/Glumerulonephritis.
- Jones criteria is used for diagnosis of Rheumatic fever (Refer Pediatric Nursing Synopsis for explanation).

ARTERIAL DISEASES

Aortic Aneurysm

- It is a sac like projection or dilation in the weak wall of the aorta (Ballooning of Artery)
- **Saccular and fusiform aneurysm are the most common types.**
- **Abdominal aortic aneurysm is most commonly seen in older persons.**

Figure 58 ■ Types of aneurysm

Key Points

Aortic dissection most commonly occur in thoracic aorta.

Aortic Stenosis

- Narrowing of the aortic valve orifice located between left ventricle and aorta.
- **Rheumatic endocarditis or degenerative calcifications are the most common causes of aortic stenosis.**
- **Heart muscles increase in size in response to obstruction.**
- **Heart failure occurs when compensatory mechanisms fail to compensate.**

Manifestations: (Remember SAD)

- **S:** Syncope
- **A:** Angina Pectoris
- **D:** Dyspnea (exertional dyspnea)

Arterial Embolism

- An **arterial embolism** may be caused by one or more clots. The clots can get stuck in an artery and block blood flow.
- **Emboli (moving clot)** arises most commonly from thrombi that develop in the chambers of the heart.
- The immediate effect is cessation of distal blood flow.
- Emboli tend to lodge at arterial bifurcations and areas of atherosclerotic narrowing (cerebral, mesenteric, renal, and coronary arteries).

Scanned with CamScanner

- Acute thrombosis frequently occurs in patients with pre-existing ischemic symptoms.
- **Management:**
  - Heparin therapy
  - Emergency embolectomy only if the involved extremity is viable.
  - Intra-arterial thrombolytic therapy (streptokinase, urokinase or staphylokinase).

Raynaud's Disease (Raynaud's Phenomenon)

- Vasospasm of the small peripheral arteries and arterioles of limbs in response to severe cold or emotional stress. This results in excessively reduced blood flow to the extremities.
- **Causes:** Cold temperature, stress, blood vessels in spasm, scleroderma, Sjögren disease, Carpal tunnel syndrome.
- **Clinical manifestation:** Blanching and cyanosis in the skins of fingers, tingling, and numbness.
- **Investigation:** Cold stimulation test, Nailfold capillaroscopy, C-reactive protein test, ESR
- **Treatment:** Calcium channel blockers, vasodilators, alpha blockers

Key Points

Calcium channel blockers **(nifidipine)** are first line drug therapy for patient with Raynaud disease.

Buerger's Disease (Thromboangitis Obliterans)

- Inflammatory occlusive vascular disorder affecting small and medium sized arteries and veins.
- Distal part of lower and upper limbs are commonly affected.

Intermittent Claudication

- Muscle pain (cramp, numbness, or fatigue), especially in the calf muscle, which occurs during exercise, such as walking, and is relieved by a short period of rest.
- **Common Cause:** Arterial insufficiency due to atherosclerotic blockage

Varicose Vein

- Large swollen elongated vein often appear on the lower extremities which cause pain and fullness in the leg.
- Most commonly affect the saphenous vein
- Valves present in the vein become incompetent and backflow of blood is going to be affected.
- **Clinical manifestation:** Pain, cramps, ache, fatigue, feeling of fullness in the leg
- **Diagnosis:** Physical examination, color Doppler, duplex ultrasonography.
- **Complication:** Bleeding, thrombophlebitis, leg ulcer
- Avoid prolonged standing, elevate leg, use of elastic bandage from toe to thigh which promotes venous return.
- **Surgical management:** Sclerotherapy, ligation and stripping of vein and laser ablation.

Key Points

Trendelenburg's test is used to assess the competency of the valves in the superficial and deep veins of the legs in patients with **varicose veins.**

Table 63 Drug of choice for cardiac diseases

Cardiac disease/abnormality	Drug of choice
Angina Pectoris	Sublingual Nitroglycerin
Acute Ventricular Tachycardia (when refractory to cardioversion shock)	Amiodarone
Supraventricular Tachycardia	Adenosine or Verapamil
Cardiogenic shock	Dopamine
Heart Failure	Digoxin
Hypertensive emergency/malignant hypertension	Sodium nitroprusside

Acyanotic

- ↑ Pulmonary flow
  - septal defect
  - PDA
- obstructive
  - Aortic ste
  - PUL stenosis

Cyanotic
- ↓ flow
- TOF
- Tricuspid Atresia

Mixed
- TGA

Golden points to remember

- As per WHO data (2015) Coronary artery disease causes most deaths world- wide (8.8 Million deaths) followed by Stroke (6.2 Million deaths).
- High Homocysteine level (**>12–15 mmol/L**) damages the inner lining of the blood vessel and causes atherosclerosis.
- Orthostatic hypotension is defined as a decrease in **systolic blood pressure** of 20 mm Hg or a decrease in **diastolic blood pressure** of 10 mm Hg within three minutes of standing when compared with blood pressure from the sitting or supine position.
- Outpouching or dilation of arterial wall is called **aneurysm**.
- Pulmonary hypertension increases the workload of the right ventricle and causes right ventricular hypertrophy also known as **cor pulmonale**.
- **Dyspnea** on exertion and **fatigue** are classic symptom of **pulmonary hypertension**.
- **Cardiac index** is cardiac output divided by the body mass index.
- Hypertension is also called **silent killer** because it is frequently asymptomatic until it becomes severe.
- World Health Organization recommends a reduction to <2 g/day sodium (5 g/day salt) in adults to reduce the risk of hypertension and cardiovascular disease.
- Common complications of hypertension are cerebrovascular disease, peripheral vascular disease, nephrosclerosis, and retinal damage.
- Postural hypotension (orthostatic hypotension) refers to fall in SBP over 20 mm Hg or DBP over 10 mm Hg when standing up or lying down after sitting (i.e. when there is a change in posture).
- The artificial cardiac pacemaker is an electronic device used to pace the heart when the normal conduction pathway is damaged or diseased.
- Common cause of infective endocarditis are **Staphylococcus aureus** and **Streptococcus viridians, and bacterial**.
- **Dukes Criteria** is used for diagnosis of pericarditis.
- **Roth's spots** are hemorrhagic retinal lesion revealed by fundoscopic examination in infective endocarditis.
- Inadequately treated streptococcal throat might cause **Rheumatic fever**.
- The most common causative agent of rheumatic fever is **streptococcus pyogens**.
- According to **Jones (1944) criteria** the presence of **two major criteria** or **one major and two minor criteria** plus evidence of group A streptococcal infection indicates a high probability of acute rheumatic fever.
- Classic symptom of peripheral arterial disease is intermittent claudication pain that occurs after considerable level of exercise and relieved by rest.
- Clinical manifestation of acute arterial ischemia includes the **six Ps: Pain, Pulselessness, Paresthesia, Paralysis, Pallor** and Poikilothermia.
- **Boot-shaped heart** is seen in Fallot's teratology disease.
- **Pear-shaped/flask-shaped** heart is seen in pericardial effusion. (Cardiac tamponade)
- Right ventricle is the most common site of injury from blunt chest trauma. It is because of the proximity of right ventricle to sternum.
- **Marfan syndrome** is a genetic **disorder** of the connective tissue. It may result in premature loss of elasticity of blood vessels and Aneurysm.
- Dressler syndrome is also known as **late pericarditis**.
- **Pain nature** in pericarditis is progressive, sharp pleuritic in nature, radiates to neck arm and can be relieved by sitting.
- Closure of AV valves gives rise to first-heart sound **(lub)** and closure of **SV** valve gives rise to second-heart sound **(dub)**. S2
- **Hallmark sign of MI** includes severe pain which is not relieved by rest, position change, or nitrate administration.
- **Cardiogenic shock** occurs when inadequate oxygen and nutrients are supplied to the tissue because of left ventricular failure.
- **Cyanosis** and **pallor** are signs of poor perfusion.
- **Assessing the weight of the patient** is the accurate indicator of health status in **heart failure patient who is on diuretics**.
- Major evidence of ischemia is drop in systolic BP of **>20 mm Hg** from baseline BP despite an increase in workload.
- Chest pain can be reduced by administering nitroglycerin, morphin sulfate, and supplemental oxygen.
- **Digitalis** is a positive inotropic agent that improves left ventricular function (increase the force of contraction of left ventricle).
- **Inotropic agents** are the drugs that increase the force of contraction and exert a positive effect.
- **Hypokalemia**, secondary to diuretics, is one of the most common causes of digitalis toxicity.
- **Digitalis toxicity** results in **hyperkalemia**.
- **Digoxin** is contraindicated if apical pulse is below 60 beats per minute because it further decreases heart rate.
- Early symptoms of **digitalis toxicity** include anorexia, nausea, vomiting and visual disturbance.
- Method: HR = number of R waves in a 6 second strip x 10
- Most lethal arrhythmia – Ventricular Fibrillation

Contd...

Scanned with CamScanner

- Stimulation of **Vagus Nerve** → Decrease in **Heart Rate**
- **Sinus bradycardia** is seen in athletes.
- Variceal hemorrhage is the most common complication associated with portal hypertension.
- Most common site of Myocardial Infarction (MI) is Anterior wall of left ventricle.
- The coronary artery most commonly involved in atherosclerosis is Left Anterior Descending Artery (LAD).
- 'Transportation of triglycerides from liver to adipose tissues' is the function of Very Low Density Lipoproteins (VLDL).
- **Myoglobin is the early marker** for MI but **Troponin is the most sensitive** (superior) marker.
- Person with serum cholesterol level **>200 mg/dL** is at high risk for development of CAD.
- **Osler's nodes** (small, painful nodes in fingers and toes) are seen in **infective endocarditis**.
- The most common direct cause of sudden death is Coronary Artery Disease.
- **Aspirin** in Coronary Artery Disease is used primarily to **inhibit platelet adhesion**.
- **Hemorrhage** and **falling Blood Pressure** are potential complications in the initial 12 hours after cardiac catheterization procedure.
- Most common cause of Intermittent claudication is **atherosclerosis**.
- **Atherosclerosis** is the most common cause of Aortic aneurysm.
- Most common cardiac anomaly among infants of diabetic mothers is **Transposition of great arteries**.
- **Transfusion** of one unit of Whole Blood/PRBC can increase **Hb by 1 g/dL** and **Hematocrit by 3%** in an adult.
- **Bobbing head** with each pulse is seen in patient with **Aortic regurgitation**.
- **Water hammer pulse** is a feature of **Aortic regurgitation**.
- When a pulse rate is irregular, it is best to count the Apical pulse for a full minute.
- Apical pulse can be auscultated in the **mid-clavicular line in the 5th inter costal space**.
- **Flushed cheeks** are seen in patients with **Mitral stenosis**.
- **Rheumatic fever** is associated with **Valvular heart disease**.
- **Aschoff's bodies** are found in myocardium in rheumatic heart disease.
- Elevated levels of antistreptolysin O are seen in **rheumatic fever**.
- Most common site of **Atherosclerotic plaques is Lower Abdominal Aorta**.
- Most common clinical manifestation of **Pulmonary embolism is Dyspnea**.
- Most dangerous complication of venous thrombus is **Pulmonary embolism**.
- **In patient with DVT** – blood clot travels to heart and gets **lodged in lungs** resulting in **pulmonary embolism**.
- Oxygen therapy followed by High Fowler's position is the priority nursing intervention for patient with Pulmonary edema.
- While measuring Central Venous Pressure (CVP), the transducer is zeroed at the level of the **4th intercostal space** (corresponds to level of right atrium) **in the mid-axillary line** on a supine patient.
- Central Venous Pressure (CVP) is measured at the end of expiration.
- Location of placement of **Permanent Pacemaker** is **subcutaneous tissue below the clavicle**.
- **Atrial Natriuretic Peptide (ANP)** is a hormone secreted by Right Atrium.
- Management of Cyanotic spell – Knee-Chest Position (increases preload and SVR).
- **Great Sephanous vein and Left Internal Mammary Artery (LIMA)** are the commonly used vein grafts in CABG.
- **Endarterectomy** is a surgical procedure to remove the atheromatous plaque material, or blockage, from the arterial wall.
- Kawasaki Disease is an acute inflammatory disease. It causes inflammation in the medium-sized arteries. It most commonly affects infants and young children.
- **Orthostatic hypotension** is a complication of all nitrates.
- Nitroglycerin is given sublingually to relieve from chest pain due to angina pectoris.
- **Raynaud's disease** is spasm of digital arteries caused by abnormal response of sympathetic nervous system to cold or emotional stress.

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

ANATOMY AND PHYSIOLOGY

1192. Which is the longest vein in the human body? *(AIIMS Nagpur NO 2018)*
a. Great saphenous b. Popliteal
c. Iliac d. Femoral

Explanation: The great (long) saphenous veins is the longest veins in the body. It ascends from the foot to the groin.

1193. Largest vein is .....
a. Superior vena cava b. Saphenous
c. Inferior vena cava d. Jugular

1194. Connection between artery and vein is known as.....
a. Capillaries b. Arterioles
c. Venules d. Lymph

1195. The network between the arteries that supplying to a particular area is known as .....
a. Collateral arteries b. Anastomoses
c. Capillary networks d. vena-caval junction

1196. The largest artery of human body is: *(DSSSB PHN, 2015)*
a. Aorta b. Carotid Artery
c. Subclavian Artery d. Pulmonary Artery

1197. Pacemaker of heart is: *(JIPMER 2012)*
a. AV Node b. SA node
c. Purkinje fibers d. Parasympathetic system

1198. Normal Cardiac Output in a healthy adult is .....
a. 1 L/ min b. 3 L/ min
c. 5 L/min d. 7 L/min

1199. Time duration of cardiac cycle is
a. 0.5 sec b. 0.8 sec
c. 1 sec d. 2 sec

1200. The blood circulation that is responsible for gas exchange between alveoli and capillaries resulting in the oxygenation of blood is the
a. Coronary circulation b. Hepatic circulation
c. Pulmonary circulation d. Systemic circulation

1201. Specialized cardiac muscles are present in ..... layer of the heart
a. Epicardium b. Myocardium
c. Endocardium d. Pericardium

1202. One of the organs located in the mediastinum is the
a. Cerebellum b. Heart
c. Stomach d. Uterus

1203. Artery in anatomical snuff box is
a. Radial b. Brachial
c. Ulnar d. Interosseous

1204. The heart valves are lined by ..... layer of the heart
a. Epicardium b. Myocardium
c. Endocardium d. Pericardium

1205. Valve between left atrium and left ventricle is .....
a. Bicuspid valve b. Tricuspid valve
c. Tetracuspid valve d. Monocuspid valve

1206. Valve between right atrium and right ventricle is .....
a. Bicuspid valve b. Tricuspid valve
c. Tetracuspid valve d. Monocuspid valve

1207. Mitral valve is also known as .....
a. Bicuspid valve b. Tricuspid valve
c. Tetracuspid valve d. Monocuspid valve

1208. Which valve prevents backward flow of blood into the left atrium? *(RRB SSNE 2015)*
a. Aortic valve b. Pulmonary valve
c. Tricuspid valve d. Mitral valve

1209. Blood from the right side of the heart flows into the
a. Superior vena cava
b. Pulmonary trunk (artery)
c. Pulmonary veins
d. Aorta

1210. The arteries that supply the heart muscles are branches of the
a. Abdominal aorta b. Thoracic aorta
c. Aortic arch d. Ascending aorta

1211. The amount of blood that is ejected from the left ventricle in one contraction is called the
a. Cardiac output b. Stroke volume
c. Preload d. Afterload

1212. Cardiac Output can be calculated using .....
a. CO = tidal volume X heart rate
b. CO = tidal volume X peripheral vascular resistance
c. CO = peripheral vascular resistance X-heart rate
d. CO = stroke volume x heart rate

1213. "Potential anastomosis" seen in
a. Labial branch of facial artery
b. Intercostal artery
c. Coronary artery
d. Arterial arcades of mesentery

1214. Identify the artery that carries deoxygenated blood
a. Umbilical artery b. Pulmonary artery
c. Both a and b d. Carotid artery

1215. Blood supply to the heart is given by .....
a. Pulmonary b. Coronary
c. Aorta d. Myocardial

1216. Identify the blood vessel which carry blood into right atrium
a. Inferior vena cava b. Superior vena cava
c. Pulmonary vein d. Both a and b

1217. Identify the blood vessel which carries blood into left atrium
a. Inferior vena cava b. Superior vena cava
c. Pulmonary vein d. Both A and B

Scanned with CamScanner

1218. Largest artery is
a. Aorta b. Carotid
c. Coronary d. Femoral

1219. Largest branch of vertebral artery is
a. Middle cerebral
b. Posterior cerebral
c. Posterior inferior cerebellar
d. Post. superior cerebellar

1220. Posterior communicating artery is branch of
a. Internal carotid artery b. External carotid artery
c. Middle cerebral artery d. Posterior cerebral artery

1221. Which of the following is not a branch of first part of maxillary artery?
a. Greater palatine artery b. Middle meningeal artery
c. Deep auricular artery d. Inferior alveolar artery

1222. Posterior cerebral artery is a branch of which of these?
a. Vertebral artery b. Basilar artery
c. Posterior cerebral artery d. Posterior choroidal artery

1223. Terminal branch of Internal Carotid Artery
a. Anterior choroidal artery
b. Anterior cerebral artery
c. Ophthalmic artery
d. Inferior hypophyseal artery

1224. Not a branch of external carotid artery
a. Inferior thyroid artery b. Facial artery
c. Superior thyroid artery d. Maxillary artery

1225. Smallest vein is.....
a. Venules b. Capillaries
c. Lymph d. Arterioles

1226. Smallest artery is .....
a. Arterioles b. Venules
c. Capillaries d. Lymph

1227. Vein used in bypass surgery
a. Great saphenous vein b. Short saphenous vein
c. Femoral vein d. Brachial vein

1228. Which of the following is an artery of the forearm?
a. Brachial artery b. Axillary artery
c. Ulnar artery d. Femoral artery

1229. What is the source that you might suspect if bright red blood is back-flowing into the tubing of an intravenous drip?
a. Capillary blood b. Venous blood
c. Arterial blood d. Peripheral blood

1230. The venous blood from organs of the digestive system such as the stomach and intestines will drain into the
a. Portal vein b. Mesenteric veins
c. Internal iliac veins d. Lumbar veins

1231. Oxygen is carried by blood after it is combining with .....
a. Albumin b. WBC
c. Hemoglobin d. Platelet

1232. The pH of blood is: *(DSSSB PHN, 2015)*
a. 6.4 b. 7.4
c. 7.8 d. 6.8

1233. The average Hb content of human blood is *(DSSSB PHN, 2015)*
a. 18-23 g/dL b. 14-16 g/dL
c. 8-10 g/dL d. 16-20 g/dL

1234. Correct option regarding angiogenesis is .....
a. New blood vessels will form
b. Repair by connective tissues
c. Formation of the blood clot
d. All of the above

1235. Tricuspid valve is located between
a. Aorta and right atrium
b. Left atrium and left ventricle
c. Right atrium and right ventricle
d. Right ventricle and pulmonary artery

1236. Valve responsible for murmurs which auscultates at the second left intercostal space along the left sternal border is ...
a. Aortic b. Bicuspid
c. Pulmonic d. Tricuspid

1237. Baro-receptors control .....
a. Blood pressure b. Arterial oxygen tension
c. SPO2 d. Stroke volume

1238. The closure of the aortic valve in the arterial waveform is denoted by .....
a. Anaerobic notch b. Dicrotic notch
c. Systolic notch d. End diastolic point

1239. Heart sounds are the result of: *(LNJP H D 2012)*
a. Movement of blood into the heart form the aorta
b. Blood flow through the heart
c. Closure of the heart valves
d. Contraction of the cardiac muscle

1240. Which of the following type of fats is considered to be harmful to the body.
a. Cis fat b. Trans fat
c. Poly unsaturated fatty acids
d. Omega 3 fatty acid

Explanation: Monounsaturated fatty acids are of two types i.e. cis fatty acids and trans fatty acids. Trans fatty acids have markedly adverse effects on serum lipids by raising levels of the lipoprotein LDL (so-called "bad cholesterol"), lowering levels of the lipoprotein HDL ("good cholesterol").

1241. Which of the following is high in saturated fatty acids
a. Fatty fish, walnuts and green leafy vegetables
b. Poultry skin, full fat milk products and tropical oils
c. Canola oil, flaxseeds and olive oil
d. Wild game, low fat milk and yogurt

Explanation: Saturated fatty acids are chiefly found in animal fats.

1242. Hyperlipidemia is seen in .....
a. Hyperthyroidism b. Nephrotic syndrome
c. Metabolic syndrome d. All of the above

1243. Great saphenous vein is present in ..... body part
a. Trunk b. Spinal cord
c. Abdomen d. Legs

1244. Which of the statements is TRUE regarding heart contraction?
a. The intercalated discs allow the atria and ventricles to contract together simultaneously.
b. The sudden influx of potassium into myocytes triggers depolarization.
c. The pressure and volume changes in the heart stimulate heart contraction.
d. Ventricular systole occurs following depolarization of the ventricles

1245. The pacemaker of the heart is the
a. Purkinje fibers
b. Atrioventricular bundle (bundle of His)
c. Atrioventricular node
d. Sinoatrial node

Ans.

1240. b
1241. b
1242. d
1243. d
1244. d
1245. d

Scanned with CamScanner

1246. SA node is located in .....
a. In the wall of right atrium
b. In the wall of left atrium
c. In the wall of atrioventricular septum
d. In the wall of ventricular septum

1247. Slowest conduction is in
a. SA node
b. Purkinje fibers
c. AV node
d. Bundle of His

1248. Distention and recoil of blood vessel during systole and diastole is achieved through the ..... property of blood vessel
a. Peripheral vascular resistance
b. Elasticity
c. Diameter
d. Smooth muscle contraction

1249. Vasoconstriction leading to increased blood pressure is triggered by the following situation.
a. Stimulation of the parasympathetic nerve supply.
b. Stimulation of the cardioinhibitory center in the medulla.
c. Increased levels of angiotensin II in the blood.
d. Increased level of carbon dioxide in the blood.

1250. Baroreceptors help in .....
a. Stimulating respiration
b. stimulating sweating
c. Maintaining BP
d. Stimulating thirst

1251. The inner most layer of blood vessels is
a. Tunica media
b. Tunica adventitia
c. Tunica intima
d. Tunica mucosa

1252. Base of the heart is formed mainly by
a. Right atrium
b. Left atrium
c. Right ventricle
d. Left ventricle

1253. Arterial supply to SA node is by
a. Left anterior descending coronary artery
b. Posterior interventricular (descending) artery
c. Left coronary artery
d. Right coronary artery

1254. Left coronary artery supplies all except
a. Anterior 2/3 of interventricular septum
b. Posterior 1/3 of interventricular septum
c. Left ventricle
d. Apex of heart

1255. Major part of the myocardium is drained by
a. Coronary sinus
b. Great cardiac vein
c. Anterior cardiac veins
d. Venae cordis minimae (Thebesian veins)

1256. Sympathetic supply to heart
a. C5-C7
b. T1-T4
c. C1-C4
d. T5-T9

1257. Coronary sinus is guarded by
a. Crista terminalis
b. Thebesian valve
c. Mitral valve
d. Spiral valve

1258. Posterior surface of heart is formed by
a. RA
b. LA
c. LV
d. RV

1259. Right coronary artery supplies all except
a. Apex of heart
b. Intraventricular septum
c. Inter atrial septum
d. SA mode

1260. The coronary sinus
a. Lies in anterior part of the coronary sulcus
b. Ends in right atrium
c. Has venae cordis minimae as its tributaries
d. Develops from right anterior cardinal vein

1261. The arterial supply of the bundle of His is
a. Interventricular branch of left coronary
b. Atrioventricular branch of right coronary artery
c. Marginal
d. Right aortic sinus

1262. Which is true about arch of aorta?
a. Starts at 3rd right ICS and ends at left 3rd ICS
b. Left vagus arches over it
c. Lies behind body of sternum
d. It is closely related to parietal pleura

1263. The left subclavian artery is a branch of
a. Brachiocephalic trunk
b. Ascending aorta
c. Arch of aorta
d. Left common carotid

1264. Posterior communicating artery a branch of
a. Posterior superior cerebellar artery
b. External carotid artery
c. Middle cerebral artery
d. Internal carotid artery

1265. Coronary sinus opens into
a. Inferior vena cava
b. Right atrium
c. Left atrium
d. Great cardiac vein

1266. Branches of brachial artery are all except
a. Profunda brachii
b. Superior ulnar collateral
c. Inferior ulnar collateral
d. Radial collateral

1267. Cephalic vein drains into
a. Brachial vein
b. Subclavian
c. Axillary vein
d. Inferior Vena Cava

1268. Right common carotid artery arises from
a. Right axillary artery
b. Arch of aorta
c. Brachiocephalic artery
d. Left subclavian artery

1269. Branches of left coronary artery are all of the following EXCEPT
a. Anterior interventricular branch
b. Left diagonal artery
c. Left atrial artery
d. Posterior interventricular branch

1270. All of the following drain into coronary sinus, EXCEPT
a. Great cardiac vein
b. Small cardiac vein
c. Middle cardiac vein
d. Anterior cardiac vein

1271. Azygous vein opens into
a. Inferior vena cava
b. Superior vena cava
c. Right brachiocephalic vein
d. Left brachiocephalic vein

1272. Femoral ring is bounded by all except
a. Inguinal ligament
b. Superior ramus of pubis
c. Femoral artery
d. Femoral vein

1273. All are branches of Internal Iliac artery except
a. Ovarian artery
b. Superior vesical artery
c. Middle rectal artery
d. Inferior vesical artery

1274. All of the following veins in the body lack valves except
a. Femoral vein
b. Portal vein
c. IVC
d. Dural venous sinuses

1275. Which of the following is valveless?
a. Portal system veins
b. Saphenous vein
c. Popliteal vein
d. Ulnar vein

Ans.

1246.	a
1247.	c
1248.	b
1249.	c
1250.	c
1251.	c
1252.	b
1253.	d
1254.	b
1255.	a
1256.	b
1257.	b
1258.	b
1259.	a
1260.	b

Scanned with CamScanner

1276. **Veins are an example of**
a. Conducting vessels b. Distributing vessels
c. Resistance vessels d. Capacitance vessels

1277. **True about valves in portal venous system**
a. Present at the junction of superior mesenteric artery with the splenic artery
b. Within the portal vein only
c. Whole system is valveless
d. In the intrahepatic portion of portal vein

1278. **IV infusion is avoided in**
a. Long saphenous vein b. Cephalic vein
c. External Jugular vein d. Internal Jugular vein

INTRODUCTION TO CARDIOVASCULAR DISORDERS

1279. **Stimulation of vagus nerve results in:** *(JIPMER 2012)*
a. Increase in heart rate b. Decrease in heart rate
c. Dilatation of bronchioles
d. Dilatation of coronary artery

1280. **Lack of oxygen in the blood stream is:** *(Kerala PSC, Nov 2014)*
a. Apnea b. Cyanosis
c. Anoxia d. Hypoxemia

1281. **What is the effect of an extremely rapid pulse rate of 200/minute on blood pressure?**
a. The blood pressure remains unchanged.
b. The blood pressure will fall.
c. The blood pressure will be raised.
d. The blood pressure will fluctuate constantly.

1282. **Which among the following is a modifiable risk factor?**
a. Age b. Smoking
c. Genetics d. Previous history of disease

1283. **Which one of the following is a non-modifiable risk factor for atherosclerosis?** *(Banaras HU 2015)*
a. Cigarette smoking b. Hyperlipidemia
c. Female over 55 years of age
d. Sedentary lifestyle

1284. **The lack of oxygen supply to myocardium of heart leads to:** *(DSSSB PHN, 2015)*
a. Fibrillation b. Heart failure
c. Angina d. Infarction

1285. **Any disturbance that blocks the transmission of nerve impulse from SA node downwards is known as:** *(DSSSB PHN, 2015)*
a. Heart block b. Heart attack
c. Nerve block d. Cardiac arrhythmias

1286. **Fever with relative bradycardia is seen in:** *(Banaras HU 2015)*
a. Malaria b. Typhoid
c. Filaria d. Diphtheria

1287. **Normal cardiac output is:**
a. 1–2 L/min b. 3–4 L/min
c. 5–6 L/min d. 7–8 L/min

Explanation: Cardiac output = Stroke volume × Heart Rate
Stroke volume is approximately 70 ml
Normal heart rate is 72 beats per minute.
Cardiac output = 70 × 72
= 5040 ml
This is in the range of 5 to 6 L

1288. **What is the normal amount of pericardial fluid ?**
a. 5–10 ml b. 20–50 ml
c. 50–100 ml d. 100–200 ml

1289. **What is preload?**
a. Pressure in the ventricle at the end of systole
b. Pressure in the ventricle at the end of diastole
c. Pressure in the aorta at the end of systole
d. Pressure in the atria at the end of systole

ASSESSMENT OF CARDIOVASCULAR SYSTEM

Electro Cardiogram (ECG)

1290. **Which of these planes does the chest leads of a 12-leaded ECG (electrocardiograph) record the heart electrical activity?**
a. Sagittal b. Coronal
c. Transverse d. Horizontal

1291. **The 'p' wave on the electrocardiogram corresponds to** *(RRB SSNE 2015; JIPMER 2012)*
a. Atrial depolarization
b. Atrial repolarization
c. Ventricular depolarization
d. Ventricular repolarization

1292. **P wave of ECG represents .....**
a. SA node and repolarizing the atria
b. SA node and depolarizing the atria
c. AV node and depolarizing the atria
d. Impulse travelling from SA node to AV node

1293. **'T' wave in an ECG represents**
a. Ventricular depolarization
b. Ventricular repolarization
c. Atrial depolarization
d. Atrial repolarization

1294. **U wave is seen in which of the following conditions**
a. Hypotension b. Hypokalemia
c. Hyperkalemia d. Hypertension

Explanation: Prominent 'U' wave in ECG is the characteristic of hypokalemia. "U" wave represents repolarization of the Purkinje fibers. Peaked T wave is seen in Hyperkalemia.

1295. **Which of the following ECG findings indicates hypokalemia?** *(DSSSB 2013)*
a. Tented T wave
b. ST segment depression
c. Widening of QRS complex
d. Prolonged PR interval

Explanation: The earliest electrocardiogram (ECG) change associated with hypokalemia is a decrease in the T-wave amplitude. As potassium levels decline further, ST-segment depression and T-wave inversions are seen

1296. **T-wave inversion on the ECG are seen in following condition, EXCEPT:**
a. Hyperkalemia
b. Myocardial infarction
c. Myocarditis
d. Subarachnoid hemorrhage

Explanation: Tall T-wave (>5 mV in standard leads and 10 mV in chest leads) is seen in hyperkalemia. All the other condition causes T-wave inversion

Ans.
1276. d
1277. c
1278. a
1279. b
1280. d
1281. b
1282. b
1283. c
1284. d
1285. a
1286. b
1287. c
1288. b
1289. b
1290. d
1291. a
1292. b
1293. b
1294. b
1295. b
1296. a

Scanned with CamScanner

1297. **Normal PR interval in ECG is:** *(Kerala PSC, Nov 2014)*
a. 0.20-0.35 sec b. 0.30-0.45 sec
c. 0.35-0.40 sec d. 0.12-0.20 sec

1298. **Hyperkalemia leads to what changes in ECG?** *(DSSSB PHN, 2015)*
a. Inverted T waves b. Tall T waves
c. Prolonged QT interval d. Wide QRS complex

1299. **QRS complex in ECG represents**
a. Atrial depolarization
b. Ventricular depolarization
c. Ventricular Repolarization
d. Atrial repolarization

1300. **ST depression in ECG represents**
a. Myocardial ischemia b. Angina
c. Hyperkalemia d. Hypercalcemia

1301. **Which of the following ECG findings indicates myocardial infarction?** *(DSSSB 2013)*
a. ST segment elevation b. Wide QRS complex
c. Presence of U wave d. T wave inversion

Explanation: The most important cause of ST segment abnormality (elevation or depression) is myocardial ischemia/infarction. Both ST segment elevation and depression are seen in MI. STEMI: ST-elevation myocardial infarction; STDMI: ST-depression myocardial infarction. Hypokalemia causes U wave presence.

1302. **A client is suspected to have cardiac tamponade. Which of the following findings in QRS complex of a lead II ECG will support the suspicion?**
a. Amplitude increase b. Amplitude decrease
c. Narrowing complex d. Widening complex

Explanation: Peaked P waves, decrease of QRS complex voltage, left axis deviation of the QRS complex, deep T wave inversions, and ST segment change are present in cardiac tamponade. Fluid accumulated in the pericardium suppress the amplitude of the QRS complex on the ECG.

1303. **Holter monitoring means**
a. Ambulatory BP
b. Ambulatory ECG
c. ECG monitoring while sleeping
d. Hourly BP monitoring

1304. **All of the following statements are correct regarding Holter monitoring, EXCEPT**
a. The patient should keep a diary of what activities he does while wearing the monitor
b. Holter monitor continuously records the heart's rhythms
c. It is also known as ambulatory electrocardiography
d. Holter monitoring is an invasive procedure

Explanation: A Holter monitor is a device that records the client's heart beats. It contains electrodes, wires and a small machine that attaches to the portable device. It is a non-invasive procedure.

1305. **Affected blood vessel if ECG shows ST elevation in leads V2?**
a. Marginal artery
b. Circumflex artery
c. Left anterior descending artery
d. Right coronary artery

1306. **Which among the following diagnostic test is preferred to determine the location of myocardial damage?**
a. Troponin - I b. CK-MB
c. Electrocardiogram d. Echocardiogram

1307. **In myocardial ischemia, ECG looks like .....**
a. Prolonged PR interval b. Spiky T wave
c. T-wave inversion d. Abnormal U wave

Other Assessments/Investigations

1308. **In an adult patient, arterial function of the lower extremity can be determined by assessing the**
a. Allen's test b. Homan's sign
c. Pedal pulse d. Cullen's sign

1309. **Auscultation over the left mid-clavicular line at the level of the fifth intercostal space is the area for S1. It indicates ..... heart valve**
a. Aortic b. Bicuspid
c. Tricuspid d. Semilunar

1310. **Apical pulse is auscultated at _____**
a. Fourth intercostal in the left side on mid axillary line
b. Fourth intercostal in the right side on mid axillary line
c. Fifth intercostal space in the left side on mid-clavicular line
d. Fifth intercostal space in the right side on mid-clavicular line

Explanation: 5th intercostal space in the mid clavicular line is the closer area to the apex of the heart as shown in the figure below.

1311. **Which among the following condition is accompanied by distant, muffled heart sounds and prominent neck vessels.**
a. Cardiogenic shock
b. Cardiac tamponade
c. Pulmonary embolism
d. Dissecting thoracic aortic aneurysm

Explanation:
- Cardiogenic shock occurs with severe damage (more than 40%) to the left ventricle. Classic signs of cardiogenic shock include hypotension, a rapid pulse that becomes weaker, decreased urine output, and cool, clammy skin.
- Cardiac tamponade is characterized by distant, muffled heart sounds and prominent neck vessels.
- Pulmonary embolism has a sudden presentation of severe dyspnea accompanying the chest pain.
- Dissecting aortic aneurysms usually are accompanied by back pain.

1312. **Blood pressure is difficult to measure in a patient with**
a. Mitral stenosis b. Aortic stenosis
c. Complete heart block d. Atrial fibrillation

Ans.

1297. d
1298. b
1299. b
1300. a
1301. a
1302. b
1303. b
1304. d
1305. c
1306. c
1307. c
1308. c
1309. b
1310. c
1311. b
1312. d

Scanned with CamScanner

1313. CVP catheter is inserted to estimate all of the following, EXCEPT
a. Mean right atrial pressure
b. Pulmonary capillary wedge pressure
c. Pressure in SVC
d. Right ventricular preload

1314. Normal CVP is ..... *(Safdarjung NO 2018; AIIMS Rishikesh Senior Nursing Officer 2018)*
a. 5 and 10 cm H2O b. 10 and 15 cm H2O
c. 15 and 20 cm H2O d. 20 and 30 cm H2O

1315. Zeroing point in CVP monitoring is known as .....
a. Midclavicular line b. Mid axillary line
c. Phlebostatic axis. d. At the level of atrium

1316. For effective measurement of CVP the transducer must be leveled to the reference point of___
a. Phlebostatic axis b. Pneumostatic axis
c. Intercostal axis d. Coronal axis

1317. Complication of faulty/incorrect insertion of CVP line is _
a. Pleural effusion b. Pneumothorax
c. Cardiac tamponade d. Subcutaneous emphysema

1318. Internal jugular vein pressure determines pressure of
a. RA b. RV
c. LA d. LV

1319. Elevation in jugular venous pressure is observed in all of the following conditions, EXCEPT *(AIIMS Raipur Grade II 2017)**
a. Right sided heart failure b. Cardiac tamponade
c. Constrictive pericarditis d. Myocarditis

Explanation: Increased jugular venous pressure is seen in right sided heart failure, pulmonary hypertension, tricuspid valve stenosis, superior vena cava obstruction, constructive pericarditis, and cardiac tamponade. Myocarditis does not cause elevation of JVP.

**The original question from the AIIMS Raipur Grade II has been modified due to multiple correct answer*

1320. Position used for assessing jugular vein distention is .....
a. High Fowler's b. Trendelenburg
c. Raised 30 degrees d. Side lying

1321. Kussmaul sign is .....
a. Rise of jugular venous pressure on inspiration
b. Rise of jugular venous pressure on expiration
c. Visible carotid pulsation during inspiration
d. Visible carotid pulsation during expiration

Explanation: Kussmaul's sign is the rise of jugular venous pressure during inspiration usually due to condition that limits filling of right ventricle or right ventricular dysfunction.

1322. The diagnostic study to assess left ventricular dysfunction is: *(JIPMER 2012)*
a. Angiogram b. Catheterization
c. ECG d. Echocardiography

1323. What is a desirable total cholesterol level?
a. 200–239 b. Less than 200
c. Greater than 240 d. None of the above

Explanation: Total cholesterol should be less than 200 mg.

1324. Which of the following is known as "good cholesterol"?
a. LDL b. VLDL
c. HDL d. Triglycerides

Explanation: Lipoproteins are those molecules that transports cholesterol in the blood. High Density Lipoprotein (HDL) transports excess of cholesterol back to liver to be excreted as bile. Since it is beneficial and protective, the HDL is known as Good Cholesterol. Low Density Lipoprotein (LDL) is known as BAD Cholesterol as it is associated with increased risk of cardiovascular disease. [Tips to Remember: GOOD and HIGH is 4 letters; LOW and BAD is 3 letters each]

1325. Boot-shaped heart in a chest X-ray is commonly associated with *(ISRO)*
a. Mitral stenosis b. Rheumatic Fever
c. Aortic regurgitation d. Fallot's Tetralogy

1326. Differentiation of various cardiomyopathy is done with the help of .....diagnostic test
a. Echocardiography b. ECG
c. Cardiac enzyme study d. Endomyocardial biopsy

1327. The drug that is used for stress test is .....
a. Atropine b. Adrenaline
c. Dobutamine d. Thallium

1328. Trans esophageal echocardiography (TCE) combines ultrasonography with which other procedure?
a. Electro cardiogram b. Endoscopy
c. Sigmoidoscopy d. Endoscopic cholangiogram

1329. When listening to heart sound, you can best hear sound, at the
a. Base of the heart
b. Apex of heart
c. Aortic area
d. IInd ICS to the left of sternum

1330. Criteria for diagnosing infective endocarditis is .....
a. Jones criteria b. Dukes criteria
c. Fallot criteria d. Bernard criteria

1331. Ventricular gallop
a. S1 b. S2
c. S3 d. S4

1332. S1 heart sound corresponds to
a. Closure of the aortic and pulmonic valve
b. Closure of the aortic valve
c. Closure of the mitral and tricuspid valve
d. Closure of the mitral valve

1333. S2 heart sound corresponds to
a. Closure of the aortic and pulmonic valve
b. Closure of the aortic valve
c. Closure of the mitral and tricuspid valve
d. Closure of the mitral valve

Explanation

Normal heart sounds:
- S1 (First Heart sound-LUBB): produced by closure of AV valves (Tricuspid and mitral)
- S2 (Second Heart sound-DUBB): produced by closure of Semilunar valves (aortic and pulmonic valve)

Abnormal heart sounds:
- S3 (Third heart sound): Also known as **ventricular gallop.** It corresponds to early ventricular filling (passive filling) when mitral valve opens. It is often associated with **Heart failure.**
- S4 (Fourth heart sound): Also known as Atrial gallop

1334. Bobbing of head with each pulse can be seen in Patient with?
a. Tricuspid regurgitation b. Aortic regurgitation
c. Aortic stenosis d. Mistral regurgitation

Ans.
1313. b
1314. a
1315. c
1316. a
1317. b
1318. a
1319. d
1320. c
1321. a
1322. a
1323. b
1324. c
1325. d
1326. a
1327. c
1328. b
1329. b
1330. b
1331. c
1332. c
1333. a
1334. b

Scanned with CamScanner

1335. The normal jugular venous pressure is
a. Less than 9 cm of H2O b. Less than 15 cm of H2O
c. Less than 12 cm of H2O d. Less than 3 cm of H_2O

1336. Wenckebach pattern is also known as
a. 1st degree heart block b. Mobitz type II
c. Mobitz type I d. Complete heart block

1337. The formula for ejection fraction is
a. $EF = \frac{\text{Stroke Volume}}{\text{End Diastolic Volume}}$
b. $EF = \frac{\text{Stroke Volume}}{\text{CO} \times \text{Heart Rate}}$
c. $EF = \frac{\text{Diastolic Volume}}{\text{CO} \times \text{Heart Rate}}$
d. $EF = \frac{\text{End systolic Volume}}{\text{Stroke Volume}}$

CARDIAC MARKERS

1338. Cardiac enzyme levels are monitored in the patient with chest pain because .....
a. Serial measurement of enzyme level reveals the extent of cardiac damage and helps to monitor healing progress
b. Help to identify area of myocardial injury
c. It reveals if the patient is truly having chest pain
d. Decreasing enzyme level helps to estimate the recovery time for the Patient with MI

1339. The enzyme level which is found elevated after myocardial infarction is: *(DSSSB PHN, 2015)*
a. Serum creatine b. Alkaline phosphatase
c. Phosphokinase d. Creatine kinase

1340. First elevating enzyme following MI is .....
a. CPK MB b. Troponin I
c. Myoglobin d. Troponin-T

Explanation: Myoglobin is the first elevating enzyme after myocardial injury but is less specific for myocardial necrosis, especially, in the presence of skeletal muscle injury or renal insufficiency.

1341. The enzyme study that is most specific to Myocardial Infarction is
a. CPK MB b. LDH
c. SGOT d. SGPT

1342. Which enzyme is found only in myocardium?
a. Troponin T b. Troponin I
c. Myoglobin d. Lactate dehydrogenase

1343. Which of the following lab test is most indicative of myocardial damage?
a. Lactic acid level
b. Lactate dehydrogenase
c. Creatine Kinase
d. Troponin I

Explanation: Troponin is the most sensitive and specific cardiac marker of myocardial damage. Troponin has increased specificity compared with CK-MB.

1344. The most sensitive biochemical marker in a patient with 7 days old Myocardial Infarction is
a. Troponin I, T b. LDH
c. Myoglobin d. CPK MB

1345. Which among the following is the most specific marker for the diagnosis of acute myocardial infarction?
a. Troponin b. Creatinine kinase
c. LDH d. Myoglobin

CARDIOVASCULAR MANIFESTATIONS

1346. Sinus Bradycardia is defined as heart rate of?
a. Less than 40/min
b. Less than 50/min
c. Less than 60/min
d. Less than 70/min

1347. Origin of a knifelike chest pain that increases in intensity with inspiration is .....
a. Cardiac b. Hepatic
c. Hematological d. Pulmonary

1348. Which is the most lethal arrhythmia? *(Staff Nurse G II 2014)*
a. Atrial fibrillation b. Ventricular fibrillation
c. Ventricular tachycardia d. Sinus arrhythmia

1349. A nurse is watching the cardiac monitor and notices that the rhythm suddenly changes, there are no P waves, the QRS complexes are wide and the ventricular rate is regular but over 100, the nurse determines that the patient is experiencing: *(LNJP H D 2012)*
a. Ventricular tachycardia
b. Ventricular fibrillation
c. Premature ventricular contractions
d. Sinus tachycardia

1350. The response to hyperstimulation of vagus nerve is:
a. Skeletal muscle relaxation
b. Skeletal muscle contraction
c. Tachyarrhythmia
d. Bradyarrhythmia

Explanation: Vagus nerve or the Xth cranial nerve innervates with the parasympathetic fibers of heart, lungs and GI tract. Hyperstimulation promotes bradyarrhythmias. When hyperstimulated, the left vagal branch predisposes the heart to conduction block at the atrioventricular node.

1351. What is the immediate goal of treatment for cardiac tamponade?
a. Relieving pain
b. Alleviating anxiety
c. Improving mobility
d. Relieving intra-pericardial pressure

1352. The triad of signs/symptoms seen in cardiac tamponade is.... .....
a. Tachycardia, tachypnea, tender hepatomegaly
b. Muffled heart sound, distended neck veins, hypotension
c. Stasis, hypercoagulability, vessel injury
d. Chest pain, heart failure, syncope

Explanation: Muffled heart sound, distended neck veins, and hypotension (**Becks triad**) are signs of cardiac tamponade. Symptoms include anxiety, restlessness, light-headedness, palpitations, swelling of legs and abdomen etc.

1353. Mitral regurgitation is seen during .....
a. Ventricular diastole
b. Ventricular systole
c. Atrial diastole
d. Atrial systole

1354. Damage to ..... heart chamber causes acute pulmonary edema
a. Left atrium b. Right atrium
c. Left ventricle d. Right ventricle

Ans.

1335. a
1336. c
1337. a
1338. a
1339. d
1340. c
1341. a
1342. b
1343. d
1344. a
1345. a
1346. c
1347. d
1348. b
1349. a
1350. d
1351. d
1352. b
1353. b
1354. c

Scanned with CamScanner

1355. In atrial flutter, the key consideration in determining the treatment is .....
a. Atrial rate b. PR interval
c. Ventricular rate d. P Wave

1356. The drug of choice for supraventricular tachycardia is .....
a. Adenosine b. Diluter
c. Carvedilol d. Amiodarone

1357. Chest pain is described as pleuritic when it
a. Resolves with sublingual NTG
b. Increase with deep inspiration and decrease when then patient sits up and leans forward
c. Occurs only during sitting
d. Resolves with a deep breath

1358. Which of the following is a cause of embolic brain injury?
a. Persistent hypertension
b. Supra ventricular tachycardia
c. Atrial fibrillation
d. Skull fracture

1359. Which of the following statement regarding ventricular tachycardia (ventricular dysrhythmia) is true?
a. Electrocardiography (ECG) is the criterion standard for the diagnosis of VT
b. Lidocaine hydrochloride (xylocaine) is the drug of choice
c. Hypokalemia, hypomagnesemia, and hypocalcemia may predispose patients to VT
d. All of the above

1360. Which among the following is not a manifestation of hyperlipidemia.
a. Corneal Arcus b. Xanthelasma
c. Xanthoma d. Erythema marginatum

Ans.
1355. c
1356. a
1357. b
1358. c
1359. d
1360. d
1361. c
1362. b
1363. a
1364. a
1365. d
1366. c
1367. b
1368. c
1369. a
1370. a
1371. c
1372. b
1373. d

Explanation:
- Corneal Arcus-grayish white ring around cornea due to lipid infiltration.
- Xanthelasma-yellowish deposition of fat under the skin usually around the eyelids.
- Xanthoma-deposition of cholesterol in tendon or other body parts.
- Erythema marginatum nonitchy red rings on extensor surfaces commonly seen in rheumatic fever.

1361. Turner syndrome is associated with?
a. Aortic regurgitation b. Pulmonic stenosis
c. Coarctation of aorta d. Aortic dissection

1362. Displacement of cardiac apex to left and downwards indicates?
a. Right ventricular hypertrophy
b. Left ventricular hypertrophy
c. Right atrial hypertrophy
d. Left atrial hypertrophy

HYPERTENSION

1363. What will be the change occurred to the BP of a person if peripheral vascular residence decreases
a. Decrease b. Increase
c. No change
d. Slightly increase then come to the normal value

1364. When blood pressure resistance, the baroreceptor inhibits the sympathetic nervous system which leads to
a. Vasodilation b. Vasoconstriction
c. Tachycardia d. Tachypnea

1365. Risk factors of hypertension is .....
a. Hyperlipidemia b. Cardiovascular problems
c. Family history d. All of the above

1366. In elderly, increased peripheral resistance and decreased vascular elasticity causes:
a. Dementia
b. Cardiac arrhythmias
c. Increased blood pressure
d. Decreased blood pressure

Explanation: Blood pressure elevates in response to hardening and thickening of arteries and veins. In addition, the increased peripheral resistance results in increased systemic vascular resistance contribute to elevated blood pressure.

1367. BP 142/90 mm Hg is interpreted as
a. Prehypertension b. Stage 1 hypertension
c. Stage 2 hypertension d. Stage 3 hypertension

1368. Persistently elevated blood pressure with an unknown cause is known as .....
a. Stage 1 hypertension b. Malignant hypertension
c. Primary hypertension d. Chronic hypertension

1369. Unchecked rapid rise in diastolic BP above 110–120 mm Hg is:
a. Malignant hypertension b. Hypertensive crisis
c. Hypertensive emergency d. White coat hypertension

Explanation: Malignant hypertension-is rapid uncheck rise in diastolic above 110–120 mm Hg.

Hypertensive emergency (crisis) is characterized by a severe elevation in blood pressure (>180/120 mm Hg) complicated by progressive organ dysfunction.

White coat hypertension—hypertensive when the BP is measured by a health care professional.

1370. Postural hypertension is defined as a fall in systolic blood pressure by ------mm Hg or diastolic by----mm Hg within 3 minutes of standing from a supine or sitting position.
a. 20, 10 b. 10, 20
c. 10, 10 d. 20, 20

Explanation: Postural hypertension or orthostatic hypotension is defined as a decrease in systolic pressure by 20 mm Hg or a decrease in diastolic pressure by 10 mm Hg with in 3 minutes of changing posture from a sitting or lying down posture to standing posture.

1371. According to the Joint National Guidelines (JNG) 8 pharmacological therapy is started at a BP reading of .....
a. >120/80 b. >130/90
c. >140/90 d. >150/90

Explanation: JNG8 recommends to start pharmacological therapy for hypertension at a BP reading of >140/90

1372. Pre-hypertension is usually treated with
a. Diuretics b. Life style modification
c. b-blockers d. ACE inhibitors

1373. Hypertension may be controlled by the use of medications, but it can also be improved by:
a. Weight loss b. Exercise
c. Low sodium diet d. All of the above

Explanation: All of the above are nonpharmacological methods to control hypertension.

Scanned with CamScanner

1374. **Most common cause of hypertension is?**
a. Renal artery stenosis
b. Essential hypertension
c. Pheochromocytoma
d. Chronic Glomerulonephritis

1375. **Essential hypertension can be managed with .....**
a. A diuretic agent
b. ACE inhibitors
c. Beta blockers
d. Diet, exercise and weight reduction program

1376. **The full form of DASH diet is:**
a. Dietary allowances to stop hypertension
b. Dietary aids to stop hypertension
c. Dietary approaches to stop hypertension
d. Dietary assistance to stop hypertension

Explanation: DASH (Dietary Approaches to Stop Hypertension) Diet modification is effective treatment to reduce blood pressure especially in stage 1 HTN.

1377. **With ageing blood pressure is often higher due to:** *(LNJP H D 2012)*
a. Decreased peripheral resistance
b. Decreased elasticity in arterial walls
c. Loss of muscle mass
d. Changes in exercise and diet

1378. **Most common cause of aortic dissection**
a. Syphilis
b. Hypertension
c. Marfan syndrome
d. Cystic medial necrosis

1379. **Which of the following complications can occur due to untreated hypertension:**
a. Renal failure, hydatidiform mole , angina
b. Asthma, cardiac tamponade, angina
c. Aortic dissection, renal failure, stroke
d. Pneumothorax, pleural effusion, cardiac tamponade

Explanation: Hypertensive cardiovascular disease, Hypertensive cerebrovascular disease (stroke), hypertensive renal disease (renal failure), aortic dissection, and atherosclerotic dissection are the complications of untreated hypertension.

1380. **Calcium channel blockers help to reduce BP through .....**
a. Vasodilation
b. Volume depletion
c. Beta receptor block
d. None of the above

1381. **Which among the following drug has the side effect as hypertension?**
a. Oral contraceptives
b. Cocaine use
c. Corticosteroids
d. All of these

1382. **Cough is a side effect of which of the following antihypertensive medication?**
a. Calcium channel blocker
b. Beta blockers
c. ACE inhibitors
d. Diuretics

Explanation: ACE inhibitors are associated with a dry, persistent cough in 5%-35% of patients. ACE inhibitors prevent the breakdown of bradykinin and substance P, resulting in an accumulation of these tussive mediators in the respiratory tract.

1383. **Treatment of choice for hypertension includes .....**
a. Weight reduction
b. Sodium restriction
c. Exercise
d. All of the above

1384. **Severe hypertensive client is experiencing increased workload of the heart due to .....**
a. Increased afterload
b. Increased cardiac output
c. Decreased peripheral vascular resistance
d. Decreased blood volume

1385. **Action of angiotensin-converting enzyme (ACE) inhibitor is .....**
a. Promote sodium retention
b. Increase contractility
c. Decrease contractility
d. Reduce blood pressure

1386. **Anti-hypertensives should be used cautiously in clients taking .....**
a. Aspirin
b. Diclofenac
c. Thioridazine
d. Warfarin

CAD/ISCHEMIC HEART DISEASES

1387. **Hereditary risk factor for developing CAD is .....**
a. Family history of heart disease
b. High cholesterol level
c. Smoking
d. Oral contraceptive use

1388. **All among the following are non-modifiable risk factor for Coronary Artery Disease, EXCEPT**
a. Obesity
b. Heredity
c. Gender
d. Age

1389. **Which of the following statements by the client to the nurse indicates a modifiable risk factor for coronary artery disease?**
a. I exercise every other day
b. My father died of myocardial infarction
c. My cholesterol is 180
d. I smoke 2 packs of cigarettes per day

Explanation: Cigarette smoking is considered as one of the major modifiable risk factors for CAD. Family history of death due to myocardial infarction is a non-modifiable risk factor while option A and C is not considered to be a risk factor for coronary artery disease.

1390. **An amino acid that increases the risk for CAD is:**
a. Homocysteine
b. Alanine transaminase
c. Glutamic acid
d. L - proline

Explanation: High levels of homocysteine causes endothelial damage, inflammation and subsequent atherogenesis

1391. **The most common direct cause of sudden death is**
a. Cardiomyopathy
b. Pulmonary hypertension
c. Heat failure
d. CAD

1392. **Coronary arteries primarily receive blood supply during**
a. Inspiration
b. Expiration
c. Diastole
d. Systole

1393. **Health education given to a client with CAD is effective, if the client states that .....**
a. Blood pressure need to keep in normal limit
b. Decrease the intake of saturated fat
c. Avoid smoking and alcoholism
d. All of the above

1394. **Sudden cardiac death is due to the dysfunction of .....**
a. Right atrium
b. Mitral valve
c. Left ventricle
d. Coronary artery

Ans.

1374. b
1375. d
1376. c
1377. b
1378. b
1379. c
1380. a
1381. d
1382. c
1383. d
1384. a
1385. d
1386. c
1387. a
1388. a
1389. d
1390. a
1391. d
1392. c
1393. d
1394. c

Scanned with CamScanner

1395. Which among the following value is the risk factor for CAD?
a. HDL: 90 mg/dl b. LDL=130 mg/dl
c. VLDL=24%
d. Total cholesterol = 250 mg/dl

1396. Priority nursing intervention in a client with CAD is .....
a. Decrease activity
b. Enhance myocardial oxygenation
c. Plan for surgery
d. Carry out lab investigations

1397. Immediate management in a client with aortic dissection is ...
a. Maintain perfusion to the organ
b. Control blood pressure
c. Monitor peripheral pulse
d. Maintain cardiac output

1398. Which among the following statement is FALSE regarding risk factors for ischemic heart disease:
a. Regular aerobic exercise protects against ischemic heart disease
b. Elevated serum homocysteine is an independent risk factor
c. Blood pressure lowering reduces the risk for ischemic cardiac events
d. Women on hormone replacement therapy are at risk for ischemic heart disease.

Explanation:
- A minimum of 150 minutes of moderate exercise per week has been recommended by American Heart Association as measure to lower blood cholesterol.
- Homocysteine is an amino acid that is related to early development of CAD.
- Elevated blood pressure damages the intima of blood vessel.
- Hormone replacement therapy in women is beneficial in preventing atherosclerosis. Estrogen lyses fat from the body.
- Aneurysm, Atherosclerosis and Arteriosclerosis

Ans.
1395. d
1396. b
1397. b
1398. d
1399. a
1400. a
1401. b
1402. a
1403. a
1404. c
1405. a
1406. b
1407. c
1408. c
1409. a
1410. d
1411. c
1412. a
1413. c
1414. b
1415. a

1399. Atherosclerosis is a
a. Chronic inflammatory and immune disease
b. Acute inflammatory and immune disease
c. Acute tissue response
d. Atrophy of epithelial tissue

1400. Which among the following is the modifiable risk factor of atherosclerosis?
a. Obesity b. Male gender
c. Advanced age d. Family history

1401. Following are the modifiable risk factor of atherosclerosis EXCEPT
a. Physical inactivity b. Family history
c. Diabetes d. Hypertension

1402. Atherosclerotic plaques are most commonly seen in .....
a. Abdominal aorta b. Arch of aorta
c. Descending aorta d. Ascending aorta

1403. The coronary artery most commonly involved in atherosclerosis is
a. Left anterior descending artery
b. Left main coronary artery
c. Right coronary artery d. Circumflex coronary artery

1404. Which of the following is a risk factor for the development of atherosclerosis and Peripheral Vascular Disease (PVD)?
a. Low levels of triglycerides concentration
b. Low levels of low density lipoprotein (LDL)
c. High levels of low-density lipoprotein (LDL)
d. High levels of high-density lipoprotein (HDL)

Explanation: Increased level of serum low density lipoprotein (LDL) cholesterol is considered as a risk factor for the development of atherosclerosis. LDL cholesterol is not broken down into the liver but is deposited into the wall of the blood vessels.

1405. Complications associated with atherosclerosis is .....
a. Embolism b. Hemorrhage
c. Decreased blood supply d. All of the above

1406. Infective agent causing atherosclerosis
a. Clostridium Diphtheriae
b. Chlamydia Pneumoniae
c. Hemophilus influenza
d. Mycobacterium Pneumoniae

1407. A condition in which cramping pain in the leg is induced by exercise, typically caused by obstruction of the arteries is known as
a. Arthritis
b. Arthralgia
c. Intermittent claudication
d. Myasthenia gravis

1408. All of the following are the characteristics of intermittent claudication EXCEPT
a. It is characterized by cramping and weakness
b. It is commonly caused by atherosclerosis
c. It is characterized by pain in the leg that occurs at rest
d. It is due to neuromuscular disorder that causes weakness in the skeletal muscles

1409. The abnormal dilatation of the wall of an artery is referred to as: *(DSSSB PHN, 2015)*
a. Aneurysm b. Hernia
c. Atherosclerosis d. Phlebitis

1410. Most common site of aortic aneurysm is .....
a. Ascending aorta b. Descending thoracic aorta
c. Aortic arch d. Abdominal aorta

1411. Which among the following genetic disorder is a risk factor for aneurysm?
a. Down syndrome b. Neurofibromatosis
c. Marfan's syndrome d. Fanconi anemia

1412. Pulsating abdominal mass on palpation is the clinical manifestation of .....
a. Abdominal aortic aneurysm
b. Wilms tumor
c. Anastomosis
d. Paralytic ileus

1413. Site for palpating abdominal aortic aneurysm is .....
a. Right upper quadrant of abdomen
b. Right lower quadrant
c. Middle lower abdomen to the left of the midline
d. Middle lower abdomen to the right of the midline

1414. Definitive diagnostic test for abdominal aortic aneurysm is ...
a. MRI
b. Aortogram
c. Computed tomography (CT) scan
d. Contrast studies

1415. Localized enlargement of an artery caused by weakness in the arterial wall is .....
a. Aneurysm b. Diverticulum
c. Hernia d. Protrusion

Scanned with CamScanner

1416. **Common cause of aneurysm or aortic aneurysm is .....**
a. Syphilis
b. Atherosclerosis
c. Congenital
d. Trauma

1417. **Aneurysm leads to .....**
a. Compression on adjacent structures
b. Thrombosis
c. Rupture and hemorrhage
d. All of these

ANGINA PECTORIS

1418. **Angina is**
a. Back pain
b. Chest pain
c. Leg pain
d. Head ache

1419. **In angina pectoris, pain occurs due to**
a. Accumulation of HCl
b. Lack of oxygen supply
c. Accumulation of Lactose Dehydrogenase
d. Movement of thrombus

1420. **What is the main reason for angina pectoris?** *(RRB SSNE 2015)*
a. Neurological disease
b. Gastric disease
c. Respiratory disease
d. Cardiac disease

1421. **Pathophysiology behind angina pectoris is**
a. Increased preload
b. Decreased afterload
c. Thrombi in coronary artery
d. Inadequate oxygen supply to the myocardium

1422. **Which condition is associated with a predictable level of pain that occurs as a result of physical or emotional stress?**
a. Prinzmetal angina
b. Stable angina
c. Unstable angina
d. Variant angina

Explanation:
- Angina is chest discomfort or pain due to poor blood flow through the blood vessels in the heart.
- Anginal pain occurring at rest is an instance of unstable angina.
- Stable angina occurs with activity or emotional stress.
- Prinzmetal or variant angina-occurs in cycles during rest due to coronary artery spasm.

1423. **Identify correct statement regarding Angina Pectoris**
a. Radiates to the left arm
b. Lasts less than 15 minutes
c. Is relieved by rest and nitroglycerine
d. All of the above

1424. **Identify correct statement regarding stable angina .....**
a. Cause is coronary atherosclerosis
b. It is precipitated by physical activity.
c. Managed with nitroglycerin.
d. All of the above

1425. **Type of angina experienced by a client with an impending myocardial infarction (MI) is .....**
a. Variant angina
b. Stable angina
c. Micro vascular angina
d. Unstable angina

1426. **Which among the following is caused due to spasm of the coronary artery?**
a. Stable angina
b. Variant angina
c. Unstable angina
d. Myocardial infarction

Explanation: Variant angina, or Prinzmetal's angina, is prolonged and severe and occurs at the same time each day, most often at rest. Stable angina is induced by exercise and relieved by rest or nitroglycerin tablets. Unstable angina occurs at lower and lower levels of activity or at rest, is less predictable, and is often a precursor of myocardial infarction.

1427. **Emergency management of angina is .....**
a. Aspirin
b. Adrenaline
c. Nitroglycerin
d. Dopamine

1428. **Nitroglycerine belongs to ..... Group of drugs**
a. Vasodilator
b. Beta blocker
c. Calcium channel blocker
d. ACE inhibitors

1429. **Common side effects of nitroglycerin include:**
a. High blood pressure
b. Headache
c. Shortness of breath
d. Constipation

Explanation: Nitroglycerine is used in treating high blood pressure Nitroglycerin is a nitrate. It works by relaxing (widening) blood vessels. Chest pain occurs when the heart needs more oxygen than it can get. Relaxing blood vessels allows blood to flow more easily. This reduces the heart's workload and the amount of oxygen needed by the heart. Vasodilatory effect of NTG cause headache, hypotension and dizziness

1430. **Medication likely to be prescribed to reduce the risk of coronary artery spasms in a client with Prinzmetal's angina is .....**
a. Thiazide diuretics
b. Digoxin
c. Lidocaine
d. Calcium channel blocker

1431. **Which among the following is the correct way to administer nitroglycerin for chest pain?**
a. One tablet or spray every three minutes, up to five times; then drive yourself to the ER
b. Take as many tablets or sprays as necessary to relieve pain; if the pain persists, it is probably not your heart
c. One tablet or spray every five minutes, up to three times; call 101 or 112 if the pain is not completely relieved
d. Take one tablet or spray and call the Heart Clinic

1432. **Which among the following is FALSE regarding the drug nitroglycerine**
a. Before taking the drug drink sips of water
b. The drug is administered sublingually or as sprays in angina
c. Nitroglycerine is a vasoconstrictor
d. The drug is photosensitive

Explanation: Nitroglycerine is a vasodilator. So Vasoconstrictor (option C) is the wrong answer. All other statements are true about nitroglycerine.

MYOCARDIAL INFARCTION

1433. **Myocardial infarction (M.I.) commonly known as .....**
a. Angina
b. Heart attack
c. Dysrhythmias
d. Heart block

1434. **Most common site of myocardial infarction is**
a. Anterior wall of left ventricle
b. Inferior Wall of left ventricle
c. Post. Wall of right ventricle
d. Post. Wall of left ventricle

Ans.

1416. b
1417. d
1418. b
1419. b
1420. d
1421. d
1422. b
1423. d
1424. d
1425. d
1426. b
1427. c
1428. a
1429. b
1430. d
1431. c
1432. c
1433. b
1434. a

Scanned with CamScanner

1435. Which among the following is NOT suggestive of acute myocardial infarction:
a. A sudden onset severe central chest pain
b. A sudden onset burning hypogastric pain
c. A new onset complete heart block
d. Sudden death

Explanation: Burning hypogastric pain is often due to gastritis or Gastroesophageal Reflux Disease (GERD). All other signs are associated with myocardial infarction.

1436. A hypertensive patient has been admitted in a ward for observation. He mentions the attending nurse about squeezing pain in the chest even at rest. Which of the following action is necessary for this patient? *(Banaras HU 2015)*
a. Give ibuprofen tablet to reduce pain
b. Advise the patient to move out for fresh air
c. Rest to the patient and call the attending doctor
d. Inform the patient that he is fine nothing to worry

1437. Risk of myocardial infarction (M.I.) increases with .....
a. Using oral contraceptive pills
b. Hyperlipidemia
c. Elevated serum iron level
d. All of the above

1438. The most common cause of new onset complete heart block is:
a. Myocardial infarction
b. Hyperkalemia
c. Atrial fibrillation
d. Infective endocarditis

Explanation: A complete heart block may occur due to occlusion of the right coronary artery.

1439. Irreversible injury in myocardium occurs after
a. 15 minutes
b. 30 minutes
c. 45 minutes
d. 60 minutes

1440. Blood vessel responsible for inferior wall MI is .....
a. Post inter-ventricular artery
b. Anterior descending artery
c. Circumflex artery
d. Nodal branch

1441. Parameters increase as myocardial oxygen consumption increases are .....
a. Preload, afterload, and peripheral vascular resistance
b. Preload, afterload, and stroke volume
c. Preload, afterload, contractility, and heart rate
d. Preload, afterload, peripheral vascular resistance and stroke volume

1442. Occlusion of circumflex branch of coronary artery cause
a. Inferior wall infarction
b. Anterior wall
c. Lateral wall infarction
d. Septal infarction

1443. Signs and symptoms of MI include .....
a. Radiating pain
b. Tachycardia
c. Dyspnea
d. All of the above

1444. Early complications of acute myocardial infarction include
a. Arrhythmias
b. Contractile dysfunction
c. Myocardial rupture
d. All of the above

1445. Which of the following complications occur within 24 hours after sustaining an MI:
a. Left ventricular aneurysm
b. Ventricular septal rupture
c. Cardiogenic shock
d. Atrial septal rupture

Ans.
1435. b
1436. c
1437. d
1438. a
1439. b
1440. a
1441. c
1442. c
1443. d
1444. d
1445. c
1446. c
1447. c
1448. a
1449. b
1450. b
1451. b

Explanation: Cardiogenic shock after AMI develops within 6 hours in about 50% of patients and within 24 hours in about 75% of patients. Other given complications are mechanical complications that can occur as early as within 48 hours or two weeks post-infarction.

1446. Which of the following is the priority intervention for a patient experiencing myocardial infarction?
a. Obtain ECG
b. Administer sublingual nitroglycerin
c. Administer oxygen
d. Administer Aspirin

1447. Among the following drugs, which is to be given first to client with acute MI is .....
a. Lovastatin
b. Amlodipine
c. Aspirin
d. Beta blockers

1448. A client with myocardial infarction suddenly becomes tachycardiac, shows signs of air hunger, and begins coughing frothy, pink-tinged sputum. Initial nursing interventions should be:
a. Lasix, oxygen, nitrates, morphine, Propped up position
b. Morphine, oxygen, nitrates, aspirin
c. Oxygen, thrombolytic, aspirin, aminophylline, inotropes
d. Oxygen, aspirin, beta blockers, nitrates

Explanation: Pulmonary edema is characterized by extreme breathlessness, dyspnea, air hunger, and the production of frothy, pink-tinged sputum. Auscultation of the lungs reveals crackles. Initial nursing intervention is to administer Lasix, morphine, nitrates, oxygen, and to give propped up position (LMNOP)

1449. Which measures should be performed immediately following CABG
a. Ambulation, 12 lead ECG, clear liquid diet
b. Vital signs, cardiac rhythm, pulse oximetry
c. Vital signs, cardiac rhythm, clear liquid diet
d. 12-lead ECG, vitals, ambulation

1450. Which of the following is expected from a patient who had coronary artery bypass graft (CABG) with mammary artery graft a week before? *(ESI 2007)*
a. Ankle edema
b. Depression
c. Dizziness
d. Memory lapses

Explanation: Following CABG clients commonly experience depression, fatigue, incisional chest discomfort, dyspnea, and anorexia. Depression typically resolves on its own and does not require medical intervention.

1451. Which of the following techniques is used to support circulation during a cardiac surgery:
a. Intra-aortic balloon pump
b. Cardiopulmonary bypass machine
c. Positive pressure ventilation
d. Negative pressure ventilation

Explanation: Cardiopulmonary bypass (heart lung machine) is a technique that maintains the circulation of the blood and oxygen content of the body by taking over the function of the heart and the lungs during surgery.

Scanned with CamScanner

1452. Mr. Siddappa has been received from operation room by the PICU nurse after the coronary artery bypass grafting procedure. Which of the following intervention would be appropriate to prevent early complications?

(AIIMS Bhopal Grade-I 2018)

a. Employing leg exercises and turning him in bed every 2 hours
b. Keeping him from ambulating until the day after surgery
c. Keeping him cool with light patient body cover to prevent elevated temperature
d. Positioning him in bed with pillows placed under his knees to improve venous return

Explanation: After CABG procedure, lower leg edema may occur after removal of the saphenous vein (which is most commonly used graft in CABG). So, employing leg exercises and turning the patient in bed every 2 hours is very important to be followed. It also facilitates the recovery

1453. Cause of shock in a client with MI is .....

a. Decrease in cardiac output
b. Less blood volume
c. Vasodilation
d. Pulmonary edema

1454. Most common sign associated with decreased cardiac output is .....

a. Shortness of breath
b. Peripheral edema
c. Cardiac murmurs
d. Arthritis

1455. Which of the following conditions can decrease oxygen demands on the heart.

a. Thyrotoxicosis
b. Treatment with diltiazem
c. Pregnancy
d. Aortic stenosis

Explanation: Diltiazem is a calcium channel blocker. Cardioselective Calcium Channel Blockers (Diltiazem and Verapamil) decrease heart rate and contractility, which leads to a reduction in myocardial oxygen demand, which makes them excellent antianginal drugs

1456. Nurse should recognize that a patient has coronary artery disease is receiving acetylsalicylic acid (aspirin) to:

(LNJP H D 2012)

a. Relieve pain
b. Decrease platelet adhesion
c. Reduce fever
d. Diminish inflammation

1457. Following MI client is advised to do leg exercises and ambulation to prevent ..... complication

a. Lymphadenopathy
b. Pressure ulcers
c. Deep vein thrombosis
d. Air embolism

1458. Common complication following myocardial infarction (MI) is .....

a. Cardiac tamponade
b. Cardio myopathy
c. Arrhythmias
d. Endocarditis

1459. Post MI client complaining of chest pain while taking deep breathes, appropriate nursing action is .....

a. Give NTG tablets
b. Auscultate pericardial friction rub
c. Give oxygen
d. Administer analgesics

1460. In myocardial infarction, morphine helps in all of the following EXCEPT.

a. Decrease pain
b. Dissolve the infarction
c. Decrease the client's anxiety
d. Decrease oxygen demand of myocardium

1461. The complication that needs to be suspected in a client who has paradoxical pulses following CABG surgery is:

a. Cardiomyopathy
b. Pericarditis
c. Aortic dissection
d. Pericardial tamponade

1462. All are used for secondary prevention of MI except

a. Aspirin
b. Beta blockers
c. Warfarin
d. Statins

1463. Dose of streptokinase to be used in MI is?

a. 0.15 Million units
b. 1.5 Million units
c. 15 Million units
d. 150 Million units

VALVULAR HEART DISEASES

1464. Vegetation on the heart valves result from

a. Bacterial invasion
b. Poor diet
c. Hypertension
d. Diabetes mellitus

1465. Causes behind cardiac valve disorders include all EXCEPT

a. Rheumatic fever
b. Infection endocarditis
c. Connective tissue abnormalities
d. Congestive heart failure

1466. Water hammer pulse is a feature of

a. Aortic stenosis
b. Aortic regurgitation
c. Mitral regurgitation
d. Aortic aneurysm

1467. Flushed cheeks can be seen in patient with .....

a. Mitral stenosis
b. Aortic stenosis
c. Mitral regurgitation
d. Tricuspid regurgitation

1468. Commonest cause of mitral valve stenosis in Indian patients?

a. Rheumatic fever
b. Rheumatic endocarditis
c. Cyanotic heart disease
d. Infective endocarditis

1469. Inflammation of the valves and inner layer of the heart is known as .....

a. Endocarditis
b. Myocarditis
c. Pericarditis
d. epicarditis

1470. Organism responsible for bacterial endocarditis is .....

a. α -Hemolytic streptococci
b. β -Hemolytic streptococci
c. Staphylococcus aureus
d. Pneumococci

1471. Which type of valve is porcine heart valve?

a. Xenogeneic
b. Allogeneic
c. Autologous
d. Metallic

HEART FAILURE

1472. Most common cause of left sided heart failure is:

(Kerala PSC, Nov 2014)

a. Septal defect
b. Congenital heart disease
c. Coronary Artery Diseases (CAD)
d. Hypertension

Explanation: Coronary Artery Diseases (CAD) is the most common cause of heart failure.

Other causes include Cardiomyopathy, Congenital heart defect, heart valve disease, Hypertension, emphysema, etc.

Ans.

1452. a
1453. a
1454. a
1455. b
1456. b
1457. c
1458. c
1459. b
1460. b
1461. d
1462. c
1463. b
1464. a
1465. d
1466. b
1467. a
1468. b
1469. a
1470. b
1471. a
1472. c

Scanned with CamScanner

1473. Clinical signs of left sided heat failure
a. Dyspnea and bradycardia
b. Dyspnea and tachycardia
c. Tachycardia and restlessness
d. Restlessness and coughs

1474. Auscultation of crackles in the lungs is present in ..... condition
a. Pulmonic valve malfunction
b. Tricuspid valve malfunction
c. Left-sided heart failure
d. Right-sided heart failure

1475. The edema in congestive heart failure is due to
a. Change in oncotic pressure
b. Renal failure
c. Liver failure
d. Venous stasis

1476. Clinical manifestation involved in right side heart failure is .....
a. Ascites b. Pedal edema
c. Oliguria d. All of the above

1477. Cheyne stokes breathing is seen in:
a. Intracranial hypotension b. Congestive heart failure
c. Left atrial myxoma d. Pickwickian syndrome

1478. Weight gain, nausea, and a decrease in urine output are the manifestation of .....
a. Myocardial infraction
b. Pericarditis
c. Right-sided heart failure
d. Left-sided heart failure

1479. Which of the following test can be used for the diagnosis and assessment of the severity of heart failure:
a. BNP b. PSA
c. Troponin d. ANA

Explanation: Brain natriuretic peptide or B-type natriuretic peptide (BNP) secreted by the ventricles in response to excessive stretching of heart muscle cells.

1480. Right ventricular hypertrophy is a complication of .....
a. Corpulmonale b. Pneumonia
c. Hemothorax d. Peritonitis

1481. Drug of choice to improve the cardiac performance is .....
a. Beta-adrenergic blockers b. Nitroglycerine
c. Opioids d. Inotropic agents

1482. The dietary management of a patient with congestive cardiac failure includes:
a. Fat restricted diet b. Sodium and water rich diet
c. Rich fiber content diet d. Salt restricted diet

1483. A client with chronic heart failure placed on a sodium restricted diet. Which among the following food item need to be avoided by the client?
a. Eggs b. Canned Sardines
c. Plain nuts d. Whole milk

Explanation: Canned sardines (sea food) are generally rich in sodium content. One can of Sardines in oil contain 500 mg of sodium (approx).

1484. Among the following identify the food group with least level of sodium
a. Milk b. Meat
c. Vegetables d. Fruits

1485. Priority intervention in a heart failure patient secondary to dilated cardiomyopathy is .....
a. Cardiac enzyme study
b. Rehabilitate the client
c. Check response to prescribed medications.
d. Monitor blood level of medication

1486. Patient is on enalapril and diuretic therapy for heart failure. Nurse should notify the physician that the therapy is not effective when she finds: *(NCFL 2019)*
a. Dry cough b. Skin rash
c. Edema in legs d. Postural fall in B.P.

Explanation: Diuretics are administered to relieve water retention. Edema (fluid accumulation) in the legs indicates that the therapy is not effective. Postural fall in BP, dry cough and skin rash are most likely to be the sign of excessive water loss rather than water accumulation.

1487. Commonly using drug for the management of cardiomyopathy?
a. Decongestants b. Beta-adrenergic blockers
c. Dobutamine d. Nitroglycerine

1488. Final treatment for cardiomyopathy if the medical management fails is
a. Valve replacement b. Pace maker
c. Heart transplantation d. Cardio version

DIGOXIN THERAPY

1489. The drug of choice in the treatment of congestive cardiac failure is
a. Digoxin b. Adrenaline
c. Diazepam d. Atenolol

1490. Digoxin is a/an *(AIIMS Bhopal Grade-I 2018)*
a. Calcium channel blockers
b. Cardiac glycosides
c. Thrombolytic agent
d. Anti-angina drug

Explanation: Cardiac glycosides are the class of organic compounds that increase the force of contraction of the heart but decrease the rate of contraction. Digoxin (Brand name: Lanoxin) is a cardiac glycoside which is mainly used in the treatment of Congestive Heart Failure, atrial fibrillation and atrial flutter

1491. All of the following statements are correct about Digoxin. EXCEPT:
a. It has positive inotropic and negative chronotropic effects
b. Withhold the drug if the pulse rate is less than 60 per minute
c. Toxicity can occur more easily in the presence of hypokalemia
d. The positive inotropic effect will decrease urine output

Explanation: Digoxin is a positive inotropic agent used to treat congestive heart failure and to slow the heart rate in patients with atrial fibrillation. It increases the force of contraction of heart. Positive inotropic effect promotes diuresis by increasing cardiac output

1492. Normal therapeutic range of serum digoxin is
a. 0. 2–0. 5 ng/mL
b. 0. 5–2. 2 ng/mL
c. 2. 2–3 ng/mL
d. 3–4 ng/mL

Ans.
1473. b
1474. c
1475. d
1476. d
1477. b
1478. c
1479. a
1480. a
1481. d
1482. d
1483. b
1484. d
1485. c
1486. c
1487. b
1488. c
1489. a
1490. b
1491. d
1492. b

Scanned with CamScanner

1493. **Which of the following therapeutic effects is expected with digoxin administration:**
a. Positive dromotropic, negative inotropic, positive chronotropic
b. Negative dromotropic, positive inotropic, positive chronotropic
c. Negative dromotropic, positive inotropic, negative chronotropic
d. Positive dromotropic, positive inotropic, negative chronotropic

Explanation: Digoxin increases cardiac contractility (positive inotropic effect), decreases heart rate (negative chronotropic effect), and decreases conductivity (negative dromotropic effect).

1494. **Which of the following electrolyte value can potentiate digoxin toxicity:**
a. Hypokalemia
b. Hyperkalemia
c. Hypocalcemia
d. Hypercalcemia

Explanation: In states of hypokalemia, digoxin toxicity is actually worsened because digoxin normally binds to the ATPase pump on the same site as potassium. When potassium levels are low, digoxin can more easily bind to the ATPase pump, exerting the inhibitory effects.

1495. **Digoxin toxicity cause which of the following electrolyte imbalance?**
a. Hyperkalemia
b. Hypokalemia
c. Hypernatremia
d. Hyponatremia

Explanation: Digoxin toxicity causes hyperkalemia (high potassium). The sodium/potassium ATPase pump normally causes sodium to leave cells and potassium to enter cells. Blocking this mechanism results in higher serum potassium levels.

Digoxin toxicity is worsened in states of hypokalemia (low potassium) since digoxin normally binds to the ATPase pump on the same site as potassium. When potassium levels are low, digoxin can more easily bind to the ATPase pump exerting the inhibitory effects.

Note: Hypokalemic condition can potentiate digoxin toxicity. On the other hand, Digoxin toxicity can cause hyperkalemia.

1496. **Signs and symptoms of digoxin toxicity includes all EXCEPT**
a. Anorexia, nausea and vomiting
b. Blurred or yellow vision
c. Dizziness and mental confusion
d. Tachycardia

1497. **In a child, digoxin needs to withheld if the apical pulse rate is less than**
a. 60 beats/min
b. 70 beats /min
c. 90 beats/minute
d. 100 beats /min

1498. **ECG changes in Digoxin toxicity are**
a. Prolonged QT interval
b. Prolonged PR interval
c. ST segment elevation
d. Tall T-waves

1499. **Which among the following needs to be monitored before administering digoxin?**
a. Apical pulse
b. Pulse deficit
c. Radial pulse
d. Pulse pressure

1500. **In an adult patient digoxin will be withheld if the pulse rate is below.....**
a. 40 bpm
b. 50 bpm
c. 60 bpm
d. 70 bpm

1501. **Which of the following drug is withheld if the patient's pulse is less than 60/min?** *(DSSSB 2013)*
a. Digoxin
b. Dobutamine
c. Dopamine
d. Phenytoin

Explanation: Digoxin is a positive inotropic agent (cardiac glycoside) which is used in the treatment of congestive heart failure. It increases the force of contraction of heart. Digoxin cause bradycardia. Hence the drug should be withheld if the pulse rate of the patient is less than 60 beats/minute. Pulse rate less than 60 beats/min indicates digoxin toxicity.

1502. **Side-effect of digoxin is/are:**
a. Visual disturbance
b. GI disturbance
c. Bradycardia
d. All of the above

1503. **Which among the following electrolyte value reveals that a client who was on digoxin therapy is suffering from its toxicity?**
a. Sodium level 140 mEq/L
b. Potassium level 5 mEq/L
c. Potassium level 2 mEq/L
d. Sodium level 120 mEq/L

PERICARDITIS

1504. **A client is suffering from constrictive pericarditis, which among the following finding reveals the serious complication associated with that?**
a. Activity intolerance
b. Pitting edema over the legs
c. Jugular venous distention
d. Hypertrophy of pericardium in echo

1505. **What type of inflammation is bread and butter pericarditis?**
a. Erythematous
b. Fibrinous
c. Connective tissue
d. Purulent

1506. **All of the following statements are correct regarding pericarditis pain EXCEPT**
a. Chest pain is almost always present, may be felt in the neck, shoulder, back, or abdomen
b. Pain may increase with coughing and swallowing
c. Pain is worst in the supine position
d. Exertion can increase the pain

Explanation: In pericarditis, exertion does not change the pain whereas in myocardial infarction, exertion can increase the pain. Sharp, pleuritic, retro-sternal pain, radiates to trapezius ridge or no radiation, worsening pain in the supine position and sudden onset of pain are the features of pericarditis pain.

INFECTIONS

1507. **Focal or diffuse inflammation of the cardiac muscle is**
a. Endocarditis
b. Myocarditis
c. Pericarditis
d. Myocardial infection

1508. **Most important nursing responsibility while caring a client with myocarditis is .....**
a. Isolation technique
b. Antibiotic prophylaxis
c. Activity restriction
d. Oxygenation and ventilation

1509. **Small painful nodes on fingers and toes called Osler's nodes are seen in:** *(Staff Nurse G II 2014)*
a. Cardiomyopathy
b. Pericarditis
c. Infective endocarditis
d. Myocarditis

Ans.

1493. c
1494. a
1495. a
1496. d
1497. b
1498. b
1499. a
1500. c
1501. a
1502. d
1503. c
1504. c
1505. b
1506. d
1507. b
1508. d
1509. c

Scanned with CamScanner

1540. The nurse is providing discharge teaching to an adult patient who had a permanent artificial pacemaker implanted. Which of the following information given by the nurse is inappropriate?
a. The client may be allowed to use household electrical appliances
b. The client should check the pulse rate once a day, in the morning upon awakening
c. The client should have regular follow up care
d. The client may engage in contact sports

Explanation: Contact sports such as football, basketball, and cricket should be avoided as this may cause trauma to the area of pacemaker implantation. Using household electrical appliances are generally safe for patient implanted with pacemaker provided the appliances are in good working condition.

1541. An example of alpha-adrenergic blocking drug is .....
a. Phentolamine b. Carvedilol
c. Lasix d. Acebutolol

1542. The following drugs are calcium channel blockers except
a. Amlodipine b. Verapamil
c. Ramipril d. Diltiazem

1543. The following drugs are ACE inhibitors except one
a. Ramipril b. Verapamil
c. Enalapril d. Benazepril

1544. Drug that protects the ischemic myocardium by blocking catecholamines and sympathetic nerve stimulation is .....
a. Calcium channel blockers b. Beta-adrenergic blockers
c. Cardiac glycosides d. Nitroglycerines

1545. Which of the following is a desired effect on heart rate while a patient is on beta blockers:
a. Heart rate greater than 100 beats/min
b. A heart rate less than 60 beats/min
c. Heart rate between 60-70 beats/min
d. Beta blockers have no effect on heart rate

Explanation: Betablockers antagonize beta receptors inhibiting the actions of the sympathetic nervous system reducing heart rate, contractility and blood pressure thus significantly decreasing oxygen demand for optimal relief from angina symptoms titration to achieve a heart rate of about 60 beats/min is frequently required.

1546. Which of the following medications should be withheld a week before cardiac surgery.
a. Ramipril b. Metiprolol
c. Furosemide d. Clopidogrel

Explanation: Clopidogrel is an antiplatelet agent withheld to prevent perioperative hemorrhage.

1547. Antidote for heparin is:
a. Calcium gluconate b. Magnesium sulfate
c. Protamine sulphate d. Vitamin K

Explanation: Intravenous protamine sulfate can rapidly reverse the anticoagulant effects of heparin. One milligram of protamine sulfate neutralizes approximately 100 units of heparin. Vitamin K is an antidote for warfarin.

1548. Drug likely to be ordered by physician in a client with transient ischemic attack secondary to atrial fibrillation is
a. Dopamine b. Amiodarone
c. Warfarin d. Lorazepam

1549. Oral medication of choice to prevent further thrombus formation is .....
a. Warfarin b. Heparin
c. Streptokinase d. Vit K

1550. Which among the following medication needs to be withheld by the physician one day prior to superior vena cava filter insertion procedure?
a. Thyroxine b. Warfarin
c. Frusemide d. KCl

1551. An alternate to aspirin for the prevention of acute coronary syndrome in a patient allergic to aspirin is
a. Stop aspirin as it is not necessary
b. Take any other NSAIDS instead of aspirin
c. Take clopidogrel instead of aspirin
d. Take ticlopidine instead of aspirin

Explanation: Aspirin is a non-steroidal anti-inflammatory drug but unlike other NSAIDS aspirin has additional antiplatelet activity there by decreasing platelet aggregation and thrombus formation. Clopidogrel is another antiplatelet drug that can be used instead of aspirin.

1552. An active male patient who weighs 81.65 kg has undergone dietary instruction. The patient reports that his current diet consists of 60 g of fat, 200 mg of cholesterol, 5 g of sodium per day. What does a nurse advise the patient to do? *(NCFL 2019)*
a. Increase cholesterol b. Increase sodium
c. Decrease cholesterol d. Decrease sodium

Explanation: Recommended sodium intake is less than 2g/day that is equal to 5 g of salt (sodium chloride) per day. Hence, the given option is more than double the recommended amount and it needs to be reduced. WHO recommends that reduced sodium intake will reduce the risk of hypertension, stroke and cardiovascular diseases in adults.

1553. Grape juice needs to be avoided in patient is on
a. Warfarin
b. Heparin
c. Cyclosporine
d. Penicillin

BLS/CPR/ACLS

1554. For giving CPR, after ascertaining unresponsiveness one should: *(JIPMER 2012)*
a. Call for help b. Establish an airway
c. Check the carotid pulse d. Give chest compression

1555. A client becomes unconsciousness and unresponsive to the stimuli, next action is .....
a. Activate the resuscitation team
b. Inform the physician
c. Give adrenaline
d. Perform suction

1556. During the resuscitation of a patient, the palpable artery in the neck that is used to assess the patient's cardiovascular status is the
a. Brachiocephalic artery
b. Subclavian artery
c. Common carotid artery
d. Temporal artery

Ans.
1540. d
1541. a
1542. c
1543. b
1544. b
1545. c
1546. d
1547. c
1548. c
1549. a
1550. b
1551. c
1552. d
1553. c
1554. a
1555. a
1556. c

Scanned with CamScanner

1557. A nurse finds the client unconscious on his bed in the ward. She assessed and found that there was no pulse or respirations. As per the new AHA (American Heart Association 2010), the first action she should take after calling for help is

a. Establish airway
b. Obtain a crash cart
c. Initiate high quality chest compressions
d. Establish a peripheral IV line

1558. Which method is used to open air way when the victim is suspected to have cervical injury?

a. Jaw thrust maneuver
b. Head tilt chin lift method
c. Both a and b
d. Nose pinch technique

1559. Which one of following is the recommended order for resuscitation

a. A-B-C
b. C-A-B
c. C-B-A
d. B-C-A

1560. Where should you attempt to perform a pulse check in a child from one year of age to puberty?

a. Carotid or femoral artery
b. Temporal artery
c. Ulnar artery
d. Brachial artery

Explanation: As per American Heart Association (AHA) guidelines, pulse should be checked either in carotid artery or femoral artery for children aged one year until puberty. The brachial artery located on the upper arm is used in infants below 1-year-old.

1561. Which one of following options is correct regarding compression?

a. Use palm of hand
b. Use heel of the hand
c. Compression depth of at least 5 inches
d. Check ECG at the end of each compression

1562. Correct position of hand placement during chest compression is .....

a. Anywhere along the sternum
b. Upper portion of the sternum
c. Middle portion of the sternum
d. Lower portion of the sternum

Explanation: Good quality compressions are with arms extended, elbows locked, shoulders directly over the victim's chest and heel of the palm on the lower half of the sternum.

The rescuer pushes hard and fast, compressing 4–6 cm deep for adults at 100–120 compressions per minute with complete chest recoil.

1563. What is the recommended rate of chest compression?

a. 90 per minute
b. At least 100/min
c. Between 100–120/min
d. More than 120/min

1564. What should be the depth of chest compression in adult?

a. 3 inches
b. >2.4 inches
c. At least 5 cm
d. At least 7 cm

1565. What is the ratio of chest compressions to ventilations when one rescuer performs cardiopulmonary resuscitation (CPR) on an adult?

a. 30:1
b. 30:2
c. 15:1
d. 15:2

1566. What is the ratio of chest compressions to ventilations when two rescuers perform cardiopulmonary resuscitation (CPR) on an adult?

a. 30:1
b. 30:2
c. 15:1
d. 15:2

1567. Compression to ventilation ratio during 2-rescuer Child/infant CPR is

a. 15:1
b. 15:2
c. 30:1
d. 30:2

1568. Compression to ventilation ratio during 1-rescuer Child/infant CPR is

a. 15:1
b. 15:2
c. 30:1
d. 30:2

1569. When 2 or more rescuer are available for resuscitation rescuer can be changed

a. Every 2 min
b. Every 2 cycles
c. Every 5 min
d. Every 6 min

1570. AED stands for: *(LNJP H D 2012)*

a. Arrhythmia eliminating device
b. Advanced emergency defibrillator
c. Authorised emergency defibrillator
d. Automated external defibrillator

1571. Which among the following statement is correct?

a. Each shock should be followed by CPR
b. CPR is not mandatory after each shock
c. Defibrillation is indicated in pulseless electrical activity
d. Compress the heart during defibrillation

1572. Heimlich maneuver involves the following: *(LNJP H D 2012)*

a. Abdominal thrusts
b. Blind finger sweep in throat
c. Chest compressions
d. Jaw thrust

1573. The nurse is providing CPR to a patient after a cardiorespiratory arrest. Which of the following initial assessment finding indicates that the patient has been successfully resuscitated?

a. Positive Babinski's reflex
b. Response to pain stimuli
c. Palpable carotid pulse
d. Pupils equal and react to light

Explanation: Presence of a palpable carotid pulse indicates the return of cardiac function which, together with the return of breathing, is the primary goal of CPR.

1574. All of the below are signs of cardiopulmonary arrest, except: *(AIIMS BPL SNO 2018)*

a. Constriction of pupil
b. Immediate loss of consciousness
c. Dilatation of pupil
d. Absence of pulse

Explanation: The ominous signs of cardiopulmonary arrest include immediate loss of consciousness, pupillary dilation, pulselessness and apnea.

Pupillary constriction suggests opioid intoxication.

Strategy: If two options are exact opposite to each other (eg. Constriction vs. dilation of pupil), then any one of those two is most probably the correct answer. *Use these strategies judiciously and only when you do not know the answer.*

1575. What would you do immediately after a cardiac arrest?

a. Give epinephrine
b. Check for breathing
c. Check for pulse
d. Chest Compressions

1576. In an adult with an advanced airway in place during 2-rescuer CPR, breaths should be administered how often?

a. Every 6–8 seconds (8–10 breaths per minute)
b. Every 2–3 seconds (20–30 breaths per minute)
c. Every 10–12 seconds (5–6 breaths per minute)
d. Every 4–5 seconds (12–15 breaths per minute)

Ans.

1557. c
1558. a
1559. b
1560. a
1561. b
1562. d
1563. c
1564. c
1565. b
1566. b
1567. b
1568. d
1569. a
1570. d
1571. a
1572. a
1573. c
1574. a
1575. d
1576. a

Scanned with CamScanner

Explanation: Twenty to thirty breaths per minute will result in hyperventilation which impedes return of spontaneous circulation.

One breath every 4–5 seconds will result in hyperventilation and is faster than the AHA guidelines recommend.

One breath every 6–8 seconds results in 8–10 breaths per minute, and is the correct ventilation rate for an adult victim with an advanced airway.

PERIPHERAL VASCULAR DISEASES

1577. Most appropriate nursing care to a patient who has been diagnosed as having thrombophlebitis is:
a. Elevate the client's legs 90°
b. Apply a heating pad to the involved site
c. Instruct the client about the need for bed rest
d. Provide active range-of-motion exercises to both legs

Explanation: Bedrest is advised to patients with thrombophlebitis to prevent dislodgement of thrombus. Dislodgment of the clot in the extremity can lead to pulmonary embolism.

1578. Vasculitis of small and medium sized veins and arteries of the extremities is known as .....
a. Raynaud's disease b. Buerger's disease
c. Aneurysm d. Septicemia

1579. Which of the following is most important to prevent the progress of disease in the thromboangitis obliterans (Buerger`s disease)? *(DSSSB 2013)*
a. Controlling blood pressure
b. Controlling Diabetes
c. Smoking cessation
d. Weight reduction

Explanation: Buerger's disease affects blood vessels in the arms and legs. The single most important thing that can slow the progression (but does not halt the progression) of the disease and severity of amputation is to stop smoking.

1580. All among the following are the clinical manifestation either in Buerger's disease or in Raynaud's phenomenon EXCEPT
a. Sensitivity to cold temperatures
b. Blood vessels become inflamed, swell and can become blocked with blood clots
c. Color changes of fingers and toes
d. Episodes of superficial vein thrombosis

1581. Most common risk factor associated with Buerger's disease is.....
a. Smoking b. Use of tobacco
c. Both a and b d. Alcohol

1582. Buerger's disease is also known as .....
a. Raynaud's disease
b. Thromboangitis obliterans
c. Deep vein thrombosis
d. All of the above

VARICOSE VEINS

1583. Primary varicose veins can be caused by .....
a. Prolonged sitting b. Pregnancy
c. Coagulopathy d. Hemorrhage

1584. Common complaints in a patient with varicose vein is .....
a. Fatigue and pressure b. Fatigue and vertigo
c. Stabbing pain and redness d. Sharp pain and cool feet

1585. Management for healing and control of venous leg ulcers is ...
a. Cold compression
b. Anticoagulant
c. Activity restriction
d. Applying elastic compression stockings

1586. Increased hydrostatic pressure and chronic venous stasis lead to .....
a. Cold extremities
b. Blockage of veins
c. Nocturnal calf muscle cramps
d. Decreased blood supply to the feet

1587. Identify correct statement regarding the management of varicose veins
a. Exercise helps the client
b. Elevate the legs
c. Lying down can relieve the symptoms
d. All of the above

1588. All of the following are signs and symptoms of varicose veins EXCEPT
a. Exercise intolerance
b. Rash on the skin
c. Absent hair growth and pallor
d. Numbness in the legs

1589. Surgical management of varicose veins is
a. Embolization b. Cold therapy
c. Ligation and stripping d. coil occlusion

1590. Following the surgical management for varicose vein which among the following intervention is required?
a. ROM exercise b. Trendelenburg position
c. Cold application d. Elastic leg compression

MISCELLANEOUS

1591. Infants of diabetic mother are likely to have the following cardiac anomaly?
a. Tetralogy of Fallot
b. Ebstein's anomaly
c. Coarctation of Aorta
d. Transposition of great arteries

1592. Which is NOT a component of Tetralogy of Fallot
a. Ventricular septal defect
b. Pulmonary stenosis
c. Overriding aorta
d. Left ventricular hypertrophy

1593. What is the most common site of injury from blunt chest trauma? *(AIIMS Raipur staff nurse grade I-2018)*
a. Aorta b. SVC
c. Left ventricle d. Right ventricle

Explanation: Right ventricle is more prone to blunt chest trauma because of the proximity of the right ventricle to the sternum

1594. A baby with cyanotic spells can be calmed by providing
a. Fowlers position b. Knee-chest position
c. Supine position d. Prone position

Explanation: Posturing the child in a knee chest or fetal position in mother's lap (simplest method to calm the child and this reduces systemic venous return and increases systemic vascular resistance).

1595. An example of cardiac tumor
a. Myxoma b. Myoma
c. Adenoma d. Cardioma

Ans.
1577. c
1578. b
1579. c
1580. d
1581. c
1582. b
1583. b
1584. a
1585. d
1586. c
1587. d
1588. c
1589. c
1590. d
1591. d
1592. d
1593. d
1594. b
1595. a

Scanned with CamScanner

HEMATOLOGY

ANATOMY AND PHYSIOLOGY OF HEMATOLOGIC SYSTEM

- **Bone Marrow**
  - Aggregate weight of bone marrow in an adult is 3000 gm.
  - Based upon the visual appearance it is divided as red and yellow
  - Red marrow is actively involving in hematopoiesis, while yellow marrow is less active in hematopoiesis.
  - **Functions of bone marrow**
    - Maintenance of pluripotent stem cells from which blood cells are derived
    - Origination and maturation of blood cells
    - Storage of large number of RBCs and neutrophils
    - Maturation of B-lymphocyte
    - Antibody production
- **Spleen**
  - Largest lymphoid organ in the body
  - Spleen is known as the graveyard of red blood cells
  - Act as a site for humoral immune response to blood borne antigen.
  - Damage to the spleen increases the risk for infection.
  - Functions
    - Helps in recycling iron from destroyed RBCs by capturing hemoglobin
    - Removal of particles from RBCs without destroying it.
- **Formation of Blood Cells**
  - Hematopoiesis is the process of formation of blood cells
  - It starts in early embryonic period and persist throughout the life
  - Major sites for hematopoiesis in adult are flat bones of sternum, ilium, ribs and vertebrae.
- **Blood**
  - Blood contain many types of cells such as RBCs, WBCs and platelet suspended in plasma.
  - 8% of body weight is of blood
  - **Arterial blood is bright red in color** because of oxygen carrying hemoglobin and **venous blood is dark red in color** because of lack of oxygen
  - **Specific gravity of blood is 1.048-1.066**
  - **pH of blood is 7.35-7.45**
- **Plasma**
  - Liquid portion of the blood
  - Plasma = Blood – Cellular components
  - Serum = Plasma – Clotting factors
  - Straw-colored
  - Plasma is composed of 92% water, 7% protein and less than 1% nutrient and metabolic waste.

Figure 60 ■ Components of blood

Hematocrit/Packed Cell Volume

- If a tube of blood is allowed to stand or centrifuged blood cells settle down at the bottom. The term hematocrit or PCV is used to express the volume or percentage of RBCs in that sample.
- Normal hematocrit is 35%–45%.
- Hematocrit will increases if plasma is less or RBCs are more, e.g. dehydration, increased RBC production (polycythemia)
- Hematocrit decreases if plasma is more or RBCs are less, e.g. over hydration, enhanced RBC loss, anemia

Figure 61 ■ Hematocrit

Scanned with CamScanner

Hematopoiesis

- Bone marrow contains pluripotent stem cells which give rise to different forms of blood cells.

Figure 62 ■ Process of hematopoiesis

- **RBCs/Erythrocyte**
  - They are oxygen carrying cells in the blood and they carry carbon dioxide back to the lung
  - Mature RBC has no nucleus
  - **Shape:** Bi-concave shape which increases the surface area of RBCs.
  - **The life span of RBCs is about 120 days.**
  - **Functions**
    - Carry oxygen and nutrients towards cells
    - Assist in excretion of waste products from tissue through lungs, kidneys and skin
    - Transporting hormones to the target site of action
    - Protecting body from harmful substance/organism
    - Hemostasis
    - Homeostasis
- **Megakaryocytes/platelets**
  - Hemostasis is the major function.
  - Time needed for the formation of platelet is **5 days.**
  - Hemostasis occurs in three stages:
    - Vasoconstriction
    - Formation of platelet plug
    - Formation of fibrin clot
- **White blood cells/leukocytes**
  - Five types of WBCs.
  - Based upon the presence of granules in the cytoplasm they are classified as granulocytes and agranulocytes
    - **Granulocytes:** Neutrophil, eosinophil and basophils
    - **Agranulocytes:** Monocyte and lymphocyte

Figure 63 ■ White blood cells

- **Granulocytes**
  - **Neutrophils**
    - Also known as polymorphonuclear leukocytes
    - These are the primary cells which respond during inflammation.
    - 90% of mature neutrophils remain in the bone marrow so that they can easily release into the circulation whenever any inflammation occur.
    - Life span of neutrophil is hours to three days.
  - **Eosinophil**
    - These cells contain large granules in the cytoplasm.
    - They are needed against parasitic infection and IgE mediated allergic response
    - The life span is hours to three days.
  - **Basophils**
    - Basophils are the least common of the granulocytes (0.5–1.0%).

Scanned with CamScanner

- Agranulocytes
  - Monocyte
    - They are transformed to form macrophages with full phagocytic action
  - Lymphocytes
    - Lymphocyte mature at thymus is T lymphocyte and which mature at bone marrow is B lymphocyte.
    - Some lymphocytes not classified as B or T lymphocyte are known as natural killer cells
    - B-cell mediates antibody mediated immune response
    - T-cells mediates cell mediated immune response.

BLOOD GROUPS AND BLOOD TYPING

Blood Groups

- Important blood groups are A, B, AB and O.
- Blood is grouped according to the antigen found on RBC and antibody found in plasma.

Table 64 Blood groups

Blood group	Antigen on RBC	Antibody on plasma
A	A	Anti-B
B	B	Anti-A
AB	A and B	None
O	None	Anti-A and Anti-B

The Rh System

- Rh system determines whether a person has positive or negative blood group.
- If D antigen is present then that person is said to be Rh positive
- If D antigen is absent then that person is said to be Rh negative

DIAGNOSTIC TESTS

Kindly refer to:
Target high page no E-45 normal value table: Hemoglobin
Target high page no E-45 normal value table: Coagulation studies
Target high page no E-46 normal value table: Arterial blood gas table

HEMATOLOGICAL DISEASES AND DISORDERS

Anemia

- It is a clinical condition resulting from decrease in healthy RBCs, decreased packed cell volume/hematocrit or due to decreased hemoglobin.
- RBCs carry oxygen to various cells, so anemia results in hypoxia.

Table 65 Main causes of anemia

Decreased production of healthy RBCs	Increased RBC destruction	Blood loss
• Folic acid deficiency • Vitamin B12 deficiency • Iron deficiency • Thalassemia • Aplastic anemia • Anemia in chronic condition such as renal failure	• Sickle cell anemia • G6PD deficiency	• Trauma • Blood vessel rupture

- **Manifestations:** Dyspnea, palpitation and diaphoresis are the major clinical manifestation.
- **Management**
  - Iron supplement, nutritional supplements
  - Control hemorrhage
  - Spleenectomy
  - Removal of toxic agents
  - Bone marrow transplantation
  - Corticosteroid therapy
  - Immunosuppressive therapy.

Iron Deficiency Anemia

- Lack of iron resulting in inadequate hemoglobin storage in RBC and thus it affects oxygen carrying capacity
- RBCs are microcytic hypochromic in this condition
- Blood loss is the most common etiological factor
- **Manifestations:** Fatigue, dyspnea, palpitation, diaphoresis, headache, pallor in face, hands, nail bed and mucous membrane.
- **Food rich in iron:** Almond, beans, carrot, cauliflower, egg yolk, spinach, soybean, whole wheat, beef, cabbage, cucumber, mushroom, orange, peanut, peas, potato, pineapple, tomato.

- **Iron supplements have to be taken with or after food.**
- **Vitamin C increases the absorption of iron.**
- Side effect of iron therapy include constipation, nausea and vomiting, dark tarry stool.

Megaloblastic Anemia

- It occurs because of defective DNA synthesis which results in abnormally large RBC.
- **Causes:** Vitamin B12 deficiency and folic acid deficiency are the reason.

Vitamin B12 Deficiency/Cobalamine Deficiency/Pernicious Anemia

- Due to deficiency of intrinsic factor in gastric juice which affects absorption of vitamin B12.
- **Diagnosis:** Schilling test is the confirmatory laboratory test
  - **Schilling test:** It measure the absorption of orally administered radioactive Vitamin B12 before and after parenteral administration of intrinsic factor.
- Client with pernicious anemia need **lifelong supplement of vitamin B12.**

Folic Acid Deficiency Anemia

- Folic acid deficiency occurs due to lack of food items which contain folic acid (green leafy vegetables, citrus fruit, liver, grain and yeast).
- FA deficiency is common with chronic alcoholic client, client on hemodialysis and client with malabsorption syndrome such as celiac disease, and steatorrhea.
- **Diagnosis:** Blood smear and bone marrow examination
- **Serum folate level appear low (normal 7-20 ng/ml).**
- **Treatment:** Folic acid supplement.

Hemolytic Anemia

- Premature destruction of RBC due to hereditary disorders or hemolytic conditions (e.g. Malaria, drug-induced, hemolysis).
- Bone marrow fail to replace RBC at the rate of their destruction.
- **Extrinsic hemolysis (most common):** Hemolysis due to toxin, mechanical injury etc.

Scanned with CamScanner

- **Intrinsic hemolysis:** Damage to RBC itself. e.g. Sickle cell anemia, G6PD deficiency etc.
- Intravascular hemolysis occurs in the circulation itself.
- **Extravascular hemolysis** occurs in liver and spleen.
- **Manifestations:** Hemochromatosis (bronze skin tone), hemoglobinuria (dark urine), jaundice, hepatomegaly, spleenomegaly, renal failure (due to increased work load with RBC break down product).
- **Treatment:** Treat the underlying cause of hemolysis.

Sickle Cell Anemia

- It is an autosomal recessive condition.
- Sickle hemoglobin gene is inherited.
- When sickle hemoglobin exposed to low oxygen concentration, RBC losses its normal shape and property and becomes sickle in shape.
- Sickle RBC adheres together in small blood vessels and obstruct the blood flow to organ and cause ischemia or infraction.
- Cold can aggravate the condition.
- **Manifestations: Enlargement of the facial and skull bones,** tachycardia, cardiac murmur, pain, swelling and fever
- **Sickle cell crisis:** Three types of crisis are there. They are vaso-occlusive crisis, aplastic crisis, sequestration crisis.
- **Vasoocclusive crisis:** Entrapment of RBC and WBC in micro blood vessel leading to lack of perfusion to an organ which cause tissue hypoxia and necrosis. Good hydration is the management
- **Aplastic crisis:** Fall in hemoglobin and decreased production of RBCs, as bone marrow is not able to produce RBC
- **Sequestration crisis:** When other organ pooled with sickle cell. In children - most commonly spleen is affected. In adult - Liver and lungs are affected.
- **Acute chest syndrome:** Sickling of small blood vessels in the lung causes acute chest syndrome, characterized by fever, cough and respiratory distress
- **Diagnosis:**
  - Low hematocrit and sickled cells on smear.
  - Hemoglobin electrophoresis is the diagnostic method
- **Management:**
  - Hydroxyurea is effective in reducing sickled Hb and increasing fetal Hb.
  - Hematopoietic stem cell transplantation is also treatment of choice.
  - RBC transfusion is also useful.

Key Points

Fetal hemoglobin is a protective factor against sickling process

Polycythemia Vera

- Increased production of RBC, WBC and platelet, caused by excessive activation of pluripotent stem cells in the bone marrow.
- Blood viscosity and volume increases. Severe blood congestion in tissue and organ occurs.
- **Manifestations:** Hypoxia, dizziness, headache, vertigo, tinnitus, visual disturbance and angina, hypertension, cardiac failure, increased chances of stroke due to increased clotting, hepatomegaly, splenomegaly.

Hemochromatosis

- Increased iron level in blood due to the increased absorption of iron from GI tract.
- Iron gets deposited in liver, heart and pancreas and can damage the vital organs.
- **Manifestations:**
  - Joint pain is the most common manifestation.
  - Fatigue, lack of energy, irritability, depression, abdominal pain, loss of body hair are other manifestations.
  - **Management:** Phlebotomy is the management along with iron restriction. opening of vein to withdraw blood, introduce fluid

Agranulocytosis/Granulocytopenia/ Malignant Neutropenia

- Reduced number of granulocytes in the blood
- 93% of granulocytes are made up of neutrophils so it is often called as neutropenia.
- Neutrophils are the first cells to respond to an infection.
- Neutropenia can leads to fatigue, weakness, sore throat, ulceration of pharyngeal and buccal mucosa, dysphagia, and fever.
- **Management**
  - Bone Marrow Transplantation (BMT) is the treatment of choice

Aplastic Anemia

- Bone marrow is damaged and unable to produce blood cells.
- RBC deficiency leads to anemic manifestations.
- WBC deficiency leads to infection.
- Platelet deficiency leads to bleeding manifestations.
- **Diagnosis:** Bone marrow aspiration shows hypoplastic or aplastic bone marrow.
- **Management:** Immunosuppressive therapy and bone marrow transplantation

Thalassemia

- Autosomal recessive condition
- Synthesis of one or more of the globulin chain within the hemoglobin is affected.
- Thalassemia is further classified as alpha and beta based upon the chain affected.
  - In alpha thalassemia, alpha chain of the hemoglobin is affected and often has no symptoms.
  - If beta thalassemia, that is beta chain of the hemoglobin is affected, it produce mild to severe symptoms
- **Thalassemia major/ cooley's anemia: Severe deficiency or complete lack of beta chain of hemoglobin. Here both genes are abnormal**
- **Thalassemia minor:** One gene is defective, it causes mild to moderate anemia.
- **Manifestations:** Paleness, failure to thrive, frequent infection, loss of appetite, jaundice, enlarged forehead and jaw
- **Management:**
  - Blood transfusion. Frequent blood transfusion causes iron overload which can be treated with chelation therapy (Deferoxamine)
  - **Bone marrow transplant and spleenectomy** are also treatment options.

Glucose-6-Phosphate Dehydrogenase (G6PD) Deficiency

- It is an X-linked recessive disorder
- Normally, G6PD gene in RBC produce an enzyme which is necessary for membrane stability.

Scanned with CamScanner

- In G6PD deficiency, client has inherited a defective enzyme which causes hemolysis of the RBC.
- It most commonly affects male whereas majority of the females are carrier.
- **Manifestations:** Paleness, extreme tiredness or dizziness, fast heartbeat, fast breathing or shortness of breath, jaundice, spleenomegaly dark, tea-colored urine

A characteristic of X-linked inheritance is that fathers cannot pass X-linked traits to their sons.

Thrombocytopenia

- Low level of platelet occurs as a result of decreased production, increased consumption or due to increased destruction of platelet.
- **Manifestation:** Bleeding and petechiae are common.
- **Diagnosis:** Bone marrow aspiration and biopsy

Hemophilia

- X-linked recessive disorder
- It occur due to deficiency of:
  - Clotting factor VIII (hemophilia A or classic hemophilia) and
  - Clotting factor IX (hemophilia B or Christmas disease)
- Hemophilia gene is located in X chromosome, so usually females are carrier and males are affected.
  - Father with **Hemophilia:** Daughters are carriers, Sons are normal
  - Mother with **hemophilia gene (carrier):** Sons - 50:50 - normal: affected; Daughters - 50:50 -normal: carriers.
- **Hemorrhage is the most common manifestation.**
- Majority of the bleeding occurs in the joints
- Bleeding can be internal (manifested as hematuria, blood in stool) or external.
- **Management:**
  - Factor concentrates are available to transfuse
  - Avoid IM injection and contact sports among hemophilic patients.

Von Willebrand Disease

- Condition occurs due to deficiency of Von Willebrand factor which is necessary for factor VIII activity.
- Manifestations: Prolonged bleeding time, Normal platelet count, and slightly prolonged APTT.
- **Management:**
  - Goal of treatment is to replace the deficient factor.
  - Desmopressin can be used before surgery or dental procedure to control bleeding.

Disseminated Intravascular Coagulation (DIC)

- Coagulation proteins are activated and coagulation occur in micro circulation which prevents blood supply to organs, resulting in organ dysfunction.
- Consumption of clotting factors can lead to life threatening hemorrhage in the client.
- All kind of hemorrhagic manifestations occurs, e.g. purpura, petechiae, ecchymosis, intracerebral bleeding, GI bleed, severe uncontrolled bleeding after surgery and child birth etc.
- **Lab findings:** Prolonged PT, prolonged APTT, very low platelet count, reduced fibrinogen level, prolonged clotting time
- **Confirmatory test:** Presence of fibrinogen degradation products such as D-dimer.
- **Management:** Transfusion of platelet and specific clotting substances such as fibrinogen or cryoprecipitate or fresh frozen plasma.

Thrombophlebitis

- It is the inflammation of venous wall resulting in thrombus formation. It can occur in superficial as well as deep veins.
- The thrombus will move and can lead to occlusion of blood vessel.
- **Signs and symptoms**
  - **Superficial vein thrombophlebitis:** Warmth, pain or tenderness which increases on applying pressure; swelling, and induration.
  - **Deep vein thrombophlebitis:** Positive Homan's sign, edema, cramping pain, fever, tenderness to touch, malaise and chills.
- **Management**
  - **Superficial vein thrombophlebitis:** May not require specific therapy. It requires treatment for symptoms.
- **Deep vein thrombophlebitis:** Anticoagulant therapy or thrombolytic therapy.
- Drug of choice for anticoagulant therapy include heparin (Intravenous) and warfarin (oral).
- **Acute vein thrombophlebitis:** Thrombolytic therapy is required.

Homan's Sign

1. The examiner should support the client's thigh with one hand and his foot with the other hand.
2. With the knee in the flexed position, forcibly dorsiflex the ankle.
3. Pain in the calf with maneuver. This maneuver indicates a positive Homan's sign.
4. Positive Homan's sign suggest deep vein thrombosis (DVT).

BLOOD TRANSFUSION

Table 66 Blood transfusion compatibility chart

Blood type	Donate blood to	Receive blood from
A+	A+ AB+	A+ A– O+ O–
O+	O+ A+ B+ AB+	O+ O–
B+	B+ AB+	B+ B- O+ O-
AB+	AB+	Everyone

Blood Products

Table 67 Uses of various blood products and their indications

Product	Description	Indication
Whole blood	• Deficient in factor V and VII • Stored at 2-4°C	• Acute blood loss • Exchange transfusion
Packed RBC	1 unit should raise Hct by 3%	• In acute and chronic blood loss
Platelet concentrate	• PCs may be stored for up to 5 days at +20°C to +24°C	• Thrombocytopenia (<10,000) • Major Surgery (<50, 000) • Spontaneous hemorrhage • C/I in ITP and TTP
FFP	• Stored at -18°C to - 20°C	• Clotting factor replacement • Emergency reversal of warfarin
Cryo precipitate	• Contains ▪ Fibrinogen ▪ vWF ▪ VIII, XIII	• Fibrinogen deficiency • vWD • Hemophilia A

Immediate Transfusion Reactions

Acute Hemolytic Reaction

- Caused by transfusion of incompatible blood
- Manifestations include dyspnea, chest pain, flushing, chills, fever, hypotension, tachycardia, flank pain, oozing at the surgical incision or infusion site.
- **Nursing intervention:**
  - Carefully monitor the first 15 minutes of any blood transfusion
  - Stop the transfusion immediately if any signs and symptoms appears
  - Administer oxygen, IV fluids, epinephrine or vasopressin as per the order
- **Allergic reaction:**
  - Presence of any allergen (antibody) in donor's blood can trigger allergic reaction
  - Manifestations include anaphylaxis, urticaria, fever, nausea and vomiting.
- **Management:**
  - Careful monitoring for allergic symptoms
  - Stop the transfusion immediately if any symptom of allergic reaction appears
  - Administer corticosteroids, antihistamines or epinephrine as per order.

Bacterial Contamination

- Caused due to bacterial contamination of blood
- Manifested by abdominal cramping, vomiting, fever, chills, diarrhea, and shock
- Treated with broad spectrum antibiotics

Hypocalcemia

- Caused by citrate content of large infusion of blood
- **Manifestations:** Hypotension, arrhythmias, seizures, muscle cramps and prolongation of QT interval.
- **Management**
  - Calcium gluconate IV
  - ECG monitoring

Golden points to remember

- Blood transfusion is contraindicated in congestive cardiac failure.
- The most abundant type of blood cells is erythrocyte.
- Monocyte is largest white blood cell with finely granulated chromatin dispersed throughout the nucleus.
- Normal life span of RBCs is **80–120** days.
- Schistocytes are fragmented red blood cells.
- Anemia is a deficiency in the number of erythrocyte, the quantity of hemoglobin and the volume of packed RBCs.
- When fully saturated, 1 g of hemoglobin contains **1.39 ml of oxygen**
- Absorption of dietary nonheme iron is enhanced by **Vitamin C.**
- Clinical symptoms of chronic iron deficiency include pallor skin, glossitis, and cheilitis.
- Pernicious anemia is a disease in which gastric mucosa is not secreting intrinsic factor, that is needed for cobalamin absorption.
- A sickle cell crisis is type of pain that begins suddenly and lasts for several hours to several days.
- The preferred method to give iron is **Z-Track Method**.
- Apheresis is a procedure used to separate components of blood, followed by the removal of one or more of these components.
- The dosage of **heparin** is adjusted according to the activated partial thromboplastin time **(aPTT)**, while **warfarin** dose is determined by the International Normalized Ratio **(INR)**.
- Reticulocytes is an immature RBCs which is nucleated.
- Erythropoiesis is regulated by cellular oxygen requirement and controlled by erythropoietin.
- Universal donor is blood group **O Negative** and **universal recipient** is blood group **AB positive**.
- Pancytopenia refers to decreased number of RBCs, WBCs and platelets.
- Cobalamin absorption occurs in **distal ileum**.
- Schilling test is done for assessing parietal cell function in case of B12 deficiency.
- Direct coombs **test detects:** Antibody attached to RBC surface.
- Indirect coombs **test detects:** Antibody in the serum.
- Ecchymosis: Large purplish lesion is caused by hemorrhage.
- Hemophilia A (Classical hemophilia) is caused by deficiency of factor VIII (Anti-Hemophilic Factor).
- Hemophilia B (Christmas disease) is caused by deficiency/absence of Factor IX.
- In hemophilia, Hepatitis C infection is common due to repeated blood transfusion.
- Hepatitis C is the most common type of post blood transfusion Hepatitis.
- Activated partial thromboplastin time (APTT) is prolonged in Hemophilia.
- Myelodysplastic **syndrome** is a group of related hematologic disorder characterized by a change in quantity and quality of bone marrow elements.
- Azacitidine is the first effective treatment for patient with MDS.
- Virchow's triad includes venous stasis, damage of the endothelium and hypercoagulability of blood which are causes of venous thrombosis.
- Homan's sign (pain on forced dorsiflexion of the foot when the leg is raised) is classic but unreliable sign of Deep Venous Thrombosis (DVT).
- Treatment of DVT involves bed rest, elevation of the extremity and anticoagulant therapy.
- Warfarin inhibits activation of the vitamin K dependent **coagulation factor II, VII, IX, X.**
- Warfarin requires **48–72** hours to affect prothrombin time.
- Telangiectasias **(spider vein)** <1 cm in diameter that appears bluish purple or red.
- Lead poisoning **leads to** Sideroblastic anemia/MCHC anemia, Hemolysis
- Oral manifestation **of vitamin B12 deficiency includes** Atrophic glossitis, Beefy tongue, Macroglossia.

Most Common

- Most common vitamin B_{12} deficiency
- Thalassemia major
- Mist common manifestation of Hemophilia A
- Most common transfusion association Viral Hepatitis
- Malabsorption
- Thalassemia or Cooley's anemia
- Recurrent hemarthrosis
- Hepatitis C virus

MULTIPLE CHOICE QUESTIONS (Including Explained and Practice Questions)

HEMATOLOGY

Anatomy and Physiology

1596. The spleen lies against: *(Safdarjung NO 2018)*

a. 6th, 7th and 8th ribs
b. 7th, 8th and 9th ribs
c. 8th, 9th and 10th ribs
d. 9th, 10th and 11th ribs

(Ref: Gray's Anatomy for Students, 3rd edition, 2015, PP. 338)

Explanation:

- Spleen lies in the area of 9th to 11th ribs. It is in the left upper quadrant of the abdomen or in the left hypochondriac region of the abdomen.
- The spleen is the largest organ in the lymphatic system. Spleen is soft and generally looks purple.

Figure ■ Position of spleen in the human body

Ans.

1596. d
1597. c

1605. d
1606. c
1607. a
1608. b
1609. c
1610. b
1611. c

1597. The last product in the process of blood coagulation is: *(LNJP H D 2012)*

a. Thromboplastin
b. Prothrombin
c. Fibrin
d. Thrombin

1598. A person with one of the following blood groups of considered a universal recipient: *(LNJP H D 2012)*

a. A negative
b. AB positive
c. O negative
d. B positive

1599. Universal donor blood group is

a. O negative
b. O positive
c. AB negative
d. AB positive

1600. Leukocytes consists of all EXCEPT

a. Neutrophils
b. Eosinophil
c. Basophil
d. Thrombocytes

1601. Granulocytes are .....

a. Neutrophil
b. Eosinophil
c. Basophil
d. All of the above

1602. Agranulocyte is/are _____

a. Neutrophil
b. Monocyte
c. Lymphocyte
d. Both b and c

1603. All statements are correct regarding lymphocytes EXCEPT

a. Comprise 25-40% of white cell population
b. Small and large types can be seen
c. It belongs to agranulocyte
d. T lymphocytes matures in Thyroid gland

1604. All are true regarding monocytes EXCEPT

a. Largest leukocytes can be seen
b. Abundant blue gray cytoplasm
c. Perform phagocytic action
d. It belongs to granulocyte category

1605. Identify correct statement regarding Eosinophil

a. 1-6% of total leukocyte count
b. Larger than neutrophils
c. Count will elevate during allergic reaction
d. All of the above

1606. Blood without blood cell is .....

a. Serum
b. Plasma protein
c. Plasma
d. Coagulation factors

1607. Part of the blood without cells and protein is known as

a. Serum
b. Plasma
c. Blood
d. None

1608. Which among the following is required for the production of RBCs?

a. Vitamin A
b. Folic acid
c. Vitamin D
d. Vitamin E

1609. True regarding plasma is .....

a. Sedimentation of uncoagulated blood gives plasma
b. Fibrinogen and other clotting factors are present
c. Both a and b
d. None of the above

1610. What is the function of thymus gland?

a. Store melanin
b. Store blood cells until they mature
c. Maintain circadian rhythm
d. Kill pathogens

1611. True about macrophage is .....

a. Macrophages are found in Late phase of inflammation
b. Histocytes, Kupffer cells, Osteoclasts are the examples of macrophages
c. Both a and b
d. None of the above

Scanned with CamScanner

1612. **Blood cells that defend against bacterial and fungal infection**
a. Eosinophil b. Neutrophil
c. T-lymphocytes d. B-Lymphocytes

1613. **Myeloid stem cells give rise to all EXCEPT**
a. Neutrophils b. Eosinophil
c. Basophils d. Lymphocyte

1614. **Bone marrow components are .....**
a. Erythroid cells b. Myeloid cells
c. Lymphoid cells d. All of the above

1615. **Highest number of bone marrow cells are .....**
a. Promyelocytes b. Myeloid stem cells
c. Erythroid cells d. Precursor

1616. **Biconcave shape of RBC is maintained by .....protein**
a. Albumin b. Spectrin
c. Globulin d. Microfilament

1617. **Hematopoietic site in fetus is .....**
a. Liver b. Spleen
c. Bone marrow d. Thymus

1618. **Color of hemosiderin is**
a. Black b. Brown
c. Ash d. Red

1619. **Schistocytes are:**
a. Material parasite
b. It indicates increased hemolysis
c. Fragmented RBC
d. Both b and c

1620. **Hemoglobin metabolism release all EXCEPT**
a. Biliverdin b. Bilirubin
c. Interferon d. Urobilinogen

1621. **Most sensitive cells to hypoxia is .....**
a. Myocardial cells b. Neurons
c. Nephrons d. Skeletal muscles

1622. **Chemical causing vasoconstriction is .....**
a. Endothelium releasing substance
b. Thromboxane A2
c. AFP
d. PGE2

1623. **Chemical causing platelet aggregation is .....**
a. Endothelium releasing substance
b. Thromboxane A2
c. AFP
d. PGE2

1624. **Immediate hemostatic mechanism just following the injury .....**
a. Collagen formation
b. Vasoconstriction
c. Prothrombin will convert to thrombin
d. Fibrin deposition

1625. **Which of these statements is TRUE regarding blood?**
a. Generally, there are four types of blood cells
b. Plasma constitutes 55% of the blood volume
c. The normal pH of blood is between the ranges of 7.2 and 7.5
d. The blood volume in an average adult is about 4% of the body weight

1626. **Blood cells are formed at ..... organ**
a. Liver b. Thymus
c. Red bone marrow d. Spleen

1627. **The insufficiency of this substance in the blood may lead to edema of the body.**
a. Albumin b. Hormones
c. Electrolytes d. Gases

1628. **Total no. of blood clotting factors are**
a. 12 b. 13
c. 14 d. 15

1629. **Which of the following is NOT a clotting factor?** *(AIIMS Bhopal Nursing officer, 2018)*
a. Fibrinogen b. Prothrombin
c. Calcium d. Sodium

Explanation: Sodium is not involved in clotting process.

1630. **Which of these types of plasma protein plays an important role in the formation of blood clots?**
a. Albumin b. Fibrinogen
c. Glycoprotein d. Immunoglobulins

1631. **Vitamin required for blood clotting is .....**
a. Vitamin – A b. Vitamin – D
c. Vitamin – E d. Vitamin – K

1632. **Blood cell which is responsible for coagulation is**
a. RBC b. WBC
c. Platelet d. Neutrophil

1633. **In coagulation, the platelets**
a. Activate the soluble fibrinogen to insoluble fibrin
b. Neutralize any free radicals circulating in the blood
c. Aggregate and become adhesive to the damaged vessel wall
d. Attract migration of fibroblasts to form fibrous connective tissues

1634. **Electrolyte required for blood clotting is .....**
a. Na b. K
c. Ca d. P

1635. **The following are the essential requirements for efficient haemostasis except**
a. Intrinsic factor b. Clotting factors
c. Calcium d. Vitamin K

1636. **Plasma protein which present in highest concentration is**
a. Albumin b. Globulin
c. Thromboplastin d. Fibrin

1637. **The main function of haemoglobin is to**
a. Maintain a normal erythrocyte sedimentation rate
b. Neutralize any free radicals circulating in the blood
c. Bind to oxygen and transport it to the tissues
d. Absorb heat generated as a by-product of cell metabolism

1638. **Excessive haemolysis may accumulate this substance in the body.**
a. Bilirubin b. Globulin
c. Haem d. Mineral

Scanned with CamScanner

1639. **The primary stimulus to increase the rate of erythropoiesis is**
a. Hypoxia b. Hypokalemia
c. Hyperthermia d. Hypercapnia

1640. **When a patient has a bacterial infection, which of these blood cells will play an immediate and major role in combating the invading pathogens?**
a. Lymphocytes b. Thrombocytes
c. Basophils d. Neutrophils

1641. **The leucocytes which contain heparin and histamine in their granules and enter tissues as mast cells are**
a. Lymphocytes b. Monocytes
c. Basophils d. Neutrophils

1642. **Which of the following statements is TRUE about hemopoiesis?**
a. The megaloblast undergoes a series of differentiation in thrombopoiesis.
b. All blood cells originate from multipotent stem cells.
c. The formation of platelets is called neutropenia.
d. Vitamin K is essential for erythropoiesis.

1643. **Most Alicia's blood group is A negative. She may receive a blood transfusion from an individual whose blood group is**
a. A positive c. AB positive
c. B negative d. O negative

1644. **The functions of the lymphatic system include all of the following, except**
a. Maintaining tissue fluid balance
b. Functioning as body's defence system
c. Absorbing fat and other substances from the digestive system
d. Producing red blood cells

1645. **The process that assists in the transport of lymph includes**
a. Gravity
b. Blood moving through the arteries
c. Blood moving through the veins
d. Contraction of the surrounding skeletal muscles

1646. **Substances that stimulate an acquired immunity response are called**
a. Antigens b. Antibodies
c. Complements d. Histamines

1647. **Antibody-mediated immunity is effective against**
a. Bacteria b. Viruses
c. Toxins d. All of the above

1648. **Helper and cytotoxic cells belong to**
a. T cells b. B cells
c. Monocytes d. Macrophages

1649. **Identify correct statement regarding hemoglobin**
a. One Hb molecule contain 4 globulin chain
b. One Hb molecule can form bond with 4 oxygen molecule at a time
c. Oxygen is carried in the form of oxyhemoglobin
d. All of the above

1650. **Antihemophilic factor – B is .....**
a. Factor 7 b. Factor 8
c. Factor 9 d. Factor 10

1651. **Antihaemophilic factor – A is .....**
a. Factor 7 b. Factor 8
c. Factor 9 d. Factor 10

1652. **Factor 9 is also known as .....**
a. Stuart Prower factor
b. Hageman factor
c. Christmas factor
d. Thromboplastin

1653. **Von Willebrand factor is secreted by**
a. Liver b. Kidney
c. Vascular endothelium d. Adrenals

1654. **"Prothrombin time" of plasma is prolonged by administration of**
a. Vitamin K b. Dicoumarol
c. Calcium and vitamins d. Proteins and minerals

1655. **Maximum reservoir of blood**
a. Veins b. Aorta
c. Heart d. Capillaries

1656. **Biconcave shape of RBC's is helpful because**
a. Easily passage through capillaries
b. Increased surface area for a given diameter
c. Both a and b
d. None

1657. **Preservation used for storing blood for transfusion is**
a. Heparin + dextrose
b. Citrate + glucose
c. CPDA (citrate phosphate dextrose adenine)
d. EDTA

1658. **Coagulation factor VII is**
a. Thromboplastins b. Accelerin
c. Proconvertin d. Antihemophilic factor

1659. **Oncotic pressure of plasma is due to**
a. Albumin b. Preabumin
c. Electrolytes d. Fibrinogen

1660. **Heme is converted to bilirubin mainly in:**
a. Kidney b. Liver
c. Spleen d. Bone marrow

1661. **Lifespan of Neutrophil**
a. 120 days b. **2-5 days**
c. 24 hours d. 4-6 hours

1662. **Life span of platelets are .....**
a. 8–12 days b. 20–30 days
c. 30–60 days d. 60–70 days

1663. **Life span of RBCs is:** *(DSSSB PHN, 2015)*
a. 120 days b. 80 days
c. 200 days d. 60 days

1664. **Life span of RBCs is**
a. 30–60 days b. 60–90 days
c. 90–120 days d. 120–140 days

1665. **The life-span of the average RBC in a new-born is**
a. 100 days b. 120 days
c. 160 days d. 60 days

1666. **Which of the following components of WBC has longest lifespan?**
a. T-Lymphocyte b. Eosinophil
c. Neutrophil d. Monocyte

1667. **Vitamin K dependent factor is**
a. Factor XII b. Factor IV
c. Prothrombin d. Factor V

1668. **Fresh frozen plasma contains**
a. Plasma proteins and clotting factors
b. RBCs
c. Platelets
d. None of the above

1669. **Platelets are stored at**
a. –40 to –50°C b. –30°C
c. 4°C d. 20-24°C

1670. **The largest group of axillary lymph nodes is:**
a. Central b. Lateral
c. Apical d. Medial

Ans.

1639. a
1640. d
1641. c
1642. b
1643. d
1644. d
1645. d
1646. a
1647. d
1648. a

1670. a

Scanned with CamScanner

1671. Absence of lymph nodes is characteristic of
a. Brain b. Liver
c. Lung d. Placenta

1672. All of the following have no lymphatics, except
a. Brain b. Internal ear
c. Cornea d. Liver

INTRODUCTION

1673. Branch of science that studies the diseases of blood and approach to their diagnosis is .....
a. Hematopathology b. Forensic pathology
c. Transfusion medicine d. Clinical pathology

1674. Which among the following suggests problem with hematological system? *(AIIMS Raipur staff nurse grade I-2018)*
a. Jaundice b. Asthma
c. Renal Calculi d. None of these

Explanation: If there is any problem with hematological system, increased RBC break down can occur and pigment will be released into the blood stream and can lead to jaundice. Asthma and renal calculi are unrelated to hematological system.

INVESTIGATIONS

1675. Prolonged stay in space will lead to all of the following changes in the body except: *(Safdarjung NO 2018)*
a. Decreased blood volume
b. Decreased hematocrit
c. Decreased cardiac output
d. Decreased muscle strength

Explanation: There will be increased hematocrit after a prolonged stay in space due to increased RBC concentrations.

An astronaut in space can lose up to 22% of blood volume after only two or three days. The cardiac output of the heart decreases in space. Astronauts experience up to a 20 percent loss of muscle mass in spaceflights lasting five to 11 days.

1676. Blood drawn for complete blood count (CBC) is collected in: *(Banaras HU 2015)*
a. EDTA vial b. Plain vial
c. Citrate vial d. Chloride vial

1677. Anti-coagulant used in blood sugar vial is .....
a. EDTA
b. Heparin
c. Potassium oxalate
d. Potassium oxalate + sodium fluoride

1678. Anticoagulant appropriate for hematological test is .....
a. EDTA b. Sodium fluoride
c. Heparin d. Clexane

1679. Cell with a horse-shoe shaped nucleus and abundant cytoplasm in a peripheral blood smear is: *(Banaras HU 2015)*
a. Neutrophil
b. Monocyte
c. Lymphocyte
d. Eosinophil

1680. Supravital staining is used for?
a. Nucleated RBC's
b. Reticulocytes
c. Myeloblasts
d. Basophils

Explanation:

Stain	Blood cell
Wright's stain	RBC, WBC (differential count)
Supravital stain	Reticulocyte [stain used New methylene blue or Brilliant cresyl blue]

1681. Diagnostic test for anemia is .....
a. Hematogram and hematocrit
b. History and examination
c. Peripheral blood smear examination
d. All of the above

1682. Test used to find out Vitamin B12 deficiency is .....
a. Schilling test b. Widal test
c. Ortolani's test d. Benedict's test

1683. Total serum protein range is .....
a. 4.0 to 6.2 g/dl b. 5.5 to 6.5 g/dl
c. 6.0 to 8.2 g/dl d. 7.0-9.1 g/dl

1684. What is the INR value for patient with mechanical prosthetic heart valve?
a. 1.5 –2.5 b. 2–3
c. 3–4 d. 2.5 –3.5

1685. Another name for cardiac blood pool image is .....
a. MUGA scan b. Cardiac MRI
c. Thallium scans d. Cardiac PET

1686. Capillary refill time is normally
a. 1–6 sec b. 1–3 sec
c. 2–5 sec d. Less them 10 sec

1687. All of the following statements are TRUE regarding serological tests, EXCEPT?
a. They are type of in-vivo test
b. They are used for identification and quantification of antigens and antibodies
c. Environmental factors like pH, salt concentration and temperature interfere these tests
d. Agglutination reaction and precipitation reactions are examples for serological test

1688. Which is a true statement regarding direct agglutination tests?
a. Detect presence of antibodies in serum
b. Use known antigens present on coated cells
c. Can be used for leishmaniasis and for diagnosing typhoid
d. All of the above

1689. Bone marrow examination is used in .....
a. Megaloblastic anemia
b. Leukemia
c. Myelodysplastic syndrome
d. All of the above

1690. Hemolytic disease of the new born is diagnosed with .....
a. Amniocentesis b. Direct Coombs' test
c. Indirect Coombs test d. Plasmapheresis

1691. Supra vital staining and Brilliant cresyl blue technique is used for .....cells
a. Lymphocyte b. Reticulocytes
c. Neutrophil d. Monocyte

1692. Which one of the following cause hemoglobin curve to shift to right ?
a. Decrease in pH
b. Increase in pH
c. Decrease in temperature
d. ↓ in 2, 3-DPG

Ans.

1671. a
1672. d
1673. a
1674. a
1675. b
1676. a
1677. d
1678. a
1679. b
1680. b
1681. d
1682. a
1683. c
1684. d
1685. a
1686. b
1687. a
1688. d
1689. d
1690. b
1691. b
1692. a

Scanned with CamScanner

1693. **A pulse oximeter continuously measures the level of oxygen saturation of haemoglobin in the**
a. Venous blood
b. Arterial blood
c. Alveolar capillaries
d. Peripheral veins

1694. **Which among the following lab findings is expected in a patient with deficiency of Von Willebrand factor?**
a. Increased PT, Increased- aPTT
b. Decreased.PT, decreased apTT
c. Decreased PT, increased aPTT
d. Normal PT, Increased aPTT

COMMON SIGNS AND SYMPTOMS

Blood Group and Blood Transfusion

1695. **Which chromosome contain ABO locus on its long arm (q arm)?**
a. 7th b. 8th
c. 9th d. 10th

1696. **Which among the following blood group is safe for an AB negative client?**
a. AB positive b. B positive
c. B Negative d. O positive

1697. **Blood group which is not likely to be present in a baby born to mother with O positive and father with A negative blood group?**
a. A positive b. A negative
c. O positive d. AB positive

1698. **Technique used for blood grouping is .....**
a. Immunochromatographic cartridge
b. Card agglutination
c. Gel card technique
d. All of the above

1699. **In which of the following condition is blood transfusion contraindicated?** *(AIIMS BPL SNO 2018)*
a. Bleeding Hemorrhoids b. Hemorrhage
c. Congestive cardiac failure
d. Hemophilia

Explanation: Congestive cardiac failure patients are not usually given blood transfusion as the pumping action of heart in congestive cardiac failure is highly compromised. Blood transfusion will result in fluid overload. Bleeding hemorrhoids, Hemorrhage and Hemophilia are indications for blood transfusion because there is excessive blood loss.

1700. **Most accurate statement regarding blood transfusion is ...**
a. Double checking is required before blood transfusion
b. Use large bore cannula of 16-18 G for blood transfusion
c. In the initial 15 min timing nurse should remain with the client
d. All of the above

1701. **Complication associated with blood transfusion includes**
a. Hyperkalemia b. Air embolism
c. Thrombocytopenia d. All of the above

1702. **During blood transfusion therapy patient developed symptoms like increased temperature, chills and pain in the kidney region. These symptoms indicate ..... reaction**
a. Hemolytic transfusion reaction
b. Anaphylactic transfusion reaction
c. Septic transfusion reaction
d. Thrombotic crisis

1703. **While receiving blood transfusion the patient develops chills and headache. What should be the nurse's initial action?** *(NCFL 2019)*
a. Notify the physician STAT
b. Stop the transfusion immediately
c. Cover the patient with a blanket and administer ordered acetaminophen.
d. Slow the blood flow to keep vein open

Explanation: While receiving blood transfusion, the patient develops chills and headache is the sign of early adverse reaction (febrile reaction). Nurses initial action is to stop the transfusion immediately because it helps to prevent the further life-threatening situations.

1704. **During blood donation at a time single donor can donate .....ml**
a. 100 - 200 ml b. 200 - 250 ml
c. 250 - 300 ml d. 350 - 450 ml

1705. **Types of blood products that can be prepared from one unit of blood is .....**
a. Packed red cells b. Platelet concentrate
c. Fresh plasma d. All of the above

1706. **Anti-Rh antibody can be seen after .....**
a. Pregnancy b. Blood transfusion
c. DIC d. Both a and b

1707. **Platelets can be stored at:**
a. 20-24°C for 5 days b. 20-24°C for 8 days
c. 4-8°C for 5 days d. 4-8°C for 8 days

Explanation: All platelets are stored at room temperature (20–21°C) for 5 days from date of collection.

1708. **Intra vascular hemolysis can be seen in .....**
a. Falciparum malaria
b. Acute G6PD deficiency
c. Incompatible blood transfusion
d. All of the above

1709. **Extravascular hemolysis occurs in -**
a. Thalassemia b. Hereditary spherocytosis
c. Sickle cell disease d. All of the above

1710. **Iron chelating agent is .....** *(AIIMS Bhopal Senior Nursing Officer 2018)*
a. Charcoal b. Deferoxamine
c. Calcium gluconate d. Alum

RBC

1711. **Blood cell decreased in case of anemia is .....**
a. Erythrocytes b. Lymphocytes
c. Leukocytes d. Thrombocytes

1712. **Normal Hb range in adult is .....**
a. 8-10 gm/dL b. 10-12 gm/dL
c. 12-16 gm/dL d. 14-18 gm/dL

1713. **After the transfusion of one unit whole blood expected increase in hemoglobin level is .....**
a. 0.5 gm% b. 1 gm%
c. 1.5 gm% d. 2 gm%

1714. **Normal hematocrit value in male is .....**
a. 10-24% b. 20-34%
c. 30-48% d. 40-54%

1715. **Commonest cause of anemia is .....**
a. Lack of dietary iron b. B12 deficiency
c. Bleeding disorders d. Hook worm infestation

Ans.
1693. b
1694. d
1695. c
1696. c
1697. d
1698. d
1699. c
1700. d
1701. d
1702. a
1703. b
1704. d
1705. d
1706. d
1707. a
1708. d
1709. b
1710. b
1711. a
1712. c
1713. b
1714. d
1715. a

Scanned with CamScanner

1716. **Chief storage form of iron in human body is .....**
a. Elementary iron
b. Serum ferritin
c. Iron hemoglobin complex
d. Serum dextran

1717. **Which of the following statement is NOT true regarding iron absorption**
a. Iron is absorbed better in presence of Vitamin C
b. Citrus fruits promote iron absorption
c. Iron taken on empty stomach enhances its absorption
d. Calcium containing foods including milk promotes iron absorption

1718. **Iron deficiency anemia is present in .....**
a. CRF
b. Thalassemia
c. Sickle cell anemia
d. DIC

1719. **Cause of iron deficiency anemia in CRF is .....**
a. Iron absorption is not taking place
b. Unable to convert iron to transferrin form
c. Decreased erythropoietin secretion
d. Increased RBC destruction

1720. **Characteristic RBC in Chronic Renal Failure is .....**
a. Microcytic
b. Hypochromic
c. Normocytic
d. Macrocytic

1721. **Correct about iron deficiency anemia is .....**
a. Reduced hemoglobin and packed cell volume
b. Reduced mean corpuscular volume
c. Microcytic hypochromic cells on peripheral smear
d. All of the above

1722. **Which among the following blood test reflects the iron deficiency anemia correctly?**
a. Hb level
b. MCH
c. MCHC
d. ESR

Explanation: MCHC stands for Mean Corpuscular Hemoglobin Concentration. These parameters reflect the size and hemoglobin content of the RBC.

1723. **All of the followings statements are true regarding iron deficiency anemia, EXCEPT**
a. Iron is stored in the form of ferritin
b. Initial management is iron rich food and oral iron supplements
c. High MCV
d. Low MCHC

Explanation: Complete Blood Count (CBC) results in iron deficiency anemia include the following: Low mean corpuscular volume (MCV), Low mean corpuscular hemoglobin concentration (MCHC) and Elevated platelet count (>450,000/μL) in most cases

1724. **Which among the following is the most probable diagnosis if RBC, WBC and platelet count is depressed?**
a. Lymphoma
b. Aplastic anemia
c. DIC
d. Thalassemia

1725. **Pancytopenia is present in .....**
a. Aplastic anemia
b. Hemolytic anemia
c. Pernicious anemia
d. Sickle cell anemia

1726. **Aplastic anemia can progress to -**
a. AML
b. ALL
c. Lymphoma
d. All of the above

1727. **The change associated with aplastic anemia is:**
a. Bowel function
b. Bleeding tendencies
c. Fluid deficit
d. Bladder function

Explanation: Aplastic anemia affects the bone marrow which in turn affect all type of blood cells and it cause bleeding tendencies.

1728. **The symptoms of congenital aplastic anemia include:-** *(AIIMS Raipur Grade II 2017)*
A. Purpura
B. Petechia
C. Neutropenia
D. Thalassemia
a. A, B, C
c. B, C, D
b. A, C, D
d. A, B, C, D

Explanation: The symptoms of congenital aplastic anemia are pallor, headache, palpitations, dyspnea, fatigue, foot swelling, gingival bleeding, petechial. In aplastic anemia, bone marrow and hematopoietic stem cells are damaged and cannot produce new blood cells. So deficiency symptoms related to RBC, WBC and platelet will be there.

1729. **Microcytic, hypochromic anemia is the characteristic of ..... anemia**
a. Vit B12
b. Iron deficiency
c. Folic acid deficient
d. Hemorrhagic

1730. **Macrocytic anemia is the characteristic of all except**
a. Liver disease
b. Iron deficiency anemia
c. Thiamine deficiency
d. Vitamin B12 deficiency

1731. **Megaloblastic anemia is present in .....**
a. Ileal resection
b. Crohn's disease
c. Appendicitis
d. Cirrhosis

1732. **Type of anemia present in hemolytic uremic syndrome is**
a. Microangiopathic
b. Macroangiopathic
c. Microcytic
d. Normochromic

1733. **A Nurse is caring for an anemic patient. What finding should suggests her that it is acute blood loss anaemia?** *(NCFL 2019)*
a. Exertional dyspnea
b. Easy Fatigue on exertion
c. Bradycardia at rest
d. Postural hypotension

Explanation: The question is interpreted as "what finding (except anemia) among given options is associated with acute blood loss?". Acute blood loss and dehydration are the major causes of acute postural hypotension. So postural hypotension is the correct answer.

1734. **All of the following are signs of anaemia in a patient except** *(Banaras HU 2015)*
a. Yellowness of the skin
b. Tachycardia
c. Dyspnoea on exertion
d. Lethargy

1735. **Priority nursing diagnosis for a client with iron deficiency anemia?**
a. Impaired gas exchange
b. Activity intolerance
c. Imbalanced nutrition
d. Knowledge deficit

1736. **What is the expected findings during liquid iron therapy?**
a. Patients teeth are stained
b. Stool is black in color
c. Complaining of constipation and leg cramps
d. All of the above

Explanation: All of the above-mentioned findings are expected during iron therapy. These signs and symptoms help to find out the compliance with the therapy.

Ans.

1716.	b
1717.	d
1718.	a

Scanned with CamScanner

1737. Actual impact of anemia is .....
a. Decreased oxygen carrying capacity
b. Low immunity
c. Prolong bleeding
d. Coagulation abnormality

1738. Risk factor for developing anemia is .....
a. Gastric suction b. NG drainage
c. Gastrectomy d. Gastrostomy feeding

1739. Chances of occurrence of sickle cell anemia among children whose parents are affected with the condition
a. 25% b. 50%
c. 75% d. 100%

1740. Hb electrophoresis shows ..... number of bands in sickle cell trait
a. 1 b. 2
c. 3 d. 4

1741. Correct regarding Sickle cell anemia is .....
a. Low hemoglobin level and sickled RBC
b. Cause for hemolytic anemia
c. Fetal Hb is a protective factor
d. All of the above

1742. Which of the following statement is NOT correct about Sickle Cell Anemia?
a. Highest prevalence is seen in Africa
b. It is an autosomal recessive disorder
c. Fetal Hemoglobin is a protective factor
d. High oxygen tension promotes sickling of RBC

1743. All of the following are characteristics of sickle cell anemia, EXCEPT
a. It is an inherited form of anemia
b. RBC has life span of 60-90 days
c. Acute chest syndrome
d. Fetal Hb is a protective factor

1744. Which of the following parameter would be increased in a child having sickle cell anemia?
a. Leukocyte level b. Hemoglobin level
c. Hematocrit level d. Reticulocyte level

1745. Sickle cell anemia gives protection against .....
a. Dengue b. Kala-azar
c. Malaria d. Chikungunya

1746. Hb chain affected in sickle cell anemia is .....
a. α-chain b. β-chain
c. Gamma chain d. All the chain

1747. Auto splenectomy is seen in..... Condition
a. Iron deficiency anemia b. Thalassemia
c. Sickle cell anemia d. Hemophilia

1748. A severe anemic client prescribed to undergo blood transfusion. The total duration of the treatment would be
a. No longer than 4 hours b. 6 hours
c. 8 hours d. 10 hours

1749. In aplastic anemia, lab value will be .....
a. Increased proliferation of macrophages
b. Decreased levels of white blood cells (WBCs), red blood cells (RBCs), and platelets
c. Hyper cellular bone marrow
d. Leukopenia

1750. Hemolytic anemias are characterized by
a. Shortened red cell survival
b. Bone marrow shows erythroid hyperplasia
c. Reticulocyte count and unconjugated bilirubin level will be elevated
d. All of the above

1751. All of the following are types of hemolytic anemia, EXCEPT
a. Sickle cell anemia b. G6PD deficiency
c. Thalassemia d. Megaloblastic anemia

1752. Defect in which of the following is seen in thalassemia
a. Hemoglobin b. Plasma proteins
c. Platelets d. Coagulation proteins

1753. All of the following are True regarding thalassemia, EXCEPT
a. Thalassemia minor is also known as Cooley's anemia
b. Hb electrophoresis and DNA analysis are useful for diagnosing
c. It can affect alpha or beta chain of Hb
d. Thalassemia major is transfusion-dependent.

Explanation: Thalassemia major is also known as Cooley's anemia. All other statements are true regarding thalassemia.

1754. All of the following statement regarding Beta thalassemia is true EXCEPT
a. Reduced or absent synthesis of beta chains of hemoglobin
b. It results in macrocytic hypochromic anemia
c. Patients with thalassemia major have hepatosplenomegaly
d. Treatment includes regular blood transfusion and reducing transfusion iron overload

1755. Which of the following lab findings is expected in a patient with pernicious anemia?
a. Hemoglobin >12.5 g%
b. ESR, 17 mm/hour
c. Intrinsic factor, absent
d. Microcytic hypochromic RBCs

1756. Vitamin B12 deficiency causes
a. Aplastic anemia b. Iron deficiency anemia
c. Pernicious anemia d. Hemolytic anemia

1757. Vitamin B12 deficiency is rare in
a. Non-vegetarians
b. Strict vegetarians
c. Elderly
d. None of the above

1758. Which among the following is the richest source of vitamin B12?
a. Meats and dairy products
b. Grains
c. Green leafy vegetables
d. Mushroom

1759. All are true in relation to schilling test, EXCEPT:
a. The Schilling test is used to determine whether the body absorbs vitamin B12
b. 24-hour urine sample is required for the test
c. Test is performed in four stages
d. NPO is not required for the procedure

Explanation: The Schilling test is a medical investigation used for patients with vitamin B12 (cobalamin) deficiency. The purpose of the test is to determine whether the patient has pernicious anemia. This test is performed in four stages and patient preparation like NPO is required for this procedure.

1760. A patient with pernicious anemia is receiving Vitamin B12 injection. The client asks to the nurse how long I will receive the therapy. The best nursing response is .....
a. Till blood level of B12 become normal
b. Till your hemoglobin level improves
c. Life long
d. For 1 month

Ans.

1749. b
1750. d
1751. d
1752. a
1753. a
1754. b
1755. c
1756. c
1757. a
1758. a
1759. d
1760. c

Scanned with CamScanner

Explanation: Injections of vitamin B12 will be necessary because without intrinsic factor vitamin B12 absorption would not take place. So the person need B12 injection lifelong.

1761. A patient with hemoglobin of 10 g/dl likely to present with
a. Pallor
b. Palpitations
c. Shortness of breath
d. No clinical signs

1762. Nutritional education given to a client with Hb 10g/dl is ...
a. Prepare food in iron containing vessels
b. Use green leafy vegetables and legumes
c. Take deworming tablets
d. All of the above

1763. In high altitude individual RBC count is more because ...
a. Variation in pressure cause increased RBC production
b. Erythropoiesis will be stimulated because of atmospheric hypoxia
c. RBC destruction is more in high altitude
d. Bone marrow become more active

1764. Which among the following suggest problem with hematological system?
a. Uremia
b. Polycythemia vera
c. Gout
d. Renal calculi

1765. Increased RBC's count is known as .....
a. Anemia
b. Leukemia
c. Polycythemia
d. Thalassemia

1766. Causes of relative polycythemia includes all of the following EXCEPT
a. Dehydration
b. Haemorrhagic fever
c. High altitude
d. Gaisbock syndrome

Explanation: People living at high altitudes have absolute polycythemia due to increased erythropoietin synthesis (not relative polycythemia).

1767. Relative and absolute polycythemia can be differentiated by
a. Measuring red cell mass and plasma volume
b. Peripheral smearing
c. Agglutination test
d. All of the above

Explanation: In relative polycythemia, the Hemoglobin and RBC are abnormally high due to an increased concentration of blood (e.g. Dehydration, vomiting, diarrhea etc). Absolute polycythemia is due to increase in the number of RBC.

Relative polycythemia – loss of plasma volume

Absolute polycythemia – increased RBC in circulation

So, Relative and absolute polycythemia can be differentiated by measuring red cell mass and plasma volume.

1768. Correct regarding polycythemia vera is .....
a. Maintain adequate oxygenation
b. Phlebotomies need to be done to decrease the blood volume
c. Activities must be initiated to decrease the thrombus formation
d. All of the above

1769. Which of the following is late symptom of polycythemia vera?
a. Shortness of breath
b. Dizziness and headache
c. Nausea and vomiting
d. Pruritis

WBC

1770. The nurse is caring for a client who had a splenectomy. In the immediate postoperative period, for which complication should the nurse specifically assess in this client?
(RAK MSc 2018)
a. Infection
b. Peritonitis
c. Intestinal obstruction
d. Abdominal distention

Explanation:

- As splenectomy is a procedure that involves surgical removal of spleen and though a person can survive without it but as its function is to filter blood as a part of immune system, the immunity is highly compromised, making the patient more vulnerable to infections. Though overwhelming post splenectomy Infection is common, it is considered to be a long term complication. In a immediate postoperative client with splenectomy, assessment for abdominal distension is more important.

1771. During the time of any infection what will happen to the WBC count?
a. Increased
b. Decreased
c. Remain unchanged
d. Fluctuating

1772. The cells involved in inflammatory reactions are called:
(Kerala PSC, Nov 2014)
a. Neutrophils
b. Eosinophils
c. Basophils
d. Lymphocytes

1773. Eosinophilia causes all EXCEPT
a. Allergic disorders
b. Psoriasis
c. Atopic dermatitis
d. Asthma

1774. All of the following conditions cause neutropenia, EXCEPT
a. Typhoid
b. Viral infections
c. cancer chemotherapy
d. Granulocyte transfusion

1775. The causes of neutropenia include:
(AIIMS Raipur Grade II 2017)
A. Metastatic cancer and lymphoma
B. Cyanotic spell and lymphoma
C. Hypersplenism and chemotherapy
D. Infectious hepatitis and radiation therapy
a. A, B, C
b. B, C, D
c. A, B, D
d. A, C, D

Explanation: The specific causes of neutropenia includes chemotherapy, chronic idiopathic neutropenia in adults, Kostmann's syndrome, Leukemia, myelodysplastic syndrome, myelofibrosis, Myelokathexis, Radiation therapy and vitamin deficiencies. Certain infections which cause neutropenia include Hepatitis A, B, C, AIDS, Malaria, Lyme disease, Salmonella infection, Sepsis, Hypersplenism and Rheumatoid arthritis and other immune disorders.

1776. Patient with which of the following condition is at higher risk of pseudomonas infection?
a. Neutropenia
b. Eosinophilia
c. Thrombopenia
d. Leukocytosis

1777. Important nursing action while caring for a neutropenia client is .....
a. Pain management
b. Infection prevention
c. Prevent fatigue
d. Maintain mobility

1778. Laboratory result expected in a client with infection is .....
a. Pancytopenia
b. Leukocytosis
c. Thrombocytopenia
d. Anemia

Ans.

1761. d
1762. d
1763. b
1764. b
1765. c
1766. c
1767. a
1768. d
1769. d
1770. d
1771. a
1772. d
1773. b
1774. d
1775. d
1776. a
1777. b
1778. b

Scanned with CamScanner

LEUKEMIA

1779. Laboratory results of a client with leukemia indicates elevated blood urea nitrogen (BUN) and uric acid levels. These laboratory results indicates:
a. Lymphadenopathy
b. Thrombocytopenia
c. Hepatic encephalopathy
d. Hypermetabolic state

Explanation: The hypermetabolic (increased rate of metabolism) state related to leukemia causes increased production of urea and uric acid (end products of metabolism). This end products get accumulated in the blood.

1780. Philadelphia chromosome can be seen in .....
a. Cancer of breast
b. Chronic myeloid leukemia
c. Burkitt lymphoma
d. Hodgkin's lymphoma

1781. Acute lymphocytic leukemia (ALL) is commonly seen in people of which age group?
a. 4–12 years
b. 20–30 years
c. 30–45 years
d. 50–70 years

Explanation: The highest incidence of acute lymphocytic leukemia (ALL) is in children of 4–12 years of age.

1782. Which of the following is NOT a common clinical manifestation of Acute Lymphocytic Leukemia (ALL)?
a. Bone and joint pain
b. Fever
c. Petechiae
d. Weight gain

Explanation: Easy bruising, signs of bleeding (petechiae), bone and joint pain, anorexia, weight loss, paleness, pain, lymphadenopathy and night sweats are the common symptoms of ALL. Anorexia and weight loss is common not weight gain.

1783. Malignancy affecting the granulocytic cells lead to .....
a. Fatigue
b. Anemia
c. Bleeding
d. Infection

1784. Bone marrow biopsy is useful in the diagnosis of -
a. CML
b. ALL
c. Hodgkin's lymphoma
d. Burkitt lymphoma

1785. Bone marrow examination is contraindicated in .....
a. Hemophilia
b. Leukemia
c. Anemia
d. None of the above

1786. Bone marrow transplantation is a treatment option for.....
a. Thalassemia
b. Leukemia
c. Aplastic anaemia
d. All of the above

1787. Bone marrow aspiration site is .....
a. Sternum
b. Posterior superior iliac spine
c. Lumbar vertebrae
d. All of the above

1788. The preferred site for bone marrow biopsy in adult is
(ISRO 2018, AIIMS Rishikesh Senior Nursing Officer 2018)
a. Posterior iliac crest
b. Anterior iliac crest
c. Lumbar spinous process
d. All of the above

1789. Site for bone marrow biopsy in an infant is .....
a. Tibia
b. Fibula
c. Femur
d. Iliac crest

1790. Complications of bone marrow aspiration include .....
a. Local infections
b. Bleeding and discomfort at the biopsy site
c. Sternal plate puncture
d. All of the above

1791. Nursing intervention for a client who is having procedural anxiety related to bone marrow biopsy and aspiration is ...
a. Restrain the patient
b. Administer GA
c. Teach relaxation techniques
d. Postpone the procedure.

1792. Nursing care following bone marrow biopsy and aspiration include .....
a. Give pain killers
b. Pressure dressing
c. Look for bleeding and monitor vitals
d. All of the above

1793. Infectious mononucleosis invades.....cells
a. B-cells
b. T-cells
c. Neutrophil
d. Lymphocyte

1794. Most common childhood malignancy is:
a. ALL
b. AML
c. Wilms tumor
d. Retinoblastoma

1795. Multiple myeloma affects .....
a. B-lymphocyte
b. T-lymphocyte
c. Basophil
d. Plasma cell

1796. The confirmative test for the diagnosis of multiple myeloma is
a. Bone marrow biopsy
b. Differential count of WBC
c. Serum calcium
d. PET

Explanation: Blood test, Urine test, X-rays, PET, CT scans, and MRI are useful in diagnosis of multiple myeloma but the definitive confirmation of multiple myeloma can be made only through a bone marrow biopsy.

1797. Patient is susceptible for febrile neutropenia after .....
a. 3 days of chemotherapy
b. 5 days of chemotherapy
c. 7 days of chemotherapy
d. 2 weeks of chemotherapy

1798. Which of the following should be instituted to a patient to prevent febrile neutropenia?
a. Antibiotic prophylaxis
b. Chlorhexidine mouth wash
c. Sitz bath
d. Steam inhalation

Explanation: Antibiotic prophylaxis decrease febrile neutropenia. Antibiotic prophylaxis to patients receiving chemotherapy for acute leukemia and high dose chemotherapy for solid tumors is recommended. It should also be offered to those receiving moderately myelosuppressive chemotherapy for solid tumors and lymphomas during the first cycle of chemotherapy.

1799. Commonly seen leukemia in older adult is .....
a. Acute myelocytic leukemia (AML)
b. Acute lymphocytic leukemia (ALL)
c. Chronic myelocytic leukemia (CML)
d. Chronic lymphocytic leukemia (CLL)

1800. Leukemia and lymphoma are treated with combination of chemotherapeutic drug because .....
a. Minimize the side effect
b. Tackle the problem of drug resistance
c. Maximize the effect of therapy
d. Both b and c

Ans.
1779. d
1780. b
1781. a
1782. d
1783. d
1784. b
1785. a
1786. d
1787. d

1797. c
1798. a
1799. d
1800. d

Scanned with CamScanner

PLATELET

1801. Platelet count of patient suffers from leukemia is 19,000/mm³. Which will be appropriate nursing action ?
a. Check the platelet count again
b. Isolate the patient
c. Use soft toothbrush
d. Monitor for signs of infection

Explanation: Patient has chances for bleeding from decreased platelet count. So, bleeding precautions should be initiated which includes using soft toothbrush to prevent gum bleeding.

1802. Which of the following actions should the nurse prioritize when taking care of a patient with a platelet count of 23,000/mm? *(RAK MSc 2018)*
a. Request an order for an anticoagulant
b. Protect the patient from injury
c. Encourage the patient to drink plenty of fluids
d. No action is necessary

Explanation: The normal value of platelets is 150,000-400,000/mm3. In the above-mentioned situation, the number of platelets is 23,000/mm³, therefore, such patients are at risk of uncontrolled bleeding if injured. So, the priority nursing intervention would be to protect the patient from injury.

1803. The major function of platelets is to
a. Carry oxygen
b. Assist phagocytosis
c. Prevent bleeding
d. Maintain oncotic pressure

1804. Platelet count is normal in patient with
a. DIC
b. Shaken baby syndrome
c. Aplastic anemia
d. Thrombocytopenia

1805. Thrombocytopenia stands for: *(Banaras HU 2015)*
a. Weakness of platelet aggregation
b. Reduced platelet count
c. Increased platelet count
d. Normal platelet count

1806. Thrombocytopenia is a clinical manifestation of .....
a. Dengue hemorrhagic fever
b. Idiopathic thrombocytopenic purpura
c. Leukemia
d. All of the above

1807. Expected clinical manifestation in a thrombocytopenic client .....
a. Spontaneous bleeding
b. Activity intolerance
c. Frequent infection
d. Nutritional imbalances

1808. Which among the following symptom is the major complaint of a client with thrombocytopenia?
a. Weakness and fatigue
b. Frequent fever attack
c. Bruising and hemorrhage
d. Nausea and vomiting

1809. Care instruction to a patient with thrombocytopenia includes all EXCEPT
a. Do not perform ROM exercise
b. While shaving, do not use razor blade.
c. Avoid forceful nasal blowing
d. Avoid medication like aspirin

1810. A client has been admitted with a diagnosis of acute lymphoblastic leukemia and receiving chemotherapy. Which of the following should be monitored to assess the patient for the development of life-threatening thrombocytopenia? *(DSSSB 2006)*
a. Diarrhea
b. Intermittent fever
c. Headache
d. Hematuria

Explanation: Thrombocytes (platelets) play a major role in blood clotting. Thrombocytopenia (decreased platelet count) leads to decreased coagulability of blood and results in hematuria (blood in urine).

1811. Drug that can induce thrombocytopenia .....
a. Heparin
b. Dapsone
c. Streptomycin
d. Adrenaline

1812. Laboratory value findings in a client with disseminated intravascular coagulation (DIC)?
a. Thrombocytopenia
b. High fibrinogen levels
c. Low levels of fibrin degradation products
d. Reduced prothrombin time (PT)

1813. Most common cause of traumatic splenic rupture is
a. Blunt abdominal blows
b. Sharp injury to abdomen
c. lymphoma
d. Rib fracture

1814. Most common cause of non-traumatic splenic rupture is
a. Malaria
b. Cirrhosis
c. Thalassemia
d. ITP

1815. Expected laboratory finding after splenectomy is .....
a. Decreased WBC count
b. Increased hemoglobin
c. Decreased hemoglobin
d. Increased thrombocyte count

1816. Splenomegaly is evident in .....
a. Malaria
b. Kala azar
c. Hemolytic anemia
d. All of the above

1817. Which of the following is affected by platelet count
a. Bleeding time
b. Thrombin time
c. Prothrombin time
d. Partial thromboplastin time

1818. Which test helps us to assess the platelet function?
a. PT
b. aPTT
c. C-reactive protein
d. Bleeding time

COAGULATION DISORDERS

1819. Reduced number of platelets is found in all the conditions except: *(Safdarjung NO 2018)*
a. Disseminated intravascular coagulation
b. Aplastic anemia
c. Acute myeloid leukemia
d. Von Willebrand disease

Explanation:

- Von Willebrand disease (vWD) is an inherited hemorrhagic disorder caused by a deficiency or dysfunction of the protein termed von Willebrand factor (vWF). Consequently, defective vWF interaction between platelets and the vessel wall impairs primary hemostasis. The number of platelets is not reduced.
- Reduced platelet count is seen in all other given conditions.

Ans.

1801.	c
1802.	b
1803.	c
1804.	b
1805.	b
1806.	d

1810.	d
1811.	a
1812.	a
1813.	a
1814.	a
1815.	d
1816.	d
1817.	a
1818.	d
1819.	d

Scanned with CamScanner

1820. Composition of blood transfused to hemophilia patient is: *(AIIMS Nagpur NO 2018)*
a. Plasma b. Packed cells
c. Cryoprecipitate d. Platelets

Explanation: Hemophilia is a condition in which there is lack of sufficient blood clotting proteins in the blood. Cryoprecipitate is prepared from plasma and contains fibrinogen, von Willebrand factor, factor VIII, factor XIII and fibronectin.

1821. The purpose of anti-embolism stockings is to:
a. Promote warmth in the legs *(Daman and Diu NO 2018)*
b. Decrease the arterial circulation to the legs
c. Prevent deep vein thrombosis
d. Prevent foot drop

Explanation: Stockings are applied to prevent venous stasis and usually is applied in the bedridden patients so as to prevent the development of deep vein thrombus, reducing the edema.

1822. All of the following clotting factors are Vitamin K dependent, EXCEPT
a. Factor II b. Factor VII
c. Factor VIII d. Protein IX

Explanation: The key vitamin K-dependent proteins include:
- **Coagulation proteins:** Factors II (prothrombin), VII, IX and X
- **Anticoagulation proteins:** Proteins C, S and Z
- **Others:** Osteocalcin and matrix-Gla protein, and certain ribosomal proteins

1823. All of the following are platelet associated coagulation factors EXCEPT
a. Von Willebrand Factor b. Factor IX
c. Factor XI d. Factor XIII

1824. Feature of factor XIII deficiency is .....
a. Early solubilization of clot
b. Fibrinogen to fibrin conversion will not be there
c. Activation of platelet will be delayed
d. Small clot fragments

1825. Bleeding time is more in .....
a. Von Willebrand disease b. Thrombocytopenia
c. Both a and b d. DIC

1826. Clotting time is more in .....
a. Severe hemophilia b. Afibrinogenemia
c. DIC d. All of the above

1827. Increase in coagulation time is the characteristic of .....
a. Hemophilia b. Von Willebrand disease
c. Christmas disease d. All of the above

1828. Prolonged PT is seen in .....
a. Warfarin therapy b. Heparin therapy
c. Liver disease d. All of the above

1829. Bleeding time range using Duke Method is .....
a. 30 sec–1minute b. 0–1 minutes
c. 1–3 minutes d. 2–5 minutes

Explanation: There are two methods of Bleeding time assessment.
- Normal range in Duke method is 1-3 mins.
- Normal range in Ivy method is 2-9 mins.

1830. Clotting time range is
a. 30 sec -1minute b. 0-1 minutes
c. 1-3 minutes d. 2-6 minutes

1831. Increased Prothrombin time can be seen in
a. Heparin therapy b. Warfarin therapy
c. Low level of vitamin K d. All of the above

1832. Blood coagulation requires .....
a. Vit K b. Calcium
c. Fibrinogen d. All of the above

1833. Vitamin required for maintaining blood circulation and coagulation is .....
a. Vit A b. Vit D
c. Vit E d. Vit K

1834. The laboratory results of a patient with disseminated intravascular coagulation are likely to include-
a. Prolonged prothrombin and partial thromboplastin times
b. Increased platelet counts
c. Increased levels of fibrinogen
d. Decreased levels of fibrin split products.

1835. Important observation for a patient on anticoagulant therapy includes: *(JIPMER 2012)*
a. Headache b. Chest pain
c. Epistaxis d. Hypotension

1836. Most dangerous complication of venous thrombus is: *(LNJP H D 2012)*
a. Chronic occlusion of the vein
b. Pulmonary embolism
c. Formation of venous ulcers
d. Gangrenous development of veins

1837. Hemophilia is associated with:
a. X chromosome b. Y chromosome
c. Chromosome 11 d. Chromosome 21

1838. If a cross is made between hemophilic man and normal woman, chance of the progeny in the subsequent generation is: *(Kerala PSC, Nov 2014)*
a. Hemophilic male b. Hemophilic female
c. Carrier male d. Carrier female

1839. A major complication associated with thrombolytic therapy is
a. Clot expansion b. Air embolism
c. Cerebral hemorrhage d. All of the above

1840. Hemophilia A is caused by lack of clotting factor
a. VII b. VIII
c. IX d. X

1841. Hemophilia B is caused by lack of clotting factor
a. VII b. VIII
c. IX d. X

1842. Which of the following coagulation disorder is an autosomal dominant disease
a. Hemophilia A b. Hemophilia B
c. Von Willebrand Disease d. All of the above

1843. Production site for Von Willebrand factor is .....
a. Vascular endothelium b. Platelet
c. Liver d. RBCs

1844. The best screening test for hemophilia:
a. Bleeding time b. Clotting time
c. PTT d. All of the above

1845. Which of the following vitamin is affected by oral antibiotic therapy that may lead to hypoprothrombinemia?
a. Vitamin A b. Vitamin D
c. Vitamin E d. Vitamin K

1846. Warfarin should be withheld _____ hours before any invasive procedure?
a. 5 h b. 18 h
c. 10 h d. 24 h

1847. The drug that act by dissolving the blood clot is:
a. Aspirin b. Heparin
c. Streptokinase d. Vitamin-K

Ans.

1820. c
1821. c
1822. c
1823. b
1824. a
1825. c
1826. d
1827. d
1828. d
1829. c

1844. c
1845. d
1846. d
1847. c

Scanned with CamScanner

1848. True about heparin therapy is that heparin
a. Prolongs the blood clotting time
b. Prolongs the bleeding time
c. Decreases the clotting time
d. Decreases blood viscosity

1849. Heparin acts by:
a. Interfering with vitamin K absorption
b. Dissolving existing thrombi
c. Inactivating thrombin that forms and dissolves existing thrombi
d. Preventing conversion of factors that are needed in the formation of clots

Explanation: Once active thrombosis has developed, larger amounts of heparin can inhibit further coagulation by inactivating thrombin and preventing the conversion of fibrinogen to fibrin. Heparin also prevents the formation of a stable fibrin clot in inhibiting the activation of the fibrin stabilizing factor.

1850. Increased Prothrombin time is/are seen when Patient
a. Is on oral anticoagulant
b. Has liver disease and Vitamin K deficiency
c. Factor VII and X deficiency
d. All of the above

1851. International normalized ratio (INR) is a laboratory test used to:
a. Assess the effect of oral anticoagulant
b. A measure of the number of polymorphonuclear cells in the blood
c. Is a relative amount of albumin to globulin
d. To differentiate various causes of liver damage

Explanation: The international normalised ratio (INR) is a laboratory measurement of how long it takes blood to form a clot. It is used to determine the effects of oral anticoagulants on the clotting system.

1852. Warfarin interferes with .....
a. Calcium metabolism
b. Fibrin formation
c. Vitamin K cycle
d. Collagen formation

1853. The choice of coagulation study for a person who is in warfarin therapy is
a. PT
b. INR
c. APTT
d. Platelet count

Explanation: International normalized ratio (INR) is a calculation made to standardize prothrombin time. INR is based on the ratio of the patient's prothrombin time and the normal mean prothrombin time. Prothrombin time is a test to learn how fast the blood clots in patients receiving oral anticoagulant medication. APTT is used to evaluate the effect of heparin.

1854. Recommended value of international normalization ratio (INR) during warfarin therapy?
a. 1 to 2
b. 1 to 3
c. 2 to 3
d. 2 to 4

1855. Most commonly thrombosis occurs in .....
a. Vein
b. Artery
c. Lymph
d. Capillary

1856. Thrombolytic therapy used in myocardial infarction is...
a. Heparin
b. T-PA
c. Nitroglycerine
d. Streptokinase

1857. Drug of choice to improve platelet count in a patient with idiopathic thrombocytopenic purpura is
a. Salicylic acid
b. Corticosteroids
c. Allopurinol
d. Vitamin K

1858. In a client with bleeding disorder, all of the following signs and symptoms suggest internal bleeding, Except:
a. Unexplained nosebleeds
b. Melena
c. Hypertension
d. Bruising

1859. Clinical manifestations of thromboembolism?
a. Edema
b. Swelling
c. Redness
d. All of the above

1860. A patient with von Willebrand (vWF) deficiency undergoing surgery, this patient needs to be treated with .....along with vWF
a. Thrombin
b. Factor VII
c. Factor VIII
d. Factor IX

1861. Risk factor for Deep Vein Thrombosis (DVT) among the following is .....
a. Oral contraceptive pills
b. Hypertension
c. Myocardial infarction
d. All of the above

1862. Classic symptoms of deep vein thrombosis (DVT) include all of the following, except: *(DSSSB 2013)*
a. Homans sign
b. Muscle pain
c. Cyanosis
d. Swelling

Explanation: Classic symptoms of DVT includes: Leg pain, including tenderness to the touch, that may worsen when standing or walking, swelling of the affected leg, skin discoloration and warmth and redness of the skin.

1863. Client with DVT experiencing dyspnea, chest pain, and diminished breath sounds. Possible diagnosis will be .....
a. Pericarditis
b. Pneumothorax
c. Pulmonary embolism
d. Mediastinal tumor

Ans.

Scanned with CamScanner

1864. **Which of the following statement regarding DIC is NOT true**
   a. Thrombocytopenia occurs
   b. Depleted clotting factors
   c. Increased prothrombin time
   d. Lab investigation shows decreased d-dimer level

1865. **DIC can occur in all of the following EXCEPT**
   a. Snake bite
   b. Placenta praevia
   c. Falciparum malaria
   d. Hemophilia

1866. **Blood coagulating faster than normal, causing thrombin and other clotting factors to multiply is known as .....**
   a. DIC
   b. Hypercoagulability
   c. Hemophilia
   d. Thalassemia

1867. **Characteristic pain in newly diagnosed DVT is .....**
   a. Stabbing pain
   b. Shooting pain
   c. Sudden onset
   d. Tingling

1868. **In DVT client pain can be managed by .....**
   a. Elastic stockings
   b. Leg elevation
   c. ROM exercises
   d. Hot application

1869. **Pressure on the popliteal space can lead to ..... complication**
   a. Pulmonary embolism b. Air embolism
   c. Pulmonary edema d. Deep vein thrombosis

Ans.

1882. d

Explanation: Popliteal vein thrombosis is a condition in which a blood clot develops in the popliteal vein. Popliteal vein thrombosis is a type of venous thromboembolism (VTE), which is also called deep vein thrombosis (DVT). It is potentially life-threatening because the thrombus that can move and travels to the lungs and cause pulmonary embolism (PE).

1870. **Which term best describes the findings on cautious palpation of the vein in typical superficial thrombophlebitis?**
   a. Dilated b. Knotty
   c. Smooth d. Tortuous

1871. **Calf muscle pain due to sharp dorsiflexion of the foot is known as .....**
   a. Chovstek sign
   b. Trousseau's sign
   c. Positive Babinski's reflex
   d. Positive Homans' sign

1872. **Health education to a client on anticoagulant therapy includes .....**
   a. Report any signs of bleeding
   b. Do lab studies such as PT, INR as ordered
   c. Both a and b
   d. None of the above

1873. **Nursing management for a client with thrombolytic agent include .....**
   a. Avoid puncture wounds
   b. Monitor potassium levels
   c. Avoid swimming
   d. Activity restriction

1874. **All of the following statement regarding Idiopathic Thrombocytopenic Purpura (ITP) are true, EXCEPT:**
   a. Patients suffer from bruising
   b. Nosebleeds and bleeding gums may occur
   c. Shortened bleeding time
   d. It is an autoimmune disorder

1875. **Which of the following statement is NOT correct about immune thrombocytopenic purpura (ITP)?**
   a. It is an autoimmune disorder
   b. Immune mediated destruction of platelets occurs
   c. Anti-platelet antibodies will not cross the placenta in a pregnant woman
   d. Spontaneous resolution of Acute form of ITP within two months

1876. **An emboli is .....**
   a. Movable blood clot
   b. Movable debris
   c. Movable pus
   d. Movable air bubble

1877. **Hereditary pattern of G6PD deficiency is .....**
   a. Autosomal dominant trait
   b. Autosomal recessive trait
   c. X-linked recessive trait
   d. X-linked dominant trait

1878. **Which of the following is TRUE regarding G6PD deficiency?**
   a. X linked recessive disorder
   b. It is a cause for hemolytic anemia
   c. Both intravascular and extravascular hemolysis is seen
   d. All of the above

1879. **Drug that is safe in G6PD deficiency:**
   a. Primaquine b. Acetanilide
   c. Quinidine d. Dapsone

1880. **Drug causing maximum hemolysis in G6PD deficiency is?**
   a. Primaquine
   b. Chloroquine
   c. Ciprofloxacin
   d. Gatifloxacin

1881. **Individuals having G6PD deficiency can be poisoned by**
   a. Fava beans
   b. Soya beans
   c. Khesari dhal
   d. Maize

1882. **True regarding Dengue fever is .....**
   a. It is caused by RNA virus and is also known as break-bone fever
   b. Low platelet count is the characteristic of this disease
   c. It is transmitted by A.aegypti
   d. All of the above

Scanned with CamScanner

RENAL SYSTEM

ANATOMY AND PHYSIOLOGY OF RENAL SYSTEM

Kidney

- Paired brownish red structures located retroperitoneally
- **Location:** T12-L3 (in Adult)
- **Weight:** 120-170 gm
- **Dimension:** 12 cm long × 6 cm wide × 2.5 cm thick
- Kidney has two distinct region (Renal parenchyma and renal pelvis)

Figure 64 ■ Cross section of kidney

- **Renal parenchyma**
  - It is further divided into cortex and medulla.
  - Cortex contain glomeruli, proximal and distal tubules and cortical collecting duct.
  - Renal medulla contains pyramids.
- **Renal pelvis**
  - **Renal pelvis or hilum:** Area through which artery, vein and nerves enter and leave kidney.
- **Glomerulus**
  - Renal artery is a branch of abdominal aorta.
  - Renal artery divides into smaller and smaller vessels and form glomerulus.
  - Glomerulus is the capillary bed responsible for filtration:
    - **Afferent arterioles:** Blood enters into the glomerulus through it (**Remember:** A before E – Entry before exit)
    - **Efferent arterioles:** Blood leaves the glomerulus through it.
  - **Normal GFR: 90–120 ml/min**
- **Nephrons**
  - Functional unit of kidney
  - Each nephron consists of glomerulus, Bowman's capsule, proximal tubules, loop of Henle, distant tubule and collecting duct.
  - Collecting duct empty into minor calyx then to major calyx and it opens to renal pelvis.
  - Two types of nephrons are there:
    - Cortical nephron - Found in the cortex of kidney
    - Juxtamedullary nephron - Seen adjacent to medulla

Figure 65 ■ Renal system

- **Bowman's capsule:** Double walled capsule which surrounds glomerulus. Glomerular filtrate filtered into bowman's space.
- **Proximal convoluted tubules:** It receives glomerular filtrate from bowman's capsule. Reabsorb water and electrolyte through active and passive transport.
- **Descending loop of Henle** — Passively reabsorbs water.
- **Ascending loop of Henle** — Passively reabsorbs sodium and chlorine.
- **Distal convoluted tubules** actively and passively removes sodium and water. ADH makes DCT and collecting duct permeable to water.

Scanned with CamScanner

Figure 66 ■ Ultrafiltration, selective reabsorption and osmoregulation by kidney

Ureter

- Fibromuscular tube which connects kidney and bladder.
- Urine formed in the nephron drains into ureter.
- 24-30 cm in length; 3-4 mm in diameter
- Originates in the lower portion of renal pelvis and terminate at trigons of bladder.
- **Right ureter is slightly shorter than the left** (due to position of the kidney)
- Ureter is lined with transitional epithelium.
- It has three narrowed portions:
  - Ureteropelvic junction
  - Ureteral part near sacroiliac segment
  - Urterovesical junction
- **Narrowed portions of the ureter are more prone to develop stricture and calculi.**

Urinary Bladder

- Muscular hollow organ located behind pubic bone.
- Four layers (from inside to outside):
  - Mucosa (inner most)
  - Submucosa
  - Muscularis
  - Serosa or adventitia (outer most)
- In infancy, bladder is an abdominal organ. Later it descends into the pelvic cavity.
- **Capacity:** 300-600 ml of urine in adult
- Bladder is lined with **transitional epithelium**.
- In adult, bladder filling and emptying is mediated by sympathetic and parasympathetic nervous system while in an infant it is controlled by the micturition center located in the pons area of brain stem

Figure 67 ■ Renal system– anatomical view

Urethra

- In males, it passes through penis while in female it opens jus anterior to vagina.
- **Female:** 4 – 5 cm long; Urethra is only for urinating.
- **Male:** 20 cm long; common for urination and ejaculation

Scanned with CamScanner

- Urethritis is more common among females than male.
- **Hypospadias:** Urethra opens on the underside (ventral surface) of penis.
- **Epispadias:** Urethra opens on the topside (dorsum) of penis.

Figure 68 ■ Hypospadias and epispadias

FUNCTIONS OF KIDNEY

Urine Formation

- Urine is formed in the nephrons through three steps:
  - Glomerular filtration
  - Tubular reabsorption
  - Tubular secretion
- **Regulation of water in the body**
  - It is under the control of ADH hormone secreted by posterior pituitary.
  - ADH secretion occurs in response to hypovolemia, increased sodium level and in dehydration.
  - ADH makes DCT and collecting duct to reabsorb more water and there by produce concentrated urine.

  Lack of ADH hormone leads to diabetes insipidus.
- **Regulation of sodium and Potassium in the body**
  - Controlled by two hormones; Aldosterone & Angiotensin II
    - **Aldosterone mechanism**

Figure 69 ■ Sodium and potassium regulation by aldosterone

- Retention of potassium is the most life threatening complication of renal failure.

- **Renin-Angiotensin-Aldosterone mechanism**
  - Increased sodium and water reabsorption leads to increased blood volume and BP.

Figure 70 ■ Renin-Angiotensin-Aldosterone mechanism

- **Regulation of blood pH**
  - Blood pH is controlled through buffer system
  - Carbonic acid and Sodium-bi-carbonate are blood buffers to maintain its pH.
  - Concentration of carbonic acid – Under the control of respiratory system
  - Concentration of bicarbonate - Under the control of kidney.

Scanned with CamScanner

- Sodium is reabsorbed in DCT in exchange for hydrogen or potassium ion.
- **Regulation of RBC production**
  - When there is decreased oxygen tension in the renal blood flow kidney produces erythropoietin hormone which stimulates RBC production.
- **Vitamin D synthesis**
  - Kidneys are also responsible for final conversion of inactive form of vitamin D to its active form 1, 25 dihydroxy-cholecalciferol.

INVESTIGATIONS

Urine Specific Gravity

- Normal value: 1.010-1.030
- **Methods of assessment:** Multiple dipstick test, urinometer and refractometer

Key Points

- Specific gravity increases in concentrated urine (with less fluid intake, dehydration etc.)
- Specific gravity decreases in diluted urine (polyuria, diabetes insipidus etc.)

Urinalysis

- Catch early morning voiding sample.
- In case of a female patient with menstruation, indicate it in the form.

Table 68 Urinalysis values

Color	Straw
Specific gravity	1.005 to 1.030
pH	4.6–8.0
Na	40–220 mEq/24 hours
K	25–125 mEq/24 hrs
Cl	80–250 mEq/day
Total Nitrogen	10–20 g/24 hrs
Creatinine	1.0 – 2.0 g/24 hrs
Calcium	0.1 – 0.7 g/24 hrs
Protein	1–15 mg/dL
Osmolality	80–1300 mOsm/L
Urine bilirubin	Negative
Urine blood	Negative
Urine ketone	Negative
Urine leukocytes	Negative
RBC's	0–2/HPF
WBC's	0–2/HPF
RBC casts	0/HPF

Urine Culture and Sensitivity

- Catch mid-stream urine into a sterile container
- Send the sample immediately to the laboratory.

Renal Function Test

Table 69 Renal function tests

Sodium	135–145 mEq/L
Potassium	3.5–5.5 mEq/L
Chloride	98–107 mEq/L
Bicarbonate	24–28 mEq/L
BUN (Blood Urea Nitrogen	7–20 mg/dL or 2.5–8.0 mmol/L
Creatinine	0.6–1.2 mg/dL or 60–125 umol/L

- Electrolyte disturbances may be due to renal failure, alterations in hydration (hypo or hyper), drug use (diuretics), alterations in pH (acidosis or alkalosis), diabetic ketoacidosis, adrenal disease, etc.
- Renal failure (and increasing BUN and creatinine) may be due to acute tubular necrosis (due to hypotension), glomerulonephritis, diabetic nephropathy, urinary tract infection, etc.

Key Points

Name of the procedure	Points to remember
Intravenous pyelography: After the injection with a dye, X-ray is taken to assess the renal system functioning.	**Pre-Procedure** • Informed consent • Assess allergy to dye, iodine and sea food • NPO after midnight • Inform the client about warm, salty, metallic taste after the injection of dye. **Post-procedure** • Increase the fluid intake if not contraindicated • Assess the puncture site for bleeding
Vanillylmandelic acid (VMA) test: 24 hr urine collection to diagnose pheochromocytoma.	• Instruct client to avoid food such as coffee, cola, vanilla, cheese, gelatin and fruits before the test. • Instruct to avoid stress • Encourage adequate food and fluid intake
Renal angiography: Dye is injected through a catheter inserted in the axillary or femoral artery to examine renal vein and artery.	**Before procedure** • Informed consent • Assess allergy to dye, iodine and sea food. • NPO after midnight • Inform the client about warm, salty, metallic taste after the injection of dye. • Instruct client to void immediately before the procedure. **Post-procedure** • Observe the injection site for bleeding and hematoma. • If axillary artery is used, BP has to be taken on the opposite arm • Assess peripheral pulse distal to the puncture site to assess the circulation.

Contd...

Scanned with CamScanner

Name of the procedure	Points to remember
	• After the procedure client has to lie in **supine position with legs straight.**
Renal biopsy	**Before procedure** • Informed consent • Obtain coagulation studies • Position the client in a prone with pillow under abdomen and shoulder • NPO after midnight • Contraindications to biopsy are uncontrolled hypertension, solitary kidney and bleeding tendencies. **During procedure** • While inserting the needle client is instructed to **breathe in and hold the breath** to prevent kidney from moving. **Post-procedure** • Monitor for hypotension and tachycardia which indicates bleeding. • Apply pressure at puncture site • After biopsy, place client in supine position and on bed rest.

DISORDERS OF RENAL SYSTEM

Urethral Strictures

- Narrowing of the urethra as a result of contraction or scar.
- Gradual dilatation and surgery (internal urethrotomy) are the management.

Urolithiasis

- **Urolithiasis:** Stone anywhere in the urinary tract
- **Renal calculi or nephrolithiasis:** stone in the kidney
- **Causes:** Dehydration, presence of crystal forming substances, and absence of substances that inhibit crystallization of urine
- **Crystal forming substances:** Calcium, phosphate, Oxalate, Uric acid, cysteine
- **Crystallization preventing substances:** Magnesium, citrate, nephrocalcin and osteopontin
- **Predisposing factors:** Immobility, dehydration, increased calcium concentration in blood and urine
- **Pain in renal calculi:** Originates in lumbar region and radiates around the testicle in man and bladder in women.
- **Pain in urethral colic** will be radiating towards the genital area and thigh.
- **Uric acid stone**
  - Seen in patient with gout and myelo-proliferative disease.
  - **Low purine diet** (restrict organ meet, mushroom and shellfish) is advised
  - **Treatment:** Allopurinol
  - **Alkaline-ash diet** is recommended (because it is acidic stone).
- **Oxalate stone**
  - Stone formation occurs in patient with inflammatory bowel disease, ileostomy or bowel resection because more oxalate will be absorbed in these patients.
  - Decrease intake of oxalate containing food items such as spinach, chocolate, almond, wheat bran, tea and peanut.
  - Acid-ash diet is recommended (because it is Alkaline stone)
- **Struvite stone**
  - Also known as infection stone
  - Formed due to persistently alkaline and ammonia rich urine.
  - Composed of magnesium and ammonium phosphate.
  - Acid-ash diet is recommended.
- **Cystic stone**
  - Formed in patient with rare hereditary disorder of cysteine absorption
  - Client is instructed to avoid milk, meats, eggs and cheese
  - Alkaline-ash diet is recommended.

Key Points

- More than 75% of urinary stones are calcium based. Calcium restriction along with increased fluid intake and thiazide diuretics are recommended.
- Low purine diet for uric acid stone
- Acid-ash diet is recommended for Oxalate and Struvite stone
- Alkaline-ash diet is recommended for Uric acid and cystic stone.

Table 70 Differences between acid-ash diet and alkaline-ash diet

Acid-ash diet	Alkaline-ash diet
• Decreases the urinary pH • Food to be included: ▪ Bread, cereal, whole grain, cheese, eggs, corn, legumes, plumes, tomato, meat, fish, poultry	• Increases urine pH • Food to be included: ▪ Fruits except tomato, cranberry, plums, and prunes. ▪ Milk, most of the vegetables

- **Treatment of urolithiasis**
  - **Cystoscopy:** For stones in lower ureter or bladder
  - **Extracorporeal shock wave lithotripsy (ESWL)**
    - Non-invasive method
    - Ultrasonic waves are used to crush the stone into pieces and it is excreted via urine
    - Fluoroscopy helps in visualizing stones.
    - Suitable for stones in upper ureter or kidney
    - **Before procedure:** Keep the patient NPO 8 hours before procedure
    - **Post procedure**
      - Monitor the client for bleeding
      - Maintain intake-output chart
      - Increase fluid intake
      - Ambulation helps in removal of stones
  - **Percutaneous lithotripsy**
    - Invasive method
    - Under fluoroscopy guidance, guide wire is inserted and ultrasonic waves are delivered to break the stone.
    - Used for ureter, bladder or kidney stones
  - **Ureterolithotomy**
    - Open surgical procedure to remove stones in the ureter.

Scanned with CamScanner

Glomerulonephritis

- Inflammation of glomeruli due to infection or autoimmune reactions in the body.
- Antigen-antibody reaction lead to inflammation of glomeruli
- **Causes**
  - Group A beta hemolytic streptococci
  - Immunological or autoimmune diseases
- This can occur following a throat infection (strep throat) or impetigo
- **Clinical Manifestations**
  - Gross hematuria (blood is visible in urine)
  - Proteinuria
  - Dark smoky cola colored urine
  - low urine pH
  - Increased specific gravity of urine
  - Increased BUN and serum creatinine
  - Oliguria or anuria
- **Increased ASO titer** can be seen
- High calorie, low sodium, low potassium, low protein diet is advised.

Nephrotic Syndrome

- Characterized by triad of symptoms such as heavy proteinuria (>1 g/m²/day), hypoalbuminemia (serum albumin <2.5 mg/dL) and edema.
- Monitor vital signs mainly BP for hypertension and hypotension due to fluid shift.
- Strict intake and output monitoring and abdominal girth monitoring.
- Assess daily weight on same time in minimal clothing.
- Edema first appears around the eyes and then it spreads to other body parts.
- **Management**
  - Diuretics, corticosteroids
  - Low sodium and low to moderate protein diet.

Key Points

Most common cause of nephrotic syndrome in adults is Diabetes Mellitus

Table 71 Comparison of nephritic syndrome and nephrotic syndrome

Nephritic syndrome	Nephrotic syndrome
• Hematuria • Azotemia • Proteinuria (<3.5 gm/day) • Oliguria • Edema • Hypertension	• Proteinuria (>3.5 gm/day) • Hypoalbuminemia • Hyperlipidemia • Lipiduria

Acute Renal Failure (ARF)

- Rapid loss of kidney function from renal cell damage.
- Causes of renal failure

Table 72 Causes of renal failure

Pre-renal cause	Intra-renal cause	Post-renal cause
Impaired renal blood flow leads to hypo perfusion in the kidney	Glomeruli damage lead to impaired filtration	Obstruction beyond kidney
Volume depletion Heart failure Sepsis Anaphylaxis	Burns Renal trauma Infection Nephrotoxic drug	Bladder neck obstruction Bladder cancer Calculi Post renal infection

Key Points

Most common type of ARF is prerenal failure

Phases of Renal Failure

1. Initiation

- Start with initial insult till the development of oliguria

2. Oliguria

- Urine output less than 400 ml/day
- Signs of excess fluid volume such as hypertension, pleural effusion, pericardial effusion, edema, CHF
- Signs of metabolic acidosis including Kussmaul's respiration
- Hypervolemia, hyperkalemia and hypernatremia

3. Diuresis

- Urine output slowly rises
- Gradual decline in BUN level and creatinine level.
- Hyponatremia and hypovolemia can occur.

4. Recovery

Improvement in GFR

- **Nursing Management**
  - Strict intake and output monitoring
  - Daily weight on same scale at same time in minimal clothing

Chronic Renal Failure (End Stage Renal Disease)

- Progressive and irreversible loss of renal function which leads to azotemia and uremia.
- Uremic syndrome cause varying symptoms in the body and it will affect almost all systems of the body.

Uremic syndrome: Refers to accumulation of nitrogenous waste in the body due to the inability of kidney to filter them in ARF and CRF.

- **Clinical manifestations**
  - Hypertension (due to sodium and water accumulation)
  - Pulmonary edema (due to fluid overload)
  - Pericarditis (due to uremic toxins)
  - Pruritus, uremic frost (due to uremic toxins)
  - Weakness, fatigue, confusion, tremors, seizure, disorientation
  - Crackles, pleuritic pain, Kussmaul respiration
  - Uremic fetor (ammonia odor to breathe), metallic taste, nausea, vomiting
  - Anemia, thrombocytopenia, hyperkalemia

Scanned with CamScanner

tages of CKD

age 1

40-75% of nephrons are damaged.
Patient remains asymptomatic as the remaining nephrons over work

age 2

75-90% of the nephrons lost its function.
Serum BUN and creatinine rises.
Polyuria and nocturia occur in patient.

age 3 (End Stage Renal Disease)

Less than 10% of the nephrons are functioning.
Dialysis is needed immediately

Key Points

Daily weight on same scale at same time is the best method to monitor fluid balance.
CKD patient are at risk for life threatening arrhythmia due to hyperkalemia. Need to be continuously monitored.
Injection erythropoietin is needed by CKD client to stimulate erythropoiesis.

Hemodialysis

Removal of uremic and nitrogenous waste from the body with the help of a machine.
A dialyzer or artificial kidney serves as a semi-permeable membrane in place of renal glomeruli.
Principles used in Hemodialysis:

- **Diffusion:** Toxins and waste products move from area of higher concentration to area of lower concentration. i.e. from blood to dialysate.
- **Osmosis:** Water moves from area of higher solute concentration to area of lower solute concentration.
- **Ultrafiltration:** water moving from area of higher pressure to area of lower pressure. More efficient method in removing water than osmosis. This can be achieved by applying negative pressure or suction to dialysate membrane.
  - Bicarbonate or acetate is used in dialysate bath preparation.

Dialyzer

- Flat plate or hollow fiber dialyzers are available. Semipermeable membrane is made up of cellophane tubules.

Dialysate

- The fluid medium passed in a dialysis filter (membrane) to exchange solutes with the blood is known as dialysate
- The composition of dialysate includes Sodium, Potassium, Chloride, Calcium, Magnisium, Acetate, Bicarbonate, Lactate and Glucose.

Key Points

Peritoneal dialysate contains higher glucose concentration than hemodialysis.

Vascular Access in Hemodialysis

Subclavian/Internal jugular/Femoral

- Insert double lumen or multiple lumen catheter into the desired vein to establish vascular access.

- Assess site for bleeding, hematoma, infection and thrombus formation.
- Between dialysis treatments, catheter should be filled with heparin and cap it to maintain patency of the line.

Key Points

Client with femoral catheter should not sit at more than 45 degree angle because it may lead to catheter displacement.

- **Fistula**
  - Anastomosing an artery and vein either side to side or end to side
  - Arterial segment is for outflow and venous segment is for inflow.
  - Maturity of the fistula will take 4-6 weeks.
  - Squeezing of a ball exercise helps the fistula to mature.

Figure 71 ▪ Fistula

- **Graft**
  - It is created by placing a biological or semi-biological or synthetic material between artery and vein.
  - This is used when fistula is not possible.
  - **Complications:** Thrombosis and infection are most common complications
  - Graft can be used after 2 weeks of creation.

Figure 72 ▪ Vascular access

Scanned with CamScanner

Key Points

Arterial steal syndrome can happen in case of fistula or graft because too much of blood is diverted into the venous end and it can even lead to Congestive Heart Failure.

Points to remember while caring a client with graft or fistula are:

- **Extremity with graft or fistula** should not be used for BP monitoring, IV line insertion, drawing blood sample or giving injections.
- Normally a **thrill can be palpated** and a **bruit can be auscultated** over graft or fistula site.
- Palpate the pulse distal to fistula or graft to ensure tissue perfusion.

Complications of Hemodialysis

- **Hypotension:** A client may be asked to skip anti-hypertensive drug dosage before hemodialysis.
- **Muscle cramps** due to the movement of electrolyte from extra cellular space.
- **Dysrhythmia** due to fluid and electrolyte changes.
- Air embolism.
- **Disequilibrium syndrome:** During hemodialysis solutes are removed faster from ECF, as compared to CSF. This causes fluid shift into the brain and cerebral edema.
- **Management:** Stop dialysis and reduce the duration of dialysis. Administer Hypertonic solution, Albumin and mannitol.

Management of air embolism during hemodialysis

- Stop hemodialysis
- Place client in left lateral position with head down (to trap the emboli in right side of the heart and prevent its movement toward lung.)
- Administer oxygen
- Assess vital sign and record the event.

Drugs used in Hemodialysis

- **Heparin:** Dialysis machine tubing is first flushed with heparinized saline to prevent clotting of the blood in the circuit.
- **Erythropoietin injection:** Subcutaneous erythropoietin injection is given to client on hemodialysis to stimulate RBC production.

Key Points

- Monitor base line vitals and laboratory values before and after HD.
- After HD, patient's temperature may be slightly elevated due to the warming of blood by dialysis machine.
- Weight of the client has to be taken before and after HD to calculate fluid loss.

Peritoneal Dialysis (PD)

- Peritoneum acts as a semipermeable membrane.
- Osmosis and diffusion are the major principles.
- Water removal is achieved through ultrafiltration which is created using higher glucose concentration in the dialysate fluid.

PD catheter insertion

- Informed consent
- Empty the bladder to avoid injury to the bladder
- Catheter is inserted 3-5 cm below the umbilicus as this area is free of any major blood vessels.
- Usual PD catheters are swanz, tenkoff, and cruz made up of silicon material which is radio-opaque.

Performing PD Exchange/Cycle

- PD contains many exchanges or cycle.
- One exchange or cycle consists of infusion, dwell and drainage.
  - **Infusion:** Flowing of PD fluid into the abdominal cavity under the influence of gravity.
  - **Dwell:** Withholding the dialysate fluid in the abdominal cavity for prescribed period of time.

Do not extent the dwell time beyond prescribed as it increases the risk for hyperglycemia.

  - **Drainage:** Once the dwell time is over, drainage will be started by unclamping the catheter under the influence of gravity.

Normally PD drainage is colorless or straw colored. If the drainage is cloudy, peritonitis need to be suspected in the patient.

- Heparin, potassium and antibiotics may be added to PD fluid.

In a PD patient, excessive water is removed by adding glucose/dextrose to the dialysate fluid to make it hypertonic.

Figure 73 ▪ Peritoneal dialysis

Complications of PD

- **Peritonitis:** Most common complication of PD is characterized by cloudy outflow, rebound tenderness and abdominal pain.
- **Leakage**
- **Bleeding:** During bleeding, more frequent exchange is needed to avoid clot formation in the PD catheter.
- **Long term complications:** Hypertriglyceridemia, abdominal hernia, aggravation of hemorrhoids, lower backache and anorexia.

Types of Peritoneal Dialysis

- **Acute intermittent PD**
  - Treatment of choice for hemodynmically unstable patient.
  - PD is performed with the help of PD machine. It removes fluid gradually.
- **Continuous ambulatory PD**
  - After infusion of dialysate, patient fold back the bags, clamp the catheter and move around. Patient is ambulatory during dwell time.
  - Once dwell time is over patient lies down and drainage will be initiated.
- **Continuous cyclic PD**
  - Dialysis is done with the help of machine.

Scanned with CamScanner

- Usually 3 cycles are done at night and one cycle with long dwell time of 8 hours is done in the morning.

Key Points

High protein loss occur during PD, so the client is advised to consume high protein diet and low carbohydrate diet.

RENAL TRANSPLANT

- Transplantation of kidney from a living/cadaver donor to a client with End Stage Renal Disease.
- **Donor Screened for:** ABO incompatibility, tissue specific antigen, histocompatibility and communicable disease.
- **Cold ischemic time:** Time gap between cessation of blood flow to kidney and the time required to anastomosis the kidney to the recipient.
- **Pre-operative**
  - Immunosuppressive therapy
  - Completion of hemodialysis 24 hours before the transplantation
  - Strict aseptic technique. Recipient must be free from infection.
- **Post-operative**
  - Urine output may be established immediately in living donor kidney and may be delayed in cadaveric donor kidney.
  - Hemodialysis is needed until the adequate renal function is established.
  - Monitor urine output hourly.
  - Daily weight monitoring.

Key Points

Most common viral infection after renal transplant is CMV

Graft Rejection

- **Hyper acute rejection:** Rejection occurs within minutes to hours
- **Acute rejection:** Usually occurs within 6 weeks post operatively
- **Chronic rejection:** Occurs in months to years after the transplantation

Oliguria, edema, fever, increased BP, weight gain, swelling and tenderness over the transplanted site are the symptoms of rejection.

MISCELLANEOUS URINARY DISEASES

Urinary Tract Infections

- UTI is caused by pathogenic organism in the urinary tract.
- Upper UTI includes:
  - Pyelonephritis (inflammation of renal pelvis)
  - Interstitial nephritis (inflammation of the kidney)
- Lower UTI includes:
  - Cystitis (inflammation of urinary bladder)
  - Prostatitis (inflammation of prostate gland)
  - Urethritis (inflammation of urethra)
- **Manifestations:** Frequent pain and burning micturition, frequency, urgency, nocturia, incontinence, fever, chills, flank or lower back ache, and **tenderness in costovertebral angle.**
- Colony count of at least **1,000,000/ml of urine** is the major criteria for UTI.
- **Hematuria:** More than 4 RBC per high power field
- **Pyuria:** More than 4 WBC per high power field.
- **Diagnosis:** Urine culture and sensitivity.

Pyelonephritis

- Repeated attack of UTI leads to chronic pyelonephritis.
- *E. coli* is the most common causative organism.

Key Points

- Most common agent associated with catheter associated UTI → E. coli
- Urinary tract is the most common site for nosocomial infection.
- UTIs are common among women than men because of their shorter urethra and proximity of the urethra to the rectum

Urinary Incontinence

- Unplanned involuntary loss of urine
- **Stress incontinence**
  - Involuntary passage of urine occurs as a result of increase in intra-abdominal pressure, e.g. leak of urine occurs during coughing and sneezing.
- **Urge incontinence**
  - Involuntary loss of urine when an overactive bladder causes sudden urge to urinate.
- **Reflex incontinence**
  - Involuntary loss of urine due to hyper-reflexia in the absence of normal sensation to void.
  - **Common following spinal injury.**
- **Overflow incontinence**
  - This occurs as a result of incomplete emptying of the bladder. There will be dribbling of urine even after using the washroom.
- **Functional incontinence**
  - Normal lower urinary tract. Cognitive and physical impairment makes it difficult to void.
- **Iatrogenic incontinence**
  - Incontinence occurs as a result of external medical factors such as medication.
- **Management:** Behavioral therapy, anti-cholinergic agents and surgical management (if any anatomical problem present).

Urinary Retention

- Inability to empty bladder completely during voiding
- This leads to overflow incontinence
- **Causes:** Diabetes mellitus, prostate enlargement, pregnancy, trauma to pelvic floor
- **Complications:** Infection, calculi and pyelonephritis.

Neurogenic Bladder

- Bladder dysfunction due to lesion in the nervous system.
- It can occur following spinal cord injury, prolapsed inter vertebral disc, spinal tumor, multiple sclerosis, spina bifida etc.
- There are two types of neurogenic bladder:
  - **Spastic neurogenic bladder**
    - Injury on upper motor neuron
    - No conscious sensation of voiding
    - Bladder emptied on reflex (reflex incontinence)
  - **Flaccid neurogenic bladder**
    - Injury on lower motor neuron
    - Bladder won't contract forcefully. Leads to overflow incontinence.
  - **Complications:** UTI, renal calculi, Vesicoureteral Reflux (VUR), renal failure
  - **Management:** Catheterization and adequate fluid intake.

Scanned with CamScanner

Vesicoureteral Reflex

- Retrograde or back flow of urine from bladder to ureter even sometimes to kidney is known as VUR.
- **Features of recurrent VUR:** UTI, palpable renal mass, and renal failure
- **Diagnosis:** Voiding cystourethrogram, uroflometry.

Golden points to remember

- **Length of male urethra:** 18–20 cm
- **Length of Female urethra:** 4 cm
- **Normal weight of prostate gland:** 20 g
- **Significant post void residual volume:** >50 mL
- **Normal GFR: 90- 120 ml/min**
- **Oliguria**: 24 hours urine output <400 mL
- **Anuria**: 24 hours urine output <100 mL
- **Microalbuminuria:** Urinary albumin excretion of 30-300 mg/day
- Neonatal kidney achieves concentrating ability equivalent to adult kidney around the age of 1 year.
- Infant kidney achieves GFR as of adult values around 2 years of age.
- **Stones formed in** Acidic urine: Uric acid stones and cystine stone.
- **Stones formed in** Alkaline urine: Struvite and phosphate.
- Stress urinary incontinence is more common in women.
- **Tear drop bladder** on Intravenous Pyelogram (IVP) suggest: Pelvic hematoma
- **Spider leg appearance** in IVP is suggestive of: Renal cyst
- Water deprivation test is used to access the function of distal tubule.
- **Aminoglycoside antibiotics** (e.g. amikacin, gentamycin) are nephrotoxic drugs.
- **Lasix** competes with aspirin for renal excretion sites and may cause **aspirin toxicity**.
- Chronic glomerulonephritis is a syndrome characterized by proteinuria, hematuria and slow development of uremia.
- **Hyperkalemia** is one of the serious complications of acute renal failure, it can cause life-threatening cardiac dyserhythmias.
- Nail and half nail sign are seen in Renal failure.
- Dialysis in initiated when **GFR (or creatinine clearance)** is less than 15 mL/minute.
- **Inulin clearance Test:** Gold standard test to estimate GFR (Creatinine clearance can overestimate GFR as it is also secreted into the proximal tubules).
- **Ham test:** Blood test to diagnose paroxysmal nocturnal hemoglobinuria (PNH).
- Furosemide (Loop diuretics) acts on the thick **ascending loop of Henle.**
- Thiazides and potassium sparing diuretics act in the early **distal tubule**.
- Osmotic diuretics acts in **Descending limb of the loop of Henle**.

Most Common

- **Most common cause of neurogenic bladder in children:** Spina bifida
- Most common renal calculus is calcium oxalate dihydrate.
- Most common hospital acquired infection is UTI.
- Most common agent associated with catheter associated UTI is E. coli.
- Most common cause of complicated UTI is E. coli.
- Most common viral infection after renal transplant is CMV.
- Most common cause of Nephrotic syndrome in adults is Diabetes Mellitus.
- Most common type of ARF is Prerenal.

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

ATOMY AND PHYSIOLOGY

1. The main function of kidney is to: *(RRB SSNE 2015)*
a. Eliminate oxygen
b. Regulate fluid balance and removing waste products
c. Metabolize vitamins
d. Eliminate carbon dioxide

2. Length of ureters
a. 8–12 cm b. 25–30 cm
c. 40–50 cm d. 10–20 cm

3. Weight of kidney is .....
a. 150 g b. 100 g
c. 200 g d. 80 g

4. Normal glomerular filtration rate is: *(JIPMER 2012)*
a. 90–120 ml/min b. 120–150 ml/min
c. 60–90 ml/hr d. 30–50 ml/hr

5. Excretory unit of kidney is: *(LNJP H D 2012)*
a. Nephron b. Henle's loop
c. Bowman's capsule d. Glomerulus

6. Length of female urethra is
a. 2 cm b. 3 cm
c. 4 cm d. 6 cm

7. The blood vessels entering the glomerulus is known as
a. Afferent b. Efferent
c. Renal artery d. Renal vein

8. The blood vessels leaving the glomerulus is known as
a. Afferent b. Efferent
c. Renal artery d. Renal vein

9. The organs of the excretory system consist of the following except
a. Blood vessels b. Skin
c. Liver d. Kidneys

10. The intermediate structure that channels urine to the ureters is the
a. Renal pyramids
b. Renal Calyces
c. Renal Pelvis
d. Renal hilum

11. Which part of the nephron is relatively impermeable to water?
a. Descending loop of Henle
b. Ascending loop of Henle
c. Distal convoluted tubule
d. Collecting duct

12. The formation of filtrate in the Bowman's capsule across the glomerulus occurs by a process called
a. Ultrafiltration
b. Active transport
c. Osmosis
d. Diffusion

1895. Urine formation is most likely reduced in this condition.
a. Pulse rate of 100–110/minute
b. Pulse rate of 60–70/minute
c. Blood pressure of 70/40 mmHg
d. Blood pressure of 90/40 mmHg

1896. A patient weighing 50 kg would be suspected of oliguria if the hourly urine output is
a. 15 mL b. 25 mL
c. 35 mL d. 45 mL

1897. The interstitium of kidney tissue that has the highest osmolality is the
a. Outer cortex b. Outer medulla
c. Inner cortex d. Inner medulla

1898. The secretion of aldosterone would be inhibited in this situation.
a. Serum urea of 5.0 mmol/L
b. Serum creatinine of 100 mmol/L
c. Serum potassium of 4.0 mmol/L
d. Serum sodium of 160 mmol/L

1899. Voluntary micturition will occur when the
a. Detrusor contracts
b. Detrusor muscle relaxes
c. External sphincter contracts
d. External sphincter relaxes

1900. The functional unit of kidney is called
a. Bowman's Capsule b. Malpighian corpuscles
c. Pyramid d. Nephron

1901. Renal vein is ..... to superior mesenteric artery
a. Posterior and inferior
b. Posterior and superior
c. Anterior and inferior
d. Anterior and superior

1902. Countercurrent mechanism in the kidney is responsible for
a. Absorption of glucose
b. Maintenance of blood flow
c. Osmotic gradient in medulla
d. Secretion of uric acid

1903. Payer's patches are found in
a. Stomach b. Liver
c. Small intestine d. Large intestine

1904. Diaphragm is supplied by which nerve
a. Phrenic nerve b. Intercostal
c. Peroneal d. Vagus

1905. GFR is increased by
a. ANP b. Vasopressin
c. Histamine d. Endothelium

1906. Best measure for GFR
a. Serum creatinine b. Urine output
c. BUN d. PAN

Ans.

1883. b
1884. b
1885. a
1886. a
1887. a

Scanned with CamScanner

1907. Thirst is activated by:
a. Increased Angiotensin II level
b. Extracellular hyperosmolarity
c. Increased ANP levels
d. Increased Renin levels

1908. Potassium is maximally absorbed in which part of nephron:
a. Proximal convoluted tubules
b. DCT
c. Collecting ducts
d. Loop of Henle

1909. Right kidney is lower than the left kidney because .....
a. In right side liver is occupying considerable space
b. Right kidney is larger in size
c. Pulling force exerted by renal ligament on right side
d. Left kidney is smaller in size

1910. Referred pain in external hemorrhoids is due to:
a. Common pudendal nerve
b. Inferior rectal nerve
c. Splanchnic nerve
d. Sympathetic nerve

1911. Benign Prostatic hypertrophy results in obstruction of urinary tract. Specific condition is associated with enlargement of
a. Entire prostate gland
b. Lateral lobes
c. Median lobe
d. Posterior lobes

1912. How the kidneys help normalizes blood pressure in a hypotensive patient?
a. Retain sodium and excrete water
b. Retain sodium and water
c. Excrete sodium and retain water
d. Excrete sodium and water

1913. The three regions of kidney are: .....
a. Cortex, medulla, peritoneum
b. Cortex, medulla, pelvis
c. Cortex, mediastinum, pelvis
d. Omentum medulla, pelvis

1914. Each kidney consist is of____
a. Ten thousand nephrons
b. 1 billion nephrons
c. 1 million nephrons
d. Thousand nephrons

1915. Amount of blood filtered in renal capsule per minute is known as .....
a. Glomerular filtration rate
b. Urine per minute
c. Tidal volume
d. Blood flow per minute

Ans.
1907. b
1908. a
1909. a
1910. b
1911. c
1912. b
1913. b
1914. c
1915. a
1916. d
1917. a
1918. a
1919. a
1920. c
1921. c
1922. d
1923. a
1924. d
1925. a
1926. d
1927. a

Explanation: Glomerular filtration rate (GFR) is a test used to check how well the kidneys are working. Specifically, it estimates how much blood passes through the glomeruli each minute. Glomeruli are the tiny filters in the kidneys that filter waste from the blood. According to the National Kidney Foundation, normal results range from 90 to 120 mL/min/1.73 m^2. Older people will have lower than normal GFR levels, because GFR decreases with age.

1916. Structures involved in blood pH regulation is: .....
a. Kidney
b. Blood plasma
c. Lungs
d. All of the above

1917. Which of the following is TRUE regarding Renin-Angiotensin-Aldosterone System (RAAS) mechanism?
a. Decreased urine output, increased reabsorption of sodium and water
b. Decreased urine output, decreased reabsorption of sodium and water
c. Increased urine output, increased reabsorption of sodium and water
d. Increased urine output, decreased reabsorption of sodium and water

1918. Hardening of the renal arteries are called as
a. Nephrosclerosis
b. Nephritis
c. Nephrotic syndrome
d. Arteriosis

1919. In a client with hypernatremia which among the following will happen?
a. Diminished action of ADH
b. Increased action of ADH
c. Secretion of aldosterone
d. Reabsorption of water in the renal system

1920. The hormone which regulate the blood pressure and is primarily secreted by the kidney is .....
a. Angiotensinogen
b. Erythropoietin
c. Renin
d. Aldosterone

1921. When the posterior bladder wall protrudes downward through the anterior vaginal wall. It is known as: *(AIIMS-BBS SNO 2019)*
a. Rectocele
b. Pyocele
c. Cystocele
d. Bubonocoele

Explanation: When the posterior bladder wall protrudes downward through the anterior vaginal wall. It is known as cystocele. It is also called prolapsed or dropped bladder, is the bulging or dropping of the bladder into the vagina. **Note:** Use of keyword **'bladder'** leads to the answer **'cystocele'**

INVESTIGATIONS

1922. Best method to collect urine for culture in children under 2 years is .....
a. Midstream voiding
b. Bag aspiration
c. Catheter aspiration
d. Suprapubic aspiration

1923. Way to obtain sterile urine specimen from an indwelling urinary catheter is .....
a. Clamp the catheter above the bifurcation and aspirate
b. Disconnect the tubing and collect
c. From the urinary bag
d. All of the above

1924. BUN used for kidney function tests stand for *(Banaras HU 2015)*
a. Blood urine nitrogen
b. Blood uric acid nitrogen
c. Blood uracil nitrogen
d. Blood urea nitrogen

1925. Identify the change that does not occur in a urine sample after prolonged time?
a. Decrease in specific gravity
b. Loss of ketone bodies
c. Bacterial growth
d. Disintegration of casts

1926. Instrument used for measuring urinary specific gravity is all, EXCEPT:
a. Urinometer
b. Refractometer
c. Reagent strips
d. Densitometry

Explanation: Densitometry is the quantitative measurement of optical density in light-sensitive materials. All other instruments are used for measuring specific gravity.

1927. Normal specific gravity of urine is .....
a. 1.010 to 1.030
b. 1.001 to 1.50
c. 1.05 to 1.5
d. 1.05 to 1.8

Scanned with CamScanner

1928. Random urine test contain ..... amount of protein
a. 30-40 mg/dl b. 0–20 mg/dl
c. 50–60mg/dl d. 60–120 mg/dl

1929. Normal serum creatinine level
a. 0.5–1.1mg/dl b. 0.6–2 mg/dl
c. 0.1 –0.6 mg/dl d. 0.8–2 mg/dl

1930. Creatinine clearance is measured as the amount of creatinine the kidneys are able to clear in a _____ period
a. 12 hours b. 18 hours
c. 24 hours d. 36 hours

1931. Normal GFR level
(AIIMS Bhopal Senior Nursing Officer 2018)
a. 60 ml/min b. 80 ml/min
c. 120 ml/min d. 180 ml/min

1932. Normal range of pH of urine is:
a. 4.5–8.0 b. 4.0– 6.0
c. 6.0–7.0 d. 7.0–8.0

1933. PH of normal urine is .....
a. Slightly alkaline b. Slightly acidic
c. Highly alkaline d. Highly acidic

1934. Normal level of urea in the blood is
a. 2-15 mg/dl b. 7-20 mg/dl
c. 15-40 mg/dl d. 20-50 mg/dl

1935. Normal urine output per day in an adult is
a. 500-1000 ml/day b. 800 to 2000 ml/day
c. 1000-2500 ml/day d. 1500-3000 ml/day

1936. Which of the following is normally found in urine?
a. Glucose b. Protein
c. RBC d. Creatinine

1937. A patient is scheduled for an IVP using a radio-opaque dye, which of the following assessment is most critical before the procedure: *(LNJP H D 2012)*
a. Measurement of baseline peripheral pulse rates
b. History of intake and output
c. History of allergy to iodine
d. Measurement of heights and weight

1938. Renal blood flow, glomerular filtration, tubular function, and secretion can be assessed with the help of .....
a. IVP b. VCUG
c. Renal scan d. Ultrasonography

1939. In a dehydrated client urinary specific gravity will be .....
a. Elevated b. Decreased
c. Normal. d. Unpredictable

1940. In a patient with diabetes insipidus urine specific gravity will .....
a. Elevated b. Decreased
c. Normal. d. Cannot measure

1941. Which of following should be immediately noted by a nurse in a client who had undergone renal biopsy
a. Sweating
b. Increased urination
c. Pain at the abdomen, back of shoulder or chest
d. Pain at biopsy site

Explanation: Localized pain at biopsy site is normal after the procedure. Pain at the back of shoulder, abdomen or chest should be immediately reported. Pain in the abdomen after the procedure is a sign of internal bleeding.

1942. Types of ketones present in blood/urine is .....
a. Acetone b. Acetoacetic acid
c. Both a and b d. None of the above

1943. Presence of bilirubin in urine can be checked with .....
a. Fouchet's test b. Gmelin's test
c. Reagent strip test d. All of the above

1944. Radiographic study which is commonly used to evaluate the structure & function of ureters, bladder and kidney is
a. Intravenous pyelogram b. Cystoscopy
c. Ureteroscopy d. Ultrasound

1945. Types of bile salts present in the urine include .....
a. Cholic acid
b. Deoxycholic acid
c. Chenodeoxycholic acid
d. All of the above

1946. Excess of nitrogenous substance in faeces and urine is known as .....
a. Azotorrhea b. Azotemia
c. Steatorrhea d. Malena

1947. Christmas tree appearance of urinary bladder is seen in:
a. Enuresis b. Stress incontinence
c. Neurogenic bladder d. Autonomous bladder

COMMON SIGNS AND SYMPTOMS

1948. Distension of renal pelvis caused by obstruction to normal urine flow: *(AIIMS Nagpur NO 2018)*
a. Renal failure b. Renal calculi
c. Hydronephrosis d. Polycystic kidney

Explanation: Hydronephrosis is swelling of one or both kidneys. It occurs when urine cannot drain from a kidney and builds up in the kidney as a result. This can occur from a blockage in the tubes that drain urine from the kidneys (ureters) or from an anatomical defect that doesn't allow urine to drain properly.

1949. Urine urge occurs at what bladder capacity?
a. 50 ml b. 150 ml
c. 250 ml d. 400 ml

1950. Polyuria is seen in .....
a. Diabetes insipidus b. Diabetes mellitus
c. Chronic renal failure d. All of the above

1951. Increase in urine specific gravity occurs with all of the following conditions EXCEPT
a. High protein diet b. Dehydration
c. Decrease renal perfusion d. Diabetes insipidus

1952. In a patient who is complaining of intra-abdominal pressure nurse is suspecting certain mass like structure above the pubis symphysis, that is .....
a. Appendix b. Cholelithiasis
c. Nephrolithiasis d. Urinary bladder

1953. Glycosuria is the manifestation of all of the following EXCEPT
a. Diabetes mellitus b. Cushing's syndrome
c. Hyperthyroidism d. SIADH

1954. The most important cause of kidney failure is
a. Accidents b. Type 2 diabetes
c. Heart disease d. Pneumonia

1955. When the kidneys fail, the body fills with extra fluid & waste products. This condition is called
a. Uremia b. Hypertension
c. Anemia d. Diabetes

1956. Clinical feature of CKD includes .....
a. Hypertension b. Anemia
c. Hyperkalemia d. All of the above

Ans.

1928. b
1929. a
1930. c
1931. c
1932. a
1933. b
1934. b
1935. b
1936. d
1937. c
1938. c
1939. a
1940. b
1941. c
1942. c
1943. a
1944. a
1945. d
1946. a
1947. c
1948. c
1949. b
1950. d
1951. d
1952. d
1953. d
1954. b
1955. a
1956. d

Scanned with CamScanner

1957. Anuria means .....
a. More urine at night time
b. Urine output of less than 100 ml in 24 hours
c. Urine output of at least 100 ml in 2 hours
d. Urine output less than 400 ml in 24 hours

1958. Oliguria means .....
a. More urine at night time
b. Urine output of less than 100 ml in 24 hours
c. Urine output of at least 100 ml in 2 hours
d. Urine output less than 400 ml in 24 hours

1959. Oliguria and decreased creatinine clearance indicate problem with .....
a. Tubular secretion b. Glomerular filtration
c. Tubular reabsorption d. Counter current mechanism

1960. Early sign of renal carcinoma is .....
a. Dysuria b. Flank pain
c. Pyuria d. Hematuria

Explanation: Hematuria is the classical and early sign of renal carcinoma. The presence of blood in urine is known as hematuria

1961. Clinical manifestations of cystitis are
a. Persistent urge to urinate
b. Burning sensation when urinating
c. Hematuria
d. All of the above

1962. Increased nitrogenous substance in blood
a. Azotorrhea b. Azotemia
c. Steatorrhoea d. Malena

1963. Hematuria is the manifestation of .....
a. Acute glomerulonephritis
b. Bladder tumors
c. Renal stones
d. All of the above

1964. Hydronephrosis means .....
a. Dilation of renal pelvis
b. Constriction of renal pelvis
c. Narrowing of renal pelvis
d. Atrophy of renal pelvis

1965. Tetrad of hematuria include all, EXCEPT: *(PGIMER 2007)*
a. Purpura b. Arthritis
c. Granulomatosis d. Abdominal pain

Explanation: Purpura, arthritis, kidney disease and abdominal pain are in tetrad of hematuria.

1966. All the food item cause color to the urine, EXCEPT:
a. Berries b. Beets *(IHBAS 2002)*
c. Carrot d. Food coloring agents

Explanation: Option C is the correct answer, except carrot all the given food items cause red color to the urine.

1967. Frequency of urination at night is called .....
a. Dysuria b. Nocturia
c. Oliguria d. Anuria

1968. Risk factor associated with renal disorder
a. High sodium diet b. Hypertension
c. Diabetes mellitus d. All of the above

RENAL CALCULI

1969. Risk factor for urinary calculi is .....
a. Hyperthyroidism b. Hypothyroidism
c. Hyperparathyroidism d. Both b and c

1970. Risk factors for urinary stone include .....
a. Dehydration
b. High-protein, salt, or glucose diet
c. Hyperparathyroid condition
d. All of the above

1971. The nurse sends the renal calculi specimen to laboratory for analyzing .....
a. Composition of calculi b. Infectious organism
c. Size of calculi d. Blood presence in stone

1972. Which of the following is an incorrect statement regarding urinary stone?
a. Found mostly in women with urinary tract infections
b. Cystine stones are rare
c. Cystine is an acid that occurs naturally in the body
d. Acid-ash diet is recommended for client with cystine stone

Explanation: Alkaline-ash diet is recommended for a client with cysteine stone. Client is instructed to avoid milk, meet egg and cheese.

1973. The diet prescribed for a patient with cysteine renal stone_____
a. High protein
b. Moderate protein
c. Low protein
d. Protein in diet is not considered

1974. Correct regarding uric acid stone is .....
a. This type of stone develops when urine is too acidic
b. A diet rich in purines can increase urine's acidic level
c. Purine is present in animal proteins, such as fish, shellfish, and meats
d. All of the above

1975. Dietary modification for a client with several uric acid renal stones include
a. Increase food rich in sodium
b. Decrease intake of calcium rich food
c. Restrict food rich in purine
d. Increased intake of spinach, strawberry and peanuts

1976. Which of the following intervention is appropriate for the patient with renal calculi?
a. Restrict fluids b. Increase dietary purines
c. Maintain bed rest d. Strain all urine

1977. Which of the following fruit is a rich source of oxalate which has to be avoided in a patient with oxalate renal calculi?
a. Citrus fruits b. Pears
c. Strawberries d. Apples

1978. Stones associated with urinary tract infections are
a. Oxalate stones b. Pyruvate stones
c. Mixed struvite stones d. Cystine stone

1979. Renal stone in the pelvic portion of kidney .....
a. Block to afferent arterioles
b. Block to efferent arterioles
c. Affect drainage of urine from kidney
d. Prevent urine concentration capacity

1980. Common type of stones seen in kidney is .....
a. Calcium stones b. Oxalate stones
c. Pyruvate stones d. Mixed struvite stones

1981. Commonest type of urinary stone is .....
a. Calcium b. Atruvite
c. Cystine d. Pyruvate

Ans.
1957. b
1958. d
1959. b
1960. d
1961. d
1962. b
1963. d
1964. a
1965. c
1966. c
1967. b
1968. d
1969. d
1970. d
1971. a
1972. d
1973. c
1974. d
1975. c
1976. d
1977. c
1978. c
1979. c
1980. a
1981. a

Scanned with CamScanner

1982. Which among the following is the most common calcium substance responsible for stone?
a. Calcium oxalate b. Calcium pyruvate
c. Calcium malate d. Calcium carbonate

1983. Cause of pain in urolithiasis is
a. Pressure exerted by the stone
b. Movement of stone
c. Decreased water intake
d. Disintegration of stone

1984. High oxalate containing food items include .....
a. Potato chips b. Pea nut
c. Chocolate d. All of the above

1985. Which among the following patient is at risk for developing uric acid stone?
a. People with gout
b. People with chemotherapy
c. Both a and b
d. None of the above

1986. Clinical manifestation related to renal calculi include .....
a. Hematuria
b. Frequent need to urinate
c. Urinating small amounts of urine
d. All of the above

1987. Patient develops small stones in the renal system. In order to promote the passage of these stones in the urine patient is advised to .....
a. Increase the fluid intake b. Ambulate.
c. Both a and b d. Avoid activities

Explanation: Increased fluid intake and mobilization will help to increases the chance of passage of stone via urine.

1988. Stag-horn calculi are made up of .....
a. Calcium oxalate
b. Cholesterol
c. Purine
d. Magnesium ammonium phosphate

1989. Diet recommended for calcium phosphate stone is called
a. Alkali-ash food b. Acid –ash food
c. High calcium rich food d. Both a and b

1990. Which among the following intervention is important for a patient with urolithiasis?
a. Strict bed rest b. Strain all urine
c. High purine diet d. Decrease fluid intake

1991. ESWL is contraindicated in which of the following stones
a. Cysteine stones b. Urate Stones
c. Oxalate Stones d. Phospate Stones

RENAL FAILURE

1992. Acute Renal failure is defined as
a. 15% or greater increase in serum creatinine above baseline
b. 20% or greater increase in serum creatinine above baseline
c. 30% or greater increase in serum creatinine above baseline
d. 50% or greater increase in serum creatinine above baseline

1993. Parameter helpful to assess the renal failure as early as possible
a. BUN b. Urine output
c. Creatinine clearance d. GFR

1994. In chronic renal failure all the following are noticed except: (DSSSB PHN, 2015)
a. Anemia b. Hypocalcemia
c. Metabolic acidosis d. Hypokalemia

1995. Acute renal failure results in
a. Hypokalemia acidosis b. Hyperkalemia alkalosis
c. Hyperkalemic acidosis d. Hypokalemic acidosis

1996. CRF is associated with?
a. Respiratory acidosis b. Metabolic alkalosis
c. Metabolic acidosis d. Respiratory alkalosis

1997. Expected laboratory findings in a person with renal failure is..... (AIIMS 2010)
a. BUN 35 mg/dl, potassium 4.0 mEq/L
b. Blood pH 7.2, potassium 6.5 mEq/L
c. BUN 15 mg/dl, increased serum calcium, creatinine 1.0 mg/dl
d. BUN 45 mg/dl, potassium 3.5 mEq/L

Explanation: Because of accumulation of uremic waste blood ph become acidic and lack of kidney function leads to accumulation of potassium.

1998. All of the following electrolyte imbalances are seen in patient with Chronic Renal Failure (CRF) EXCEPT
a. Hypocalcemia b. Hyperkalemia
c. Hyponatremia d. Hypophosphatemia

1999. The cause of pruritus in CKD patients
a. Hyperkalemia b. Uremia
c. Hyperphosphatemia d. Hypernatremia

2000. The cause of acidosis in CKD_____
a. Inability of kidney tubules to excrete ammonia
b. Inability to reabsorb sodium bicarbonate
c. Decreased excretion of phosphate & organic acids
d. All of the above

2001. The GFR value of patients with stage V CKD is
a. 15–29 ml/min/1.73 m² b. 30–59 ml/min/1.73 m²
c. <15 ml/min/1.73 m2 d. 15–20 ml/min/1.73 m2

2002. The amount of protein intake to be maintained during renal failure is: (DSSSB PHN, 2015)
a. 0.6–0.8 g/kg/day b. 0.8-1.0 g/kg/day
c. 1.0-1.5 g/kg/day d. 1.5-2.0 g/kg/day

2003. The most important nursing diagnosis for a patient in end-stage renal disease is
a. Risk for injury
b. Activity intolerance
c. Fluid volume excess
d. Altered nutrition less than body requirement

2004. Patient with chronic renal failure need to avoid .....
a. Banana b. Yogurt
c. Dark green leafy vegetables
d. All of the above

Explanation: All of the above-mentioned food items are potassium rich and a patient with chronic renal failure need to avoid all these items. High potassium foods include beans, dark leafy greens, potatoes, squash, yogurt, fish, avocados, mushrooms, and bananas.

2005. Electrolyte abnormality need to be closely monitored in the diuretic phase of renal failure is.....
a. Hyperkalemia and hyponatremia
b. Hyperkalemia and hypernatremia
c. Hypokalemia and hyponatremia
d. Hypokalemia and hypernatremia

Ans.

1982. a
1983. b
1984. d
1985. c
1986. d
1987. c

Scanned with CamScanner

2006. Which of the following is the cause of pre-renal failure?
a. Interference with renal perfusion
b. Interference with renal function
c. Obstruction in urine flow
d. All of the above

2007. Acute renal failure (ARF) secondary to cardiogenic shock is considered as
a. Prerenal b. Intrinsic
c. Postrenal d. Idiopathic

2008. Major electrolyte elevated in the oliguric phase of renal failure is .....
a. Sodium b. Potassium
c. Calcium d. Phosphorus

2009. Which of the following is the cause of intra-renal failure?
a. Interference with renal perfusion
b. Interference with renal function
c. Obstruction in urine flow
d. All of the above

2010. Which of the following is the cause of post-renal failure?
a. Interference with renal perfusion
b. Interference with renal function
c. Obstruction in urine flow
d. All of the above

2011. Which among the following is the most common cause of intra-renal failure?
a. Glomerulonephritis b. Acute tubular necrosis
c. Wilms tumor d. Nephrotic syndrome

2012. Low erythropoietin level is seen in?
a. Aplastic anemic b. Renal failure
c. Obesity d. Hematoma

2013. In ESRD, GFR will be .....
a. Less than 15/1.73 m2 b. Less than 15-29/1.73 m2
c. Less than 30-34/1.73 m^2 d. Less than 35-59/1.73 m^2

Nephritis, Nephrotic Syndrome, Nephritic Syndrome

2014. Risk/causative factor for nephrotic syndrome is .....
a. Amyloidosis b. Diabetes mellitus
c. Glomerulonephritis d. All of the above

2015. Triad of symptoms in nephrotic syndrome include all, EXCEPT
a. Proteinuria b. Hypoalbuminemia
c. Edema d. Weight loss

Explanation: Nephrotic syndrome is defined by a triad of clinical features: oedema, substantial proteinuria (>3.5 g/24 hours) and hypoalbuminaemia (<30 g/L). It is often associated with hyperlipidaemia, thromboembolism and an increased risk of infection. Weight gain occurs due to fluid retention.

2016. Causes of nephrotic syndrome include ...
a. Diabetes mellitus. b. Idiopathic
c. SLE d. All of the above

2017. Reason behind edema in nephrotic syndrome
a. Proteinuria b. Hypoalbuminemia
c. Hyperlipidemia d. Hematuria

2018. In nephrotic syndrome edema first appear .....
a. Around the eyes b. Lower leg
c. Abdomen d. All over the body

2019. Priority nursing intervention for edema in a client with nephrotic syndrome is
a. Provide meticulous skin care
b. Maintain intake output
c. Administer diuretics
d. Administer corticosteroids

2020. Prolonged steroid therapy to treat nephrotic syndrome can leads to .....
a. Cushingoid appearance b. Hypoaldosteronism
c. Cryptorchidism d. Oliguria

2021. Which of the following characteristic defines nephritic syndrome?
a. Fatty casts in urine b. Polyuria & hypotension
c. Proteinuria (< 3.5 g/dl) and Hematuria
d. RBC casts in urine with a decreased BUN & creatinine

2022. Lipid casts are seen in
a. Cytomegalic inclusion disease
b. Acute tubular necrosis
c. Nephrotic syndrome d. None of the above

2023. The cause of edema in Nephritic syndrome is
a. Decreased in plasma protein concentration
b. Reduced plasma osmotic pressure
c. Increased in plasma protein concentration
d. Sodium and water retention

(Ref: Harsh Mohan 4th/e pg. 644, 645)

Explanation:

- The heavy proteinuria depletes serum albumin levels in patients with nephrotic syndrome. This results in generalized edema as a consequence of ↓ed colloid osmotic pressure. Sodium & water retention is also seen which aggravates the edema.
- However, in Nephritic syndrome damage to glomeruli causes a fall in GFR and eventually produces uremic symptoms with salt & water retention, leading to edema and hypertension.

2024. The clinical manifestations of pyelonephritis includes: *(AIIMS Raipur Grade II 2017)*
A. Abdominal or suprapubic pain
B. Costovertebral angle tenderness
C. Persistent vomiting
D. Severe dehydration
a. A, B, C b. B, C, D
c. A, C, D d. A, B, C, D

Explanation: The symptoms of pyelonephritis include a sudden onset of chills, fever (body temperature of 38°C or greater), and unilateral or bilateral flank pain with costovertebrlal tenderness, dysuria, urinary frequency and urgency.

2025. Glomerulonephritis means .....
a. Inflammation of renal pelvis
b. Inflammation of glomerulus of nephron
c. Inflammation of afferent arterioles
d. Inflammation of efferent arterioles

2026. Clinical features of acute glomerulonephritis includes all, EXCEPT
a. Oliguria b. Hematuria
c. Sudden onset of hypotension
d. Proteinuria

2027. In a patient hospitalized with acute glomerulonephritis, nursing care include all of the following except:
a. Recording vital signs every 4 hourly *(Banaras HU 2015)*
b. Recording the weight of the patient twice weekly
c. Recording fluid intake and output every 8 hourly
d. Recording BP 4 hourly

2028. Clinical manifestation of post-streptococcal glomerulonephritis include .....
a. Oliguria b. Smoky urine
c. Proteinuria d. All of the above

Scanned with CamScanner

2029. **Clinical manifestations of acute glomerulonephritis includes all of the following EXCEPT**
a. Hematuria and proteinuria
b. Azotemia
c. Sudden onset of hypertension
d. Polyuria

2030. **The main cause of glomerulonephritis**
a. Group A beta-hemolytic streptococcal infection
b. Staphylococcal infection
c. E.coli infection
d. Clostridium infection

2031. **Glomerulonephritis which affects the entire glomerulus is.....**
a. Focal glomerulonephritis
b. Global glomerulonephritis
c. Proliferative glomerulonephritis
d. Rapidly progressive glomerulonephritis

2032. **Diet recommended for patient with glomerulonephritis**
a. High protein, low calorie
b. Low protein, high calorie
c. Low protein, high sodium, potassium
d. High calorie, high protein

2033. **Clinical manifestations of glomerular injury is**
a. Proteinuria b. Hematuria
c. Hypertension d. All of the above

2034. **Proteinuria is a sign of**
a. A diet with lot of protein b. Damaged nephrons
c. Healthy muscles d. Taking less water

2035. **Proteinuria is seen in .....**
a. Nephrotic syndrome b. Nephritic syndrome
c. Multiple myeloma d. All of the above

2036. **Polyuria with low fixed specific gravity urine is seen in**
a. Potomania
b. Diabetes mellitus
c. Chronic glomerulonephritis
d. Diabetes insipidus

Explanation: Low specific gravity (<1.005) is characteristic of diabetes insipidus, nephrogenic diabetes insipidus, acute tubular necrosis, or pyelonephritis. Fixed low specific gravity, in which values remain 1.010 regardless of fluid intake, occurs in chronic glomerulonephritis with severe renal damage.

2037. **Positive dipstick for RBC with Red color urine and clear supernatant after centrifugation is due to**
a. Porphyria b. Hematuria
c. Hemolysis d. Rhabdomyolysis

2038. **A patient with glomerulonephritis is complaining of thirst. The nurse should offer .....**
a. Juice b. Water
c. Tea d. Hard candy

HEMODIALYSIS AND PERITONEAL DIALYSIS

2039. **When receiving hemodialysis, the complication of the removal of too much sodium may occur. Therefore, the nurse should assess the client for:** *(RAK MSc 2018)*
a. Chvostek's sign b. Cardiac dysrhythmias
c. Muscle cramps d. Increased temperature

Explanation: If sodium levels are too low, the client will experience muscle cramps and hypotension due to changes in concentration between intracellular and extracellular compartments.

2040. **The nurse is checking patency of a new right arm AV fistula. What should be the action of the nurse in this condition?**
a. Auscultate the right brachial pulse *(RAK MSc 2018)*
b. Auscultate and palpate the right radial pulse
c. Measure blood pressure in the right arm
d. Palpate for thrill and auscultate bruit over the fistula

Explanation: AV fistulas are artificial passage made between a vein and an artery for purpose such as hemodialysis treatment. It is usually made on the dominant side of the patient i.e. right, hence called right hand AV fistula. For assessing the patency of right arm AV fistula, the nurse has to palpate thrill and auscultate bruit, these are the vascular sounds heard as a result of turbulence made by blood. In case of an AV fistula, these sounds serve as an indicator for its patency.

2041. **Hemodialysis is a process of**
a. Adding O_2 to the blood
b. Extracting nitrogenous wastes from the blood
c. Extracting antibodies from the blood
d. Mixing blood with essential nutrients

2042. **Among the following which is not the principle of hemodialysis**
a. Ultrafiltration b. Osmosis
c. Inhibition d. Diffusion

2043. **For a patient on hemodialysis, increased fluid intake may cause_____**
a. Sinus problems, bad breath, ringing in the ears, body odour
b. Headache, hearing problem
c. Swelling, trouble breathing, heart damage, hypertension
d. Weight loss, slurred speech, uncontrolled sneezing

2044. **Which among the following parameter is helpful for assessing the effectiveness of hemodialysis?**
a. Electrolyte value such as potassium
b. Low serum creatinine level
c. Blood pressure
d. Urine output

2045. **A synthetic semi-permeable membrane that is used in hemodialysis is known as**
a. Dialysate b. Dialyzer
c. Shunt d. Extracorporeal tubing

2046. **Which mineral must be limited for a person on hemodialysis?**
a. Potassium b. Iron
c. Zinc d. Molybdenum

2047. **Hemodialysis removes harmful wastes from the body. It also removes _____**
a. Extra protein b. Extra water
c. Extra insulin d. All of the above

2048. **Common side effect of hemodialysis?**
a. Muscle cramps and weakness
b. Dizziness
c. Nausea
d. All of the above

2049. **Which of the following is not a likely cause of muscle cramps during hemodialysis?**
a. Hypernatremia b. Excess fluid removal
c. Hypercalcemia d. Hypokalemia

2050. **The HD access that is surgically created by anastomosing an artery to vein either side to side or end to side is known as .....**
a. AV graft b. AV fistula
c. AV shunt d. Catheter

Ans.

2029. d
2030. a
2031. b
2032. b
2033. d
2034. b
2035. d

2038. d
2039. c
2040. d
2041. b
2042. c
2043. c
2044. b
2045. b
2046. a
2047. b
2048. d
2049. c
2050. b

Scanned with CamScanner

2051. The complication that occurs during hemodialysis as a result of cerebral fluid shift is _____
a. Hypotension b. Dysrhythmia
c. Disequilibrium d. Chest pain

2052. The access used for short term hemodialysis is
a. Fistula b. Graft
c. Catheter d. Shunt

2053. The amount of protein recommended for a patient on hemodialysis is
a. 1.2–1.3 g/kg of body wt/day
b. 4–6 g/kg of body wt/day
c. 1.6–2 g/kg of body wt/day
d. 5–8 g/kg of body wt/day

2054. The purpose of peritoneal dialysis is to: *(JIPMER 2012)*
a. Clean the peritoneal cavity
b. Re-establish kidney function
c. Remove the toxins and metabolic waste
d. Provide fluid

2055. Advice given to a client before the insertion of peritoneal dialysis catheter is
a. Empty the bladder
b. Instruction regarding the venous access created
c. Types of diet need to be followed
d. All of the above

2056. Peritoneal dialysis uses _____as the access for treatment
a. Catheter b. Fistula
c. Graft d. Dialysis machine

2057. The process of infusing dialysate, dwell drainage of the dialysate is called _____
a. Replacement b. Exchange
c. Hemo sterilizing d. Equilibration

2058. The semi permeable membrane used in peritoneal dialysis is .....
a. Pleural membrane b. Peritoneum
c. Osseous membrane d. Pericardium

2059. The substance is dialysate fluid that causes ultra-filtration through an osmotic gradient is .....
a. Protein b. Electrolytes
c. Glucose d. All of the above

2060. The most common serious complication of peritoneal dialysis is .....
a. Leakage b. Bleeding
c. Peritonitis d. Hypertriglyceridemia

2061. Bruit in the fistula can be checked by monitoring its_____
a. Color b. Smell
c. Sound d. Feel

2062. The thrill in the fistula can be checked by monitoring its___
a. Color b. Smell
c. Sound d. Feel

UTI AND KIDNEY INFECTIONS

2063. The most common lower urinary tract infection is
a. Prostatitis b. Cystitis
c. Urethritis d. Renal & peri renal abscess

2064. Characteristics of urinary system that helps in maintaining its sterility includes all EXCEPT
a. Adequate urine volume b. Complete bladder emptying
c. Ureterovesical junction d. Alkaline urine

2065. Married women comes to the clinic with frequent history of UTI, nurse need to educate the client to.....
a. Take sitz bath
b. Urinate before and after sexual intercourse
c. Clean the area with luke-warm water and apply topical antibiotic creams
d. Take acid-ash diet

2066. Which of following causes majority of UTI in hospitalized patients *(AIIMS Rishikesh Senior Nursing Officer 2018)*
a. Decrease fluid intake
b. Invasive procedures
c. Inadequate self-care
d. Immunosuppressant

2067. Who among the following is at a risk of developing UTI?
a. A woman with otitis media
b. A post-menopausal woman
c. A woman with pneumonia
d. A woman with fracture in upper extremity

2068. Discharge teaching for a patient taking pyridium for the management of UTI include
a. Take this drug along with food
b. Stop this drug if you develop abdominal pain
c. Urine become bright orange
d. Take drug at bed time

2069. Which of following juices is recommended for a patient with UTI?
a. Apple juice b. Lemon juice
c. Cranberry juice d. Grape juice

2070. Which of the following is not a common cause of UTI among men
a. Prostate enlargement b. Erectile dysfunction
c. Renal stone d. Indwelling catheter

2071. Micro-organism responsible for renal candidiasis is .....
a. Bacterial b. Viral
c. Protozoal d. Fungi

INCONTINENCE

2072. Involuntary loss of urine which result from sudden increases in abdominal pressure such as coughing/sneezing is known as .....
a. Functional incontinence
b. Stress incontinence
c. Reflex incontinence d. Total incontinence

2073. Which among the following help to increase the bladder control in an incontinence client?
a. Frequent micturition
b. Intermittent self-catheterization
c. Kegel exercises
d. Douching

2074. Enuresis is .....
a. Involuntary passage of urine
b. Painful urination
c. Involuntary passage of urine during night
d. Excessive urination at night

2075. Amphetamine is indicated in
a. Attention deficit hyperkinetic disorder in children
b. Enuresis
c. Obesity
d. All of the above

RENAL TRANSPLANTATION

2076. Kidney transplantation is an:
a. Allograft b. Isograft
c. Xenograft d. Synergic graft

Ans.

2051. c
2052. c
2053. b
2054. c

2075. d
2076. a

Scanned with CamScanner

Explanation:

- **Allograft:** An organ or tissue transplanted from one individual to another individual of same species
- **Alloantigen:** Transplant antigen
- **Alloantibody:** Transplant antibodies

ADD:

- **Xenograft:** a tissue graft or organ transplant from a donor of a different species from the recipient.

2077. Which among the following is an absolute exclusion criteria for living kidney donors?

a. Obesity
b. Border line urinary abnormalities
c. Cancer
d. H/o Gestational diabetes

2078. First sign/symptom of renal graft rejection is

a. Tenderness b. Fever
c. Increased creatinine d. Rash

Explanation: In case of transplant rejection, clinical evidence in the form of fever, swelling and tenderness over the auograft in rarely appreciated. Rise in serum creatinine may be the only initial evidence which may or may not present with a reduction in urine volume.

2079. Chronic rejection in renal transplantation usually occur after

a. 1 week b. 2 weeks
c. 4 weeks d. 12 weeks

Explanation

- Hyperacute Rejection - Minutes to Hours
- Acute rejection - 10 days to 30 days
- Chronic rejection - months to years

2080. In the immediate post renal transplant period which condition a physician should be noted immediately?

a. Pain
b. Urine output <30 ml/hr
c. Hematuria
d. Bleeding from surgical site

2081. Mr. Rahul has undergone renal transplantation. Which of the following assessment indicates the possibility of organ rejection?

a. Sudden weight loss
b. Shock
c. Hypertension
d. Polyuria

2082. Clinical manifestation for transplanted kidney rejection include .....

a. Diminished urine output
b. Hypoxemia
c. Malaise
d. Pain at the incision sites

2083. Immunosuppressant therapy following renal transplantation is required

a. For 36 hours
b. For one week
c. Until serum creatinine becomes normal
d. For life long

2084. Which lab result indicate an adverse effect of cyclosporine prescribed for a renal transplant patient

a. Increase in Hb level b. Decrease cellulite want
c. Increase in BUN d. Decrease in urea level

2085. Which among the following is the main side effect of corticosteroids

a. Hair loss
b. Increased blood glucose
c. Increased creatinine level
d. Darkening of skin

2086. The most common ocular infection after renal transplantation is by

a. Cytomegalovirus (CMV) b. Toxoplasma
c. Herpes virus d. EB virus

2087. Dementia in patient of chronic renal failure with chronic hemodialysis is due to

a. Aluminium toxicity b. Uremia
c. A Beta amyloid d. A Beta amyloid deposition

OTHER INTERVENTIONS AND DRUG THERAPIES

2088. Furosemide acts on which part of the nephron? *(NCFL 2019)*

a. Proximal tubule
b. Descending limb of the loop of Henle
c. Ascending limb of the loop of Henle
d. Distal tubule

Explanation: Furosemide (Loop diuretics) acts on the thick **ascending loop of Henle.** It blocks the sodium, chloride and potassium co-transporter and it increases sodium, chloride and potassium excretion. Thereby, it increases the rate of urine flow.

2089. A patient with heart failure is on diuretics. Which of the following is the accurate indicator of such patient's health status? *(Daman & Diu NO 2018)*

a. Vital signs
b. Urine-specific gravity
c. Fluid intake and output
d. Weight

Explanation: Assessing the weight is the accurate indicator of health status in heart failure patient who is on diuretics. Measuring weight daily helps to detect hypervolemia before symptoms develop and may prevent full exacerbations.

2090. Surgery involving renal pelvis is: *(JIPMER 2012)*

a. Pyloroplasty
b. Urethroplasty
c. Lithotripsy
d. Pyeloplasty

2091. A client has a ureteral catheter in place after renal surgery. The nurse should

a. Clamp catheter every 2 hours
b. irrigate catheter with NS every day
c. Ensure that catheter is draining freely
d. All of the above

2092. Correct regarding urinary catheter irrigation is .....

a. Use sterile equipment
b. Follow strict surgical asepsis
c. Both a and b
d. None of the above

2093. Which of the following findings is anticipated from a patient who has been taking furosemide for the last one week?

a. Edema of the foot b. Anorexia
c. Gastric irritation d. Weight gain of 2 kg

Ans.

2077. c
2078. c
2079. d
2080. d
2081. c
2082. a
2083. d
2084. c
2085. b
2086. a
2087. a
2088. c
2089. d
2090. d
2091. c
2092. c
2093. b

Scanned with CamScanner

2094. Common complication associated with peritoneal dialysis is
a. Over flow problem
b. Bleeding
c. Peritonitis
d. Back ache

2095. How Furosemide (Lasix) helps to control BP?
a. It dilates renal blood vessels
b. It deactivates sympathetic nervous system
c. Activate RAAS mechanism
d. Decreases reabsorption of sodium and water in the loop of Henle

2096. Dietary education to a patient with cholesterol stone includes.....
a. Take low calorie diet
b. Well-balanced diet
c. Limit sugar intake
d. Limit fatty foods

2097. Severe renal colic can be managed with .....
a. Opioids as prescribed
b. Increase water intake
c. Insert Foley's catheter
d. Ambulation of patient

2098. Radiation therapy to treat the cancer of kidney can cause damage to .....
a. Liver
b. Spleen
c. Adrenal glands
d. Intestine

2099. Correct regarding steroid therapy is: .....
a. Complication associated with long-term use of topical steroid is Glaucoma
b. Common complication of systemic steroid therapy is Cataract
c. Steroid therapy cause hyperglycemia
d. All of the above

2100. A client with ileal conduit is advised to empty the pouch frequently, so as to prevent:
a. Interruption of urine production
b. Damage to ileal conduit
c. Development odor
d. Separation of appliance from skin

2101. A client with ileal conduit complained presence of moderate amount of mucus in urine. Which among the following is most appropriate action?
a. Notify physician immediately
b. Encourage excess of fluid intake
c. Change the pouch
d. Change the position of patient

2102. The nurse should teach the client with ileal conduit to wash the reusable appliance with .....
a. Soap and water
b. Sprit
c. Hydrogen peroxide
d. Only with water

MISCELLANEOUS

2103. Wilms tumor is associated with: *(Kerala PSC, Nov 2014)*
a. Polycystic kidney
b. Renal dysplasia
c. Renal Hypoplasia
d. Horse-shoe kidney

2104. The polycystic kidney disease is first identified by:
a. Lower abdominal pain
b. Upper abdominal pain
c. Flank pain
d. Both a and b

2105. Renal bone disease occurs when phosphorous in the blood pulls ____ mineral from the bone?
a. Zinc
b. Calcium
c. Iron
d. Potassium

Ans.
2094. c
2095. d
2096. d
2097. a
2098. c
2099. d
2100. d
2101. b
2102. a
2103. b
2104. c
2105. b

ENDOCRINE SYSTEM

ANATOMY AND PHYSIOLOGY OF ENDOCRINE SYSTEM

- Endocrine glands are ductless glands.
- Their secretions are known as hormones and these are secreted directly into the blood.
- Hormones are of different categories:
  - Steroids (corticosteroid hormones)
  - Peptide (insulin)
  - Amino acid derivatives (tyrosine, epinephrine, norepinephrine).

Figure 74 ■ Anatomy of endocrine gland

Hypothalamus

- Hypothalamus regulates pituitary function.
- Specialized neuron clusters called neurosecretory cells in the hypothalamus produce ADH and oxytocin
- ADH and oxytocin are stored in posterior pituitary.

Pituitary Gland

- It is known as **master gland** in the body.
- It is also called as **hypophysis**.
- It is situated in the **dorsal surface of hypothalamus** and is connected to hypothalamus with hypophyseal stalk.
- It has three lobes:
  1. Anterior pituitary (adenohypophysis)
  2. Posterior pituitary (neurohypophysis)
  3. Intermediate lobe

Figure 75 ■ Pituitary hormones and its functions

Scanned with CamScanner

Anterior lobe of the pituitary

- Anterior lobe of the pituitary secretes stimulating hormone in response to releasing hormone from the hypothalamus.
- This lobe secretes and stores hormones such as:
  - Growth hormone (GH) } Hormones
  - Prolactin
  - Adrenocorticostropic (stimulating) hormone (ACTH)
  - Follicle stimulating hormone (FSH)
  - Thyroid stimulating hormone (TSH)
  - Luteinizing hormone (LH)

  } Stimulating Hormones
- Except Growth hormone and prolactin, anterior pituitary hormones are stimulating hormones (Functions mentioned in the figure)

Growth hormone (somatostatin)

- It is secreted by anterior pituitary.
- Stimulates growth of all tissues by hypertrophy (increase in cell size) and hyperplasia (increase in number of cells).

Prolactin

- **Anterior pituitary** produces prolactin.
- Sucking reflex promotes prolactin secretion and there by milk production.

Posterior Lobe of the Pituitary

- This lobe stores the hormones secreted by hypothalamus.
- Hormones stored include ADH (vasopressin) and Oxytocin.

Intermediate lobe

- It has little physiological significance in human.

Thyroid Gland

- Thyroid gland is located in the neck just below the cricoid cartilage.
- It is a butterfly shaped gland.
- Lobes of the thyroid gland lies on the side of trachea and lobes are connected with help of stalk called **isthmus.**
- Thyroid is the only gland which synthesizes and stores its own secretion and secrete it into the blood whenever needed.
- Secretions of thyroid glands **are triiodothyroxine (T3), thyroxine (T4) and thyrocalcitonin**

Figure 76 ■ Thyroid and parathyroid glands

Parathyroid Gland

- There are four parathyroid glands.
- They are seen near or embedded in thyroid gland.
- Hormone secreted by parathyroid gland is parathyroid hormone or parathormone.

Pancreas

- Endocrine system of pancreas is known as islets of Langerhans.
- Pancreas secrete three types of hormone which control the blood glucose level
- Alpha cells of pancreas secrete **glucagon**, beta cells secrete **insulin** and delta cells secrete **somatostatin.**

Adrenal Gland

- Paired endocrine gland located above the kidney like a cap
- Outer region of the gland is known as cortex and inner region is known as medulla.
- Adrenal cortex has three region such as:
  - **Zona glomerulosa** which secrete mineralocorticoids (aldosterone) and corticosterone.
  - **Zona fasciculata** and **zona reticularis** which secrete glucocorticoid (cortisol), corticosterone and androgen sex hormones.
- Adrenal medulla secretes **catecholamine** such as **epinephrine** and **norepinephrine.**

Figure 77 ■ Adrenal gland

Scanned with CamScanner

DIAGNOSTIC TESTS IN ENDOCRINOLOGY

Table 73 Description of diagnostic tests in endocrinology

Diagnostic test	Description	Points to remember
Thyroid function test (TFT)	• To determine primary and secondary hypothyroidism • **Primary hypothyroidism:** TSH is elevated • **Secondary hypothyroidism:** TSH is low or undetectable	Early morning fasting blood sample is needed
Anti-thyroid antibodies	• To diagnose autoimmune diseases of thyroid gland • Serological test will be performed	
Glycosylated hemoglobin (HbA1C)	• It reflects the blood glucose level over 2-3 months. • **Normal value:** Less than **6.5%**	

DISORDERS OF ENDOCRINE SYSTEM

Hyperpituitarism

- Excessive secretion of one or more of the pituitary hormones.
- Growth hormone and prolactin are the two major hormones overproduced by anterior pituitary.
- Overstimulation of other endocrine gland through excessive production of stimulating hormone can also be seen.
- Over production of prolactin causes hyperprolactinemia.
- Over production of growth hormone in children causes gigantism and in adult it cause acromegaly.

Gigantism

- Over production of growth hormone in children cause this condition.
- Gigantism occurs before the closure of epiphyseal plates of the bone.
- Skeletal growth velocity will be increased but with little bony deformity.
- **Cause:** Most commonly due to pituitary adenoma
- **Management**
  - Resection of the tumor
  - GH analogue octreotide is very effective in reducing GH level.
  - Pituitary radiation

Acromegaly

- Over production of GH in adult causes acromegaly.
- It occurs after the closure of epiphyseal plate, so **transverse growth** can be observed.
- Large hands and feet, thick lips, coarse facial features, protruding forehead and enlarged jaw, widely spaced teeth are the clinical manifestation.
- **Management:** Similar to gigantism.

Hyperprolactinemia

- Increased level of prolactin in the blood is known as hyperprolactinemia
- **Cause:** Tumor in the pituitary
- **Manifestations**
  - Infertility, decreased sex drive and bone loss in both sexes
  - In males: erectile dysfunction and gynecomastia
  - In females: vaginal dryness, irregular or absence of menstruation, production of milk in non-pregnant and non-nursing mothers.
- **Diagnosis**
  - Serum hormonal assay
  - CT and MRI of brain
- **Management**
  - Bromocriptine and cabergoline decreases the prolactin level.
  - Surgery and radiation therapy may also be useful in case of tumor.

Note

Elevated levels of prolactin after delivery is normal.

Hypopituitarism

- Deficiency of anterior lobe pituitary hormones is named as hypopituitarism.
- Failure of both anterior and posterior pituitary lobes to secrete hormone is called as **panhypopituitarism**.
- **Short stature**
  - Stunted growth resulting from absence or deficient growth hormone.
- **Sexual and reproductive disorders**
  - Deficiencies of gonadotropins (FSH and LH) lead to sterility, decreased sex drive and decreased secondary sexual characters.
- Hypothyroidism
- Secondary adrenocortical insufficiency
- Prolactin deficiency

Posterior Pituitary Disorders/ Neurohypophyseal Disorders

- Posterior pituitary disorders are rare, even if damaged, because posterior lobe is only storing the hormones produced by hypothalamus.
- If the hypothalamus is damaged then even if there is a healthy pituitary, disorders are going to occur.
- Posterior lobe of the pituitary stores **ADH** and **oxytocin**.
- **Antidiuretic hormone (ADH)/vasopressin**
  - Hormone produced by hypothalamus and stored in posterior pituitary
  - Water balance of the body is under the control of this hormone.
  - Deficiency of ADH causes **diabetes insipidus**.
  - Excessive secretion of ADH causes syndrome of inappropriate anti-diuretic hormone (SIADH).
- **Oxytocin**
  - Hypothalamus produces, posterior pituitary stores and releases.
  - It promotes uterine contraction during delivery.
  - It causes ejection of milk from the breast tissue following sucking, so this is the hormone responsible for **let down reflex**.

Scanned with CamScanner

Diabetes Insipidus (DI)

- **Deficiency of ADH** leads to inability to conserve water.
- It can be central/neurogenic or nephrogenic.
  - **Central/neurogenic:** DI occurs as a result of problem with CNS or posterior pituitary.
  - **Nephrogenic:** DI occurs as a result of inability of distal tubules of the kidney to respond to ADH.
- **Risk factors for neurogenic DI:** Head injury, neurosurgery, CNS infection, pituitary tumors etc.
- In this condition, water won't be absorbed back from distal tubules, resulting in loss of large amount of water via urine.
- **Characteristic feature:** Large quantity of dilute urine with **low urine specific gravity**
- **Other Manifestations**
  - Skin and mucous membrane become dry; tachycardia can be seen in cardiovascular system.
  - Hypovolemia, hypotension and shock can occur.
  - Serum sodium level increases and urinary sodium decreases.
- **Water deprivation test:** Client with DI continues to eliminate large quantity of urine even if water intake is restricted and there is a weight loss. It is confirmatory test for DI.
- **Management:** ADH replacement and removal of tumors are the management.

Syndrome of Inappropriate Antidiuretic Hormone (SIADH)

- **Large amount of Antidiuretic hormone (ADH)** from posterior pituitary causes SIADH.
- **Causes:** Ectopic tumors such as bronchogenic cancer, lymphoma of the duodenum, brain, bladder and pancreatic cancer secrete ADH like substance and causes SIADH.
- **Manifestations**
  - Water retention, hyponatremia and hypo-osmolality
  - Increased extra cellular fluid volume.
  - Physical manifestation related to hyponatremia such as decreased deep tendon reflex, fatigue, headache, seizure, anorexia, nausea and change in mental status.
  - Weight gain related to water retention, jugular venous distention, tachycardia and tachypnea can be seen.
- **Management:** Fluid restriction and hypertonic saline.

THYROID GLAND

- **Euthyroidism:** Normal thyroid gland
- **Hyperthyroidism:** Increased secretion of thyroid hormone
- **Hypothyroidism:** Decreased secretion of thyroid hormones

Thyroid Hormone

- T3 (triiodothyronine) and T4 (thyroxine) are thyroid hormones.
- It is lipid soluble and found in plasma by binding with thyroid binding globulin.
- T3 has rapid effect than T4.
- These hormones increase the metabolism and heat production.
- It promotes growth in children.

Disorders of Thyroid Gland

Goiter

- Enlargement of the thyroid gland
- **Causes:** Deficiency of iodine, inflammation or benign/malignant changes
- It can be seen in both hyperthyroidism and hypothyroidism.
- **Endemic goiter:** Due to nutritional iodine deficiency and is seen in people living in iodine deficient regions.
  - **In India, the Himalayan region is often termed as the 'goiter belt'.**
- **Sporadic goiter:** Due to faulty iodine metabolism (genetic issue), people who consume more food items (cabbage, soybeans or spinach) which inhibit T4 and cause goiter. Ingestion of certain medications such as dopamine, glucocorticoids and lithium also causes sporadic goiter. It is not related to iodine deficiency.
- **Treatment:** Iodine and thyroid hormones supplements. A strong iodine solution such as Lugol's solution or potassium iodide can be given.
- **Educate the client to consume iodine rich food and switch to iodized salt.**

Hypothyroidism

- Decreased production of thyroid hormone → decreased tissue metabolism, decreased heat production and decreased oxygen consumption by the tissues.
- It can be either due to primary thyroid gland dysfunction or secondary to anterior lobe of pituitary dysfunction.

Primary hypothyroidism

- **Thyroid gland is unable to produce sufficient amounts of thyroid hormone.**
- **Low thyroid hormones and High (TSH) Thyroid stimulating hormone level**
- **Pituitary tries to overcome the under production of thyroid hormone.**
- **Autoimmune: This is also known as Hashimoto's disease.**
- **Most common cause is iodine deficiency.**

Secondary hypothyroidism

- **Low secretion of TSH from the pituitary**
- **It occurs because of the problem with the pituitary or due to peripheral resistance to thyroid hormone.**
- **Both TSH and thyroid hormones are in low range.**

Tertiary or central hypothyroidism

- **Inadequate secretion of (TRH) thyrotropin releasing hormone from the hypothalamus**
- **Low level of TSH and thyroid hormones in serum.**

- **Manifestations**
  - Decreased body metabolism, decreased heat production, decreased body temperature.
  - Cold, lethargy, dry skin, forgetfulness, depression, weight gain can be seen
  - **Myxedema:** When a person with hypothyroidism faces stressful situation such as infection, trauma or surgery may not be able to cope up with the situation. It is characterized by skin changes such as puffiness and swollen skin.
- **Management**
  - Thyroid hormone supplement such levothyroxine sodium.

Myxedema coma: it's a medical emergency triggered by stressful situations in life and is characterized by hypothermia, hypoventilation, respiratory acidosis and hypotension.

T4 supplement to an **older client** has the risk of development of ischemic heart disease evidenced by angina. So client should be closely monitored for blood level of drug and also pulse needs to be recorded.

Scanned with CamScanner

Congenital Hypothyroidism

- Most common cause is thyroid dysgenesis (75 - 80%)
- **Significant Clinical features**
  - Asymptomatic at birth (due to maternal T4)
  - **Wide and open posterior fontanel**
  - Macroglossia (Large tongue)
  - Prolongation of physiological jaundice
  - Edematous face
  - Hoarse cry
  - Growth retardation
  - Mental retardation within 2 years of age
  - **Delayed dentition**
- Neonatal Screening for TSH and T4 can be done at postnatal day 2 - 4 by filter paper method
- **Treatment:** Replacement therapy with Thyroxine T4

Hyperthyroidism

- Excessive secretion of TSH
- Hyperthyroidism is more common in females than males.
- Most common form of hyperthyroidism is **Grave's disease** characterized by hyperthyroidism, goiter and exophthalmos.
- **Assessment**
  - Thyroid gland is enlarged
  - Bruit heard over thyroid arteries
  - Low serum TSH, high free T4
  - Increased radioactive iodine intake
- **Manifestations**
  - Client appears extremely irritated and agitated
  - Tremors at rest, weight loss despite of increased hungry and food intake
  - Heat intolerance, diaphoresis, tachycardia
  - Warm, smooth and moist skin
  - Hair appear thin and soft
  - Mood swings are common from mild euphoria to hyperactivity.

Thyroid storm is the complication associated with grave's disease.

- **Thyroid storm/ thyrotoxicosis/ thyroid crisis:** it is a fatal condition characterized by high fever, hyper-reflexia, severe tachycardia, delirium, dehydration, hypertension and extreme irritability
- **Treatment for Grave's disease:** Anti-thyroid medication, Radioactive iodine therapy [I^{131}], and thyroidectomy.
- **Antithyroid medications** - Propylthiouracil and methimazole.

Granulocytosis is the side effect of propylthiouracil.

- Most common complication associated with radio iodine therapy is development of hypothyroidism in later life.
- Surgical management – Total or partial Thyroidectomy
- Lifelong replacement of thyroid hormone is necessary in total thyroidectomy.
- In subtotal thyroidectomy, one sixth of the gland remains intact and is able to produce thyroid hormone. Hormone replacement may not be necessary.

Key Points

Pre-operative preparation for thyroidectomy - Administer anti-thyroid drugs and iodine supplements to achieve euthyroid state and to decrease the size and vascularity of the gland.

Complications of thyroidectomy - Hemorrhage, laryngeal edema, infection, vocal cord injury and thyroid storm.

Accidental removal of parathyroid gland is very common during thyroidectomy. So closely monitor the client for calcium imbalances.

Thyroiditis

- Inflammation of the thyroid gland
- Most commonly caused by *Streptococcus pyogenes, S.aureus and Pneumococcus pneumoniae.*

PARATHYROID GLAND

Parathyroid Hormone

- Role of parathyroid gland is to maintain normal blood calcium level.
- Fall in serum calcium level promotes the production of parathyroid hormone.
- Parathormone increases the release of calcium from bone to blood and increases the GI absorption of calcium.
- In kidney it will prevent the urinary loss of calcium.

Disorders of Parathyroid Gland

Hyperparathyroidism

- Over activity of one or more of the parathyroid gland
- In hyperparathyroidism, more calcium will be mobilized from bone to blood, that leads to bone damage, hypercalcemia and kidney damage.

Figure 78 ■ Hyperparathyroidism

- **Manifestations**
  - Bone pain, backache, pathological fracture, in long standing it may cause bone bending.
  - Nephrolithiasis and urine may contain sand, gravel or stone.
- **Management**
  - Drug that inhibits bone resorption such as plicamycin, calcitonin, gallium nitrate etc.
  - Increases the hydration and achieve calciuria with the help of frusemide
  - Parathyroidectomy is the permanent surgical management for the condition.

Key Points

- Respiratory distress either related to bleeding or due to damage to laryngeal nerve is common following parathyroidectomy.
- After the removal of the gland, client needs supplements such as calcium and vitamin D.

Scanned with CamScanner

Hypoparathyroidism

- Under-secretion of parathyroid hormone causes abnormally low serum calcium level, increased phosphate level and manifestation of tetany.
- Because of decreased serum calcium level, calcium may deposit in various body tissues and can lead to brain stem calcification and cataract formation.
- **Manifestations:** Chvostek's sign, trousseau's sign, hyperactive deep tendon reflex, circumoral paresthesia, numbness and tingling in the fingers are the common manifestations.
- **Medical management:** Increase the serum calcium level by administering 10% calcium gluconte.

Key Points

- Untreated hypothyroidism may cause laryngeal spasm and respiratory obstruction due to tetany.
- Patient is instructed to inhale CO_2 by exhaling into a paper bag while administering calcium gluconate to manage hypocalcaemia. This is because CO_2 causes respiratory acidosis and increases the ionized calcium level in the blood.

ENDOCRINE-PANCREAS

Note

Anatomy of Pancreas has been discussed in the unit 'Gastrointestinal System'

- Pancreas is a **digestive exocrine gland** and a **hormone-producing endocrine gland.**
- Endocrine pancreas produce Insulin, Glucagon and Somatostatin.
  - **Insulin**
    - Insulin is secreted by beta cells in the islets of Langerhans of pancreas.
    - Insulin decreases blood sugar level by increasing the storage, use and uptake of glucose.
  - **Glucagon**
    - Glucagon is secreted by Alpha cells in islets of Langerhans.
    - Glucagon increases the blood sugar level by acting in the liver.
  - **Somatostatin**
    - Somatostatin is secreted by Delta cells in islets of Langerhans.
    - Usually it releases after the intake of food.
    - It inhibits the release of insulin and glucagon.
    - It delays the nutrient absorption by prolonging the intestinal duration of food.

Disorder of Pancreas

Diabetes Mellitus

- Diabetes mellitus is a group of metabolic disorder characterized by elevated levels of blood glucose (hyperglycemia) resulting from defects in insulin secretion, insulin action, or both.

Types

- **Type 1 diabetes mellitus (insulin-dependent)**
  - Deficiency of insulin secretion and it may be hereditary
  - 5–10% of patients with diabetes have type I
- **Type 2 diabetes mellitus (Non-insulin dependent)**
  - In this condition insulin production is there in the body but the body receptors are unable to respond to that insulin.
  - 90–95% of patients with diabetes have type II
- **Gestational Diabetes Mellitus**
  - Any degree of glucose intolerance with onset during pregnancy. It usually disappears after delivery.

Clinical Manifestations

- Classic signs: Polyuria, polydipsia, and polyphagia
- Sudden vision changes, fatigue, somnolence, wounds or skin lesions that are slow to heal.

Diagnosis

- Fasting plasma glucose levels above 125 mg/dL
- Random and postprandial (2 hours) blood sugar levels more than 200 mg/dL
- Other tests include glycosylated hemoglobin which helps to assess the blood sugar level in the last three months.

Complications of Diabetes Mellitus

- **Acute:** Hypoglycemia, **hyperglycaemic hyperosmolar nonketotic syndrome (HHNS)** and **Diabetic Ketoacidosis (DKA)**
- **Chronic**
  - Macrovascular disease, affects coronary, peripheral and cerebral circulations
  - Microvascular disease affects eyes (retinopathy) and kidneys (nephropathy)
  - Neuropathic disease affects sensory motor and autonomic nerves which leads to impotence and foot ulcers.

Diabetic Ketoacidosis (DKA)

- Results from insufficient insulin, which prevents glucose from entering cells and causes it to accumulate in the blood.
- Liver increases the biosynthesis of glucose from non-carbohydrate substance such as protein and fat.
- Use of fat resulting in generation of ketone bodies, accumulation of ketone bodies results in ketosis and ketonuria.
- Accumulation of ketone bodies cause metabolic acidosis and results in DKA.
- **Management:** DKA is treated with regular IV insulin, IV fluids to supplement intravascular volume, potassium replacement, and sodium bicarbonate if the pH is less than 6.9.
- **Complications**
  - Body attempt to eliminate ketone and glucose via urine. This will result in increased urine output and dehydration.
  - Because of metabolic acidosis, hydrogen ion moves into the cells and potassium ion moves out of the cell which causes **intra cellular potassium depletion.**

Hyperglycemic Hyperosmolar Nonketotic Syndrome (HHNS)

- In this condition some amount of insulin is there, so there would not be any fat break down so there is no ketone body release.
- This condition is characterized by extreme hyperglycemia, dehydration, hyperosmolarity and mild or undetectable ketonuria.
- Commonly seen in older client with type 2 DM.
- Important electrolyte that need to be replaced in condition is potassium

Scanned with CamScanner

Treatment

- Type I DM: Insulin
- Type II DM
  - Weight reduction
  - Exercise is important in enhancing the effectiveness of insulin.
  - Oral hypoglycemic agents if exercise is not effective
  - Change of lifestyle.

Nutritional Management

- Diet is planned for individual patient based on their metabolic and nutritional requirements.
- **Recommended diet restriction**
  - Fat intake should equal 20%–30% of total calories
  - Protein intake, 10%–20% of total calories
  - Carbohydrate intake, 50%–60% of calories
  - Cholesterol intake, 300 mg or less
  - Fibre intake, 20–30 g daily
  - Sodium intake, 2–3 g daily.

Table 74 Types of insulin used in the treatment of diabetes mellitus

Types of insulin	Onset of action	Peak action	Duration of action
Regular insulin	30–60 minutes	1–5 hours	6–10 hours
Rapid-acting insulins Lispro (Humalog) and Aspart (Novo log)	5–25 minutes	30–90 minutes	2–5 hours
Intermediate-acting insulin Neutral protamine Hagedorn (NPH) or lente insulin)	1–4 hours,	6–12 hours	12–24 hours
Long acting insulins Protamine zinc or ultralente insulin)	4–8 hours	16–18 hours	Up to 30 hours

Key Points

- Rate and depth of respiration increases in DKA and is known as Kussmaul's respiration. The breath has fruity or acetone like odor.

ADRENAL CORTEX

Aldosterone

- It is the mineralocorticoid hormone of the **adrenal cortex.**
- It promotes the sodium absorption in kidneys and increases the potassium excretion.

Cortisol

- It is the **glucocorticoid** hormone of the **adrenal cortex.**
- It increases metabolism and increases the blood glucose level.
- It is also known as stress hormone.
- It has anti-inflammatory action.
- It's secretion exhibits diurnal rhythm, so secretion is highest in the early morning and lowest in the evening.

Disorders of Adrenal Glands

Adrenal Insufficiency/Addison's Disease

- Hypo-functioning of the adrenal cortex is termed as adrenal insufficiency.
- **Primary adrenal insufficiency:** Due to impairment of adrenal gland which cause hypo function.
  - **Causes**
  - Auto-immunity is the most common cause.
  - X-linked or autosomal recessive
  - Drugs—Ketoconazole, mitotane, rifampicin, phenytoin, etc.
- **Secondary adrenal insufficiency:** Due to problem with hypothalmo-pituitary axis
- **Manifestations:** Fatigue, irritability, weight loss, nausea, vomiting and postural hypotension.
- **Diagnosis**
  - Low level of plasma cortisol and increased level of adrenocorticotropic hormone (ACTH)
  - **High serum potassium** and **low serum sodium**
- **Management**
  - Replacement of glucocorticoids and mineralocorticoids.
  - Hypoglycemia needs to be corrected.

Addison's Crisis

- A person who is with adrenal insufficiency with no adequate hormone replacement, when faces a stressor in life such as infection, surgery, pregnancy etc. may show sudden pain in the back, abdomen, legs, volume depletion, hypotension, loss of consciousness and shock.
  - In a client with Addison's crisis hypotension and electrolyte imbalance need to be corrected quickly. Ensure adequate rehydration of the client.

Key Points

- **Osteoporosis and hypercortisolism are the common complications of management with glucocorticoids.**

Adrenocortical Hyperfunction

Hyperfunction of the adrenal cortex results in increased secretion of glucocorticoids, mineralocorticoids and androgen.

Hypercortisolism/Cushing's Syndrome

- Characterized by **excessive secretion of glucocorticoids.**
- It is of two types:
  - **ACTH Independent**
    - Functioning adrenocortical tumor (85% in children <7 years, girls: boys ration 3:1)
    - Primary pigmented nodular adrenocortical disease
    - Nodular hyperplasia, adenoma (Mccune Albright syndrome)
  - **ACTH Dependent**
    - Bilateral adrenal hyperplasia (older children, boys = girls)
    - Pituitary adenoma (Cushing's disease)
    - Ectopic ACTH production - rare in children

Scanned with CamScanner

- **Causes**
  - Iatrogenic administration of steroids
  - Hyper secretion of cortisol by cortisol secreting adrenal tumor
  - Hyperplasia of adrenal gland
- **Clinical manifestation**
  - Persistent hyperglycemia or steroid diabetes
  - Muscle wasting and weakness, capillary fragility which cause ecchymosis
  - **Osteoporosis** → compression fracture in spinal cord and cause kyphosis
  - Loss of height
  - Sodium and water retention cause hypertension and edema.
  - **Hypernatremia and hypokalemia** are the electrolyte imbalances seen in this condition.
  - **Moon shaped face, buffalo hump, truncal obesity** with thin limbs
  - Pink purple striae appear over breast, abdomen, axilla and legs because of the thinning of skin
  - Susceptibility to infection and poor wound healing
  - Hirsutism and masculine characters in women
- **Management:** Bilateral adrenelectomy. Lifelong replacement with glucocorticoids and mineralocorticoids is needed after bilateral adrenelectomy.

Hyperaldosteronism

Primary Hyperaldosteronism

- Lesion in the adrenal gland results in **excessive secretion of aldosterone.**
- Sodium and water retention → hypertension and excessive loss of potassium (hypokalemia)
- This condition is also known as **Conn's syndrome.**

Secondary Hyperaldosteronism

- It occurs **not** because of the adrenal cortex issue but because of other condition, e.g. sodium wasting renal disease, diuretic usage etc.
- **Manifestations:** Hypernatremia, hypokalemia, water retention, hypertension
- **Management:** Unilateral or bilateral adrenelectomy

ADRENAL MEDULLA

- Epinephrine and Nor-Epinephrine
  - Actions of this hormone mimics sympathetic nervous system.
  - These hormones are known as emergency hormones.
  - Both these hormones increases the metabolism

Disorders of Adrenal Medulla

- Main two types of tumors of adrenal medulla are **pheochromocytoma** and **neuroblastoma.**

Pheochromocytoma

- Catecholamine secreting tumor of the chromaffin cells of the adrenal medulla.
- Catecholamine release occurs at various frequencies and intensities known as paroxysm.
- **Manifestations:** Diabetes mellitus and glycosuria, hypertension, hyperthyroidism and psychoneurosis.
- **Management:** Unilateral or bilateral adrenelectomy

Neuroblastoma

- Tumor found on the top of the adrenal glands.
- **Symptoms**
  - Fatigue, loss of appetite and fever
  - Lump or compression of tissues in the affected area.
- **Management:** Surgery, chemotherapy and radiotherapy.

Key Points

Manipulation of tumor during surgery for pheochromocytoma causes release of hormones into the blood and results in rapid rise in BP. Following surgery, withdrawal of hormone can cause fall in BP.

GONADS

Testosterone

- Male sex hormones produced by gonads.
- This is the primary steroids abused by athletes.
- It has anabolic action.

Estrogen

- Female sex hormones produced by gonads.
- Puberty related growth and initiation of mensuration are linked with the increased release of estrogen and progesterone.

Target High Extra Edge

Golden points to remember

- Maximum level of ACTH and cortisol is at the time of early morning.
- In secondary adrenal insufficiency: Aldosterone secretion is not affected therefore electrolytes are usually normal.
- Midline facial defect, single central incisor micro penis, hypoglycemia are the features seen in the deficiency of **Growth hormone**.
- Earliest manifestation of Cushing's syndrome: Loss of diurnal variation
- 1st sign of pubertal changes in boys: Enlargement of testis
- 1st sign of pubertal changes in girls: Thelarche
- Testis starts producing testosterone under the influence of: Placental HCG
- Normal consonance of puberty is:
  - Girls → Thelarche → Pubarche → Menarche
  - Boys → Gonadarche → Pubarche → Spermarche
- Hyposecretion of growth hormone in children results in **Dwarfism**.
- Hypersecretion of growth hormone in adults results in **acromegaly**.
- **Hashimoto's thyroditis**: It is progressive autoimmune disease of the thyroid gland with degeneration of its epithelial elements and replacement by lymphoid and fibrous tissue.
- Cretinism is the endocrine disorder that can lead to **mental retardation**.
- The sign of Cushing syndrome is moon face appearance, and buffalo hump.
- The classic symptoms of DM are **polyuria** (frequent urination), **polydipsia** (increased thirst) and **polyphagia** (increased hunger).
- Calcitonin is secreted by the thyroid gland and inhibits osteoclastic bone resorption by directly interacting with active osteoclast.
- Addison's disease is caused by deficiency of corticosteroid hormone.
- Diabetic insipidus occurs due to the deficiency of Antidiuretic hormone.
- Whipple's triad **visible** in Insulinoma and other conditions causes hypoglycemia:
- Symptom of hypoglycemia is low plasma glucose levels
- Relief of symptoms after plasma glucose is raised
- Enlargement of pituitary tumor after adrenalectomy is called Nelson's syndrome.
- HbA1C indicates post serum glucose levels over previous 3 months period.

Most Common

- Most Common cause of **viral meningoencephalitis**: Herpes Simplex Virus
- Most common cause of **meningoencephalitis**: Enterovirus
- Most common site of Neural Tube Defect: Lumbosacral region
- Most common location of Myelomeningocoele: Lumbosacral region
- Most common genetic cause of MR: Down's syndrome
- Most common cerebrovascular diseases/stroke: ischemic stroke
- Most common ischemic stroke is embolism
- Most common site of hemorrhagic CVA is Brain parenchyma
- Most common hemorrhagic CVA is Hypertension

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

ANATOMY AND PHYSIOLOGY

2106. The gland that is located below Hypophyseal Fossa of Sphenoid bone is: *(DSSSB PHN, 2015)*
a. Adrenal gland b. Thyroid gland
c. Pituitary gland d. Thymus

2107. The effect of Antidiuretic Hormone (ADH) is *(DSSSB PHN, 2015)*
a. Oliguria b. Anuria
c. Increased urine output d. Decreased urine output

2108. Thyroid gland is present in: *(ESIC Chennai May 2012)*
a. Chest b. Back
c. Abdomen d. Neck

2109. Corticosteroid is naturally produced by: *(ESIC Chennai May 2012)*
a. Thalamus b. Ovary
c. Thyroid gland d. Adrenal glands

2110. Which among the following hormone has intracellular receptors in all the organ?
a. Parathyroid hormone b. Estrogen
c. Growth hormone d. Thyroid hormone

2111. The hormone secreted by Posterior Pituitary gland
a. Insulin b. Glucagon
c. Corticotrophin d. Oxytocin

2112. Pituitary gland releases all of the following hormones EXCEPT
a. ACTH b. Oxytocin
c. TSH d. Cortisol

Explanation: Cortisol is released from the adrenal cortex. Other hormones are released from pituitary.

2113. ADH secretion increases when there is .....
a. Hyperkalemia b. Hypokalemia
c. Hypernatremia d. Hyponatremia

2114. Hormone responsible for fluid and electrolyte balance is ...
a. Antidiuretic hormone b. Angiotensin
c. Aldosterone d. Rennin

2115. All the following hormones are secreted by anterior pituitary EXCEPT
a. GH b. TSH
c. ADH d. ACTH

2116. Posterior pituitary secretes .....
a. Growth hormone b. Prolactin
c. TSH d. Oxytocin

2117. The hormone secreted by anterior pituitary gland includes
a. Antidiuretic hormone b. Adrenocorticotropin
c. Cortisol d. Oxytocin

Explanation: Adrenocorticotropin is secreted by the anterior pituitary gland. Antidiuretic hormone (vasopressin) and oxytocin are secreted by posterior pituitary gland. Cortisol is secreted by the adrenal gland.

2118. Ovarian reserve is best indicated by
a. FSH b. LH : FSH ratio
c. LH d. Estrogen

2119. Complications of total thyroidectomy are all, except
a. Hypocalcaemia b. Hypercalcemia
c. Hoarseness of voice d. Parathyroid loss

2120. GH secretion decrease in which of the following conditions
a. Sleep b. Hyperglycemia
c. Surgical stress d. Glucagon

2121. All are true about Melatonin EXCEPT
a. Secreted by Pineal gland
b. Maintains sleep-wake cycle
c. Increase in melatonin cause awakenin
d. Secretion decrease in light

2122. Pineal gland located at
a. Thalamus b. Epithalamus
c. Hypothalamus d. Telencephalon

2123. Parathyroid hormone acts on kidney causing
a. Calcium retention, phosphate loss
b. Calcium loss, phosphate retention
c. Loss of both calcium and phosphate
d. Retention of calcium and phosphate

2124. Catecholamines are synthesized from
a. Tyrosine b. Insulin
c. Glucagon d. Alanine

2125. Gonadotrophin releasing factor is secreted by
a. Adenohypophysis b. Neurohypophysis
c. Hypothalamus d. Basal ganglion

2126. Major stress hormone is
a. Epinephrine b. Norepinephrine
c. Thyroxine d. Cortisol

2127. Hormone increased in post menopausal women
a. FSH b. LH
c. HCG d. Prolactin

2128. Milk ejecting hormone is
a. Prolactin b. Oxytocin
c. Progesterone d. Estrogen

2129. Let down reflex is the responsibility of ..... hormone
a. Prolactin b. Oxytocin
c. Progesterone d. Estrogen

2130. Milk producing hormone is
a. Prolactin b. Oxytocin
c. Progesterone d. Estrogen

2131. Insulin increases the entry of glucose into
a. All tissues
b. Renal tubular cells
c. Mucosa of the small intestine
d. Skeletal muscle

2132. Hormones from anterior pituitary are all EXCEPT
a. Growth Hormone b. Prolactin
c. Luteinizing Hormone d. Oxytocin

Ans.

2106.	c
2107.	d
2108.	d
2109.	d
2110.	d
2111.	d
2112.	d
2113.	c
2114.	a
2115.	c
2116.	d
2117.	b
2118.	a

Scanned with CamScanner

133. **Anterior pituitary is also known as**
a. Adenohypophysis b. Neurohypophysis
c. Corpus callosum d. Arachnoid villi

134. **Posterior pituitary is also known as**
a. Adenohypophysis b. Neurohypophysis
c. Corpus calosum d. Arachnoid villi

135. **ACTH level is highest during**
a. Early morning b. Evening
c. Afternoon d. Night

136. **Insulin acts by stimulation of**
a. Ionotropic receptor
b. Enzymatic receptor
c. Metabotropic receptor
d. Nuclear receptor

137. **Serotonin is secreted by**
a. Argentaffin cells
b. Adrenal medulla
c. Adrenal cortex
d. Thyroid

138. **All of the following hormones are secreted by anterior pituitary EXCEPT**
a. Growth hormone
b. Oxytocin
c. Prolactin
d. Gonadotropin

139. **All of the following are features of diabetes insipidus include all the following EXCEPT**
a. Low specific gravity of urine
b. Increased serum sodium
c. Increased osmolality
d. Hypokalemia

140. **Which of the following stimulates the release of ADH from posterior pituitary gland?**
a. Increased sodium level in blood
b. Decreased sodium level in blood
c. Increased glucose level in blood
d. Decreased glucose level in blood

141. **Insulin is essential for entry of glucose in**
a. Most neurons in cerebral cortex
b. Renal tubular cells
c. Skeletal muscles
d. Mucosa of small intestine

142. **Which of the following hormones helps in increasing the blood glucose level?**
a. Insulin b. Estrogen
c. Glucagon d. Progesterone

Explanation: Glucagon helps in increasing the blood glucose level by activating gluconeogenesis. Gluconeogenesis refers to synthesis of glucose from non-carbohydrate sources such as protein and fat.

143. **Which inhibits glucagon secretion?**
a. Secretin b. Beta agonist
c. Exercise d. Aminoacids

144. **Vasopressin is synthesized in**
a. Renal cortex b. Anterior pituitary gland
c. Posterior pituitary gland d. Hypothalamus

145. **Calcitonin is secreted by**
a. Thyroid gland b. Parathyroid gland
c. Both of the above d. None of the above

146. **Role of calcitonin is**
a. Decrease Ca level b. Increase Ca level
c. Increase PO4 d. None of the above

147. **FSH is produced by**
a. Chromophobes b. Acidophiles
c. Basophils d. All of the above

148. **Not required for absorption of calcium**
a. Parathyroid hormone b. Calcitonin
c. Bile salts d. Vitamin D

149. **Number of parathyroid gland in human body is/are .....**
a. 1 b. 2
c. 3 d. 4

150. **Thyroid-binding globulin increases in**
a. Diabetes mellitus b. Pregnancy
c. Grave's disease d. Nephrotic syndrome

151. **Insulin promotes transport of glucose in all of the following, EXCEPT**
a. Adipose Tissue b. RBC
c. Muscles d. Hepatocytes

152. **Which of the following is the primary function of the parathyroid gland?**
a. Regulates serum calcium levels
b. Maintains BMR
c. Receive hormonal signals from hypothalamus
d. Send hormonal signals to other endocrine glands

153. **Gland which contain both exocrine and endocrine part is**
a. Pituitary b. thyroid
c. Pancreas d. Uterus

154. **Melatonin is secreted by**
a. Pineal gland b. Thyroid gland
c. Anterior Pituitary d. Pancreas

155. **Hormones secreted by the placenta include**
a. Progesterone
b. Human chorionic gonadotropin
c. Estradiol
d. All of the above

156. **Action of ADH**
a. Reabsorption of NN in DCT
b. Reabsorption of water in DCT
c. Reabsorption of Glucose in DCT
d. Reabsorption of HC03 in DCT

157. **Site of action of ADH is**
I. Distal Convoluted tubules
II. Collecting Duct
III. Proximal convoluted tubules
IV. Loop of Henle
a. II and III b. II and IV
c. I and II d. I and III

158. **Which of the following hormone is not secreted by the kidney?**
a. Renin b. Angiotensin I
c. Erythropoietin d. 1, 25 DHCC

159. **Diabetes insipidus is related to deficiency of**
a. Oxytocin b. Insulin
c. Vasopressin d. Prolactin

160. **Which of the following hormone is secreted by alpha cells of pancreas?**
a. Glucagon b. Insulin
c. Somatostatin d. Somatotropin

161. **The hormone from the anterior pituitary gland that stimulates ovulation is called**
a. Follicle-stimulating hormone
b. Luteinizing hormone
c. Adrenocorticoid trophic hormone
d. Progesterone

Ans.

2133. a
2134. b
2135. a
2136. b
2137. a
2138. b
2139. d
2140. a
2141. c
2142. c
2143. a
2144. d
2145. a
2146. a
2147. c
2148. c
2149. d
2150. b
2151. b
2152. a
2153. c
2154. a
2155. d
2156. b
2157. c
2158. b
2159. c
2160. a
2161. b

Scanned with CamScanner

2162. The functions of the placenta include the production of
a. FSH b. LH
c. HCG d. TSH

2163. The suckling reflex occurs in response to
a. Prolactin b. Progesterone
c. Oxytocin d. Estrogen

2164. A drug that would stop the production of milk in the breast after a few days probably has the effect of
a. Inhibiting prolactin secretion
b. Inhibiting oxytocin secretion
c. Increasing prolactin secretion
d. Increasing oxytocin secretion

2165. The glands of the endocrine system
a. Secrete hormones into blood
b. Secrete hormones into ducts
c. Usually have a poor blood supply
d. Only produce hormones

2166. Adrenocorticotrophic hormone (ACTH) stimulates the
a. Thyroid gland b. Ovaries and testes
c. Hypothalamus d. Adrenal cortex

2167. The hormone from the posterior pituitary that increases water reabsorption in the kidney tubules is.
a. Antidiuretic hormone b. Prolactin
c. Oxytocin d. Aldosterone

2168. The main function of parathyroid hormone is to.
a. Increase the calcium level in the blood
b. Inhibit the formation of vitamin D in the kidneys
c. Decrease the rate of bone breakdown
d. Decrease the blood calcium level

2169. If blood glucose decreases below normal levels,
a. The nervous system will be excited
b. Breakdown of fat will increase
c. Breakdown of protein will increase
d. A large amount of urine will be produced

2170. Insulin is secreted in response to
a. Increased blood glucose levels
b. Decreased blood glucose levels
c. Decreased blood level of amino acids
d. Decreased parasympathetic stimulation

2171. Symptoms of diabetes mellitus include
a. Weight gain b. Increased appetite
c. High energy level d. Limited urine output

2172. The major target tissue for glucagon is the
a. Heart b. Brain
c. Liver d. Stomach

2173. The hormone that increases blood glucose levels and lipid breakdown, but slows, protein breakdown is
a. Glucagon b. Insulin
c. Glucocorticoid d. Growth hormone

2174. The hormone that acts to increase the permeability of renal tubules to water in order to produce less urine output is
a. Rennin b. Aldosterone
c. Antidiuretic hormone d. Atrial natriuretic hormone

2175. Excessive secretion of growth hormone leads to .....
a. Gigantism before the closure of epiphyseal plate
b. Acromegaly after the closure of epiphyseal plate
c. Both a and b
d. Cretinism

2176. Which hormone is released from zona glomerulosa? *(AIIMS Bhopal Grade-I 2018)*
a. Oestrogen b. Aldosterone
c. Adrenalin d. Cortisol

Ans.

2162. c
2163. c
2164. a
2165. a
2166. d
2167. a
2168. a
2169. b
2170. a
2171. b
2172. c
2173. d
2174. c
2175. c
2176. b
2177. c
2178. c
2179. c
2180. c
2181. a
2182. c
2183. c
2184. a
2185. d
2186. d
2187. a

Explanation: The zona glomerulosa of the adrenal gland is the most superficial layer of the adrenal cortex, lying directly beneath the renal capsule. Aldosterone is mineralocorticoid hormone expressed in the zona glomerulosa.

2177. Aldosterone directly regulate the concentration of?
a. Calcium b. Potassium
c. Sodium d. Phosphorous

2178. Hormones are secreted into the blood stream by
a. Unicellular glands b. Multicellular glands
c. Endocrine glands d. Exocrine glands

ASSESSMENT, DIAGNOSIS AND INVESTIGATIONS

2179. Glycated hemoglobin (HbA1c) tests, mean glucose levels: *(RAK MSc 2018)*
a. Over 2 days b. Over 15 days
c. Over 90 days d. Over 30 days

Explanation: HbA1c also called hemoglobin A1c (HbA1c), glycated hemoglobin or glycosylated hemoglobin. It is a blood test that is used to help diagnose and monitor people with diabetes.

The HbA1c test tells average level of blood glucose over the past 3 months (90 days) in the body. The HbA1c test measures how much glucose is bound to RBC.

2180. Normal random blood sugar level is
a. 30-60 mg/dl b. 60-90 mg/dl
c. 80-110 mg/dl d. 180-210 mg/dl

2181. In normal person, the percentage of glycosylated haemoglobin is: *(ESIC Chennai May 2012)*
a. 7 b. 14.5
c. 15.5 d. 17.9

2182. Impaired glucose tolerance is said when
a. Fasting blood sugar >100 mg%
b. Fasting blood sugar is normal and PP blood is 100–140 mg%
c. Fasting blood sugar is normal and PP blood is 140–200 mg%
d. Fasting blood sugar is 100-120 mg% and PP blood is >200 mg%

2183. Fasting blood sugar is 120mg/dL and 2 hr post prandial sugar after 75 gm of oral glucose administration is 180 mg/dL. Diagnosis is
a. Normal individual b. Impaired glucose tolerance
c. Pre-diabetes d. Diabetes mellitus

2184. In a person with hypocalcaemia parathyroid dysfunction is suspected, the confirmatory diagnostic test shows .....
a. Decreased parathormone
b. Increased parathormone
c. Decreased calcitonin d. Increased serum calcium

2185. Diagnostic test specific to Cushing syndrome is .....
a. Urine cortisol level
b. Dexamethasone suppression test
c. Plasma cortisol level
d. All of the above

2186. Levodopa test is used to detect
a. LH b. ACTH
c. FSH d. GH reserve

COMMON SIGNS AND SYMPTOMS

2187. Gigantism is seen in .....
a. Hyperpituitarism b. Hypopituitarism
c. Hyperthyroidism d. Hypothyroidism

Scanned with CamScanner

2188. Hypoglycemia is present in .....
a. Addison's disease
b. Hepatocellular failure
c. Glucose-6 phosphatase defect
d. All of the above

2189. Hyperglycemia is the manifestation of .....
a. Diabetes mellitus
b. Cushing syndrome
c. Hyperthyroidism
d. All of the above

2190. Short stature, secondary to growth hormone deficiency is associated with
a. Height age is equal to Bone age
b. Normal body proportion
c. Low birth weight
d. Normal epiphyseal development

Explanation:

Growth Hormone deficiency
- GHD babies are born AGA (not SGA)
- They have maintained body proportions, i.e. - proportionate short stature
- Disproportionate SS is seen in following (Upper segment: lower segment)
  - US > LS → Richets & Achondroplasia
  - US < LS → Spondylo epiphyseal dysplasia
  - GHD — children have significantly delayed bone age - but which is appropriate for height age i.e., CA > HA = BA

2191. Hyperpigmentation is seen with which hormone?
a. FSH b. LH
c. ACTH d. TSH

2192. Increased blood sugar level is the characteristic feature of all of the following, EXCEPT
a. Diabetes mellitus b. Corticosteroid therapy
c. Pancreatitis d. SIADH

2193. Clinical manifestation of SIADH includes .....
a. Increased urine Na+ b. Decreased serum Na+
c. Decreased urine osmolality
d. All of the above

2194. Hypertriglyceridemia can be seen in .....
a. Obesity b. Diabetes
c. Cushing syndrome d. Both a and b

2195. Which of the following is associated with hypercalcemia?
a. Tetany b. Urinary calculi
c. Petechiae d. T wave inversion in ECG

PITUITARY HORMONES

2196. Growth hormone is secreted by: *(Kerala PSC, Nov 2014)*
a. Neurohypophysis b. Adrenal cortex
c. Adenohypophysis d. Adrenal medulla

2197. The hyper secretion of growth hormone leads to: *(DSSSB PHN, 2015)*
a. Cretinism b. Myxedema
c. Acromegaly d. Grave's diseases

2198. The Hypofunction of the anterior pituitary gland that rarely affects the posterior lobe leading to: *(AIIMS Raipur Grade II 2017)*
a. Grave's disease
b. Simmond's disease
c. Frohlick's Syndrome
d. Levi Syndrome

Explanation: Simmonds disease is characterized by pan-hypopituitarism that causes progressive emaciation, atrophy of the gonads, thyroid, and adrenal cortex, and loss of body hair that results from atrophy or destruction of the anterior lobe of the pituitary gland.

Fröhlich's syndrome/Adiposogenital Dystrophy is a metabolic disorder characterized by obesity, growth retardation, and retarded development of the genital organs associated with tumours of the hypothalamus, causing increased appetite and depressed secretion of gonadotropin.

Roussy-Lévy syndrome/Roussy-Lévy hereditary areflexic dystasia is a rare genetic disorder of humans that results in progressive muscle wasting which is caused by mutations in the genes.

Graves' disease/toxic diffuse goiter is an autoimmune disease which is a common cause of hyperthyroidism.

2199. Twelve hours after a transsphenoidal hypophysectomy, the client keeps clearing his throat and complains of a drip in his mouth. To accurately assess this, the nurse should test the fluid for
a. Glucose b. Protein
c. Bacteria d. Blood

Explanation: Dripping in the back of the throat after a transsphenoidal hypophysectomy may be cerebrospinal fluid. CSF contains glucose. Testing for glucose will confirm if CSF present in the fluid. Saliva and mucus do not contain glucose.

2200. Tumors within Sella turcica and small adenomas of the pituitary glands can be removed through____ *(ESIC 2019)*
a. Infratentorial approach b. Transsphenoidal approach
c. Supratentorial approach d. Craniotomy

Explanation:
- Tumors within Sella turcica and small adenomas of the pituitary glands can be removed through transsphenoidal approach.
- Infratentorial approach: For pineal gland
- Supratentorial approach: For occipital, frontal, parietal and temporal lobes
- Craniotomy: A craniotomy is a surgical operation in which a bone flap is temporarily removed from the skull to access the brain.

THYROID

2201. Under production of thyroxine leads to: *(JIPMER 2012)*
a. Myxedema b. Grave's disease
c. Cushing's disease d. Acromegaly

2202. Deficiency of thyroxin in adults leads to a condition called: *(Safdarjung NO 2018)*
a. Tetani b. Cretinism
c. Myxedema d. Graves' disease

Explanation: Deficiency of thyroxin in adults leads to a condition called myxedema. Deficiency of thyroxine in infant and children causes cretinism that is associated with mental retardation and edema. Excessive thyroxine hormones in adults may leads to graves' disease that is hypermetabolic state.

2203. Hormones involved in calcium homeostasis is .....
a. Calcitonin b. Parathormone
c. Adrenaline d. Both a and b

2204. Cause of goiter is .....
a. Iodine deficiency b. Excess iodine
c. Thyroiditis d. Thyroidectomy

Ans.
2188. d
2189. d
2190. b
2191. c
2192. d
2193. d
2194. d
2195. b
2196. c
2197. c
2198. b
2199. a
2200. b
2201. a
2202. c
2203. d
2204. a

Scanned with CamScanner

2205. Most common cause of goiter in India is:
a. Diffuse Endemic Goitre b. Hashimoto's Thyroiditis
c. Papillary carcinoma d. Toxic Multinodular

2206. Most sensitive method to diagnose thyroid function is
a. T3 b. T4
c. TSH d. Thyroglobulin

Explanation:
- Most sensitive and specific test to detect hypothyroidism and hyperthyroidism is **TSH** Assay
- **Total T4:** Reflects output from thyroid gland
- **Total T3:** More indicative of peripheral thyroid metabolism, hence not useful for screening

2207. Hormone elevated in a client with hypothyroidism is .....
a. T3 b. T4
c. TSH d. Thyroxine

2208. Most reliable investigation for hypothyroidism is .....
a. T3 and T4 levels b. TRH level
c. TSH level d. iodine level

2209. Lack of thyroid hormone in children leads to .....
a. Cretinism b. Gigantism
c. Acromegaly d. Grave's disease

2210. Clinical features of congenital hypothyroidism is .....
a. Large anterior fontanelle
b. Poor feeding
c. Macroglossia
d. All of the above

2211. Congenital hypothyroidism is .....
a. Graves disease b. Cretinism
c. Myxedema d. Acromegaly

2212. Cretinism/myxedema develops due to .....
a. Hypothyroidism b. Hyperthyroidism
c. Hypopituitarism d. Hyperpituitarism

2213. A life threatening clinical condition that represents severe hypothyroidism with physiological decompensation is known as
a. Myxedema crisis b. Hypertensive crisis
c. Delirium tremens d. Thyroid storm

2214. Weight gain is the feature of .....
a. Hyperthyroidism b. Steroid therapy
c. Cushing's syndrome d. Both b and c

2215. Nursing management of a client with hyperthyroidism is
a. Provide cool environment
b. Provide a restful environment
c. Both a and b d. Provide small meals

2216. Clinical manifestations of grave's disease includes
a. Metabolic rate will increases and weight loss will be there
b. Exophthalmos is a clinical manifestation of this condition
c. Over production of thyroid hormone
d. All of the above

2217. Mechanism of action of parathyroid hormone
a. Decreases Calcitriol
b. Decreases Phosphate excretion
c. Increases Calcium absorption
d. Act an osteoclasts

2218. Which among the following is an expected lab finding in client with primary hyperparathyroidism?
a. Elevated serum calcium
b. Low level of serum calcium
c. Increased bone density
d. Low urine calcium

2219. All are features of hyper-parathyroidism EXCEPT
a. Increase serum calcium
b. Decreased serum phosphate
c. Diarrhea
d. Nephrocalcinosis

2220. Clinical manifestations of hypoparathyroidism includes
a. Muscle weakness b. Positive Chvostek's sign
c. Positive trousseau's sign d. All of the above

2221. Which of the following is caused by hypoparathyroidism?
a. High serum calcium b. Low serum calcium
c. High serum potassium d. Low serum potassium

Explanation: Hypoparathyroidism is a condition characterized by decreased blood levels of parathyroid hormone. Parathyroid along with vitamin D and dietary phosphorous regulates calcium level in the body. Decreased parathyroid hormone leads to hypocalcemia (low calcium).

2222. Clinical manifestation related to hypothyroidism is .....
a. Weight loss b. Shivering hands
c. Tachycardia d. Weight gain

2223. Hyperthyroidism leads to .....
a. Weight loss b. Sweating
c. Irritability d. All of the above

2224. All of the following are clinical manifestations of thyroid storm EXCEPT
a. High fever b. Tachycardia
c. Hypertension d. Severe constipation

2225. Which of the following is the priority nursing care for a client with severe hyperthyroidism?
a. Assess for emotional trauma
b. Encourage range-of-motion exercises
c. Provide diversionary activity
d. Provide a calm and non-stimulating environment

Explanation: Distractible over activity and exaggerated sensitivity to noise are characteristic features of hyperthyroidism. A calm environment is important to reduce activity.

2226. Drug of choice for hyperthyroidism is .....
a. Propylthiouracil (PTU) b. Methimazole
c. Levothyroxine sodium d. Both a and b

2227. Which of the following complication is most likely to develop if hyperthyroidism remains untreated?
a. Respiratory failure b. Cerebro vascular accident
c. Heart failure d. Pulmonary embolism

Explanation: Some of the most serious complications of hyperthyroidism involve the heart. These include a rapid heart rate, a heart rhythm disorder called atrial fibrillation and congestive heart failure.

2228. Risk factors for autoimmune thyroiditis (hashimoto disease) is .....
a. DM b. Myasthenia gravis
c. SLE d. All of the above

2229. Which of the following signs and symptoms are expected from a client with diagnosis of hypothyroidism?
a. Elevated blood pressure b. Moist and coarse hair
c. Tachycardia and weight gain
d. Hypothermia and constipation

Explanation: Hypothyroidism is a condition which slows the metabolic rate and peristalsis, leading to hypothermia and constipation respectively.

Ans.
2205. a
2206. c
2207. c
2208. c
2209. a
2210. d
2211. b
2212. a
2213. a
2214. d
2215. c
2216. d
2217. c
2218. a
2219. c
2220. d
2221. b
2222. d
2223. d
2224. d
2225. d
2226. d
2227. c
2228. a
2229. d

Scanned with CamScanner

2230. Drug of choice for hypothyroidism is .....
a. Propylthiouracil (PTU) b. Methimazole
c. Levothyroxine sodium d. Both A and B

2231. Exophthalmos of the eyes is a characteristic sign of: *(LNJP H D 2012)*
a. Grave's disease b. Cushing 's disease
c. Myxedema d. Cretinism

2232. Which of the following nursing intervention is essential for client with exophthalmos?
a. Administer artificial tears
b. Encourage the client to wear spectacle
c. Promote bed rest
d. Monitor pulse rate q4h

Explanation: Exophthalmos (protrusion of the eyes) may be so severe that the eyelids cannot close. The most essential measure is to keep the eyes moist. Hence, artificial tears is to keep the eyes moist so that abrasions do not occur.

2233. Which of the following is NOT correct about Hashimoto's disease
a. Chronic lymphocytic thyroiditis
b. An autoimmune disorder
c. Treated by oral levothyroxine
d. Characterized by severe weight loss

2234. Electrolyte imbalance seen in hyperthyroidism is .....
a. Hypocalcemia b. Hypercalcemia
c. Hypernatremia d. Hyperkalemia

Explanation:
Causes of Hypocalcemia
- Hypoparathyroidism
- Deficiency of vitamin D

Causes of Hypercalcemia
- Hyperparathyroidism
- Hyperthyroidism

Hyperthyroidism is reported to be associated with mild to moderate hypercalcemia in approximately 20% of total patients

2235. Electrolyte imbalance seen in hyperparathyroidism is .....
a. Hypocalcemia b. Hypercalcemia
c. Hypernatremia d. Hyperkalemia

2236. Electrolyte imbalance seen in hypoparathyroidism is .....
a. Hypocalcemia b. Hypercalcemia
c. Hypernatremia d. Hyperkalemia

2237. Secretion of parathyroid hormone is stimulated by: *(Kerala PSC, Nov 2014)*
a. Hypokalemia b. Hypercalcemia
c. Hyperkalemia d. Hypocalcemia

2238. The causes of hypoparathyroidism include: *(AIIMS Raipur Grade II 2017)*
A. Damage of glands during thyroidectomy
B. Congenital anomaly of the gland
C. Fractured base of skull
D. Development of antibodies to parathyroid cells
a. A, B, C b. B, C, D
c. A, B, D d. A, B, C, D

Explanation: The causes of hypoparathyroidism include injury to or removal of parathyroid glands, Digeorge syndrome, genetics, autoimmune diseases, cancer radiation treatments and low magnesium levels.

2239. Which of the following laboratory value is expected in patient diagnosed with hyperparathyroidism?
a. Elevated serum vitamin D
b. Elevated serum calcium
c. Low urine calcium
d. All of the above

2240. Which of the following hormone antagonize the action of parathyroid hormone?
a. Insulin b. Glucagon
c. Calcitonin d. Triiodothyronine

2241. Which among the following intervention is most appropriate in a client who is experiencing hemorrhage following thyroidectomy?
a. Intubate the client
b. Prepare for tracheostomy
c. Lateral position
d. Start IV fluids

2242. After thyroidectomy accidental removal of parathyroid gland need to suspect if .....
a. Easily fracture following a minor fall injury
b. Renal calculi occurred
c. Hypertension and difficulty swallowing
d. Laryngospasms and tingling in the hand and feet.

2243. An adult patient with myxedema is started on thyroid replacement therapy. Which of the following is considered to be an expected adverse reaction to the medication?
a. Angina pectoris b. Bradycardia
c. Severe cramps d. Weight gain

Explanation: Thyroxine will increase the heart rate, and the heart will require more oxygen. Angina is a likely and serious complication that can occur as result of thyroid replacement therapy.

2244. A 45-year-old female patient underwent subtotal thyroidectomy in the morning. On the same day evening, she complains of nausea. Assessment found that her temperature is 104°F, tachycardia and restlessness. This nurse understands that the most likely cause of these signs and symptoms is
a. Hypoglycemia b. Thyroid crisis
c. DKA d. Hypocalcemia

2245. Which of the following is the best method to assess for hemorrhage in a client who underwent thyroidectomy?
a. Check blood pressure hourly
b. Assess the client for frequent swallowing
c. Roll the client to side and check for bleeding
d. Place a hand under the client's neck and shoulders to feel bed linens

Explanation: Client will be in semi-sitting position so drainage would go to the back of the neck. So the right method to assess bleeding is to place a hand under the client's neck and shoulders to feel bed linens. Blood trickling down the throat is seen in patients with tonsillectomy.

2246. A patient who has just had a thyroidectomy returns to the unit in a stable condition. Which of the following equipment is important for the nurse to have readily available?
a. Dressing set b. Thoracotomy tray
c. Tracheostomy set d. Ice collar

Explanation: Thyroidectomy is subject to complications in the first 48 hours after surgery. Inflammation of operative site may cause airway obstruction. The nurse should have a tracheostomy set and oxygen at the bedside for 48 hours after thyroidectomy.

Ans.
2230. c
2231. a
2232. a
2233. d
2234. b
2235. b
2236. a
2237. d
2238. c
2239. b
2240. c
2241. b
2242. d
2243. a
2244. b
2245. d
2246. c

Scanned with CamScanner

2247. During early post-operative period after thyroidectomy, which of the following findings is a cause of concern?
a. A sore throat
b. Complaints of pain in the area of the surgical incision
c. Carpal spasm when the blood pressure is taken
d. Temperature of 101°F

Explanation: Carpal spasm is a sign of tetany and is known as Trousseau sign. Trousseau sign of latent tetany is a medical sign observed in patients with low calcium. Inadvertent removal of parathyroid glands causes hypocalcemia which leads to tetany.

2248. After thyroid surgery (thyroidectomy) patient shows carpopedal spasm. This sign indicates *(Banaras HU 2015)*
a. Severe postoperative bleeding
b. Very low thyroid hormone levels
c. Decreased metabolism and hypothermia
d. Hypocalcemic tetany

2249. A patient who is on oral levothyroxine should be advised to take the medication at what time of the day
a. Morning
b. In between meals
c. Evening
d. At bedtime

Diabetes Mellitus

2250. World diabetes day is celebrated on: *(Safdarjung NO 2018)*
a. 14th September
b. 14th August
c. 14th November
d. 24th January

Explanation: World diabetes day is celebrated on 14 November. It is observed by International Diabetes Federation in response to creating awareness about rising threats from diabetes.
Tips to Remember: Children's day and Diabetes day are on 14th November.

2251. The most rapid absorption of insulin occurs in *(Safdarjung NO 2018)*
a. Abdomen
b. Arms
c. Thigh
d. Buttocks

Explanation: The most rapid absorption of insulin occurs through abdomen. More subcutaneous tissue is present in abdomen area than arms, thighs and buttocks for better absorption of insulin.

2252. Other name for type-I diabetes mellitus (DM) is .....
a. Juvenile diabetes
b. Adult onset diabetes mellitus
c. Gestational diabetes
d. DM with infection

2253. Type II diabetes mellitus is also known as
a. Juvenile diabetes
b. Adult onset diabetes mellitus
c. Gestational diabetes
d. DM with infection

2254. Which among the following DM is characterized by resistance of the cells to insulin
a. Type 1
b. Type 2
c. Gestational
d. All of the above

2255. Which among the following DM is characterized by damage to beta cell
a. Type 1
b. Type 2
c. Gestational
d. All of the above

2256. Ps of diabetes mellitus are all EXCEPT
a. Polyuria
b. Polyphagia
c. Polydipsia
d. Polyarthria

2257. Patient with diabetes mellitus complaining of irritability, sweating and thirst. These are suggestive of .....
a. Hypoglycemia
b. Dawn phenomenon
c. DKA
d. HHNKS

2258. All of the following are the clinical manifestation of diabetes mellitus, EXCEPT: *(DSSSB 2013)*
a. Glycosuria
b. Hyperglycemia
c. Hypoglycemia
d. Polyuria

Explanation: The most common diabetes signs and symptoms include frequent urination (polyuria), presence of glucose in urine (glycosuria), increased blood sugar (hyperglycemia), intense thirst and hunger, weight gain, unusual weight loss, fatigue, cuts and bruises that do not heal, male sexual dysfunction, numbness and tingling in hands and feet. Hypoglycemia is not feature of diabetes mellitus.

2259. Mechanism behind polyuria and polydipsia in diabetes mellitus is .....
a. Fat metabolism leads to ketone release
b. Hyperglycemia cause osmotic imbalance
c. Renal threshold of the kidney for glucose will exceeds
d. Decreased erythropoietin secretion

2260. A patient with diabetes mellitus is complaining of irritability, sweating and thirst. The priority nursing action is _____
a. Ask the patient to lie down
b. Check urine for ketone bodies
c. Check the patient's blood glucose level
d. Assess for other neurologic symptoms

2261. The complaint of Insulin secretion is noticed in: *(DSSSB PHN, 2015)*
a. Type I diabetes
b. Type II diabetes
c. Secondary diabetes
d. Diabetes insipidus

2262. SGL 2 Inhibitors are the new group of drugs used in treatment of *(ISRO)*
a. Diabetes Mellitus
b. Dyslipidemia
c. Hyperthyroidism
d. Chronic renal failure

2263. Complication of diabetes mellitus include .....
a. Hyperglycemic hyperosmolar non-ketotic syndrome
b. Diabetic ketoacidosis
c. Microvascular complication
d. All of the above

2264. While preparing a patient for surgery who has diabetes mellitus, the nurse should be aware of which of the following potential surgical risks associated with this disease? *(AIIMS Bhopal Grade-I 2018)*
a. Altered metabolism and excretion of drugs
b. Fluid and electrolyte imbalance
c. Respiratory depression from anesthesia
d. Poor wound healing

Explanation: The patients with diabetes mellitus have high blood glucose level which contributes to the formation of fatty deposits in blood vessels wall. Overtime, it leads to hardening and narrowing of the blood vessels which restricts the blood flow to peripheral areas or wound. Also an elevated blood sugar level decreases the function of RBC's that carry nutrients to the tissues, this lowers the efficiency of WBC's to fight with infection. So, the nurse should be aware that poor wound healing is potential surgical risk associated with diabetes.

Ans.

2247.	c
2248.	d
2249.	a
2250.	c
2251.	a

2254.	b
2255.	a
2256.	d
2257.	a
2258.	c
2259.	b
2260.	c
2261.	a
2262.	a
2263.	d
2264.	d

Scanned with CamScanner

2265. Which meal plan is best for the patient with reactive hypoglycemia? *(Kerala PSC, Nov 2014)*
a. Avoidance of fats and proteins
b. Small frequent meals
c. Low fiber, high carbohydrate diet
d. Avoid fats, complex carbohydrates and proteins

2266. Glipizide, an oral hypoglycemic agent should be administered
a. With breakfast
b. Before lunch
c. After dinner
d. At bed time

2267. Rotation of injection site while administering insulin prevents
a. Insulin resistance
b. Anaphylactic reactions
c. Edema
d. Lipodystrophy

2268. Which of the following insulin has the most rapid action?
a. Lente
b. Ultralente
c. Lispro
d. Humulin N

2269. Most common cause for insulin resistance is .....
a. Over-weight
b. Post receptor defects
c. Damage to beta cell
d. Pancreatic dysfunction

2270. Characteristic respiration present in diabetic ketoacidosis is .....
a. Kussmaul respiration
b. Chyne-stroke respiration
c. Hyperventilation
d. Apnea

2271. Electrolyte needs to be replaced in DKA is .....
a. Sodium
b. Potassium
c. Calcium
d. Phosphorous

2272. How exercise helps a diabetes patient?
a. Reduce insulin need by reducing blood glucose level
b. Use stored fat to meet the energy requirement
c. Sweating control the electrolyte imbalances
d. None of the above

2273. Diabetic foot care teaching plan include .....
a. Apply a moisturizing lotion to dry feet but not between the toes
b. Use mirror to check the foot
c. Use shoe of appropriate size
d. All of the above

2274. All of the following are included in diabetic teaching plan EXCEPT
a. Change position frequently to increase circulation
b. Inspect feet and legs daily for any changes
c. Keep the unused insulin in the refrigerator
d. Keep legs elevated on 2 pillows while sleeping

Explanation: In a diabetic patient, there is impaired blood circulation to distal part of the extremities. Elevation of legs during sleep will further decrease the circulation.

2275. The nurse is teaching a client to self-administer insulin. The instructions should include teaching the client to:
a. Inject the needle at a 45° angle into the muscle
b. Rotate injection sites
c. Vigorously massage the area after injection
d. All of the above

Explanation: Injection sites should be rotated to prevent tissue damage or lipodystrophy. Insulin is injected at a 90° angle into the subcutaneous tissue, not 45° angle into the muscle. Vigorously massaging the injection site is not advised.

2276. Which of the following tests is most sensitive for detecting early diabetic nephropathy?
a. Serum Creatinine
b. Ultra sonography
c. Microalbuminuria
d. Creatinine clearance

2277. Most common oral infection in diabetes mellitus?
a. Candida
b. Staphylococcus
c. Streptococcus
d. Aspergilius

2278. Incorrect about gestational diabetes mellitus?
a. Congenital malformations
b. Metformin is used
c. Prolonged labour
d. Large for date baby

2279. Which of the macrovascular complication of Diabetes occurs first
a. Diabetic neuropathy
b. Diabetic.nephropathy
c. Diabetic. retinopathy
d. CAD

2280. Niacin is contraindicated in diabetes patient because
a. It increases insulin resistance
b. It increases metabolism of anti diabetic drugs
c. It causes scleroderma which leads to loss of injection sites
d. It causes hypoglycemia

2281. Oral anti-diabetic drug safe in renal failure is:
a. Glyburide
b. Chlorporamide
c. Repaglinide
d. Metformin

Explanation: Repaglinide is excreted through bile and is independent of renal function.

2282. Female with blood sugar of 600 mg% and sodium of 110 mEq. Insulin was given, what will happen to serum sodium levels?
a. Sodium increase
b. Sodium decrease
c. Sodium unaffected
d. Relative sodium deficiency

Explanation: Insulin stimulates reabsorption of sodium for DCT

2283. The most effective correction of acidosis in diabetic ketoacidosis is by
a. IV bicarbonate
b. IV saline
c. IV insulin
d. Oral bicarbonate

Diabetes Insipidus and Siadh

2284. Diabetes insipidus is caused by the deficiency of: *(DSSSB 2013)*
a. Antidiuretic hormone
b. Insulin
c. Glucagon
d. Renin

Explanation: Diabetes insipidus (DI) is a condition caused by inadequate output of the pituitary hormone ADH (antidiuretic hormone). It is characterized by excessive thirst and excretion of large amounts of diluted urine.

2285. Clinical manifestation expected in a client with diabetes insipidus is _____
a. Polyuria and hyponatremia
b. Polyuria and hypernatremia
c. Low urine output and hyponatremia
d. Low urine output and hypernatremia

2286. In a client with diabetes insipidus, the serum sodium level
a. Increases
b. Decreases
c. Within the normal range
d. Fluctuating

2287. Water deprivation test is used for the diagnosis of .....
a. Diabetic mellitus
b. Diabetic insipidus
c. SIADH
d. Diabetic ketoacidosis

Ans.

2265. b
2266. a
2267. d
2268. c
2269. b
2270. a
2271. b
2272. a
2273. d
2274. d
2275. b
2276. c
2277. a
2278. a
2279. d
2280. a
2281. c
2282. a
2283. c
2284. a
2285. b
2286. a
2287. b

Scanned with CamScanner

Explanation: In diabetic insipidus water intake will be restricted in the person, following that, if urine output increases and weight loss occurs in a person, then the person is diagnosed as diabetes insipidus.

2288. Causes of nephrogenic diabetes insipidus include
(DSSSB 2001, AIIMS Raipur staff nurse grade I-2018)
a. Idiopathic b. Genetic
c. Head injury d. Histiocytosis X

Explanation: Nephrogenic diabetes insipidus (NDI) is characterized by inability to concentrate the urine, which results in polyuria (excessive urine production) and polydipsia. Cause of Nephrogenic diabetes insipidus is either acquired or hereditary (genetic). Options A, C and D are causes of cranial diabetes insipidus. Genetic is the most common cause for nephrogenic diabetes insipidus.

2289. Priority nursing management in a client with Diabetes insipidus is
a. Hourly urine output
b. Hourly blood glucose
c. Hourly head circumference
d. Hourly abdominal circumference

2290. What should be included in the nursing care plan of a client with diabetes insipidus?
a. Measure blood pressure every hour
b. Glucose monitoring four times a day
c. Maintain strict intake and output
d. Monitor urine for ketone bodies

Explanation: Diabetes insipidus is excessive and severely diluted urine excretion due to insufficient antidiuretic hormone. Because of the excessive urine output, it is necessary to monitor intake and output.

2291. Following the resection of craniopharyngioma important nursing intervention is measurement of
a. Hourly urine specific gravity
b. Hourly blood sugar
c. Hourly abdominal girth
d. Hourly head circumference

Explanation: Surgery can cause damage to hypothalamus

2292. Cause of SIADH .....
a. Excess of ADH b. Deficiency of aldosterone
c. Deficiency of ADH d. Excess of aldosterone

2293. In a client with SIADH, serum sodium level _____
a. Increases b. Decreases
c. Remain in normal range d. Fluctuates

2294. Clinical manifestation expected in a client with SIADH is
a. Polyuria and hyponatremia
b. Polyuria and hypernatremia
c. Low urine output and hyponatremia
d. Low urine output and hypernatremia

ADRENAL GLANDS

2295. Stress hormone is
a. Gonadotrophins
b. Insulin
c. Cortisol
d. Growth hormone

2296. Emergency or acute stress hormones are released from
a. Adrenal cortex b. Adrenal medulla
c. Pituitary d. Thyroid

Explanation: Stress hormones (Epinephrine, norepinephrine) stimulate sympathetic nervous system. They are secreted by Adrenal medulla.

Adrenal Cortex secrets cortisols and Aldosterone.

2297. Increased adrenal cortex hormone secretion leads to .....
a. Cushing's syndrome b. Addison's syndrome
c. Pheochromocytoma d. Adrenal insufficiency

2298. Decreased adrenal cortex hormone secretion leads to .....
a. Cushing's syndrome b. Addison's syndrome
c. Pheochromocytoma d. Wilms tumor

2299. All are seen in Addison's disease EXCEPT?
a. Hypotension b. Hyponatremia
c. Hyperkalemia d. Metabolic alkalosis

2300. Glucose fever is related with
a. Glucagon b. Parathyroid
c. Cortisol d. GH

Explanation: Patient with Addison's disease may develop high grade fever following glucose infusion. This is what is caused as Glucose fever and is linked to lack of cortisol. Following the fever patient may develop adrenal crisis.

2301. Electrolyte abnormality seen in Cushing syndrome is
a. Hypokalemia b. Hypernatremia
c. Both a and b d. None of the above

2302. What are the signs and symptoms of Cushing's syndrome other than obesity? *(DSSSB 2010)*
a. Abdominal striae and ankle enlargement
b. Large thighs and upper arms
c. Posterior neck fat pad and thin extremities
d. Flabby abdomen and large hips

Explanation: Common signs and symptoms of Cushing's syndrome involve progressive obesity and skin changes, such as weight gain and fatty tissue deposits, particularly around the midsection and upper back, in the face (moon face), and between the shoulders (buffalo hump).

2303. Not seen in Cushing's syndrome
a. Hypoglycemia b. Hypertension
c. Frank psychosis d. Hypokalemia

2304. Which of the following hormone is called a "Stress" hormone? *(Kerala PSC, Nov 2014)*
a. Calcitonin b. Vasopressin
c. Cortisol d. Prolactin

2305. Adrenal medulla hormone include .....
a. Epinephrine b. Norepinephrine
c. Both a and b d. None of the above

2306. Which of the following hormone is NOT a steroid hormone
a. Mineralocorticoids b. Glucocorticoids
c. Sex hormones d. Epinephrine

2307. Principal hormone high in Cushing syndrome is .....
a. Glucocorticoids b. Mineralocorticoids
c. Aldosterone d. Androgens

2308. Causes of Cushing's syndrome is .....
a. Prolonged administration of corticosteroids
b. ACTH secreting pituitary tumor
c. Cortisol secreting neoplasm
d. All of the above

2309. Moon face with central obesity is noticed in: *(DSSSB PHN, 2015)*
a. Addison's disease b. Cushing's syndrome
c. Down's syndrome d. Turner's syndrome

Ans.
2288. b
2289. a
2290. c
2291. a
2292. a
2293. b
2294. c
2295. c
2296. b
2297. a
2298. b
2299. d
2300. c
2301. c
2302. c
2303. a
2304. c
2305. c
2306. d
2307. a
2308. d
2309. b

Scanned with CamScanner

2310. Moon face, hirsutism and truncal obesity are the characteristic of .....
a. Addison's disease b. Cushing's syndrome
c. Pheochromocytoma d. Renal blastoma

2311. Which of the following feature is not related to Cushing's triad? *(JIPMER 2012)*
a. ⊠systolic BP b. Hypothermia
c. Bradycardia d. Widening pulse pressure

2312. Which of the following is NOT TRUE regarding pheochromocytoma is .....
a. Catecholamine secreting tumor found in adrenal medulla
b. Client will be having hypertension
c. Pounding headache and profuse sweating are the clinical manifestations
d. Bradycardia is present

Explanation: Tachycardia and profuse sweating are the clinical manifestations of pheochromocytoma. So presence of bradycardia is incorrect regarding pheochromocytoma.

2313. A 40-years-old lady comes with pheochromocytoma. Most characteristic symptom is?
a. Orthostatic hypotension
b. Weight loss
c. Sweating attacks
d. Paroxysmal hypertension

2314. Drug given to diminish the catecholamine production is ...
a. Metyrosine b. Phenoxybenzamine
c. Prazosin d. All of the above

2315. Which among the following is an expected pre-operative preparative order for a patient with adrenalectomy for hyperaldosteronism?
a. Monitor catecholamine level
b. Measure urinary catecholamine level
c. Administer potassium-sparing diuretics
d. Enema

2316. One of the interventions associated to manage the side effects of corticosteroid therapy is .....
a. Increase calcium intake to 1500 mg/day
b. Perform Kegel exercises
c. Get all immunization to control infection
d. Stop the drug if you feel better

2317. Electrolyte abnormality seen in Addison's disease is
a. Hyperkalemia b. Hyponatremia
c. Both a and b d. None of the above

Explanation: Addison's disease is caused by inadequate secretion of adrenal gland. Aldosterone (secreted by adrenal cortex) regulates blood pressure and electrolytes. Aldosterone enhances excretion of potassium and increases reabsorption of sodium. Hence hypoaldosteronism can be associated with hyperkalemia and hyponatremia.

2318. Management of Addison's disease include all, EXCEPT
a. Salt restriction
b. Replacement therapy with hydrocortisone
c. Minerelocorticoid supplementation
d. Oral corticosteroids such as Hydrocortisone

2319. Symptoms of Addison's diseases includes all, EXCEPT
a. Weight gain
b. Bronze or hyperpigmentation of the face, neck
c. Cramping and abdominal pain
d. Postural hypotension

2320. Adrenal cortex hormone include .....
a. Corticosteroids b. Androgens
c. Mineralocorticoids d. All of the above

2321. Best time to have the corticosteroids replacement therapy is .....
a. Night before going to the bed
b. Any time every alternative day
c. After waking up or in the late afternoon
d. Every 4 hourly

2322. Which of the following diet is NOT appropriate for a patient diagnosed with Addison's disease
a. Sodium restricted diet
b. High protein diet
c. Diet with adequate calorie intake
d. Diet high in complex carbohydrates

2323. Angiotensin-II increases which of the following? *(Kerala PSC, Nov 2014)*
a. Vasodilation and ADH secretion
b. Vasoconstriction and aldosterone secretion
c. Venous flow from the extremity
d. Arterial flow to the extremity

2324. All of the following are the complication associated with long term use of corticosteroid therapy, EXCEPT .....
a. Hypolipidemia
b. Osteoporosis
c. Cushingoid appearance
d. Adrenal insufficiency

Explanation: Long-term corticosteroid use is associated with **hyperlipidemia**, osteoporosis, aseptic joint necrosis, adrenal insufficiency, gastrointestinal, hepatic, and ophthalmologic effects, growth suppression, and possible congenital malformations. So hypolipidemia is incorrect.

2325. All of the following are the complication associated with short term use of corticosteroid therapy, EXCEPT .....
a. Hypertension b. Immunosuprression
c. Hypoglycemia d. Electrolyte abnormalities

Explanation: Short-term corticosteroid use is associated with generally mild side effects, including hyperglycemia, hypertension, electrolyte abnormalities, pancreatitis, cutaneous effects, hematologic, immunologic, and neuropsychologic effects.

2326. A client is getting inj. Prednisolone as continuous IV infusion important nursing management is
a. Hourly urine specific gravity
b. Hourly blood sugar
c. Hourly abdominal girth
d. Hourly head circumference

COMMON INTERVENTIONS AND MANAGEMENT

Miscellaneous

2327. Production of estrogen by a mature ovarian follicle leads to ...
a. Negative inhibition to estrogen production
b. Increased production of progesterone
c. Release of GnRH and increased secretion of LH
d. Oogenesis

NERVOUS SYSTEM

ANATOMY AND PHYSIOLOGY OF NERVOUS SYSTEM

Neuron

- Basic functional unit of the nervous system.

Figure 79 ■ Structure of a Neuron

- **Dendrite**: A branch like structure for receiving electrochemical message.
- **Axon**: Long projections which carry impulses away from cell body.
- **Synapse**: It is the specialized junction between neurons.
- **Myelin**: A fatty material that acts as an insulator and conductor to speed up the process of communication.
- **Synaptic cleft/synaptic gap**: It is the space between neurons at which nerve impulses are transmitted by neurotransmitters.

Neurotransmitter

- Neurotransmitter helps to communicate information between two neurons.
- Neurotransmitters are synthesized and stored in synaptic vesicles.

CLASSIFICATION OF NERVOUS SYSTEM

The Central Nervous System

Figure 80 ■ Classification of central nervous system

Scanned with CamScanner

Astrocytes - largest neuroglia (# share)
microglia - smallest "

Brain

- Brain is divided into three major areas:
  - **Cerebrum** - Composed of two hemispheres, thalamus, hypothalamus and basal ganglia
  - **Cerebellum** - Located under cerebrum and behind the brain stem
  - **Brain stem** - Includes midbrain, pons and medulla

Figure 81

Cerebrum

- It consists of two hemispheres, right and left hemispheres.
- Right handed persons are having dominant left hemisphere which is responsible for linguistic, verbal, calculating, arithmetic, and analytical functions.
- Non-dominant hemisphere is for geometric, visual, spatial, pattern and musical function.
- Corpus callosum connects both hemispheres.
- Gyri - Outside wrinkled (folded) appearance of cerebral hemisphere. This folded appearance increases the surface area of brain.
- External surface or cerebral cortex is made up of grey matter i.e cell bodies.
- Inner surface or white matter is made up of nerve fibers.
  - **Thalamus**
    - It lies on either side of the third ventricle.
    - It is the relay center for all information **except smell**.
    - Pain gate and reticuloendothelial system (RAS) is also the part of this lobe.
  - **Hypothalamus**
    - Lies inferior and anterior to thalamus
    - It contains **optic chiasm** (point at which two optic nerves intersect) and mammillary bodies (involved in olfactory reflex and emotional response to odors)
    - Hypothalamus connects to the pituitary via infundibulum and plays an important role in endocrine regulation and fluid regulation
    - Involved in **temperature regulation**
    - **Hunger center** is located in hypothalamus.
  - **Basal ganglia**
    - Located deep in cerebral hemisphere
    - It is responsible for fine motor movements of upper and lower extremities
- The cerebral hemispheres are divided into frontal, parietal, temporal and occipital lobes.

Table 75 The functions of each lobe of cerebral hemisphere

Lobe	Function
Frontal lobe	• Largest lobe • Concentration, abstract thought, information storage, memory, motor function, affect, personality and inhibitions. • Broca's area of speech (production of speech) is located in this lobe
Parietal lobe	• Sensory cortex is present in this lobe • Helps in individual's awareness of the body in space, orientation and spatial relationship.
Temporal lobe	• Auditory receptive area • Wernicke's area for language development is in this lobe
Occipital lobe	• Visual interpretation

Cerebellum

- Cerebellum is separated from cerebrum by tentorium cerebelli.
- It has **excitatory and inhibitory action**.
- It is responsible for **coordination of movements.**

Brain Stem

- It consists of **mid brain, pons and medulla oblongata**.
- **Midbrain** connects pons and cerebrum.
- **Medulla oblongata:** Most inferior region of the brain stem. It becomes the spinal cord at the level of the foramen magnum.

Protective Structures of Brain

- Brain is covered by rigid skull bone.
- Meninges are fibrous connective tissues which cover brain and spinal cord.
- Layers of meninges are:
  - **Dura mater:** Outermost cover of brain and spinal cord
  - **Arachnoid mater:** It has no blood supply. This layer contains **choroid plexus** which produce CSF. This membrane also has finger like projections called arachnoid villi which reabsorb CSF.
  - **Pia mater:** Inner most layer.

Scanned with CamScanner

Target High - Fifth Premium Edition

Production and Circulation of CSF

Figure 82 ▪ Production and circulation of CSF

Cerebral Circulation

- Brain receives 15% of cardiac output.
- Brain has high metabolic demand and it requires high blood flow.
- Blood flow to the brain is against gravity.
- Brain has good collateral circulation.
- Arterial Supply to the Brain
  - Two internal carotid arteries and two vertebral arteries provide blood supply to the brain.
  - Internal carotid artery arises from common carotid artery.
  - Vertebral artery is a branch of subclavian artery that enters the cranium through foramen magnum.
  - Vertebral artery joins to form basilar artery at the level of brain stem.
  - At the base of the brain, internal carotid artery and vertebral artery form rings of arteries known as circle of Willis.
  - Arteries in the circle of Willis provide collateral circulation if one or more of the arteries are ligated or occluded.
  - The arteries along with the circle of Willis are the frequent sites for aneurysm.

Figure 83 ▪ Arterial supply to brain

- **Venous Drainage from the Brain**
  - Network of sinus (dural sinus) carries venous blood from the brain empties into internal jugular vein and returning blood to the heart.
  - Unlike other veins cerebral vein do not have valves. It depends on gravity and blood pressure.

Blood Brain Barrier

- All the substances entering in the brain will be filtered by endothelial cells and astrocytes (blood brain barrier).
- This property helps in proper neuronal function and also protects the neural tissue from toxins and pathogens.

Spinal Cord

- It is approximately **45cm long.**
- It is H shaped structure that extends from foramen magnum at the base of the skull to lower border of the first lumbar vertebra.
- **Grey matter** (Ascending tract) is in the center and is surrounded by the **white matter** (Descending tract).
- There are **31 pairs of spinal nerves.**

Vertebral Column

- It consists of 33 vertebrae and are divided as follows:
  - Cervical -7
  - Thoracic-12
  - Lumbar-5
  - Sacral- Five fused vertebra
  - Coccyx – Four fused vertebrae

Scanned with CamScanner

- Vertebrae are separated by disc except at first and second cervical, the sacrum and at the coccyx.
- C1 vertebra which supports the skull is known as atlas and the C2 vertebra which pivots the atlas is known as axis.

The Peripheral Nervous System

- It consists of cranial nerves (12 pairs), spinal nerves (31 pairs) and autonomic nervous system.

Cranial Nerves and its Functions

Table 76 Cranial nerves with their functions

O3 T2 AF VGR VAH

Cranial nerve	Fibers	Structures innervated	Functions	Brainstem nucleus
I Olfactory	Sensory	Olfactory epithelium (via olfactory bulb)	Olfaction	
II Optic	Sensory	Retina	Vision	
III Oculomotor	Motor	Superior/middle/inferior rectus, inferior oblique, levator palpebrae	Movement of eyeball	Oculomotor nucleus
	Parasympathetic	Pupillary constrictor, ciliary muscle of eyeball. Both via the ciliary ganglion	Pupillary constriction and accommodation	Oculomotor nucleus
IV Trochlear	Motor	Superior oblique	Movement of eyeball	Trochlear nucleus
V Trigeminal	Sensory	Face, scalp, cornea, nasal and oral cavities, cranial dura mater.	General sensation	Trigeminal sensory nucleus
	Motor	Muscles of mastication	Opening/closing mouth	Trigeminal motor nucleus
		Tensor tympani muscle	Tension of tympanic membrane	Trigeminal motor nucleus
VI Abducens	Motor	Lateral rectus	Movement of eyeball	Abducens nucleus
VII Facial	Sensory	Anterior 2/3 of tongue	Taste	Nucleus solitarius
	Motor	Muscles of facial expression	Facial movement	Facial motor nucleus
		Stapedius muscle	Tension of ossicles	Facial motor nucleus
	Parasympathetic	Salivary and lacrimal glands via submandibular and pterygopalatine ganglia	Salivation and lacrimation	Superior salivatory nucleus
VIII Vestibulocochlear	Sensory	Cochlea	Hearing	Cochlear nucleus
		Vestibular apparatus	Proprioception of head, balance.	Vestibular nucleus
IX Glossopharyngeal	Sensory	Eustachian tube, middle ear	General sensation	Trigeminal sensory nucleus
		Carotid Body, and sinus	Chemo/baroreception	
		Pharynx, posterior 1/3 of tongue	Taste	Nucleus solitarius
	Motor	Stylopharyngeus	Swallowing	
	Parasympathetic	Salivary glands via the otic ganglion	Salivation	Inferior salivatory nucleus
X Vagus	Sensory	Pharynx, larynx, esophagus, external ear	General sensation	Trigeminal sensory nucleus
		Aortic bodies and arch	Chemo/baroreception	
		Thoracic and abdominal viscera	Visceral sensation	Nucleus solitarus
	Motor	Soft palate, larynx, pharynx, upper esophagus	Speech, swallowing	Nucleus ambiguus
	Parasympathetic	Cardiovascular, respiratory and gastrointestinal systems	Control of these systems	Dorsal motor nucleus of vagus
XI Accessory	Motor	Sternomastoid, trapezius	Movement of head and shoulders	Nucleus ambiguus, cranial nerves
XII Hypoglossal	Motor	Intrinsic and extrinsic muscles of tongue	Movement of tongue	Hypoglossal nucleus

Scanned with CamScanner

Target High - Fifth Premium Edition

Spinal Nerves

- There are 31 pairs of spinal nerves (8 cervical, 12 thoracic, 5 lumbar, 5 sacral and 1 coccyx).
- Each spinal nerve has a dorsal root and ventral root.
- Dorsal root carries sensory information to body parts through dorsal ganglia.
- Ventral roots carry information from spinal cord to body parts.

Autonomic Nervous System

- **Function** - Maintenance of internal environment
- It has two divisions namely **sympathetic and para-sympathetic**
  - **Sympathetic nervous system** (adrenergic) is mainly excitatory and responsible for **fight and flight response.**
  - **Para-sympathetic nervous system** is cholinergic and is responsible for **rest and breed**.
- Sympathetic stimuli are mediated by nor-epinephrine.
- Parasympathetic impulses are mediated by acetylcholine.
- Sympathetic and parasympathetic systems are antagonistic with each other.

Figure 84 ▪ Autonomic nervous system

ASSESSMENT AND DIAGNOSTIC TESTS

Table 77 Assessment of cranial nerves

Cranial nerve	Type	Assessment
Olfactory	Sensory	Smell – Coffee, peppermint, gloves
Optic	Sensory	Visual acuity – Snellen chart; test for visual field; ophthalmoscope
Oculomotor	Motor and Sensory	Move eye ball up and down; Test for accommodation; pupillary constriction
Trochlear Abducens	Motor and Sensory	Lateral and inferior movement of eye
Trigeminal	Sensory and Motor	Assess corneal reflex; Sensation in skin of the face with cotton wisp; chewing, biting, lateral jaw movements
Facial	Sensory and Motor	Taste – anterior 2/3rd of tongue; (sweet, salt and sour)
Vestibulocochlear	Sensory	Hearing, balance (Weber and Rinne test)
Glossopharyngeal	Sensory and Motor	Swallowing; Taste – Posterior 1/3rd of tongue (bitter)
Vagus	Sensory and Motor	Assess Gag reflex, Swallowing, and sensation of posterior 1/3rd of tongue.
Spinal Accessary	Motor and Sensory	Shoulder Shrug, Shoulder movement, head rotation.
Hypoglossal	Motor and sensory	Tongue movement (protrude tongue. Push tongue into the cheek.

Scanned with CamScanner

Key Points

- Unilaterally dilated pupil indicates damage to third cranial nerve
- Mid position or fixed pupil indicates damage to mid brain
- Pinpoint pupil indicates pontine hemorrhage

Muscle Strength

Assess patient ability to flex or extent the extremities against resistance test muscle strength.

Table 78 Muscle strength is scored as follows:

Score	Interpretation
5	• Normal muscle strength • Full power of contraction against gravity and resistance
4	• Fair strength • Not full strength against gravity or moderate amount of resistance or slight weakness
3	• Just sufficient strength to overcome the force of gravity • Moderate weakness
2	• Ability to move but not to overcome the force of gravity • Severe weakness
1	• Minimal contractile power • Weak muscle contraction can be palpated but no movement • Very severe weakness
0	• Complete paralysis

Neurological Balance

Romberg test: This test is to check balance. Patient stands with feet together and arms at the side. This is performed first with open eyes and then with closed eye. If patient looses balance and falls down then it is considered as positive Romberg test.

Note

Nurse should give priority for patient safety during Romberg test to prevent fall.

Table 79 Key points to be kept in mind while carrying out diagnostic neurological tests

Name of the diagnostic test	Description	Points to remember
Cerebral angiography	• X-ray study of the cerebral circulation with the help of a dye injected into selected artery • This is a valuable test to find out aneurysm, arterio-venous malformation.	• Instruct the client that a warmth and metallic taste may be felt in the mouth while injecting dye. • Observe the site of dye injection following procedure for bleeding and hematoma. • Monitor pulse, distal to the puncture site.
Myelography	• It's the X-ray of the spinal arachnoid space after the injection of a contrast agent. • This test helps to find out tumors, cyst, herniated intervertebral disc or other lesions.	After myelography patient lies in the bed with 30-40 degree head end elevation Advice the patient to take large amount of fluids after the procedure for rehydration and to replace CSF and thereby to avoid post lumbar puncture headache.
Electroencephalography (EEG)	• It records the cerebral activity through the electrodes placed over scalp or micro-electrodes placed inside the brain tissue. • Useful for diagnosing selzure disorder, coma or organic brain syndrome	• Sometimes to increase the chances of electrical activity patient may be deprived of sleep one night before procedure. • Sedatives, Stimulants, Anti-seizures, tranquillizers, types of drug may be withheld 24-48 hours before the procedure. • Coffee, tea, cola and chocolate are omitted from diet • Sleep EEG needs collodion based glue for electrode application

Contd...

Scanned with CamScanner

Name of the diagnostic test	Description	Points to remember
Evoked potential studies	• In visual evoked response, patient is exposed to visual stimuli and transit time from retina to the occipital areas is measured. • In auditory evoked response, auditory stimulus is given and transit time from brain stem to cortex is measured. • In somatosensory evoked response, peripheral nerves are stimulated through skin electrodes and transit time from spinal cord to cortex is measured.	
Electromyography	• Electrodes are introduced into skeletal muscles to measure change in electrical potential of the muscles • Useful for diagnosing neuromuscular disorders and myopathies.	
Lumbar puncture	• Lumbar puncture or spinal tap is performed to withdraw CSF from subarachnoid space. • Needle is inserted between L3-L4 or L4-L5.	• Collected specimen should be send to the laboratory immediately • Post lumbar puncture headache can be reduced by making the patient to lie down and increasing the fluid intake. • Complications: Herniation of intracranial content, epidural abscess, hematoma and meningitis

Glasgow Coma Scale (GCS)

The **Glasgow Coma Scale** is the most common scoring system used to describe the level of consciousness in a person following a traumatic brain injury. Maximum score is 15 and minimum score is 3.

Table 80

Behaviour	Response	Score
Eye opening response	Spontaneously	4
	To speech	3
	To pain	2
	No response	1
Best verbal response	Oriented to time, place and person	5
	Confused	4
	Inappropriate words	3
	Incomprehensible sounds	2
	No response	1
Best motor response	Obeys command	6
	Moves to localized pain	5
	Flexion withdrawal from pain	4
	Abnormal flexion (decorticate)	3
	Abnormal extension (decerebrate)	2
	No response	1
Total score	Best responses	15
	Comatose client	8 or less
	Totally unresponsive	3

Altered Level of Consciousness

- It is apparent in patient who is not oriented, does not follow command or needs persistent stimuli to achieve alertness.
- **Coma** is a clinical stage in which patient is not aware about self and environment for prolonged period of time.
- **Akinetic mutism**: A state of unresponsiveness to the environment in which patient makes no movement or sound but opens the eyes.
- **Decorticate positioning**: Involve adduction and flexion of upper extremities, internal rotation of the lower extremities and plantar flexion of the feet
- **Decerebrate positioning:** Involve extension and outward rotation of upper extremities and plantar flexion of the feet.

In an unconscious patient taking temperature via oral route is contraindicated because of the risk for bite.

Increased Intracranial Pressure (ICP)

- **Intracranial pressure (ICP)** is the pressure inside the cranial cavity.
  - **Normal:** 5–15 mm Hg
  - **Mild elevation:** 16–20 mm Hg
  - **Moderate elevation:** 21–30 mm Hg
  - **Severe elevation:** More than 30 mm Hg
- Cerebral perfusion pressure (CPP) is the net pressure that causes cerebral blood flow to the brain cells;
- CPP = Mean Arterial Pressure (MAP) – Intracranial Pressure (ICP)
- Normal range of CPP is 70–100 mm Hg
- **Causes:** Cerebral edema, intracranial or subarachnoid bleeding, brain tumor, interstitital cerebral edema.
- **Signs and symptoms**
  - Altered loss of consciousness is usually the **earliest sign of increased ICP**.
  - Cushing's triad is a late sign of increased ICP. It includes **bradypnea, bradycardia, and hypertension.**

Scanned with CamScanner

- Partial or complete loss of sensory or motor function may occur.
- Complications of increased ICP include brain stem herniation, diabetes insipidus, and syndrome of inappropriate anti-diuretic hormone (SIADH).
- **Diagnosis:** CT scan, skull X-ray, ICP monitoring
- **Treatment:** Treatment goal is to normalize ICP and avoid complications:
  - Surgical placement of shunts to correct CSF blockage
  - Surgical removal of tumor or hematoma
  - Burr holes or craniotomy for decompression
  - Hyperventilation therapy to decrease the partial pressure of CO_2
  - Osmotic diuretics such as mannitol to withdraw the fluids from brain tissue
  - Fever control and avoidance of shivering
  - Slight elevation of head end of bed to increased venous return from the brain.
  - **Lumbar puncture is contraindicated in increased ICP** because of the chances of brain stem herniation.

Key Points

- The earliest sign of increase in ICP is change in level of consciousness.
- Projectile vomiting may occur in a client with increased ICP.
- When ICP is monitored, the fluid system and transducer is calibrated at 2.5 cm above the ear when the patient is in supine position and this point is correspondence to foramen of monro in the brain.
- A client who is on ventilator and is having increased ICP suction should not be longer than 15 seconds.
- High level of PEEP (Positive end expiratory pressure) need to be avoided among these patients as it will increases the intra thoracic pressure

Intracranial Surgery

Cranial surgeries are used to open the skull and to gain access to intracranial content. There can be different types of approaches and they are:

- **Supratentorial:** These are the parts of brain located above the tentorium cerebelli. After this approach client has to be placed in 30-45 degree head elevation with neck in neutral alignment
- **Infratentorial:** These are the part of brain located below the tentorium cerebelli. After surgery, maintain neck in neutral position and place the client on either side.
- **Transsphenoidal:** In this, incision is made below the upper lip through the mouth and nasal cavity to gain access to pituitary gland.
  - Advice the client to avoid blowing through nose.
  - Keep the head end of the bed elevated to promote venous drainage from the brain.
  - ~~Advice the client to avoid blowing through~~ nose.
  - ~~Keep the head end of the bed elevated to promote venous drainage from the brain~~.

Figure 85 ▪ Tentorium cerebelli

SEIZURE DISORDERS

- **A seizure** is a sudden disruption of the brain's normal electrical activity accompanied by altered consciousness and/or other neurological and behavioral manifestations.
- **Epilepsy** is a condition characterized by recurrent seizures that may include repetitive muscle jerking called convulsions.
- **Causes:** Electrolyte imbalances, toxic state, tumors, anorexia, increased ICP, CNS inflammation or idiopathic
- **Types:** Seizures are classified in 2 main categories:
  - **Partial seizures** involve a part of the brain. They can be:
    - **Simple partial seizures:** Symptoms may include involuntary twitching of the muscles or arms and legs; changes in vision; vertigo; and having unusual tastes or smells. The person does not lose consciousness.
    - **Complex partial seizures:** Symptoms may be like those of partial seizures, but the person does lose awareness for a time.
  - **Generalized seizures** involve much more or all of the brain. They can be:
    - **Absence seizures (petit mal):** Characterized by a short period of blanking out or "absent" stare.
    - **Myoclonic seizures:** Characterized by jerking or twitching of the limbs on both sides of the body.
    - **Tonic-clonic seizures (grand mal):** Symptoms include jerking or shaking of the body, LOC (Loss of consciousness) and loss of bladder control. The person may have an aura before the seizure starts. Tonic-clonic seizures may last for 1-3 minutes. A tonic-clonic seizure that lasts longer than 5 minutes is considered as Medical Emergency.
- **Diagnosis:** Medical history, neurological examination, CT scan, cerebral angiography, electroencephalogram (EEG), and MRI
- **Treatment:** Anticonvulsants (e.g. Carbamazepine, sodium valproate). If brain tumor is involved, it should be surgically removed.
- **Key nursing interventions**
  - Prevent injury
  - Do not force tongue blade during an episode of seizure (it may injure tooth)
  - Loosen tight clothes
  - If possible, place the client on side which prevent falling back of tongue and to facilitate drainage of secretions.
  - Note prodromal signs and time of onset after a seizure occurs.

Status epilepticus: series or chain of seizure attacks, between each seizure attack patient won't gain full recovery of consciousness.

Scanned with CamScanner

STROKE

- **Stroke**, also known as **cerebrovascular accident (CVA)** is a disruption in cerebral perfusion causing neurological deficit.
- **Types of strokes**
  - **Thrombotic ischemic stroke:** When cerebral arteries are blocked by blood clot.
  - **Embolic stroke:** Impaired cerebral perfusion due to embolism, vasospasm or atherosclerotic plaque.
  - **Hemorrhagic stroke**
    - Due to ruptured or leaking aneurysm, intravenous malformation, bleeding disorder, arterial rupture or trauma.
    - Most of the intracerebral hemorrhages are arterial in origin.
    - **Severe explosive headache** is the characteristic of hemorrhagic shock.
- **Signs and symptoms** depend on the affected artery and severity of the damage.
  - **Motor symptoms**
    - **Hemiplegia:** Paralysis of one side of the body.
    - **Hemiparesis:** Weakness in one side of the body
    - **Paraplegia:** Paralysis of lower extremities
    - **Quadriplegia:** Paralysis of all four limbs of the body
    - **Ataxia:** Unsteady gait
  - **Communication disturbance**
    - **Dysarthria**: Difficulty in speaking
    - **Dysphasia or aphasia:** Defective speech or loss of speech. It can be expressive, receptive or mixed
    - **Expressive aphasia:** It is due to damage to brocca's area of speech, here client can understand what others are communicating but can't communicate back.
    - **Receptive aphasia**: Wernicke's area in the temporal lobe is affected. In this condition, client is unable to understand spoken or written word.
    - **Apraxia:** It is the inability to perform previously learned activities.
  - **Perceptual problems**
    - **Hemianopsia:** Loss of half of the visual filed
    - **Diplopia:** Double vision
  - **Agnosia:** Inability to recognize familiar object or person.
- **Treatment**
  - Anticoagulants are contraindicated in patients with hemorrhagic stroke but useful in nonhemorrhagic stroke.
  - The only fibrinolytic agent that has been shown benefit in selected patients with acute ischemic stroke is tissue plasminogen activator (t-PA).
  - NIH stroke scale/score (NIHSS) is done to ascertain the need of thrombolysis.
  - Surgical evacuation of clot or hematoma relieves increased ICP.
  - Carotid endarterectomy remove plaques.
  - Anticonvulsants to prevent seizure. Analgesics to control pain.
- **Key nursing interventions**
  - Assess LOC
  - Monitor ICP and vital signs
  - Bleeding is the most common side effect of t-PA. So closely monitor the client.
  - Speak slowly and simply to patient.
  - Monitor fluid input and output hourly.
  - Positioning of the patient to prevent deformity.
  - Physical therapy to prevent contractures.

Unilateral neglect or neglect syndrome: Seen in stroke patient who is unaware about the existence of paralyzed part.

HEAD TRAUMA/HEAD INJURY

- Head trauma/head injury refers to any trauma to scalp, skull or brain.
- Head trauma may be ranging from minor bruise to traumatic brain injury.
- **Types of head trauma/injury**
  - **Primary injuries:** Concussion, contusion and laceration.
  - **Secondary injuries:** Intracranial hemorrhage (including cerebral, subarachnoid, epidural and subdural) or hematoma, increased intracranial pressure (ICP), herniation of brain.
    - **Concussion**: It occurs following accelerative or decelerative injury. There will be a transient loss of consciousness which may last over 3 min.
    - **Contusion**: Closed brain injury which leads to bruising of the tissue within the local area. If the injury occurs at the site of impact, it is called as coup and if it occurs on opposite side away from injury is known as contre-coup.

Figure 86 ▪ Contusion

    - **Laceration:** It involve tearing of blood vessel due to penetrating trauma or injury. It is associated with bleeding.
- **Signs and symptoms**
  - Loss of consciousness (LOC)
  - Increased ICP
  - Motor and sensory changes, seizures
  - Frequent swallowing, rhinorrhea and otorrhea may manifest, if CSF leakage occurs.
- **Battle's sign:** Area of ecchymosis or bruising over temporal bone. It indicates basilar skull fracture. CSF otorrhea and CSF rhinorrhea are the major manifestations.

Figure 87 ▪ Battle's sign

Scanned with CamScanner

Racoon eyes: Periorbital ecchymosis following orbital fracture is known as raccoon eyes.

Figure 88 ■ Racoon eyes

Halo sign: It is also known as ring sign, double-ring sign. It indicates CSF leakage. Drainage from the nose is collected over a white paper or filter paper produces characteristic halo sign. i.e. following the ring of blood another concentric yellow colored ring will be formed by CSF.

Figure 89 ■ Halo sign

- **Diagnosis:** Skull X-ray, CT scan, MRI, lumbar puncture, cerebral angiography and EEG.
- **Treatment:** (Depends on severity and location)
  - Drug therapy for increased ICP
  - Intubation and mechanical ventilation
  - Invasive hemodynamic monitoring
  - Invasive ICP monitoring

SPINAL CORD INJURIES

Injury to the spinal cord resulting in total disruption of the neuronal pathway.

Complications are respiratory failure, autonomic dysreflexia and spinal shock.

Table 81 Associated motor loss according to level of spinal injury

Level of spinal injury	Associated motor loss
C1–C4	Loss of respiratory function and Quadriplegia
C4–C5	Quadriplegia Respiratory function may be affected if phrenic nerve is damaged by edema
C5–C6	Quadriplegia Loss of intercostal muscle innervations
C6–C7	Quadriplegia Weakened thumb grasp Intact diaphragmatic breathing
C7–C8	Quadriplegia Loss of intercostal muscle innervations Intact diaphragmatic breathing
T1 and L1–L2	Paraplegia Loss of some intercostal muscle innervations Intact voluntary motor function of the arms
Cauda equina	Loss of sensory and motor functions Loss of bladder and bowel functions Loss of sexual function
Sacral spinal nerves	Loss of bladder, bowel and sexual functions

Contd...

Cervical Spine Injuries

- Injury to C1 and C2 is fatal.
- C4 provides supply to diaphragm via phrenic nerve. So C4 injury leads to respiratory difficulty.

Thoracic Spine Injuries

- Loss of movement and sensation in chest, trunk, lower extremities, bowel and bladder can happen.
- **Autonomic dysreflexia**
  - Spinal cord injury at T6 or above leads to this condition. Any stimuli (signal) that occurs below the spinal cord injury is blocked at spinal cord injury site and it is not possible to correct it. It leads to hypertension, vasodilation, bradycardia, sweating and stiff neck.
  - It can be caused by a full bladder and bowel.
  - This condition calls for emergency and is fatal.
  - **Immediate management include:** Provide Fowler's position, empty bowel and bladder, provide anti-hypertensive drugs and loosen the tight clothes

Lumbar and Sacral Injuries

- Loss of sensation and movement of the lower extremities.
- S2 and S3 are center of micturition, so below this level bladder can't empty. This is called as neurogenic bladder.

Management of Spinal Cord Injury

- Immobilize the client in a spinal back board with head in neutral position.
- Log roll the client
- Skull tongs and halo traction are used to immobilize the cervical spine.
- Assess and support respiratory status of the client.

Spinal shock or neurogenic shock: Complete loss of reflex below the level of injury is known as spinal shock.

MENINGITIS

- Inflammation of the meninges that is covering brain and spinal cord.
- **Septic meningitis:** Caused by bacteria, e.g: *Neisseria meningitides*

Scanned with CamScanner

- The most common cause of Bacterial Meningitis in adults: ***Streptococcus pneumoniae***
- **Aseptic meningitis:** Caused by virus, abscess, lymphoma or leukemia
- **Manifestations:** Fever, headache, nuchal rigidity (early sign) and photophobia are some of the manifestations.
  - **Kernig's sign:** When patient lies in supine position and legs flexed to abdomen, the legs cannot be extended.
  - **Brudzinski's sign:** When patient's neck is flexed, flexion of knees and hips also occur.

Transmission of meningitis is via droplet and direct contact.

Rashes over the body are one of the features of meningitis caused by *Neisseria meningitides*.

Figures 90 A and B (A) Kernig's sign; (B) Brudzinski sign

Table 82 Comparison of CSF analysis in bacterial meningitis v/s viral meningitis

Bacterial meningitis	Viral meningitis
Low glucose	Normal glucose
High protein level	Normal or high protein level
Polymorphonuclear cells > 300/mm³	Mononucleate cells <300/mm³

ENCEPHALITIS

- Defined as an acute inflammation of brain, caused by infection or allergic reaction.
- **Causes**
  - **Viral encephalitis:** Enteroviruses (e.g. Polio), adenoviruses, mumps and measles viruses, HIV, herpes virus, and arboviruses.
  - **Bacterial and other:** Amebic infection, toxoplasmosis, malaria and mycoplasma (in a person with compromised immune system)
- **Signs and symptoms:** Acute onset of fever, headache, confusion, nausea, vomiting, absent superficial reflexes, exaggerated deep tendon reflexes, paralysis of the extremities, **positive Brudzinski's sign, positive Kernig's sign and nuchal rigidity.**
- **Diagnosis:** CSF culture; CSF may contain elevated protein, WBC and decreased glucose
- **Treatment** focuses on treating underlying cause.

BRAIN ABSCESS

- It is the collection of infectious material within the brain tissue.
- It occurs either due to direct invasion (intra cranial trauma or surgery) of brain tissue by infectious organism or via spread from nearby sites such as paranasal sinus, ear, teeth etc.

MULTIPLE SCLEROSIS

(CNS)

It is the demyelinating disorders of the CNS which cause demyelination of brain and spinal cord.

- **Signs and symptoms**
  - Sensory and visual problems
  - Diplopia, blurred vision, nystagmus, optic neuritis and ophthalmoplegia
  - Muscular dysfunction include gait ataxia, hyperreflexia, weakness of muscle, spasticity and paralysis of extremities.
- **Treatment:** Corticosteroids and muscle relaxants
- **Key nursing interventions:** Encourage physical therapy, bowel and bladder training and family education.
- Demyelination of the nerves in the CNS, which leads to impaired impulse transmission.
- Most frequently affected parts are optic nerve, chiasm and tract, cerebrum, brain stem and cerebellum.
- **Causes:** Autoimmune disease, viral disease, and allergic reaction to infection.
- Diagnosis By **McDonald criteria**
  - MRI → **Dawson finger** appearance
  - CSF → Oligoclonal bands and Intrathecal IgG production
- **Manifestations**
  - Early symptoms are visual problems such as diplopia, blurring of vision and patchy blindness, nystagmus, ophthalmoplegia, optic neuritis.
  - Other symptoms include fatigue, weakness, ataxia, vertigo, tremors and spasticity of lower extremities, paresthesia, emotional changes, hyperreflexia or absent reflex.
- **Treatment:** Beta interferons, corticosteroids and muscle relaxants.
- **Nursing Management**
  - Management of bowel and bladder dysfunction involves use of toileting regime, continence management, teaching self-catheterization and education.

MYASTHENIA GRAVIS

(Acetylcholine

- It is a chronic autoimmune neuromuscular disorder marked by muscular weakness without atrophy.
- It is characterized by abnormal muscle weakness during activity which is usually relieved by rest.
- **Cause:** Acetylcholine deficiency or defect of postsynaptic receptor site.
- In Myasthenia Gravis, antibodies are bound to the acetyl choline receptors, so only few receptors are available for acetyl choline to bind which impair impulse transmission and cause muscle weakness.
- **Manifestations:** Ptosis (drooping of the eye lid), diplopia, weakness of facial muscles result in bland facial expression, laryngeal involvement cause dysphonia and increased risk for choking and aspiration.
- It may affect the respiratory muscle and cause respiratory failure.
- MG is purely a motor disorder and has no effect on sensation and co-ordination

Scanned with CamScanner

- Diagnosis
  - **Edrophonium chloride or tensilon test:** I/V Edrophonium is given to the client. If there is improvement in facial weakness and ptosis for about 5min, diagnosis of MG is confirmed as positive Edrophonium test.
  - If there is no improvement of symptoms after the administration of Edrophonium, it indicates negative test and the antidote (atropine sulfate) has to be given.

- Treatment: Anticholinesterase alleviate symptoms. Corticosteroid, immunosuppressive therapy and thymectomy.
- **Key nursing interventions**
  - Maintain patent airway; use oral or endotracheal suction
  - Schedule activity 20–30 minutes after medication is given.
  - Edrophonium test places the client at risk for ventricular fibrillation and cardiac arrest.

GUILLAIN-BARRE SYNDROME

- It is an autoimmune disease which causes demyelination of the peripheral nerves.
- Typical Characteristics: It causes **ascending weakness.**
- It begins with weakness and diminished reflexes in the lower limbs
- Weakness and hypo-reflexia results in quadriplegia.
- Guillain-Barré **syndrome** is the most common cause of **acute** flaccid paralysis.
- It can also cause respiratory muscle paralysis.
- Treatment includes supportive hemodynamic measures including plasmapheresis.

Note

Breathing difficulty is one of the major concerns in GBS, so closely monitor the respiratory status of the client.

TRIGEMINAL NEURALGIA

- Sudden, recurrent severe pain in the area supplied by fifth cranial nerve is known as trigeminal neuralgia.

Trigeminal nerve has three branches: ophthalmic, maxillary and mandibular.

- Pain is described as unilateral, shooting and stabbing sensation.
- Manifestations
  - Washing of the face, brushing teeth, shaving, eating, drinking, a draft of cold air and direct pressure against nerve trunk can cause pain.
  - Client may complain of pain around gums, lips, and nose and across cheek.
- **Management**
  - Carbamazepine relieves pain in most of the patients.
  - Microvascular decompression and percutaneous radiofrequency trigeminal gangliolysis are the surgical management.
  - Educate the client to chew on the unaffected side and to avoid hot or cold foods.

BELL'S PALSY

- It is also called as facial paralysis which affects seventh cranial nerve,
- It can occur as a result of infection, trauma, meningitis or tumor.
- This condition may result in **unilateral paralysis of the face.**
- **Manifestations**: Flaccid paralysis of facial muscles, inability to raise eyebrows, frown smile, puff out of the cheek, upward movement of the eyes when tries to close the eyelid and loss of taste.
- **Management**: Encourage facial exercise, prevent dryness of the eye and frequent oral care are the management.

PARKINSON'S DISEASE

- It is a chronic, progressive degenerative disease of the nervous system marked by tremor, muscular rigidity and slow movement (bradykinesia).
- It is associated with degeneration of substantia nigra, basal ganglia, and corpus striatum of the brain.
- Shortage of dopamine cause imbalance between excitatory (Acetyl Choline) and inhibitory (dopamine) neurotransmitters which lead to movement problems.
- **Signs and symptoms**
  - Cardinal symptoms of parkinson's disease are tremors, rigidity and bradykinesia.(abnormally slow movement).
  - Pill rolling tremor of the fingers, arms and hands that may also affect the chin, lips, legs and the trunk.
  - Postural instability or impaired balance and coordination
  - Micrographia (shrinking, slow hand writing), mask like face (expression less face) and frequency of eye blinking also decreases.
  - Dysphonia (soft, slurred low-pitched voice), dysphagia, drooling and risk for choking and aspiration.
- **Treatment:** Carbidopa/levodopa, dopamine receptor agonists (Bromocriptine, pergolide, ropinirole) and Selegline (MAOI)
- **Key nursing interventions**
  - Patient and family teaching about safety; install hand rail, remove loose carpeting, elevate toilet seat, etc.
  - Encourage physical therapy.
  - Instruct the client to avoid food high in vitamin B6 because they block the effect of anti-parkinsonian drug.
  - Monoamine oxidase inhibitor (MAOI) are contraindicated. It may precipitate hypertensive crisis.

ALZHEIMER'S DISEASE

- Alzheimer's disease (AD) is one of the most common form of dementia seen in old age people.
- AD is a progressive, irreversible, degenerative neurologic disease that **begins insidiously** and is characterized **by gradual losses of cognitive function** and disturbances in behavior and affect.

Scanned with CamScanner

- AD is the most common cause of cortical dementia.
- **Dementia:** Loss of memory, reasoning, language and judgment which is going to affect day to day activities of a person.
- Old age and genetics are the two main factors contributing to dementia.
- **Stages of Alzheimer's disease**
  - **Early stage:** Recent memory loss, personality changes, difficulty finding words and mood swings.
  - **Intermediate stage:** Reduced ability to remember past events, wandering, agitation, hostility, incontinence and disorientation to place and time.
  - **End stage:** Total incontinence, recent and remote memory loss, and inability to walk, eat and swallow.
- **Clinical manifestations**
  - Forgetfulness and subtle memory loss
  - Conversation becomes difficult with word finding difficulties
  - Cognitive impairment
  - Personality changes
  - Dysphagia as the disease progress
  - As the disease progresses, patient needs assistance for all activities of daily living.
- **Diagnostic findings**
  - Functional ability assessment (MMSE; mini mental status examination) and health history
  - EEG, CT and MRI
  - Laboratory examination of CSF
  - Decrease in Ach levels
- **Medical management**
  - Treatment relies on management of cognitive symptoms
    - Cholinesterase inhibitors (Donepezil, rivastigmine, galantamine and tacrine)
- **Key points to remember in nursing care of patient with Alzheimer disease**
  - Supporting cognitive functions
  - Promote physical safety of the patient
  - Promote independence in self-care activities
  - Reduce anxiety and agitation in patient
  - Improve communication and socialization
  - Adequate nutrition and balancing activity

HUNTINGTON'S DISEASE

- It is also known as Huntington's chorea.
- Autosomal dominant neurodegenerative disease. It results in death of brain cells and consequently dementia.
- **Age of onset:** Between 25 and 45 years
- An affected person has 50% chance to pass the disease to their offspring.

- Degeneration of basal ganglia & cerebral cortex

- Condition is characterized by **chorea** (involuntary body movements), intellectual decline, emotional disturbance and difficulty in chewing and swallowing.
- Death typically occurs within 10–15 years after the onset of the illness

AMYOTROPHIC LATERAL SCLEROSIS (ALS)

- ALS (Lou Gehrig's disease or Charcot's disease)) is a specific disorder of unknown cause that involves loss of motor neurons that control voluntary muscles.
- In specific, it is due to the loss of motor neurons in the lower brain stem and anterior horns of the spinal cord.
- Commonly manifested by fatigue, progressive muscle weakness, cramps, muscle twitching, and incoordination.
- No specific treatment available. Symptomatic treatment is given based on symptoms.

BRAIN TUMOR

- Brain tumor can be malignant or benign.
- It compresses the adjacent tissue that results in destruction of neurons, increased ICP and displacement of brain structures.
- Meningiomas and gliomas are the most common type of primary brain tumors.
- **Signs and symptoms**
  - Symptoms of increased ICP (altered LOC, bradycardia, impaired temperature regulation, nausea and vomiting etc.).
  - **Temporal tumors:** Seizures
  - **Occipital tumors:** Visual disturbances or blindness
  - **Frontal tumors:** Memory loss, personality changes
  - **Acoustic tumors:** Impaired hearing
  - **Tumor near the optic tract:** Visual disturbances
  - **Pituitary tumors:** Disrupted hormonal functions
- **Diagnosis:** X-ray of skull, MRI, EEG, and CT scan
- **Treatment:** Surgery and radiation depends on histologic type and size of the tumor.

Most common type of brain tumor is glioma.

NEUROCYSTICERCOSIS

- It is the infection of CNS caused by larvae of ***Taenia solium***.
- It is the most common parasitic disease of CNS and is the leading cause of adult onset disease
- Consumption of infected pork with cysticercosis is the risk factor.

Golden points to remember

- The medulla oblongata is a portion of the hindbrain that controls autonomic functions such as breathing, digestion, heart and blood vessel function, swallowing, and sneezing.
- The brain region which is responsible for coordination of voluntary muscular movement posture and balance is **cerebellum**.
- Tumors within Sella turcica and small adenomas of the pituitary glands can be removed through **transsphenoidal approach**.
- Auditory lobe is found in temporal lobe.
- Visual area is found in occipital lobe.
- Hypothalamus contains temperature control center of the body.
- **Glasgow Coma Scale (GCS):** The lowest possible score is 3, and the highest possible score is 15.
- A patient whose GCS score is 8 or less is said to be in coma.
- **The biceps and brachioradialis** reflexes are mediated by the C5 and C6 nerve root.
- **The triceps** reflex is mediated by the **C6 and C7** nerve root, mainly by C7 nerve root.
- The knee jerk reflex is mediated by the **L3 and L4** nerve roots, mainly L4.
- Triad sign of multiple sclerosis include **ataxia (unsteady gait), nystagmus, and tremor.**
- **Wernicke's encephalopathy** is inflammatory, hemorrhagic, degenerative condition of brain caused by **thiamine deficiency**. It is common with **chronic alcoholic patients**.
- The **classic triad** of diagnostic signs of meningitis consist of nuchal rigidity, sudden high fever, and altered mental status.
- Corticosteroids (e.g. methylprednisolone) are used to reduce brain swelling and inflammation.
- Ascending paralysis is visible in Guillain–Barré syndrome.
- Four As of Alzheimer are:
  1. **Amnesia:** loss of memory
  2. **Agnosia:** unable to recognize inanimate objects
  3. **Apraxia:** no recognition of object function
  4. **Aphasia:** unable to speak
- Compression of facial nerve in the temporal bone will lead to **Bell's palsy**.
- **Trigeminal nerve** has the highest number of branches.
- **Trigeminal neuralgia (tic douloureux):** In this sensory or afferent branch primarily the maxillary and mandibular branches are involved.
- The first-line therapy for trigeminal neuralgia **carbamazepine, phenytoin** and **valproate**.
- Parkinson's disease is characterized by tremor and rigidity of limbs.
- Contusion is the bruising of the brain tissue within a focal area without altering the integrity of pia mater and arachnoid layer.
- Signs of meningitis include positive kerning's sign, brudzinski sign, stiff neck, bulging fontanel (in infants), fever, bradycardia and increased ICP.
- **Cold caloric test** is performed to assess function of brain stem.
- **Amyotrophic lateral sclerosis** is a progressive neurodegenerative disease that affects nerve cells in the brain and spinal cord.
- Main cause of peripheral neuropathy is Diabetes Mellitus.
- Tubercular Meningitis is most commonly seen between 6-24 months of age. (2 yr)
- Kernicterus (bilirubin deposition in Basal Ganglia) can lead to Chorioathetoid/Dystonic Cerebral palsy.
- **Negri bodies** are found in Rabies.
- **Lewy bodies** are found in Parkinson's disease.
- Pinpoint pupil is a characteristic of Pontine hemorrhage (a form of intracranial hemorrhage).
- The type of seizures that involve both sides of brain is called **generalized seizure**.
- Focal (or partial) seizures occur when seizure activity is limited to a part of **one brain hemisphere**.
- The type of seizure that involves one side of brain is called **partial seizure**.
- **Babinski reflex** is one of the normal reflexes in infants up to 2 years of age.
- Babinski reflex is an **abnormal reflex** action in adults.
- The patellar reflex or knee-jerk is a stretch reflex which tests the L2, L3, and L4 segments of the **spinal cord**.
- A client with high cervical injury (C1-C4) is at greatest risk for **respiratory compromise**.
- Cervical injuries above the level of C4 may cause total **loss of respiratory muscle (diaphragm) function.**
- **Altered level of consciousness** is most sensitive and earliest indicator of Increased Intracranial Pressure (ICP).
- Patients with a left-brain stroke have right hemiplegia and right brain stroke have left hemiplegia.
- **Anosmia** refers to loss of sense of smell.
- Patients with **epilepsy** are advised to avoid taking showers in bathtub due to risk of drowning if seizure occurs during shower.
- Guillain-Barré syndrome (GBS) is a rare neurological disorder in which the immune system of body mistakenly attacks part of its own **peripheral nervous system**.
- **Tay-Sachs** disease is a genetic disorder that results in the destruction of nerve cells in the brain and spinal cord.
- While performing Romberg test a nurse must ensure patient's safety to prevent a fall during examination.

"When you are sick of your sickness, you are no longer sick."
—Chinese Proverb

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

ANATOMY AND PHYSIOLOGY

2329. The parts of brain stem are: *(Safdarjung NO 2018)*
a. Mid brain, pons and medulla
b. Pons and Medulla
c. Midbrain and Medulla
d. Pons, cerebellum and medulla

Explanation: Brainstem is the area at the base of the brain that connects the cerebrum with the spinal cord. It includes mid brain (mesencephalon), pons (part of metencephalon) and medulla oblongata (myelencephalon). The brainstem regulates vital cardiac and respiratory functions and acts as a vehicle for sensory information.

2330. Function of cerebellum is all, except: *(Safdarjung NO 2018)*
a. Maintenance of muscle tone
b. Maintenance of posture
c. Equilibrium
d. Hearing

Explanation:
- Hearing is not a function of cerebellum. The auditory cortex located at the temporal lobe of the brain is responsible for hearing.
- Cerebellum also called "little brain" is located at the back of the brain, under the occipital and temporal lobes of the cerebral cortex.
- **The following are the functions of Cerebellum:**
  - Coordinates voluntary movements
  - Controls tone, posture and equilibrium
  - Controls movement of eyeballs
  - Plays a role in cognition
  - Helps in learning of special motor skills
  - Maintenance of muscle tone and posture.

2331. Cell most sensitive to hypoxia is?
a. Neuron
b. Liver cell
c. Stem cell
d. Muscle

2332. Damage to nervous tissue is repaired by which cells of CNS
a. Neuroglia
b. Axons
c. Microglia
d. Fibroblasts

2333. In a neuron, the cell processes that receive information and carry it to the cell body are called.
a. Dendrites
b. Axons
c. Tracts
d. Projections

2334. The gaps between the segments of oligodendrocytes or between individual Schwann cells are called
a. Nodes of Ranvier
b. Synapse
c. Synaptic cleft
d. Sulci

2335. The white matter of the nervous system is formed by the
a. Nerve cell bodies and their dendrites
b. Nerve tracts
c. Nuclei
d. Sulci

2336. The posterior (dorsal) horns of the spinal cord contain
a. Sensory neurons
b. Motor neurons
c. Nerve tracts
d. White matter

2337. Identify the correct statement regarding neurons:
I. Synaptic vesicles contains neurotransmitters
II. Dendrites typically carry signals toward the cell body
III. Schwann cells forms myelin sheath
IV. Nodes of Ranvier are found in dendrite
a. I, II, III, IV
b. I, III, IV only
c. I, II, IV only
d. I, II, III only

2338. Clusters of nerve cell bodies located in the peripheral nervous system are called
a. Nuclei
b. Ganglia
c. Nerve tracts
d. Nerves

2339. The presynaptic terminal is separated from the postsynaptic terminal by
a. Vesicles
b. Action potential
c. Synaptic cleft
d. Synoptic terminal

2340. An action potential occurs when
a. The membrane potential reaches a threshold value
b. Negative proteins and ions rapidly enter the cell
c. The inside of the cell becomes negative compared to the outside
d. There is repolarization

2341. The action potential relies on movement of
a. Calcium and magnesium
b. Iron and iodide
c. Sodium and magnesium
d. Sodium and potassium

2342. Outermost layer of meninges is .....
a. Duramater
b. Piamater
c. Arachnoid matter
d. Choroid plexuses

2343. The middle layer of meninges is: *(DSSSB PHN, 2015)*
a. Dura mater
b. Pia mater
c. Arachnoid mater
d. Choroid Plexus

2344. Inner most layer of meninges is .....
a. Duramater
b. Piamater
c. Arachnoid matter
d. Choroid plexuses

2345. The space between the duramater and vertebral wall is known as .....
a. Cavity
b. Epidural
c. Subdural
d. Subarachnoid

2346. CSF is contained in
a. Extradural space
b. Subdural space
c. Subarachnoid space
d. Subpial space

2347. Folded appearance on the surface of cerebrum is known as
a. Sulci
b. Gyri
c. Both a and b
d. Corpus callosum

Ans.
2329. a
2330. d
2331. a
2332. a
2333. a
2334. a
2335. b
2336. a
2337. d
2338. b
2339. c
2340. a
2341. d
2342. a
2343. c
2344. b
2345. b
2346. c
2347. c

Scanned with CamScanner

2348. The number of pairs of cranial nerves are: *(ESIC Chennai May 2012)*
a. 14 b. 16
c. 10 d. 12

2349. The 10th cranial nerve is: *(DSSSB PHN, 2015)*
a. Abducent b. Vagus
c. Facial d. Hypoglossal

2350. Which of the following is the 5th cranial nerve? *(Kerala PSC, Nov 2014)*
a. Trochlear b. Trigeminal
c. Abducent d. Facial

2351. Which is the largest cranial nerve
a. Vagus nerve b. Trigeminal nerve
c. Facial nerve d. Abducent nerve

2352. The smallest cranial nerve in terms of the number of axons in contains is:
a. Olfactory nerve b. Oculomotor nerve
c. Trochlear nerve d. Accessory nerve

Explanation:
- Largest cranial nerve: Trigeminal
- Smallest cranial nerve: Trochlear
- Shortest cranial nerve: Olfactory

2353. The cranial nerve which regulates heart rate is
a. VII b. VIII
c. IX d. X

Explanation: The vagus nerve (X nerve) mediates important homeostatic reflexes such as heart rate, blood pressure, and respiration.

2354. Most important nerve in parasympathetic nervous system is
a. Olfactory b. Abducent
c. Vagus d. Spinal accessory

2355. Which of the following function is not likely to be affected by vagus nerve?
a. Tongue movements b. Peristaltic movements
c. Pancreatic secretion d. Heart rate

Explanation: Movement of the tongue is controlled by 12th cranial nerve (Hypoglossal nerve). All other functions (option B, C, and D) are controlled by vagus nerve.

2356. Pupillary constriction is controlled by ..... cranial nerve
a. I b. III
c. V d. VII

2357. Cranial nerve first to be affected by increased intracranial pressure
a. II b. III
c. IV d. VI

2358. Largest nerve in human body is
a. Sciatic nerve b. Femoral nerve
c. Obturator nerve d. Pudendal nerve

2359. Largest branch of Lumbar plexus
a. Sciatic nerve b. Femoral nerve
c. Obturator nerve d. Pudendal nerve

2360. Number of pairs of spinal nerves that exit from the spinal cord are: *(ESIC Chennai May 2012)*
a. 31 b. 33
c. 24 d. 30

Explanation: In humans there are 31 pairs of spinal nerves. This includes 8 cervical, 12 thoracic, 5 lumbar, 5 sacral, and 1 coccygeal. Each pair connects the spinal cord with a specific region of the body. The spinal nerves are named according to where it emerges.

2361. The lobe of the brain that can decode and interpret visual information: *(Staff Nurse GII 2014)*
a. Temporal b. Frontal
c. Parietal d. Occipital

2362. Speech center is: *(JIPMER 2012)*
a. Broca's area b. Premotor area
c. Frontal area d. Postcentral area

2363. A client with C4 spinal cord injury is at greatest risk for: *(AIIMS-BBS SNO 2019)*
a. Neurogenic shock b. Respiratory compromise
c. Paralytic ileus d. Stress ulcer

Explanation: Cervical injuries above the level of C4 present special problems because of the total loss of respiratory muscle function. The fourth cervical vertebra is the level where nerves run to the diaphragm, the main muscle that allows us to breathe.

2364. The Broca's areas are situated in the
a. Temporalobe b. Occipital calcarine fissure
c. Inferior frontal gyrus d. Mammillary body region

2365. Respiratory center is located at: *(JIPMER 2012, Kerala PSC, Nov 2014)*
a. Cerebrum b. Pons
c. Medulla oblongata d. Spinal cord

2366. The part of the brainstem that regulates heart rate, breathing, swallowing, coughing and sneezing is the
a. Cerebellum b. Medulla oblongata
c. Pons d. Midbrain

2367. Medulla oblongata is also called
a. Prosencephalon b. Mesencephalon
c. Myeloncephalon d. Metencephalon

2368. Circle of Willis is formed by all EXCEPT
a. Anterior cerebral artery
b. Middle cerebral artery
c. Posterior cerebral artery
d. Posterior communicating artery

2369. Middle meningeal artery is a branch of
a. Middle cerebral artery
b. Maxillary artery
c. Superficial temporal artery
d. Vertebral artery

2370. The following nerves supply to the muscles of the forearm EXCEPT:
a. Musculocutaneous nerve
b. Redial nerve
c. Median nerve
d. Ulnar nerve

Explanation: The major peripheral nerve of upper arm is musculocutaneous nerve which innervates the anterior compartment muscles (brachialis, bicep brachii and coracobrachialis) of upper arm and gives rise to lateral cutaneous nerve of forearm which innervate lateral surfaces of the forearm. But the muscles of forearm (Flexor carpi ulnaris, Flexor carpi radialis, pronator teres etc.) innervated by radial nerve, ulnar nerve and median nerve. PS: The question is about muscle innervations (not cutaneous innervations). Cutaneous innervations of forearm is supplied by musculocutaneous nerve.

2371. Ulnar nerve severed above elbow causes all EXCEPT
a. Complete loss of sensation in 4th and 5th fingers
b. Paralysis of all lumbricals
c. Paralysis of flexor carpi ulnaris
d. Paralysis of flexor profundus

Ans.

2348.	d
2349.	b
2350.	b
2351.	b
2352.	c
2353.	d
2354.	c
2355.	a
2356.	b
2357.	d
2358.	a
2359.	b
2360.	a
2361.	d
2362.	a
2363.	b
2364.	c
2365.	c
2366.	b
2367.	c
2368.	b
2369.	b
2370.	a
2371.	b

Scanned with CamScanner

2372. Injury to radial nerve at wrist leads to
a. Wrist drop
b. Sensory loss on adjacent sides of IIIrd and IVth fingers
c. Paralysis of adductor pollucis
d. Loss of supination in extended position

2373. Triceps is supplied by.....nerve
a. Axillary b. Ulnar
c. Radial d. Musculocutaneous

2374. Nerve supply to hypothenar muscles is from
a. Ulnar nerve b. Median nerve
c. Radial nerve d. Musculocutaneous nerve

2375. The cubital fossa is bounded by the
a. Biceps b. Triceps
c. Brachioradialis d. Coracobrachialis

2376. Ulnar nerve paralysis causes
a. Ape thumb deformity b. Wrist drop
c. Claw finger deformity d. Madelung deformity

2377. Policeman's tip hand is seen in
a. Erb's palsy b. Klumpke's paralysi,
c. Axillary nerve injury d. None of the above

2378. The plexus that supply nerves to the skin and muscles of the upper limbs and some of the chest muscles is: *(AIIMS Raipur Grade II 2017)*
a. Cervical plexus b. Brachial plexus
c. Lumbar plexus d. Sacral plexus

Explanation: Cervical plexus supply nerves to the back of the head and some neck muscles. Lumbar plexus supply nerves to the vascular lacuna near the saphenous hiatus and supplies the skin below the inguinal ligament. Sacral plexus supply nerves to the skin and muscles of the pelvis and lower limb.

Ans.
2372. b
2373. c
2374. a
2375. c
2376. c
2377. a
2378. b
2379. c
2380. a
2381. a
2382. b
2383. d
2384. d
2385. c
2386. a
2387. d
2388. a
2389. a
2390. c

2379. Depolarization of axolemma during nerve conduction takes place because *(DSSSB 2010)*
a. More Na+ outside
b. Equal amount of Na+ and K+ move out across axolemma
c. Na+ move inside and K+ move more outside
d. None of the above

Explanation: The axolemma is the cell membrane surrounding an axon. Sodium channels open when the threshold potential is reached, facilitating a rapid influx of sodium into the axolemma interior and producing depolarization. Option C refers to sodium influx (move inside).

2380. Which of the following activity is increased by sympathetic nervous system?
a. Heart rate b. Secretion of digestive juices
c. Secretion of saliva d. All of these

Explanation: Activation of sympathetic nervous system leads to increase in heart rate, widening of airways (bronchioles) in the lungs, and dilation of pupils. It also results in slowing down of digestive activity by inhibiting secretion of digestive juices and saliva.

2381. Vasoconstriction in skin is due to
a. Sympathetic b. Parasympathetic
c. Wheal and flare d. Warm climate

2382. Which division of the nervous system initiates a response known as fight or flight? *(RRB SSNE 2015)*
a. The parasympathetic nervous system
b. The sympathetic nervous system
c. The somatic nervous system
d. None of these

2383. All of the following are neurotransmitters, EXCEPT:
a. Dopamine b. GABA
c. Serotonin d. Troponin

Explanation: Dopamine, GABA (Gamma Amino Benzoic Acid), Serotonin (5-HT) are neurotransmitters. Troponins are specific proteins found in heart muscles. It is considered as a biomarker in diagnosis of myocardial infarction (MI).

2384. The autonomic nervous system regulates visceral activities such as: *(ESIC Chennai May 2012)*
a. Respiration
b. Contraction of smooth muscles
c. Gastrointestinal motility
d. All of the above

2385. The part of brain, which is responsible for the co-ordination of movement is: *(LNJP H D 2012)*
a. Brain stem b. Thalamus
c. Cerebellum d. Hypothalamus

2386. The group of nuclei scattered throughout the brainstem that play role in arousing and maintaining consciousness is the
a. Reticular formation b. Pons
c. Colliculi d. Pyramids

2387. Which of the following is a function of parasympathetic nervous system
a. Contraction of arrector pili
b. Stimulation of sweat glands
c. Acceleration of heart rate
d. Constriction of pupil

Explanation: Stimulation of the parasympathetic nervous system leads to constriction of pupil. Option A, B and C are associated with sympathetic nervous system functions.

2388. The nerve fibers which carry impulses from the receptors to the central nervous system are known as:
a. Afferent b. Efferent
c. Synapse d. Nodes of Ranvier

Explanation: The afferent neurons are also known as the sensory neurons: they bring the stimuli from the sensors (e. g. , skin, eyes, ears) to the CNS. The efferent neurons are also known as motor neurons: they bring the responses from the brain to the muscles and the glands.

2389. Sixth cranial nerve (Abducens) controls
a. Movement of the eyeball
b. Taste perception
c. Closure of epiglottis
d. Movement of the tongue

Explanation: Movement of the eyeball is controlled by three cranial nerves, i.e. oculomotor (III), trochlear (IV) and abducens nerve (VI). The abducens nerve supplies the lateral rectus muscle of the eye.

2390. Which of the following function is influenced by autonomous nervous system?
a. Knee-jerk response
b. Pupillary reflex
c. Peristalsis of the intestine
d. Blinking of eye

Explanation: The digestive system is under control of the autonomic nervous system (ANS). Autonomic nervous system (sympathetic and parasympathetic nervous system) is involved in peristalsis of the intestine. Option A, B and D are somatic reflexes.

Scanned with CamScanner

2391. Which one of the following is not a neurotransmitter? *(PGIMER 2007)*

a. Cortisone
b. Acetylcholine
c. Epinephrine
d. Norepinephrine

Explanation: Cortisone is a steroid (glucocorticoid) while others function as neurotransmitters.

2392. Monro-Kellies hypothesis is about

a. Equilibrium of cranial content
b. Affected mental function
c. Increasing intracranial pressure
d. Unresponsive to environment

Explanation: The pressure-volume relationship between ICP, volume of CSF, blood, and brain tissue, and cerebral perfusion pressure (CPP) is known as the Monro-Kellie doctrine or the Monro-Kellie hypothesis. The Monro-Kellie hypothesis states that because of the limited space for expansion within the skull, an increase in any one of the components causes a change in the volume of the others. Because brain tissue has limited space to change, compensation typically is accomplished by displacing or shifting CSF, increasing the absorption of CSF, or decreasing cerebral blood volume. Without such changes, ICP will begin to rise.

2393. Which of these is an example of a neurotransmitter? *(RRB SSNE 2015)*

a. Dopamine
b. Norepinephrine
c. Acetylcholine
d. All of these

2394. CSF is secreted from

a. Choroid plexuses
b. Arachnoid villi
c. Base of lateral ventricle
d. Aqueduct

2395. Drainage of CSF from lateral to third ventricle is through

a. Foramen of Monro
b. Foramen of Luschka
c. Foramen of Magendie
d. Aqueduct of Sylvius

2396. CSF pressure depends primarily on

a. Rate of CSF absorption
b. Rate of formation from the choroid plexus
c. Cerebral blood flow
d. Blood pressure

2397. Which is not true about CSF?

a. It is clear, colorless, odorless fluid
b. Present in ventricles, spinal canal, and around the brain
c. Arachnoid villi produce CSF
d. CSF contains glucose, protein and WBC

2398. Aqueous humor is secreted by .....

a. Choroid plexus
b. Papillary muscles
c. Arachnoid villi
d. Ciliary body

2399. Which one of the following brain area regulates body temperature? *(Staff Nurse GII 2014, Banaras HU 2015)*

a. Cerebrum
b. Cerebellum
c. Hypothalamus
d. Hippocampus

2400. The a commonest cause for neuralgic pain in foot is

a. Compression of communication between medial and lateral plantar nerves
b. Exaggeration of longitudinal arches
c. Injury to deltoid ligament
d. Shortening of planter aponeurosis

2401. Ipsilateral facial palsy with contralateral hemiplegia is seen in lesions of

a. Medulla
b. Pons
c. Tegmentum
d. Mid brain

2402. Most sensory input that ascends through the spinal cord and brainstem projects to the:

a. Pineal body
b. Hypothalamus
c. Thalamus
d. Mamillary bodies

2403. True about spinal cord is/are:

a. In adults spinal cord ends at lower border of L1 vertebra
b. In newborn may extend up to L3
c. Cauda equina extends from lumbar vertebra to coccyx
d. All of the above

Introduction and Basics

2404. Malformation of the spine in which the posterior portion of the lamina of one or more vertebrae fails to fuse, with or without defective development of the spinal cord is called:- *(AIIMS Raipur Grade II 2017)*

a. Rachischisis
b. Encephalocele
c. Spina bifida
d. Anencephaly

Explanation: Rachischisis is a developmental birth defect involving the neural tube which occurs in utero, when the posterior neuropore of the neural tube fails to close by the 27th intrauterine day. Encephalocele/cranium bifidum are neural tube defect characterized by sac-like protrusions of the brain and the membranes that cover it through openings in the skull. Anencephaly is the absence of a major portion of the brain, skull, and scalp which occurs during embryonic development.

In spina bifida, vertebral column is incompletely formed or absent. It can be of two types, spina bifida occulta and spina bifida cystica. In occulta, skin is intact and there is overlying sac but there is a bony vertebral arch defect. Rachischisis is a severe form of spina bifida cystica. In spina bifida cystica, both vertebral defect and a visible sac on the back will be there.

2405. Which of the following substance can lead to neurological injury in a newborn known as kernicterus?

a. Bile salt
b. Conjugated bilirubin
c. Unconjugated bilirubin
d. Biliverdin

Explanation: Unbound, unconjugated, circulating bilirubin crosses the blood-brain barrier, and because it is lipid soluble, it penetrates neuronal and glial membranes. Unconjugated hyperbilirubinemia in a newborn can lead to accumulation of bilirubin in certain brain regions (particularly the basal nuclei) with consequent irreversible damage to these areas manifesting as various neurological deficits, seizures, abnormal reflexes and eye movements. This type of neurological injury in newborn is known as kernicterus.

2406. Which of the following condition most commonly causes ischemic stroke?

a. AV malformation
b. Cocaine use
c. Head trauma
d. Rupture of aneurysm

Explanation: Cocaine is a potent vasoconstrictor and may result in a life-threatening reaction.

2407. Which of the cranial nerve disorder causes Bell's palsy?

a. Facial (VII)
b. Trigeminal (V)
c. Vagus (X)
d. Vestibulocochlear (VIII)

Explanation: Bell's palsy is characterized by facial dysfunction, weakness and paralysis. Bell's palsy is a condition whereby the inner ear becomes inflamed, resulting in pressure on the facial nerve, which in turn causes facial paralysis on the affected side.

Ans.

2391. a
2392. a
2393. d
2394. a
2395. a
2396. a
2397. c
2398. d
2399. c
2400. a
2401. b
2402. c
2403. d
2404. a
2405. c
2406. b
2407. a

Scanned with CamScanner

2408. Lower motor neuron lesions cause
a. Flaccid muscle paralysis
b. Hyperactive and abnormal reflexes
c. Increased muscle tone
d. Hypertrophy of muscle

Explanation: A lower motor neuron lesion is a lesion which affects nerve fibers traveling from the ventral horn or anterior grey column of the spinal cord to the relevant muscles. Hence, lower motor neuron lesions cause flaccid muscle paralysis, muscle atrophy, decreased muscle tone and loss of voluntary control.

2409. The most common type of brain neoplasm is
a. Acoustic neuroma b. Neuroma
c. Glioma d. Angioma

Explanation: Gliomas is a malignant tumor of the glial tissue of the nervous system. It is the most common brain neoplasm, accounting for 45% of all brain tumors.

2410. Upper motor neuron lesions causes all except
a. Flaccid muscle paralysis b. Hyperactive reflexes
c. Spastic muscle paralysis d. Loss of voluntary control

Explanation: Upper motor neuron lesions do not cause muscle atrophy but do cause loss of voluntary control.

2411. The injury of which nerve leads to Wrist Drop'? *(DSSSB PHN, 2015)*
a. Axillary nerve b. Median nerve
c. Radial nerve d. Ulnar nerve

2412. Bell's Palsy is due to the injury of which cranial nerve? *(DSSSB PHN, 2015)*
a. Trigeminal b. Facial
c. Trochlear d. Hypoglossal

2413. Which of the following is a neural tube defect? *(Staff Nurse G II 2014)*
a. Meningitis b. Meningocele
c. Scoliosis d. Encephalitis

2414. The following factor is most important in preventing fetal open neural tube defects: *(Staff Nurse G II 2014)*
a. Zinc b. Folic Acid
c. Vitamin-D d. Vitamin-A

2415. Which one of the following is the most appropriate additions to the care plan for the patient with Bell's palsy? *(LNJP H D 2012)*
a. Inspect the buccal pouch for food after eating
b. Advise the patient to drink liquids from a cup
c. Discourage the patient from looking in a mirror
d. Reduce the amount of light with in the room

2416. Leading cause of cerebrovascular accident (C.V.A) is .....
a. Embolism b. Hypertension
c. Aneurysm d. Blunt trauma

2417. Most common intracranial tumor is .....
a. Glioma b. Craniopharyngioma
c. Meningioma d. Retinoblastoma

2418. Leading cause of aortic aneurysm is .....
a. Loss of elasticity b. Trauma
c. Atherosclerosis d. Septicemia

2419. All are present in Dandy- Walker syndrome EXCEPT
a. Hydrocephalus
b. Arnold Chiari malformation
c. Posterior fossa cyst
d. Cerebellar vermis deficiency

2420. Most common site from which brain metastasis occur is ...
a. Neck b. Lung
c. Breast d. Oral cavity

2421. Functions affected in anterior cerebral artery obstruction is .....
a. Language comprehension
b. Balance and coordination
c. Judgment, insight, and reasoning
d. Visual and auditory

2422. Location of brain tumor in a client with signs and symptoms include memory deficits, visual disturbances, weakness of right upper and lower extremities, and personality changes is.....
a. Frontal lobe b. Parietal lobe
c. Occipital lobe d. Temporal lobe

2423. Which among the following client is at max. risk for stroke?
a. Obese 45-year-old man.
b. 35-year-old men with alcohol intake
c. 32-year-old woman with DM
d. 65-year-old man with hypertension.

2424. Correct option regarding amyotrophic lateral sclerosis is
a. It is a progressing disease
b. It eventually results in permanent paralysis
c. Person will not lose any cognitive function
d. All of the above

2425. Which of the following is NOT an essential component of reflex arc?
a. Afferent neuron b. Efferent neuron
c. Spinal Pathway d. Effector organ

2426. Cause of autonomic dysreflexia is .....
a. Hypertension b. Noxious stimuli
c. Head injury d. Neurogenic shock

2427. Nerve involved in Carpal tunnel syndrome is .....
a. Peroneal nerve b. Ulnar nerve
c. Brachial plexuses d. Median nerve

2428. Labourer's nerve is another name for which nerve?
a. Median nerve b. Radial nerve
c. Ulnar nerve d. Axillary nerve

2429. Foot drop result as a result of injury to
a. Deep peroneal nerve b. Superficial peroneal nerve
c. Tibial nerve d. Deltoid ligament

ASSESSMENT, DIAGNOSTIC PROCEDURES AND INVESTIGATIONS AND LAB VALUES

2430. Which assessment finding is specific in client having neurological deficit involving limbic system ?
a. Affect is flat
b. Recall deficit
c. Disoriented to time and place
d. Inability to add and subtract

Explanation: Limbic system is responsible for affect.

2431. Two point discrimination test exhibits maximum sensitivity in?
a. Shin b. Soles
c. Toes d. Finger pads

2432. Which of the following is not a test for integrity of 7th and 9th nerve:
a. Taste
b. Palate symmetry
c. Tongue protrusion d. Position of uvula

Ans.
2408. a
2409. c
2410. a
2411. c
2412. b
2413. b
2414. b
2415. a
2416. a
2417. a
2418. c
2419. b
2420. b
2421. c
2422. a
2423. d
2424. d
2425. c
2426. b
2427. d
2428. a
2429. a
2430. a
2431. d
2432. c

Scanned with CamScanner

2433. While performing Romberg test nurse must ensure patients *(AIIMS Raipur NO 2019)*

a. Gait
b. Posture
c. Safety
d. Closing of Eyes.

Explanation: Romberg test is used to assess neurological function for balance. The standing patient is asked to close eyes. It is positive if there is actual loss of balance and patient falls while the eyes are closed. Gait, posture and closing of eyes are observed during exam but the priority is to ensure the patient's safety during examination.

2434. In adult, the reflex action of the toes that is indicative of abnormalities in the motor control pathway leading from cerebral cortex is known as. *(ESIC 2019)*

a. Romberg test
b. Patellar reflex
c. Babinski reflex
d. Achilles reflex

Explanation: Babinski sign occurs when stimulation of lateral plantar aspect of the foot leads to extension (dorsiflexion or upward movement) of the big toe (hallux). Also, there may be fanning of the other toes. Babinski reflex is an abnormal reflex action in adults while it is normal in infants up to 2 years of age.

Figures A and B ■ A. Plantar reflex; B. Babinski sign

2435. A person present in emergency. On examination he is found to open eyes only on painful stimuli, he says inappropriate words and moves his limbs on commands. His GCS is

a. 11
b. 10
c. 9
d. 13

Explanation: Based on GCS table,

- Eye opening on painful stimuli- 2 points
- Inappropriate words- 3 points
- Obeys commands to motor response- 6 points

2436. Which of the following score indicates coma in an adult patient as per Glasgow Coma Scale

a. 0
b. 5
c. 9
d. 12

Explanation: A score below 8 in Glasgow Coma Scale indicates Coma. 15 is the maximum score and 3 is the minimum achievable score. Zero score is not applicable as per GCS.

2437. While assessing an unconscious client who was brought into emergency room after a road traffic accident, the nurse would be most concerned if the assessment revealed:

a. An elevated temperature
b. An increased blood pressure
c. Bleeding from ears
d. All of the above

Explanation: Nurse should thoroughly assess for signs that could indicate increased intracranial pressures, fractures and bleeding. Bleeding from the ears occurs only with basal skull fractures that can easily lead to raise in intracranial pressure and brain herniation.

2438. Complaints of pain by the elderly patient is to be carefully assessed because older people

a. Have increased tactile perception
b. Often experience chronic pain
c. Have a decreased pain threshold
d. Have reduced sensory perception

Explanation: Age-related degenerative changes in the elderly causes decreased sensory perception. This may result in altered pain perception in older persons. So it is essential to carefully assess any complaints of pain by elderly because pain has an impact on quality of life.

2439. The emergency room nurse is assessing an adult patient who was brought in following a road traffic accident. Which of the following manifestations could have resulted from sympathetic nervous system stimulation?

a. Increased awareness and attention
b. Decreased physiologic functioning
c. Increased salivation
d. A rapid pulse and increased respiratory rate

Explanation: Activation of sympathetic nervous system leads to increase in heart rate, widening of airways (bronchioles) in the lungs, and dilation of pupils. This is similar to fight or flight response facilitated by sympathetic nervous system. Increased cardiac and respiratory activity facilitates survival.

2440. A 42-year-old male client is to undergo lumbar puncture. Which of the following is the least important information about lumbar puncture (LP)?

a. It may be used to withdraw CSF for diagnostic purpose.
b. Specimens obtained to be labeled in their proper sequence.
c. Force fluids before and after the procedure.
d. Assess movements and sensation in the lower extremities after the procedure

Explanation: The client is advised to increased fluid intake to 3L (if not contraindicated) for 24-48 hours after the procedure (to facilitate CSF production). There is NO instruction to increased fluid intake before the procedure.

- Lumbar puncture involves insertion of a needle into spinal cord to withdraw CSF or inject drugs into spinal cord.
- Specimens obtained to be labeled.
- Assessment of sensation in lower extremities after the procedure is important to rule out nerve injury.

2441. A patient with cerebral thrombosis is scheduled for cerebral angiography. Which of the following nursing care is appropriate for this client?

a. Inform the client that a warm, flushed feeling and a salty taste may occur
b. Avoid applying a pressure dressing over the site of puncture
c. Keep the extremity used as puncture site flexed to prevent bleeding
d. All of the above

Explanation: Angiography is imaging technique that uses an injection of a liquid dye to make the arteries easily visible on X-rays. During the procedure contrast (dye) is injected into the bloodstream to make the blood vessels visible on X-rays. When the contrast is

Ans.

2433. c
2434. c
2435. a
2436. b
2437. c
2438. d
2439. d
2440. c
2441. a

Scanned with CamScanner

injected the client may feel flushing sensation, a salty or metallic taste in the mouth, nausea, and/or a brief headache. These effects usually last for only a few moments. The nurse must inform about this to patient before undergoing the procedure. Also the nurse must apply a pressure dressing over the site of puncture to prevent bleeding. Keeping the extremity used as puncture site flexed will increase chance of thrombus formation so it is to be avoided.

2442. A client is admitted with thrombotic cerebrovascular accident (CVA). Which of the following is the priority nursing assessment in the first 24 hours after admission?
a. Bowel sounds
b. Electroencephalogram
c. Electromyogram
d. Pupil size and pupillary response

Explanation: Pupil size and papillary response indicate changes around the cranial nerves. In the first 24 hours, it is vital to monitor for pupil size and response.

2443. An adult male client has undergone spinal surgery. Which of the following intervention is appropriate for this client? *(ESI 2009)*
a. Assess the client's feet for sensation and circulation
b. Encourage client to drink plenty of fluids
c. Log-roll the client to prone position
d. Observe the client's bowel movement and voiding patterns

Explanation: The client's feet must be assessed for any alteration in sensation and circulation. Altered sensation and circulation to feet indicates damage to the spinal cord, if these occurs notify the physician immediately.

2444. Which of the following is the most important assessment during the acute stage of an unconscious patient?
a. Coherence and sense of hearing
b. Level of awareness and response to pain
c. Pupillary reflexes and response to sensory stimuli
d. Patency of airway and adequacy of respiration

Explanation: Checking airway, breathing and circulation is the priority assessment for the unconscious patient. At all levels of care, the ABC (Airway, Breathing and Circulation) protocol exists to remind the person delivering treatment of the importance of airway, breathing, and circulation to the maintenance.

2445. Which of the following diagnostic procedure involves the injection of radioisotopes into the body?
a. CT imaging
b. MRI
c. PET
d. X-ray

Explanation: A positron emission tomography (PET) an imaging test that helps reveal how the tissues and organs are functioning. A PET scan uses a radioactive drug (tracer) to show this activity. The tracer may be injected, swallowed or inhaled, depending on which organ or tissue is being studied by the PET scan.

2446. What must the nurse do when preparing a client for a computed tomography (CT) scan?
a. Administer a laxative preparation
b. Encourage fluid intake
c. Administer a radioisotope
d. Explain the procedure

Explanation: Explanation is all that is necessary. The client is not given a radioisotope. Fluids are not pushed prior to the procedure.
Tips: Use elimination technique to eliminate inappropriate answers.

2447. Electroencephalogram is: *(ESIC Chennai May 2012)*
a. Recording of brain wave activity
b. Recording of peristalsis
c. Recording of heart activity
d. None of the above

2448. The most common site of rupture of a cerebral aneurysm with resulting subarachnoid hemorrhage is
a. Anterior communicating artery
b. Posterior communicating artery
c. Middle cerebral artery
d. Internal carotid artery

2449. In case of delay in transportation of cerebrospinal fluid (CSF) sample, it should be *(Banaras HU 2015)*
a. Kept at room temperature
b. Refrigerated at 4°C
c. Kept at – 20°C
d. Kept in ice bucket

2450. A 36 years old female complains of headache and neck pain, examination by a nurse reveals painful flexion of the neck to the chest (nuchal rigidity). This could be due to *(Banaras HU 2015)*
a. Brain tumor
b. Meningitis
c. Cerebrovascular accident
d. Subdural hematoma

2451. As a part of the assessment of the cranial nerves, the nurse asks the patient to arise the eyebrows, smile and show the teeth, these actions provide information about which cranial nerve? *(LNJP H D 2012)*
a. Facial
b. Vagus
c. Olfactory
d. Optic

2452. Glasgow coma scale has all, except: *(LNJP H D 2012)*
a. Sensory response
b. Eye opening
c. Verbal response
d. Motor response

2453. All among the following investigation can be performed in a patient with brain tumor EXCEPT
a. CT scan
b. MRI
c. Doppler
d. Lumbar puncture

2454. Contraindications of LP include all except
a. Raised intracranial pressure
b. Neoplasm
c. Hematoma
d. Headache

2455. Optic nerve damage can be assessed through .....
a. Ophthalmoscopy
b. Slit lamp examination
c. Perimetry
d. Goniometer

2456. Decreased glucose in CSF suggestive of .....
a. Bacterial meningitis
b. Viral meningitis
c. Brain abscess
d. Encephalitis

2457. Low or absent glucose in CSF indicate .....
a. Bacterial meningitis
b. Viral meningitis
c. Brain abscess
d. Encephalitis

2458. C.S.F. findings in bacterial meningitis is .....
a. Increased protein and decreased sugar
b. Increased protein and increased sugar
c. Decreased protein and increased sugar
d. Decreased protein and decreased sugar

2459. CSF laboratory findings in bacterial meningitis shows .....
a. CSF protein level elevated
b. CSF glucose level decreases
c. WBC level increases
d. All of the above

Ans.
2442. d
2443. a
2444. d
2445. c
2446. d
2447. a
2448. a
2449. a
2450. b
2451. a
2452. a
2453. d
2454. b
2455. c
2456. a
2457. c
2458. a
2459. d

Scanned with CamScanner

2460. A lethargic patient who has fever, vomiting, headache and the nurse has to prepare him for which one of the following procedures? *(RAK MSc 2018)*

a. Blood culture
b. Lumbar puncture
c. CAT scan
d. Ultrasound scan

Explanation: A lethargic patient with fever, vomiting and headache may be the manifestations of injury or infection of brain or spinal cord which can only be confirmed by analyzing the CSF. CSF samples can be obtained by performing lumbar puncture. Hence the nurse may prepare the patient for Lumbar puncture. Lumbar puncture, also known as a spinal tap, is a medical procedure in which a needle is inserted into the spinal canal, most commonly to collect cerebrospinal fluid for diagnostic testing.

2461. Which of these is true regarding lumbar puncture method?

a. Also known as spinal tap
b. Needle passed between 3rd and 4th or 4th and 5th lumbar vertebrae
c. Knee chest position will be given to client
d. All of the above

2462. Site for lumbar puncture is .....

a. L1-L2
b. L2-L3
c. L2-L4
d. L3-L4

2463. Which of the following is the diagnostic indication of lumbar puncture?

a. Intra cranial infection
b. Meningeal leukemia
c. Neoplasms of brain
d. All of the above

2464. Complications of LP include

a. Infection
b. Brain stem herniation
c. Hematoma
d. All of the above

2465. Normal CSF contain all among the following EXCEPT

a. Red blood cells
b. White blood cells
c. Insulin
d. Protein

2466. Normal level of glucose in CSF is

a. 10-20 mg/dl
b. 20-40 mg/dl
c. 45-80 mg/dl
d. 75-85 mg/dl

2467. Normal level of protein in CSF is

a. 5-12 mg/dl
b. 15-45 mg/dl
c. 45-80 mg/dl
d. 75-85 mg/dl

2468. Trendelenburg test is positive due to injury to which of the following nerve

a. Obturator
b. Sciatic
c. Superior Gluteal
d. Inferior Gluteal

2469. Unilateral trigeminal nerve injury is tested by

a. Elevation and lowering of jaw
b. Inability to tense the jaw
c. Blinking of eye
d. Corneal reflex

2470. Pre-procedural preparation for MRI include .....

a. Enema
b. Prostheses or a pacemaker
c. Any known allergy to antibiotics
d. Vitals monitoring

2471. Neurological examination of a client shows that client is unable to perceive pain, so the examiner need to avoid .....

a. Balancing test
b. Hearing test
c. Temperature perception
d. Romber's test

2472. Normal range of ICP is ..... *(AIIMS Rishikesh Senior Nursing Officer 2018)*

a. 0-5 mm Hg
b. 5-10 mm Hg
c. 5-15 mm Hg
d. 15-20 mm Hg

2473. Normal range of cerebral perfusion pressure is .....

a. 10-35 mm Hg
b. 40 and 80 mm Hg
c. 50-100 mm Hg
d. 60-140 mm Hg

2474. What is the minimum score in Glasgow coma scale?

a. 0
b. 1
c. 2
d. 3

2475. CPP (cerebral perfusion pressure) can be calculated using

a. MAP– ICP
b. SBP– ICP
c. ICP– MAP
d. DBP– ICP

2476. Allen's test is used for

a. Integrity of palmar arch
b. Ulnar nerve function
c. Median nerve compression
d. None of the above

COMMON SIGNS AND SYMPTOMS

2477. Which of the following shows presence of meningitis ?

a. Glasgow Coma Scale score of 15
b. Positive Brudzinski sign
c. Negative Kernig sign
d. Nil nuchal rigidity

Explanation: In meningitis, patient shows positive brudzinski sign, positive Kernig sign and nuchal rigidity.

2478. A client with a spinal cord injury has paraplegia. The nurse assesses for which major problem the client may experience early in the recovery period. *(RAK MSc 2018)*

a. Bladder control
b. Nutritional intake
c. Quadriceps setting
d. Use of aids for ambulation

Explanation:

- Client with spinal cord injury with paraplegia experience issues related to bladder control in the recovery period which is a major concern.
- The sacral spinal cord segments i.e. S2-S4 segments is the place from which the spinal nerves travel to innervate the bladder. In case of spinal injury, this route of communication between bladder musculature and brain is compromised resulting in impaired bladder control.

2479. Which of the following signs in a child with meningitis is characterised by pain or resistance on extending the legs at the knee when the child is lying supine? *(AIIMS Bhopal Grade-I 2018)*

a. Brudzinski
b. Kernig's
c. Macewen
d. Chvostek's

Explanation: Meningitis is an inflammation of the meninges, is a life threatening illness. Kernig's sign (flexing the patient's hip 90 degree then extending the patients knee causes pain) and Brudzinski's sign (flexing the patient's neck causes flexion of the patient's hips and knees) are clinical signs facilitate the diagnosis of meningitis.

2480. Inability to carryout normal activities despite intact motor function is: *(AIIMS Raipur Grade II 2017)*

a. Anhedonia
b. Apraxia
c. Apathy
d. Amnesia

Explanation: Anhedonia is inability to experience pleasure. Apathy is a state of indifference or suppression of emotions. Amnesia is deficit in memory caused by brain damage or disease and psychological trauma. Apraxia is inability to execute complete

Ans.

2460. b
2461. d
2462. d
2463. d
2464. d
2465. a
2466. c
2467. b
2468. c
2469. a
2470. b
2471. c
2472. c
2473. d
2474. d
2475. a
2476. a
2477. b
2478. a
2479. b
2480. b

Scanned with CamScanner

coordinated movement without muscular or sensory impairment. It occurs because of the underlying brain damage.

2481. Willis-Ekbom syndrome is also known as: *(AIIMS BPL SNO 2018)*

a. Kleine-Levin syndrome b. Dhat syndrome
c. Restless legs syndrome d. Ganser syndrome

Explanation: Willis Ekbom Syndrome is also known as Restless legs syndrome. It is a chronic neurosensory *disorder* that is characterized by a strong urge to move, accompanied by an uncomfortable paresthesia in the legs.

2482. Vitamin E deficiency causes

a. Ataxia b. Megaloblastic anemia
c. Hemorrhagic stroke d. Cardiac failure

2483. Uncoordinated movement of the extremities in a patient with a traumatic brain injury is termed as

a. Ataxia b. Apraxia
c. Dystonia d. Dyskinesia

Explanation: The word 'ataxia' means without coordination. The ataxia is often used to describe symptoms of incoordination which can be associated with infections, injuries, other diseases, or degenerative changes in the central nervous system. Clients with ataxia have problems with coordination because parts of the nervous system that control movement and balance are affected. Ataxia may affect the fingers, hands, arms, legs, body, speech, and eye movements.

Ans.

2481. c
2482. a
2483. a
2484. b
2485. a
2486. b
2487. c
2488. b
2489. d
2490. c
2491. c
2492. a
2493. b
2494. b

2484. Which of the following is a feature of extrapyramidal tract involvement

a. Positive Babinsky Sign
b. Increased Muscular Tone
c. Exaggerated Deep tendon reflexes
d. Paralysis

2485. All of the following are metabolic causes of headache EXCEPT

a. Hyperglycemia b. Hyponatremia
c. Hypercapnia d. Hypoxia

2486. Which of the following function will be affected due to an obstruction of the anterior cerebral arteries

a. Auditory perception.
b. Judgement, insight, and reasoning
c. Balance and coordination
d. Visual integration from language comprehension

Explanation: The medial and anterior portions of the frontal lobes are supplied by the anterior cerebral arteries. The anterior portion of the frontal lobe controls higher mental functions such as judgement, insight and reasoning. Hence, the obstruction of blood supply to anterior portion of the frontal lobe results in impairment of judgement, insight and reasoning.

2487. Which of the following is considered to be the earliest sign of increased ICP?

a. Ipsilateral dilation of the pupils
b. Contralateral hemiparesis
c. Progression from restlessness to confusion and disorientation to lethargy
d. Widening of pulse pressure

Explanation: Increasing ICP decreases the cerebral perfusion causing hypoxia of brain cells. It produces a progressive alteration in the loss of consciousness. Alternation in LOC is initially manifested by restlessness.

2488. Raised intra cranial pressure (ICP) is seen in all except

a. Inspiration b. Mechanical ventilation
c. Coughing d. Valsalva maneuver

2489. Flapping hand tremors is seen in which of the following conditions?

a. Uremic syndrome b. Chronic renal failure
c. Hepatic encephalopathy d. All of the above

Explanation: Asterixis (also called the flapping tremor, or liver flap) is a tremor of the hand when the wrist is extended, sometimes said to resemble a bird flapping its wings. Chronic renal failure and hepatic encephalopathy results in uremia (uremic syndrome) which is a major cause of flapping hand tremors. It can be seen in any metabolic encephalopathy, e.g. chronic renal failure, severe congestive heart failure, acute respiratory failure and commonly in decompensated liver failure.

2490. Fever, headache and nuchal rigidity are classic symptoms seen in: *(DSSSB 2013)*

a. Alzheimer's disease b. Brain abscess
c. Meningitis d. Parkinson's disease

Explanation: Classic symptoms of meningitis include nuchal rigidity (neck stiffness), sudden high fever, and head-ache. This is known as classic triad of diagnostic signs of meningitis.

2491. Inability to speak or understand the spoken words is known as: *(DSSSB 2013)*

a. Agnosia b. Apraxia
c. Aphasia d. Insomnia

Explanation: Inability (or impaired ability) to understand or produce speech, as a result of brain damage is called as Aphasia. Agnosia means inability to interpret sensations. Apraxia is a motor disorder and insomnia refers to sleep disturbances.

2492. Which of the following symptoms is commonly reported by the patients immediately following cerebral aneurysm rupture?

a. Explosive headache b. Photophobia
c. Hemiparesis d. Seizures

Explanation: An intracranial (cerebral) aneurysm is a dilation of the walls of a cerebral artery that causes explosive headache. An explosive headache is often the first presenting symptom of a bleeding cerebral aneurysm. Photophobia, seizures, and hemiparesis may occur later.

2493. Muscular hypertonicity with increased resistance to stretch is called as

a. Atonicity b. Spasticity
c. Jerking movements d. Reflexes

Explanation: Spasticity is a condition in which there is an abnormal increase in muscle tone (hypertonicity) or stiffness of muscle, which might interfere with movement or be associated with discomfort or pain.

2494. Which of the following term is used to describe edema of the optic nerve?

a. Angioneurotic edema b. Papilledema
c. Glaucoma d. Lymphedema

Explanation: Papilledema (or papilloedema) is optic disc swelling that is caused by increased intracranial pressure. The swelling is usually bilateral and can occur over a period of hours to weeks.

Scanned with CamScanner

2495. Which of the following terms refers to weakness of both legs and lower part of the trunk
a. Paraparesis b. Quadriparesis
c. Hemiplegia d. Tetraplegia

Explanation: Paraparesis (paraplegia) refers to partial (-paresis) or complete (-plegia) loss of voluntary motor function in the pelvic limbs. Similar involvement of all four limbs is termed tetraparesis (tetraplegia) of Quadriparesis (Quadriplegia). Hemiplegia refers to paralysis of one side of the body.

2496. Brudzinski's sign and Kernig's sign are diagnostic signs of: *(AIIMS Nagpur NO 2018)*
a. Tetanus b. Meningitis
c. Encephalitis d. Kernicterus

Explanation: Positive Kernig's sign and Brudzinski's sign are observed in **Meningitis.**

2497. Positive Kernig's sign is observed in: *(Daman & Diu NO 2018; DSSSB PHN, 2015)*
a. Cholecystitis b. Nephritis
c. Meningitis d. Appendicitis

2498. Aphasia refers to: *(Banaras HU 2015)*
a. Increased rate of speech b. Inability to speak
c. Loud speech d. High pitch speech

2499. Hemiplegia involves: *(JIPMER 2012)*
a. Paresis of both lower extremities
b. Paralysis of one side of the body
c. Paralysis of both lower extremities
d. Paresis of upper and lower extremities

2500. Macewen's sign is an indication of: *(JIPMER 2012)*
a. Cerebral Palsy b. Mental Retardation
c. Hydrocephalus d. Meningitis

2501. Painful extension of knee when the thigh is flexed at the hip and knee at 90 degree angle is known as
a. Positive Kernig's sign b. Positive Brudzinski's sign
c. Positive Babinski's sign d. Positive Homan's sign

2502. If the bending of patient's neck produces flexion of the knee and hip, it is known as
a. Positive Cullen's sign b. Positive Brudzinski's sign
c. Positive Babinski's sign d. Positive Homan's sign

2503. Immediate chief complaint following cerebral aneurysm rupture is
a. Photophobia b. Explosive headache
c. Otorrhea d. Epistasis

2504. Patient is complaining of drainage from nose and ear., which among the following sign suggest that drainage is CSF?
a. Halo sign b. Goodle's sign
c. Hagar's sign d. Chadwick sign

2505. Involuntary, jerking, rhythmic movements of the eyes is known as .....
a. Diplopia b. Double vision
c. Nystagmus d. Ptosis

2506. Which among the following is most commonly seen in a client with C6 injury?
a. Paralysis b. Hemiparesis
c. Paraplegia d. Quadriplegia

2507. If both lower limbs are paralyzed then it is known as .....
a. Quadriparesis b. Paraplegia
c. Hemiparesis d. Quadriplegia

2508. If all the four limbs are paralyzed then it is known as .....
a. Quadriplegia b. Paraplegia
c. Hemiplegia d. Paralysis

2509. if half of the body is paralyzed then it is known as .....
a. Quadriplegia b. Paraplegia
c. Hemiplegia d. Paralysis

2510. Extra pyramidal symptoms occur because .....
a. Nerve damage
b. Drug toxicity
c. Integration of somatic and special sensory inputs.
d. Loss of automatic movements associated with skeletal muscle activity.

2511. Symptom helps to differentiate between hemorrhagic stroke from a thrombotic stroke is .....
a. Loss of consciousness
b. Recent memory
c. Muscle weakness
d. Sudden onset of severe headache

2512. Which of the following will NOT be observed in a client with a right hemispheric stroke? *(AIIMS-BBS SNO 2019)*
a. Impulse control difficulty
b. Loss of depth perception
c. Right hemiplegia
d. Lack of awareness

Explanation: Patients with a right-brain stroke have left hemiplegia and left-brain stroke will have right hemiplegia.

2513. Left sided hemiplegia and aphasia occur because of the involvement of .....
a. Carotid artery
b. Vertebral artery
c. Left middle cerebral artery
d. Right middle cerebral artery

2514. A male patient is experiencing urinary incontinence after a stroke. Bladder training for this patient includes all, EXCEPT
a. Kegel exercises
b. Intermittent self-catheterization
c. Assisting the patient to stand to void
d. Continuous urinary drainage

2515. The commonest and early symptom of a spinal cord injury is .....
a. Urinary incontinence
b. Back pain that worsens with activity
c. Bowel incontinence
d. Absence of cough and gag reflex

Ans.

2495. a
2496. b
2497. c
2498. b
2499. b
2500. c
2501. a
2502. b
2503. b
2504. a
2505. c
2506. d
2507. b
2508. a
2509. c
2510. d
2511. d
2512. c
2513. d
2514. c
2515. b

Scanned with CamScanner

2516. Following spinal cord injury patient is experiencing falling blood pressure with bradycardia, it indicates .....
a. Hypovolemia
b. Cardiac injury
c. Neuronal injury
d. Neurogenic shock from massive vasodilation

2517. Leading risk factor of hemorrhagic stroke is.....
a. CAD
b. Atherosclerosis
c. Hypertension
d. Aneurysm

2518. Client at risk for autonomic dysreflexia is .....
a. Head injury
b. Neurogenic bladder
c. A client with a high cervical spine injury
d. Femur fracture

2519. Which among the following indicate improvement after spinal shock
a. Cough and gag reflex
b. Return of reflexes below the injury
c. Spontaneous respirations
d. Urinary incontinence

CARE OF UNCONSCIOUS PATIENT

2520. The nurse is aware that the early indicator of hypoxia in an unconscious patient is
a. Cyanosis of extremities
b. Altered respirations
c. Hypertension
d. Restlessness

Ans.
2516. d
2517. c
2518. c
2519. b
2520. d
2521. b
2522. d
2523. b
2524. b
2525. d
2526. b
2527. c
2528. b
2529. c
2530. b

Explanation: If the patient is unconscious but shows restlessness, attention should be given to the possibility of cerebral hypoxia.

2521. While monitoring an unconscious child admitted with a history of fall, nurse notices that the child suddenly has a fixed and dilated pupil. This indicates *(Banaras HU 2015)*
a. Eye trauma
b. Neurosurgical emergency
c. Increased parasympathetic activity
d. Indication of brain death

Care of Patients with Increased ICP

2522. Which of the following is a symptom of increasing intracranial pressure that should be reported immediately to the health care provider? *(RAK MSc 2018)*
a. Constricted pupils
b. Decreased level of consciousness
c. Narrowing pulse pressure
d. Bradypnea

Explanation:
- Cushing's triad is the presentation of three clinical manifestations as they relate to decompensated responses to increasing intracranial pressure (ICP): widening pulse pressure with hypertension (increasing systolic BP), bradycardia, and irregular respirations (most commonly **bradypnea**).
- Dilated pupil and widened pulse pressure are expected in increased ICP. Level of consciousness decreases progressively according to the patient's intracranial pressure.

2523. Increased ICP is shown by?
a. Miosis
b. Reduction in GCS
c. Tachycardia
d. Systemic hypotension

2524. Increased intra-cranial pressure is related to
a. Hypotension and tachycardia
b. Hypertension and bradycardia
c. Hypertension and tachycardia
d. Hypotension and bradycardia

2525. Later signs of increased Intracranial pressure (ICP) includes which of the following?
a. Narrow pulse pressure
b. Increased blood pressure
c. Decrease pulse rate
d. Projectile vomiting

Explanation: Projectile vomiting may occur with increased pressure on the reflex center in the medulla.

2526. Which of the following is NOT an expected finding in the assessment of a client having increased intracranial pressure? *(AIIMS-BBS SNO 2019)*
a. Unequal pupils
b. Clear consciousness
c. Irritability
d. Headache

Explanation: Clear consciousness is NOT an expected finding in the assessment of a client having increased ICP. **Loss of consciousness** is most sensitive and reliable indicator of increased ICP. So, change in consciousness is a sign of increased ICP..

2527. All of the following measures are used to decrease brain edema, Except *(AIIMS Bhopal Grade-I 2018)*
a. Hydrocortisone
b. Hyperventilation
c. Dextrose infusion
d. Mannitol infusion

Explanation: Movement of the water between the brain and intravascular space is dependent on osmotic gradients. Mannitol, a hypertonic crystalloid solution is commonly used to reduce the ICP. But the hypo-osmolar solutions like 5% dextrose in water reduce serum sodium, and increases brain water and ICP.

2528. A nurse is monitoring an adult male patient 8 hours after a road traffic accident, which of the following findings by a nurse suggest increasing intracranial pressure (ICP)?
a. Blood pressure is decreased from 150/90 to 110/70
b. The patient is oriented when aroused from sleep, and fall asleep immediately.
c. Pulse is increased from 80 to 92.
d. The client refuses dinner because of anorexia.

Explanation: Change in LOC is one of the major indication of increased ICP. Oriented immediately after arousal from sleep and going back to sleep immediately is the indication that the patient's consciousness is decreasing.

2529. Medical management for increased intracranial pressure (ICP) includes: *(DSSSB 2013)*
a. Administer half strength saline
b. Administer plasma volume expanders
c. Administer mannitol
d. Reduce the number of breaths in the ventilator

Explanation: Management of increased ICP includes sedation, drainage of cerebrospinal fluid, and hyperosmolar therapy (Mannitol or hypertonic saline). Other interventions do not reduce ICP.

2530. Which one of the following is NOT true for increased intracranial pressure (ICP) in infants? *(Banaras HU 2015)*
a. Drowsiness
b. Increased blood pressure
c. Bulging fontanelle
d. Vomiting

Scanned with CamScanner

2531. Cushing's triad is seen in *(ISRO)*
a. Cushing's Syndrome
b. Hypothyroidism
c. Increased intracranial tension
d. Hyperthermia

2532. Benign intracranial hypertension is found in *(ISRO)*
a. Vit C toxicity b. Vit. D toxicity
c. Vit. K toxicity d. Vit. A toxicity

2533. Which among the following is the management for increased ICP?
a. Provide semi fowler's position
b. Minimum stimuli to the patient
c. Administer ICP lowering agents as ordered
d. All of the above

2534. Position given to a client with increased intracranial pressure is .....
a. Supine position
b. Elevate the head of the bed to 30 degrees.
c. High fowler's position
d. Knee chest position

2535. All of the following nursing procedures increases ICP of the patient EXCEPT
a. Application of Suction
b. Elevation of head end of bed to 30°
c. Repositioning of patient
d. Neurological assessment

2536. Management of increased intracranial pressure (ICP) resulting from traumatic brain injury (TBI) includes all, EXCEPT
a. Corticosteroids b. Elevation of head end of bed
c. Mannitol d. Sedation

Explanation: Medical management of increased ICP include sedation, drainage of CSF, and osmotherapy with either mannitol or hypertonic saline. For ICP refractory to initial medical management, barbiturate coma, hypothermia, or decompressive craniectomy should be considered. **Steroids are not indicated** and may be harmful in the treatment of increased ICP resulting from TBI.

HEAD INJURY

2537. If a nurse notes colorless drainage on dressing after surgery of brain tumor, then which of the following is the prompt nursing action?
a. Notify the physician
b. Elevate the head of bed
c. Documentation
d. Monitor the patient continuously

Explanation: Colorless drainage on dressing after surgery of brain tumor shows presence of cerebrospinal fluid, so it should be reported to doctor immediately.

2538. Which option shows the presence of cerebrospinal fluid leakage from nose after basilar skull fracture, if the fluid
a. Shows negative for glucose
b. Is clear
c. Clumps on dressing
d. Shows positive for glucose

Explanation: Cerebrospinal fluid always test positive for glucose.

2539. Most common cause of intracranial hemorrhage is
a. Subdural hemorrhage b. Subarachnoid hemorrhage
c. Extradural hemorrhage d. Intracerebral hemorrhage

2540. Priority nursing intervention for a client admitted with head injury is .....
a. Patency of airway b. Peripheral perfusion
c. Nutritional balance d. Hydration

2541. First sign and symptom following head injury which indicative of increased ICP is .....
a. Bradycardia b. Vomiting
c. Restlessness and confusion
d. Blurred vision

2542. A 23-year-old client is admitted with tonic-clonic seizure. The nurse knows that the most common cause of tonic-clonic seizure for this age group is:
a. Stroke b. Electrolyte imbalance
c. Head trauma d. Congenital defect in brain

Explanation: Head injury is the most commonly known cause in young adults. For middle-age individuals, strokes, tumors and injuries are more frequent catalysts. In people age 65 and older, stroke is the most common known cause, followed by degenerative conditions such as Alzheimer's disease. Often, seizures do not begin immediately after a person has an injury to the brain. Instead, a seizure may occur many months later.

2543. What should be the initial action of a medical-surgical nurse if a patient develops 'slurred speech and disorientation to time and place' who sustained a head injury 24 hours ago?
a. Recheck the patient's neurologic status in 15 minutes
b. Prepare the patient for emergency surgery
c. Continue to hourly neurologic assessments
d. Inform the neurosurgeon of the patient's status

Explanation: Change in the level of consciousness need to be informed the concerned doctor first.

2544. A 35-year-old male patient is brought into emergency room with a head injury following a road traffic accident. Patient is confused, drowsy and has unequal pupils. Which of the following nursing diagnosis is given priority in this condition?
a. Altered cognition
b. Altered cerebral tissue perfusion
c. High risk for injury d. Altered sensory perception

Explanation: Maintaining cerebral perfusion is essential to prevent further brain damage. Hence, restoration of cerebral perfusion is the priority intervention at this time.
TIPS: Use ABC (Airway, Breathing and Circulation) principle to locate the answer. Here altered cerebral perfusion is related to circulation and there are no other nursing diagnosis related to airway or breathing.

2545. A patient was brought to the emergency department after a head injury. The nurse noticed that there is a clear drainage from the nose. Which of the following test is useful and most reliable to determine if the drainage is a cerebrospinal fluid (CSF)?
a. pH test b. Test for Beta2-transferrin
c. Test for glucose d. Test for chlorides

Explanation: The CSF contains a large amount of glucose. A rapid but highly unreliable test is glucose-content determination with the use of glucose oxidase paper. This method of detecting cerebrospinal fluid (CSF) in rhinorrhea is no longer reliable screening or confirmatory test. Due to the presence of reducing substance in the lacrimal-gland secretions, it can lead to false positive results. Test for

Ans.
2531. c
2532. d
2533. d
2534. b
2535. b
2536. a
2537. a
2538. d
2539. d
2540. a
2541. c
2542. c
2543. d
2544. b
2545. b

Scanned with CamScanner

beta 2-transferrin is a most reliable test to determine whether the nasal drainage is CSF because the substance is only present in CSF.

2546. All of the following are symptoms of head injury except: *(Banaras HU 2015)*
a. Sleepiness b. Vomiting
c. Sweating d. Headache

2547. Position given to a patient with multiple injury over the face and neck is .....
a. Supine position b. Semiprone position
c. Side lying d. Trendelenburg

2548. Drainage of CSF via nose suggestive of .....
a. Basilar skull fracture b. Frontal fracture
c. Temporal fracture d. Nasal septal fracture

2549. Leading cause of subarachnoid hemorrhage is .....
a. Embolism b. Hypertension
c. Aneurysm d. Blunt trauma

2550. Intracranial hemorrhage most commonly occur in .....
a. Cerebellum b. Cerebrum
c. Medulla oblongata d. Pons

SEIZURE/EPILEPSY

2551. Which of the following action is contraindicated in epileptic patient
a. Loosen the clothes b. Restrain client's limbs
c. Raising padded side rails d. Give side lying position

Explanation: Limbs are never restrained because the strong muscle contractions could cause harm.

2552. Which of the following is NOT a triggering factor for seizures and epilepsies? *(AIIMS-BBS SNO 2019)*
a. Acute alcohol ingestion b. Exposure to flashing lights
c. Hyperventilation d. Decreased physical activity

Explanation: Alcohol intake or drug use, exposure to flashing light, hyperventilation, non-compliance to medication and sleep deprivation are common triggers for seizures, whereas decreased physical activity is a positive activity that usually do not a trigger seizures.

2553. What should the nurse do first when a male client is having a tonic-clonic seizure? *(AIIMS Bhopal Nursing Officer, 2018)*
a. Restrain the client's arms and legs
b. Elevate the head of the bed
c. Place a tongue blade in the client's mouth
d. Take measures to prevent injury

Explanation: If any person is experiencing tonic clonic seizure most appropriate nursing intervention is to ensure measures to prevent injury.

2554. Which of the following diagnostic investigation is useful to detect seizure? *(DSSSB 2013)*
a. CT scan b. EEG
c. MRI scan d. X-ray

Explanation: Electroencephalography (EEG) is a test that detects electrical activity of the brain through electrodes attached to scalp. EEG is most often used to diagnose epilepsy, which causes obvious abnormalities in EEG readings.

2555. Which action should the nurse implement to prevent aspiration in patient who is experiencing seizure in bed?
a. Elevate the head
b. Loosen restrictive clothing
c. Position the client on the side with head flexed forward
d. Use tongue depressor between teeth

Explanation: Positioning patient in side lateral position prevent aspiration. Other interventions also useful in the management of patient with seizure but does not prevent aspiration.

2556. Mr. Santosh 18-years-old student, is admitted to the ward with a diagnosis of epilepsy. He tells the nurse that he is experiencing a generalized tingling sensation and smell of roses. These complaints indicate *(Banaras HU 2015)*
a. Acute neuritis
b. Acute cerebrovascular accident
c. An aura
d. An olfactory hallucination

2557. Most common type of seizure in early childhood period is
a. Intra cranial infection b. Febrile illness
c. Intra cranial malignancy d. Electrolyte imbalance

2558. Absence seizure is treated with .....
a. Clonazepam b. Valproate
c. Phenytoin d. Midazolam

2559. Complex partial seizure can be managed with
a. Midazolam b. Sodium valproate
c. Lorazepam d. Carbamazepine

2560. Important nursing intervention for a client having a tonic-clonic seizure?
a. Maintaining a patent airway
b. Restrain the client
c. Intubate the client
d. Insert Foley's catheter

2561. Drug of choice for status epilepticus is .....
a. Midazolam b. Benzodiazepines
c. Lorazepam d. Phenytoin

2562. A client recalls headache and unusual sensation before seizure attack. It is known as .....
a. Atonic seizure b. Aura
c. Tonic d. Clonic

2563. Seizure in a meningitis client can be controlled by all of the following interventions, Except
a. Administration of phenytoin
b. Side lying position
c. Control of fever
d. Minimal environmental stimuli

2564. The key instruction to be given to the patient and the caregiver with epilepsy is as follows, EXCEPT *(ESIC 2019)*
a. Take medications daily
b. Maintain medication and seizure chart
c. Avoid alcohol, smoking, hypoglycemia
d. Take showers in bathtubs

Explanation: Taking showers in bath tub is not advised because it is a high-risk activity for a patient with epilepsy. If seizure occurs while bathing in tub then drowning can occur and client may die.

2565. Drug of Choice for Generalized Tonic-Clonic Seizure (GTCS) in pregnancy is
a. Lamotrigine b. Valproate
c. Levetiracetam d. CBZ

2566. Neurological manifestation of Whipple's disease is:
a. Encephalopathy
b. Cerebellar ataxia
c. Focal neurological deficits
d. Seizures

Ans.

2546. c
2547. b
2548. a
2549. c
2550. b
2551. b
2552. d
2553. d
2554. b
2555. c
2556. c
2557. b
2558. b
2559. d
2560. a
2561. b
2562. b
2563. b
2564. d
2565. a
2566. d

Scanned with CamScanner

2567. Best drug for photosensitive epilepsy:
a. Topiramate
b. Valproate
c. Zonisamide
d. Ethosuximide

INFECTIONS

2568. Basic nursing measures in the care of patient with viral encephalitis is
a. Providing comfort measure
b. Monitoring cardiac output
c. Administer narcotics
d. Administer amphotericin B

Explanation: Providing comfort measures directed at the headache, include dimmed lights, limited noise and analgesics are basic nursing measures in the care of patient with viral encephalitis. Amphotericin B is an antifungal agent which is not useful in viral encephalitis.

2569. The most common complication of Tuberculous meningitis is: *(Kerala PSC, Nov 2014)*
a. Encephalitis
b. Subdural empyema
c. Hydrocephalus
d. Brain abscess

2570. Meningitis is: *(ESIC Chennai May 2012)*
a. Inflammation of the membranes that surround the liver
b. Inflammation of the membranes that surround the brain and the spinal cord
c. Inflammation of the membranes that surround the heart
d. Inflammation of the membranes that surround the kidney

2571. Correct regarding pyogenic meningitis (bacterial meningitis) is .....
a. Haemophilus influenzae, Streptococcus pneumonia and Neisseria meningitides are the main organisms
b. Markedly decreased CSF glucose and increase in CSF protein is present
c. CT and MRI shows thin and linear leptomeningeal enhancement
d. All of the above

2572. Most common complication of tubercular meningitis is ...
a. Lymphoma
b. Tuberculoma
c. Lymphadenopathy
d. Aneurysm

2573. Important nursing intervention in a client with meningitis is.....
a. Check for Kernig's sign, Brudzinski's sign and nuchal rigidity
b. Isolate the child immediately
c. Prepare for lumbar puncture
d. Give prophylactic antibiotic to family members

2574. Which among the following is the sign of meningitis?
a. Battle sign
b. Brudzinski sign
c. Cullen's sign
d. Ring sign

2575. Subdural empyema is caused by .....
a. Pneumococci
b. Gonococci
c. Streptococcus pneumonia
d. Staphylococcus aureus

2576. Inflammation of pia arachnoid is .....
a. Nuchal rigidity
b. Leptomeningitis
c. Meningismus
d. TB meningitis

2577. CSF of acute pyogenic meningitis shows .....
a. Cloudy/frankly turbid CSF
b. Elevated CSF pressure (above 180 mm water)
c. Presence of polymorphs (10-10,000/ul)
d. All of the above

2578. CSF findings in tubercular meningitis includes .....
a. Mild turbidity; may form fibrin web on standing
b. Mononuclear leukocytosis
c. Increased protein
d. All of the above

2579. All of the following are correct regarding poliomyelitis EXCEPT
a. Caused by RNA virus
b. The virus belongs to enterovirus family with three subtypes
c. Affects the motor neurons of spinal cord and brainstem
d. Route of transmission is fecal–oral route

MYASTHENIA GRAVIS, MULTIPLE SCLEROSIS, GUILLAIN-BARRE SYNDROME, TRIGIMINAL NEURALGIA, HUNTINGTON'S DISEASE, ALS

2580. Which of the following assessment indicates that spinal shock persists following spinal cord injury ?
a. Overactive reflexes
b. Normal reflexes
c. Flaccid paralysis
d. Unconciousness

Explanation: Flaccid paralysis shows the presence of spinal shock.

2581. The patient may suffer from Guillain Barre Syndrome, if he has shown the symptoms of
a. Encephalitis
b. Gastrointestinal and respiratory infection in first 4 weeks
c. Trauma to Brain
d. Spinal Cord Injury

Explanation: Recent history of gastrointestinal and respiratory infection are predisposing factors of Guillain Barre Syndrome

2582. When caring for a patient admitted with Guillain-Barre syndrome, which nursing diagnosis should take priority? *(RAK MSc 2018)*
a. Anxiety
b. Imbalanced nutrition
c. Impaired gas exchange
d. Impaired mobility

Explanation: Guillain-Barre syndrome is an autoimmune disorder resulting in progressive muscle weakness due to damaged nerves. Impaired gas exchange is related to skeletal muscle weakness. Diaphragmatic weakness due to phrenic nerve involvement is also common. Approximately one third of hospitalized GBS patients require mechanical ventilation because of respiratory muscle or oropharyngeal weakness.

2583. Damage to which of the following leads to Gullain-Barré syndrome?
a. Brain parenchyma
b. Peripheral nervous system
c. Spinal cord
d. Thyroid glands

Explanation: Guillain-Barré syndrome (GBS) is a rapid-onset muscle weakness caused by the immune system damaging the peripheral nervous system. This autoimmune disease is caused by the body's immune system mistakenly attacking the peripheral nerves and damaging their myelin insulation. Sometimes this immune dysfunction is triggered by an infection. The diagnosis is usually made based on the signs and symptoms, through the exclusion of alternative causes, and supported by tests such as nerve conduction studies and examination of the cerebrospinal fluid.

Ans.

2567. b
2568. a
2569. c
2570. b
2571. d
2572. b
2573. b
2574. b
2575. c
2576. b
2577. d
2578. d
2579. a
2580. c
2581. b
2582. c
2583. b

Scanned with CamScanner

2584. True about Gullain-Barre syndrome is all EXCEPT
a. Inflammatory
b. Plasmapheresis can be done
c. Descending paralysis
d. Demyelinating

Explanation:
- GBS is an acute inflammatory demyelinating polyradiculo-neuropathy (AIDP) that presents within 2-4 weeks of a respiratory or GI infection.
- It presents as ascending weakness with areflexia.
- CSF picture is of normal cell counts with raised proteins.
- Treatment consist of IVIG or plasmapheresis.

2585. CSF finding in Gullian Barre syndrome
a. Normal cells with increased protein
b. Normal cells and normal protein
c. Increased cells with low sugar
d. Increased protein with increased cells

2586. A nurse is caring for a patient with myasthenia gravis. Which of the following nursing diagnosis is a priority which needs immediate intervention?
a. High risk for injury related to muscle weakness
b. Ineffective coping related to illness
c. Ineffective airway clearance related to muscle weakness
d. Pain related to muscle weakness

Explanation: Ineffective airway clearance is a priority nursing diagnosis which needs immediate intervention by a nurse. Weakness of respiratory muscles decreases airflow, causing a gradual decline in vital capacity making breathing and clearing the airway through coughing difficult.

2587. Which of the following conditions is an early symptom of myasthenia gravis? *(AIIMS Staff Nurse 2016; RML 2007)*
a. Dysphagia
b. Fatigue improving in the evening
c. Ptosis
d. Respiratory distress

Explanation: In more than half the people who develop myasthenia gravis, their first signs and symptoms involve eye problems, such as drooping of one or both eyelids (ptosis), double vision (diplopia), which may be horizontal or vertical, and improves or resolves when one eye is closed.

2588. Immunosuppressive therapy is effective in patient with myasthenia gravis because it
a. Decreases the production of auto antibodies that damage the acetylcholine receptors
b. Increases the production of acetylcholine
c. Inhibits the breakdown of acetylcholine
d. Removes antibodies that impair the transmission of impulses

Explanation: Immunosuppressant medications work to decrease the production of auto antibodies. This results in decreased immune system response at the neuromuscular junction (NMJ) and limits muscle fatigue A combination of corticosteroids (prednisone or prednisolone) and azathioprine remains the first-choice immunosuppressive drug alternative for most MG patients.

2589. Ice pack test is done for
a. Myasthenia Gravis
b. Hypokalemic periodic paralysis
c. Hyperparathyroidism
d. Multiple system atrophy

2590. Degenerative neurological disorders include which of the following:
a. Huntington's disease
b. Glioma
c. Paget's disease
d. Osteomalacia

Explanation: Huntington's disease is a chronic, progressive, degenerative neurological hereditary disease of nervous system that results in involuntary choreiform movement and dementia.

2591. _____ bladder is expected when a patient is experiencing spinal shock *(AIIMS 2006)*
a. Atonic
b. Normal
c. Spastic
d. Uncontrolled

Explanation: Atonic, or sometimes 'flaccid', bladder sees the organ dilate as usual but fail to empty. This is often due to the brain sending incorrect signals to the bladder usually stemming from some kind of spinal cord injury or a condition such as multiple sclerosis.

2592. In multiple myeloma neurological complication usually involve .....
a. Brain
b. Spinal column
c. Cranial nerves
d. Autonomic nervous system

2593. Earliest sign of myasthenia gravis is .....
a. Pill rolling movements of the hand
b. Fatigue improving at the end of the day
c. Ptosis
d. Respiratory distress

2594. Which among the following helps to find out the extent of myasthenia gravis?
a. Ptosis
b. Respiratory distress
c. Increased dopamine levels
d. Muscle rigidity

2595. Correct option regarding Huntington's disease is .....
a. Progressive breakdown (degeneration) of nerve cells in the brain
b. Chorea, Intellectual decline and Emotional disturbances are the clinical manifestations
c. Treatments cannot prevent the physical, mental and behavioral decline associated with the condition.
d. All of the above

2596. Effectiveness of levodopa in a myasthenia gravis client will be evaluated through .....
a. No ptosis
b. Fatigue improving at the end of the day
c. Reduction in short-term memory
d. Lessened rigidity and tremor

2597. Earliest symptoms of multiple sclerosis is .....
a. Ptosis
b. Diplopia
c. Pill rolling movement
d. Dementia

Explanation:
- Problems with vision, including diplopia, can be an early symptom of multiple sclerosis. Damage to nerve pathways that controls eye movements are damaged in MS.
- Ptosis (drooping of one of both eyelids) - Earliest sign of **Myasthenia Gravis.**
- Pill rolling movements are seen **Parkinsonism.**
- Most common cause of Dementia is **Alzheimer's disease.**

2598. Guillain-Barre syndrome affects .....
a. Brain
b. Cranial nerve
c. Peripheral nerve
d. Spinal cord

Ans.
2584. c
2585. a
2586. c
2587. c
2588. a
2589. a
2590. a
2591. a
2592. b
2593. c
2594. d
2595. d
2596. d
2597. b
2598. c

Scanned with CamScanner

2599. **In Guillain-Barre syndrome, respiratory distress occurs because of .....**
a. Elevated protein levels in the CSF
b. Respiratory infection
c. Absence of gag and cough reflex
d. Paralysis ascending to the nerves that stimulate the thoracic area

2600. **Guillain-Barré syndrome is manifested with:** *(Kerala PSC, Nov 2014)*
a. Muscle atrophy and persistent reflexes
b. Symmetric muscle weakness, diminished reflexes and paresthesia
c. Muscle atrophy convulsions and behavioral problems
d. Symmetric muscle weakness, increased tone and persistent reflexes

2601. **A patient with multiple sclerosis was advised to undergo an exercise program. While teaching this patient about the exercise program, the nurse should caution to avoid activities that**
a. Are aerobic
b. Increases the heart rate
c. Leads to dehydration
d. All of the above

PARKINSON'S DISEASE, ALZHEIMER'S DISEASE, DEMENTIA

2602. **Which is the earliest symptoms of Parkinsonism?**
a. Tremors
b. Rigidity
c. Bradykinesia
d. Chorea

2603. **Element causing Parkinsonism?**
a. Copper
b. Zinc
c. Iron
d. Manganese

2604. **Which of the following is NOT a physical assessment finding in Parkinson's disease?** *(AIIMS-BBS SNO 2019)*
a. Absence of cognitive impairment
b. Mask-like expression
c. Dysarthria
d. Pill rolling tremors of the fingers

Explanation:
- Cognitive impairment is a significant non-motor symptom of Parkinson's disease (PD). So cognitive impairment is likely to be a finding in a patient with Parkinson's disease. So Absence of cognitive impairment is not a correct answer.
- All other given symptoms are present in Parkinson's disease.
- Note: Question has 'negative stem' with a key word "NOT a finding" and the answer also has a negative key word "ABSENCE of cognitive impairment".

2605. **Which of the following lobe of the brain is affected earliest in most of the cases of Alzheimer's disease?**
a. Temporal lobe
b. Parietal lobe
c. Frontal lobe
d. Occipital lobe

Explanation: Alzheimer's disease (AD) is a progressive, degenerative brain disease that slowly erodes memory and thinking skills, and eventually even the ability to carry out simple tasks. It is the most common cause of dementia. The **hippocampus** in the temporal lobe is one of the earliest affected brain regions in Alzheimer's disease (AD) and its dysfunction is believed to underline the core feature of the disease-memory impairment.

2606. **Parkinson's disease is caused by deficiency of which of the following neurotransmitter?**
a. Acetylcholine
b. Dopamine
c. GABA
d. Serotonin

Explanation: Parkinson's disease is a degenerative disorder of the central nervous system mainly affecting the motor system. Parkinson's disease is primarily caused by low and falling dopamine levels.

2607. **Which of the following is the earliest sign of Parkinson's disease?**
a. Disturbed vision
b. Forgetfulness
c. Tremors
d. Muscle atrophy

Explanation: The three cardinal signs of Parkinson's disease are tremor, rigidity, and bradykinesia. Tremor is the most apparent and well-known symptom. It is also the most common and earliest sign of Parkinson's disease.

2608. **Mr. Prem has been diagnosed to have Parkinson's disease. He complains that the resting tremors he is experiencing in his right hand are very frustrating. What advice to be given to him by the attending nurse?** *(Banaras HU 2015)*
a. To take a warm bath
b. To hold an object
c. To practice deep breathing
d. To give diazepam as needed

2609. **Which among the following area in the brain is affected earliest in Alzheimer's disease?**
a. Occipital lobe
b. Hippocampus
c. Broca's area
d. Wernicke's area

2610. **Earliest sign in Parkinson's disease?**
a. Akinesia
b. Ptosis
c. Dementia
d. Pill rolling movements of the hand

2611. **Masklike facies is the clinical feature of.....**
a. Guillain-Barre syndrome
b. Multiple sclerosis
c. Parkinson disease
d. Mental retardation

2612. **Which antiparkinsonian drug cause tolerance or toxicity if taken for too long?**
a. Amantadine
b. Carbidopa-levodopa
c. Imipramine
d. Sertraline

2613. **The nurse administers levodopa to a client with Parkinson's disease. Which therapeutic effect does the nurse expect the medication to produce?** *(RAK MSc 2018)*
a. Increase in acetylcholine production
b. Replacement of the neurotransmitter in brain
c. Regeneration of injured thalamic cells
d. Improvement in myelination of neurons

Explanation: Levodopa is converted to dopamine in the basal ganglia producing symptom relief. It acts by reducing the excessive influence of excitatory cholinergic neurons on the extrapyramidal tract.

2614. **True regarding dementia is .....**
a. Cognitive dysfunction is there
b. Loss of memory is also present
c. Both a and b
d. None of the above

2615. **Vascular dementia occurs because of .....**
a. Aneurysm rupture
b. Intra cranial infection
c. Cerebral ischemia
d. All of the above

2616. **Dementia is diagnosed on the basis of .....**
a. CT/MRI
b. Doppler study
c. EEG
d. Patient history and cognitive assessment

Ans.

2599.	d
2600.	b
2601.	c
2602.	a
2603.	d
2604.	a
2605.	a
2606.	b
2607.	c
2608.	b
2609.	b
2610.	d
2611.	c
2612.	b
2613.	b
2614.	c
2615.	c
2616.	d

Scanned with CamScanner

2617. Earliest feature of Alzheimer Disease is .....
a. Somnambulism
b. Memory problems and mild confusion
c. Nocturia
d. Mood disorder

2618. Main nursing intervention to a client with Alzheimer Disease is .....
a. Maintain patient safety
b. Maintain nutritional status
c. Maintain normal activity level
d. Meet elimination needs

2619. Creutzfeldt-Jakob disease is characterized by
a. Memory loss
b. Memory impairment, muscle jerks, and blindness
c. Remission and relapse
d. Increased ICP and cognitive impairment

COMMON MEDICAL AND SURGICAL INTERVENTIONS

2620. Nurse has to insert a nasogastric tube to a stroke client and understands that the best position for the insertion is? *(AIIMS Raipur NO 2019)*
a. Low Fowlers position b. Sims position
c. High Fowler's position d. Trendelenburg position

Explanation: Patient with stroke is also associated with dysphagia, therefore the insertion of NG tube become more difficult. High Fowler's position eases the insertion of NG tube and reduces the risk of aspiration. Semi Fowler's or Low Fowler's position prevents the risk of aspiration especially in comatose patients.

2621. A 35-year-old male client has undergone spinal anaesthesia. The nurse should immediately position the client in which of the following position?
a. Flat in a supine position b. Left lateral position
c. Prone position with the head turned to the side
d. Knee chest position

Explanation: The client should be kept in flat in a supine position for approximately 4–12 hours postoperatively to prevent the complication of a painful spinal headache. Leakage of CSF from the puncture site is believed to be the cause of headaches. By keeping the client in supine position, pressure of CSF is equalized, which prevents trauma to the neurons.

2622. Doctor has advised the nurse to prepare the room for a patient with a spinal cord injury (at C7 level). Which one of the following is most essential to be kept ready for this patient? *(Banaras HU 2015)*
a. The halo brace device b. A catheterization tray
c. A ventilator on stand by d. The spinal kinetic bed

2623. Surgery done for myasthenia gravis is: *(JIPMER 2012)*
a. Pallidotomy b. Hypophysectomy
c. Sympathectomy d. Thymectomy

2624. VP shunt is the surgical management for: *(JIPMER 2012)*
a. Spina bifida b. Brain tumor
c. Hydrocephalus d. ASD

2625. The neural tube defect among new born can be prevented by providing:
a. Folic acid to the mother in first trimester
b. Vitamin K to the mother in first trimester
c. Iron and folic acid throughout pregnancy
d. Iron to the mother in 3rd trimester

2626. Priority nursing intervention after craniotomy is .....
a. GCS assessment
b. Neutral position
c. Prevent infection
d. Prevention of increase in ICP

2627. Bromocriptine is indicated in
a. Prolactinoma b. Parkinson's disease
c. Infertility d. All of the above

2628. Long-term treatment for thrombotic stroke is
a. Acetaminophen
b. Tissue Plasminogen Activator
c. Aspirin
d. Warfarin

2629. Long-term treatment for embolic stroke is
a. Acetaminophen
b. Tissue Plasminogen Activator
c. Aspirin
d. Warfarin

2630. Most effective treatment for ischemic stroke is
a. Acetaminophen
b. Tissue Plasminogen Activator
c. Aspirin
d. Warfarin

2631. Significant complication associated with thrombolytic therapy is .....
a. Ischemia b. Cerebral hemorrhage
c. Microthrombi d. Resolution of the clot

2632. Nursing intervention for a client who had undergone a L4-L5 laminectomy?
a. Encourage the client to be out of in bed the first postoperative day
b. Adhere to the treatment regimen
c. Maintain ROM of all joints
d. Health education and discharge teaching

2633. Health education to a client on phenytoin therapy include
a. Report for blood monitoring as ordered to avoid toxicity
b. Use soft bristle brush to avoid injury to oral mucosa
c. Quit the habit of consuming alcohol
d. All of the above

2634. Following laminectomy a client is experiencing frequent voiding of small amounts of urine. The problem experienced by the patient is .....
a. Urinary incontinence b. Diabetes insipidus
c. Urine retention d. Neurogenic bladder

2635. Purpose of carotid endarterectomy for a patient with TIA is to.....
a. Decrease cerebral edema
b. Reduce cerebral ischemia
c. Prevent a stroke by removing atherosclerotic plaques that is blocking cerebral blood flow
d. Provide a circulatory bypass around thrombotic plaques obstructing cranial circulation

2636. A chronic alcoholic developed ataxia, nausea, vomiting and ophthalmoplegia. The possible diagnosis is
a. Korsakoff psychosis
b. Wernicke's encephalopathy
c. Cerebellar infarction
d. Alcohol Intoxication

2637. Arsenic poisoning causes?
a. Mononeuritis multiplex b. Myelopathy
c. Radiculopathy d. Polyneuritis

Ans.

2617. b
2618. a
2619. b
2620. c
2621. a
2622. c
2623. d
2624. c
2625. a
2626. d
2627. d
2628. c
2629. d
2630. b
2631. b
2632. a
2633. d
2634. c
2635. c
2636. b
2637. d

Scanned with CamScanner

DRUGS AND DIET RELATED

2638. Which of the following pharmacological management is inappropriate regarding medical management of a client with CVA?
a. Osmotic diuretics are given to decrease cerebral edema
b. Aspirin is used in the acute management of a completed stroke
c. Corticosteroids are given to decrease cerebral edema
d. Thrombolytics are most useful within three hours of an occlusive CVA

Explanation: Aspirin is a platelet deaggregator used in the prevention of recurrent or embolic stroke but is not used in the acute management of completed stroke as it may lead to bleeding.

2639. Which of the following medications are the safest to administer to adults needing assistance in falling asleep?
a. Barbiturates
b. SSRIs
c. Minor tranquilizers
d. Benzodiazepines

Explanation: Therapeutic index of the benzodiazepines is high so it has high safety margin. It acts by decreasing levels of arousal and induces sleep with relatively fewer side effects.

2640. An adult patient diagnosed with brain tumor was scheduled for craniotomy. Which of the following class of drugs are useful in preventing the development of cerebral edema after surgery?
a. Antihypertensive
b. Antihistamines
c. Diuretics
d. Steroids

Explanation: Glucocorticoids (Steroids) are used to prevent or reduce cerebral edema due to its anti-inflammatory properties.

2641. An assessment specific to safe administration of IV mannitol is: *(RRB 2005)*
a. Vital signs q4h
b. Weighing daily
c. Hourly urine output
d. Level of consciousness q8h

Explanation: Mannitol is an osmotic diuretic which increases the urine excretion. Hence, the urine output must be carefully monitored (hourly) to prevent any fluid imbalance.

2642. Anti-emetics with least CNS side effect is .....
a. Metoclopramide
b. Chlorpromazine
c. Prochlorperazine
d. Ondansetrone

2643. Which among the following is correct regarding phenytoin and alcohol interaction ?
a. Alcohol increases effectiveness of phenytoin activity
b. Alcohol decreases seizure threshold
c. Alcohol has no interaction with phenytoin
d. Alcohol decreases the effectiveness of phenytoin

2644. Common side effect of drug phenytoin is
a. Gingival hyperplasia
b. Hirsutism
c. Cushingoid appearances
d. Bleeding gum

2645. Correct regarding IV phenytoin is .....
a. Administer via IV push
b. Stop the drug if there is no sign and symptoms
c. Mixing the drug with saline solution only
d. Flushing the IV catheter with dextrose solution

HYDROCEPHALUS

2646. In CSF pathway obstruction at aqueduct of sylvius cause enlargement of.....
a. Lateral ventricle
b. Third ventricle
c. Fourth ventricle
d. Both a and b

2647. How can we differentiate between hydrocephalus due to aqueductal stenosis and Dandy walker malformation?
a. Third ventricle size
b. Posterior fossa volume
c. Lateral ventricular size
d. Fourth ventricle size

2648. The commonest cause of primary hydrocephalus is
a. Obstruction to flow of CSF
b. Overproduction of CSF
c. Decreased reabsorption of CSF
d. Congenital malformation

Ans.

2638. b
2639. d
2640. d
2641. c
2642. d
2643. d
2644. a
2645. c
2646. d
2647. b
2648. a

ONCOLOGY

CANCER

- Cancer is considered as chronic disease requiring ongoing management, rather than terminal illness.
- **Risk factors**
  - Age
  - Tobacco
  - Carcinogen exposure
  - UV rays
  - Genes

Table 83 Infections and viruses associated with an increased risk of certain forms of cancer

Infection	Increased risk of certain forms of cancer
HPV	Cervical cancer, anal cancer, upper airway cancer
Epstein-Barr virus	Lymphoma, nasopharyngeal cancer, gastric cancer, Kaposi sarcoma
Cytomegalovirus	Kaposi sarcoma, colon cancer
Hepatitis B & C	Hepatocellular cancer

- **Metastasis**
  - Cancer cells move from their original location to other site.
  - **Haematogenous spread** is the most common route of spread of cancer.

Screening Test for Cancer

- **Breast cancer**
  - Breast self-examination – 3 to 5 days after the period starts every month. After menopause, one day of every month or any fixed day in a month.
  - **Clinical breast examination:** Preferably every 3 year
  - **Mammography**: After the age of 40 years
- **Cervical cancer**
  - Women ≥ 21 years: Pap test is done
- **Colon cancer**
  - Fecal Occult Blood Test, Guaiac based test.
- **Prostate cancer**
  - Prostate specific antigen (PSA)

Figure 91 ▪ Early warning signs of cancer

Cancer Treatment Modalities

Surgical Management

- Surgical management for cancer consists of diagnostic surgery (biopsy), surgery as primary treatment, prophylactic surgery, palliative surgery and reconstructive surgery.
- **Biopsy:** It can be incisional, excisional and needle method.
- When surgery is considered as a primary treatment option, **debulking surgery** will be performed.
- **Prophylactic surgery:** Removal of non-vital tissue or organ which are at increased risk for developing cancer.
- **Palliative surgery:** Surgeries performed to improve quality of life as a symptomatic management when surgical removal of tumor is not possible.
- **Reconstructive surgery:** Performed to improve functions or for cosmetic effect.

Chemotherapy

- **Adjuvant**: Use of systemic treatment following surgery and radiation
- **Neoadjuvant**: Use of systemic treatment prior to primary surgery or radiation
- **Nadirs**: Period of Lowest blood cell and platelet count as a side effect of chemotherapy is known as Nadirs.
- Chemotherapy usually affects hair, skin, mucous etc.
- Fatigue, alopecia, nausea, vomiting, anaemia, thrombocytopenia and leucopoenia are expected during chemotherapy.

Radiation Therapy

- **Teletherapy**: Radiation source is external to patient's body. Delivered through linear accelerator. It is also known as **external beam radiation.**
- **Brachytherapy**: Radiation sources is inside patient's body. Seed or wires are used to deliver radiation. It is also known as **internal beam of radiation. Patient emit radiation and considered as hazardous to others.**
- Gray is the unit of absorbed radiation dose equal to 100 rads.

TNM Classification

T: Extent of primary Tumor
N: Lymph Node involvement
M: Distant Metastasis.

Table 84

Primary tumor (T)	Regional lymph node (N)	Distant metastasis (M)
Tx: Primary tumour cannot be assessed. **T_0:** no evidence of primary tumour **Tis:** Carcinoma in situ **T1, T2, T3, T4:** Increasing size or local extent of the primary tumour.	**Nx:** regional lymph node cannot be assessed. **N_0:** no regional lymph node involvement **N1, N2, N3:** based upon the extent of regional lymph node	**Mx:** Distant metastasis cannot be assessed. **M_0:** No distant metastasis **M_1:** Distant metastasis is present.

Scanned with CamScanner

FEW COMMON CANCERS

Oral Cancer

- **Most common type of oral cancer** - Squamous cell carcinoma
- **Risk factors:** Tobacco use, alcohol, virus (HPV, EBV, herpes simplex), poor dental hygiene, exposure to radiation and malnutrition
- Most of the time clients present with non-healing ulcer with varying degree of pain and bleeding.

Laryngeal Cancer

- It is the malignant growth in the larynx.
- Based upon the anatomic location, laryngeal cancer is divided as supra glottic, glottic and subglottic.
- **Glottic is the most common type** followed by supraglottic and then subglottic
- **Risk factors:** Smoking, alcohol, exposure to chemical such as sulphuric acid mist and asbestoses
- **Clinical Manifestation**
  - **Early symptoms** - Hoarseness of voice and change in quality of voice
  - Painless lump in the throat, dysphagia, dyspnea, weight loss, weakness, and hemoptysis
- Chemotherapy and radiation therapy can be used as treatment modality.
- Laryngectomy is the surgery of choice.
- Nursing responsibility following laryngectomy:
  - Assess the client for respiratory complications and ensure a patent airway.
  - Fowler's position to client for better gas exchange
  - Establish an alternative way of communication. It includes:
    - Speech therapy
    - Esophageal speech
    - Electric larynx
    - Transesophageal puncture

Cancer of Lung

- Malignant growth in the bronchi and peripheral lung tissue.
- **Histological classification**
  - Small cell carcinoma
  - Non-small cell carcinoma
    - Squamous cell carcinoma
    - Adenocarcinoma
    - Large cell carcinoma
- Most common type of lung cancer is **adenocarcinoma**.
- **Risk factors:** Smoking (active and passive), exposure to chemicals such as silica, coal, mustard gas. Asbestoses
- **Clinical manifestation:** Cough, wheezing, dyspnea, hoarseness, hemoptysis, chest pain, anorexia, and weight loss.
- **Management:** Chemotherapy, radiation therapy and surgery
  - **Pneumonectomy:** Surgical removal of one entire lung
  - **Lobectomy:** Surgical removal of one lobe of the lung
  - **Segmental resection:** Surgical removal of a lobe segment
- **Nursing Management**
  - Provide fowler's position to the client
  - Provide humidified oxygen

Often drainage tube is not inserted after pneumonectomy. The serous fluid accumulates over the space of removed lung and it prevents the shift of mediastinum, heart and the other lung.

Cancer of Stomach (Gastric Carcinoma)

- It is the invasion of cancer in the inner cell lining the stomach.
- Majority of the gastric carcinomas are **adenocarcinoma**.
- **Risk factors:** Spicy food, smoked food, salty food, low-fruit and low-vegetables in diet, *H-pylori* infection, smoking, alcohol, and family history
- **Clinical manifestations**
  - **Early symptoms:** Indigestion, abdominal discomfort, and fullness in the stomach
  - **Others:** Nausea, Vomiting, Anorexia, weight loss, abdominal pain, fatigue, dysphagia, iron deficiency anemia, palpable abdominal mass
- **Diagnosis:** Endoscopy with biopsy
- **Treatment of choice:** Tumor resection and partial or complete gastric resection
- **Subtotal gastrectomy**
  - Part of stomach will be removed. It is of two type:
    1. **Billroth I:** It is also known as gastroduodenostomy. Stomach is partially resected and remaining portion is anastomosed to duodenum.
    2. **Billroth II:** It is also known as gastrojejunostomy. Stomach is partially resected and remaining portion is anastomosed to Jejunum.

Figure 92 ▪

- **Total gastrectomy**
  - Complete excision of stomach followed by anastomosis of oesophagus either to duodenum or to jejunum.

Carcinoma of Liver (Hepatocellular Carcinoma)

- **Risk factors:** Hepatitis B & C infection, cirrhosis of liver, smoking, alcohol intake
- Males are at increased risk than females.
- **Common presenting symptoms:** Right upper quadrant mass, pain and weight loss
- **Diagnosis:** Biopsy, Blood test, CT, MRI
- Primary hepatocellular carcinoma: Increased levels of alpha-fetoprotein is seen.
- **Treatment:** Hepatic resection, liver transplantation, percutaneous ablation, chemotherapy, radiation therapy, chemoembolization

Scanned with CamScanner

Colon Cancer

- **Most common type** of colon cancer is **adenocarcinoma**.
- **Risk factors:** Inflammatory bowel disease, family history, decreased fiber intake, increased red meat and fat in diet, **age > 50 years**
- **Diagnosis:** Fecal occult blood test, sigmoidoscopy, colonoscopy, air contrast barium enema, carcinogenic embryonic antigen
- **Diagnostic colonoscopy along with biopsy** is considered as **gold standard** tool for diagnosing cancer of colon.
- **Clinical manifestations:** Hematochezia, melena, change in bowel pattern, weakness, anemia, palpable abdominal mass
- **Treatment:** Surgical resection of cancerous cells along with regional lymph nodes and anastomosis, chemotherapy and radiation therapy
- Colostomy and ileostomy may be in place after the surgery for colon cancer.

Table 85 Location of stoma in colostomy and appearance of stool

Location of stoma in colostomy	Appearance of stool
• Ileal stoma	• Initially green in color. • Yellow once patient start to eat.
• Ascending colon	• Liquid in form
• Transverse colon	• Semisolid form
• Descending colon	• Close to normal stool
• Sigmoid colon	• Close to normal stool

- In ileal stoma there is a great risk associated with fluid and electrolyte imbalance.
- **Healthy stoma appears red in color.**
- **Complications of colostomy:** Peritonitis, abscess, fistula formation, hemorrhage, intestinal obstruction.

Breast Cancer

- Breast cancer is the **most common cancer** in women (India & World)
- **Invasive ductal carcinoma** is the most common type of breast cancer.
- **Upper outer quadrant of the breast tissue** is most commonly affected area.
- **Risk factors**
  - Early menarche, late menopause
  - Late first child birth or nulliparity
  - Family history
  - Obesity
  - Exposure to radiation
  - Previous history of cancer to ovary, breast and uterus
  - Women who are not lactated
  - Increased use of OCP and hormonal replacement
  - Alcohol consumption

Doc - Tamoxifen

- **Clinical manifestation**
  - New lump or mass in the breast
  - Irritation or dimpling in the breast skin
  - Secretion other than milk from nipple
  - Change in shape of the breast
- **Diagnosis:** Needle biopsy, mammogram, ultrasound, PET, MRI, breast self-examination
- **Treatment:** Chemotherapy, hormonal therapy (only for those women who have estrogen receptor positive tumor), radiation therapy and surgical management.

- **Metastasis**
  - **Most common site for metastasis is bone** followed by lungs.
  - Liver and skull are also the site of metastasis.
- **Surgeries**
  - **Lumpectomy:** Tumor cells are removed. Breast tissue conserving surgery. Additional incision for removal of lymph nodes.
  - **Simple mastectomy:** Nipple and breast tissue are removed, lymph nodes are left intact.
  - **Modified radical mastectomy:** Breast tissue, nipples and lymph nodes are removed. **Muscles are left intact.**
- **Post-operative care**
  - Semi-fowler's position
  - Position the head on the back or unaffected side
  - Elevate the upper extremity on the side of surgery on a pillow to reduce lymphedema
  - If drainage is in situ, maintain adequate suction and record the amount and color of drainage.

Avoid BP monitoring, IV injections and other interventions in the arm on the side of mastectomy as it increases the risk for lymphedema.

Cancer of Cervix

- It is the malignant tumor deriving from the cells of cervix.
- Second most common cancer among women in India
- **Most common type of cervical cancer** is squamous cell carcinoma.
- **Risk factors:** HPV infection, younger age at first intercourse, multiple sexual partners, multiparty with poor birth spacing, STD, OCP use, smoking, poor personal hygiene and poor socio-economic status.
- **Clinical manifestation:** Post-coital bleeding or discharge (clear or foul smelling), post-menopausal bleeding, heavier and larger menstrual period, discomfort while urinating, pelvic pain, leg pain, weight loss and fatigue.
- **Diagnosis:** Pap smear, colposcopy, biopsy,
- **Site for metastasis:** lungs, extra pelvic nodes, liver and bone.
- **Treatment:** Chemotherapy, surgery, cryotherapy, laser therapy and radiation therapy.

Table 86 Procedures in case of cancer of cervix

Procedure	Description
Loop electrocautery excision procedure (LEEP)	A thin wire loop with laser is used to remove the cancerous cervical tissue.
Cone biopsy (conization)	Removal of cone shaped portion of the cervix.
Total hysterectomy	Removal of uterus, cervix and ovaries
Radical hysterectomy	Removal of uterus, ovaries, fallopian tube, proximal vagina and bilateral lymph nodes via **abdominal approach or via vaginal approach.**
Bilateral pelvic lymphadenectomy	Removal of lymphatic vessels and nodes
Pelvic exenteration	Removal of pelvic organ including bladder, rectum, and pelvic lymph nodes and construction of diversional conduit, colostomy and vagina
Radical trachelectomy	Removal of cervix and selected lymph nodes to preserve child bearing capacity of the women.

Scanned with CamScanner

Breast cancer - CA15-3
GIT cancer - CA19-9
Ovarian " - CA125
Prostate " - CA PSA

Cancer of Ovary

- These are the invasive tumors which originate in the ovary.
- Most common type is **epithelial ovarian cancer.**
- **Risk factors: Early menarche, late menopause**, family history, old age, obesity
- **Clinical manifestation:** Increased abdominal girth, pelvic pressure, bloating, back pain, constipation, abdominal pain, urinary urgency, indigestion, flatulence, increased waist size, leg pain and pelvic pain
- **Diagnosis:** MRI, transvaginal and pelvic ultrasound, chest X-ray, blood test for CA-125., abdominal CT with or without contrast
- **Treatment:** Chemotherapy, radiation therapy and surgery.
- **Surgical management**
  - Bilateral salpingo-oopherectomy and omentectomy (removal of ovaries, fallopian tube and omentum),
  - Total abdominal hysterectomy

Uterine Cancer (Endometrial Cancer)

- These are the tumors of endometrial mucosal lining of the uterus.
- **Risk factors:** Exposure to estrogen therapy, early menarche, late menopause, nulliparity, anovulation, family history, infertility, diabetes.
- **Clinical manifestation:** Abnormal bleeding, vaginal discharge, low back ache, pelvic pain, abdominal pain, enlarged uterus.
- Radiation therapy, chemotherapy and surgery are the treatment modalities.
- **Surgical management**
  - **Total hysterectomy:** Removal of uterus, cervix and ovaries
  - **Radical hysterectomy:** Uterus, ovaries, fallopian tube, proximal vagina and bilateral lymph nodes are removed. It can be done via abdominal approach or via vaginal approach.
  - **Bilateral salpingo-oophorectomy:** Removal of the ovaries and fallopian tube.

Bladder Cancer

- **Risk factors:** Smoking, exposure to environmental **carcinogen (rubber, dye, leather, ink or paint), recurrent UTI**, bladder stone, pelvic radiation therapy
- **Metastasis to:** Liver, bone and lung
- **Clinical manifestation:** Gross or microscopic painless hematuria **(most common sign)**, frequency, urgency, dysuria.
- **Diagnosis:** Urine cytological studies, tumor marker analysis, Intravenous Pyelogram (IVP), ultrasound, CT, MRI, bladder wash specimen and biopsy.

Management

- **Radiation therapy** is useful for decreasing the tumor size to relieve symptoms.
- **Chemotherapy:** Chemotherapeutic agents are instilled into bladder and then client's position is changed every 15-30 minutes. After 2 hours client void in sitting position.
  → Instruct the client to increase the fluid intake to clear the bladder
  → The urine excreted by the patient is a bio-hazard.
- Transurethral resection of bladder tumor, partial cystectomy (removal of up to half of bladder)
- Cystectomy and urinary diversion is the other method of surgery. In this, complete removal of bladder and the creation of urinary diversion technique will be there.
  - **Ileal conduit (Bricker's procedure):** It is also known as urteroileostomy. Ureters are attached to a portion of ileum and one part of the ileum is taken to the abdominal wall as stoma. Continuous leakage of urine will be there. Client has to wear any appliance over stoma.
  - **Kock pouch (continent ileostomy):** Part of ileum and ascending colon is used to create urinary pouch. Ureters are implanted on the side of pouch. It has nipple valve that helps the patient to be continent (unlike ileal conduit). Patient is to be educated about intermittent self-catheterization to empty the bladder.
  - **Indiana pouch:** Pouch is created using terminal ileum and ascending colon which provide a pouch with higher capacity than kock pouch.
  - **Neobladder:** Segment of intestine is used to create internal pouch and ureters are connected to the pouch. The reservoir is connected to urethra. So client can void via natural orifice by increasing abdominal pressure or by intermittent-self catheterization.
  - **Nephrostomy:** Stoma is created over kidney and urine is drained with the help of tube.
  - **Ureterostomy:** Ureters are brought over the abdomen to drain urine.
  - **Vesicostomy:** Stoma is created over bladder and urine is drained.

Prostate Cancer

- Most common type of cancer of prostate is adenocarcinoma
- **Risk factors:** Increase in age, family history, excessive red meat and diary products in diet, hormones such androgen and estrogen
- **Clinical manifestations**
  - Asymptomatic at early stages
  - Urinary obstruction in advanced stage (due to obstruction of bladder neck by prostate tumor)
  - Painful ejaculation, Blood in urine and semen
  - Sexual dysfunction usually occurs before diagnosis is made.
- **Diagnosis:** Pea-sized, hard nodule is palpated on Digital Rectal Examination (DRE). Prostate Specific Antigen, Transrectal Ultrasound (TRUS) with biopsy. **Histological examination** is confirmatory test.
- **Gleason score** is the most commonly used tumour grading system
- **Metastasis to:** Mainly bone, lungs, liver and kidney.
- **Treatment**
  - **Radical prostatectomy – first line treatment.** Prostate, seminal vesicles, tip of vas deferens and surrounding blood vessels and fat is removed.
  - **Transurethral Resection of the Prostate (TURP)** is the most commonly used surgical procedure.
    - Chemotherapy, Brachytherapy and Teletherapy.
  - **Hormonal therapy: Androgen deprivation therapy**

Key Points

- Hemorrhage is the most common complication after TURP.
- Continuous bladder irrigation is recommended after TURP to prevent obstruction of catheter by blood clot.
- Hyponatremia is a possible complication due to bladder irrigation
- A feeling of urge to void is normal after prostatectomy
- Sterility may occur after prostatectomy

Scanned with CamScanner

Gliomas

- Most common type of brain tumors among adults.
- These originate from glial cells.
- Astrocytoma are the most common type of glioma.
- **Risk factor:** Exposure to ionizing radiation
- **Clinical manifestations:** Signs and symptoms related to increased ICP such as headache, vomiting, visual disturbance, seizure, mental status changes
- **Diagnosis:** CT, MRI, cerebral angiography, EEG, cytological studies of CSF
- **Management:** Chemotherapy, radiation therapy and surgical resection of tumor.

Osteosarcoma

- Most common and fatal malignant bone tumor.
- **Risk factor:** Paget's disease, exposure to radiation
- **Clinical manifestations:** Pain, swelling, limited motion, weight loss, bony mass may be palpable, tender and fixed.
- **Diagnosis:** CT, MRI, bone scan, myelogrpahy, biopsy and blood serum shows elevated alkaline phosphate level.
- **Management:** Surgical excision, radiotherapy and chemotherapy.

Oncological Emergencies

Table 87 Management of oncological emergencies

Condition	Description	Clinical manifestations	Management
Superior vena cava syndrome	• Obstruction of superior vena cava by tumor obstruct the venous drainage from head, neck arm and thorax. • Most commonly seen in lung cancer • If it is left untreated oxygenated blood supply to brain will be affected resulting in tissue anoxia and death of person.	• Swelling over the face • Swelling over arm, neck and thorax • Dysphagia and dyspnea • Enlarged jugular vein and temporal vein • Increased ICP and related headache, visual disturbance, altered mental status.	• Chemotherapy or radiation therapy to shrink the tumor size. • Thrombolytic therapy if thrombus is in the blood vessel. • Vena cava bypass surgeries • Assist the client with breathing support • Monitor fluid volume status of the client and administer fluid carefully.
Tumour lysis syndrome	• Due to the destruction of rapidly growing tumor cells by radiation therapy or chemotherapy, the intracellular content is released into the blood and it leads to electrolyte imbalances such as hyperkalemia, hyperurecemia, hypocalcemia and hyperphosphatemia.	**Neurological:** Seizure, fatigue, weakness, altered mental status, cramps, muscle pain, tetany, and paraesthesia. **Cardiovascular:** Elevated BP, short QT interval, wide QRS complex, dysarrhythmia, cardiac failure **GI:** Cramps, nausea, vomiting, anorexia. **Renal:** Oliguria, anuria, renal failure, pain in the flank region.	• Ensure good hydration before chemotherapy itself. Good hydration helps to increase urine volume and thereby eliminate uric acid and electrolyte released into the blood following chemotherapy. • Adding sodium bicarbonate helps to alkalize urine and thereby prevent kidney failure secondary to uric acid. • Diuretics therapy with carbonic anhydrase inhibitor or acetazolamide therapy alkalize urine and helps to prevent renal damage. • Administration of sodium polystyrene sulfonate helps to remove potassium through bowel. • Giving hypertonic dextrose with saline helps to shift potassium into the cells. • Administration of aluminium hydroxide helps to remove excessive phosphate through bowel. • Hemodialysis is also a treatment of choice • Assess urine pH to confirm the alkalization of urine.
Spinal cord compression	• Compression of spinal cord from tumor, lymphoma, intervertebral disc prolapse or tumor metastasized from breast, lung, kidney, prostate, myeloma and lymphoma cause this. It will lead to permanent neurological damage and mortality.	• Local inflammation, edema, venous stasis, pain along the affected nerve root, neurological dysfunction (motor and sensory), weakness and flaccid paralysis, bowel and bladder dysfunction.	• Radiation therapy and chemotherapy to reduce the size of tumor and to relieve compression. • Corticosteroid therapy to lessen the inflammation • Surgery may be required to remove tumor.

Contd...

Scanned with CamScanner

Condition	Description	Clinical manifestations	Management
Hypercalcemia	• A life threatening condition among patient with cancer because of release of calcium from bone more than in amount which can be eliminated by kidney. It occurs because of: ▪ Destruction of bone by cancer cells ▪ Some tumor release parathyroid hormone like substance which leads to demineralization of bone ▪ Release of prostaglandin and osteoclast like substance which activate bone demineralization. ▪ Excessive use of vitamins and minerals and other conditions like dehydration, hyperparathyroidism, renal impairment, use of diuretics etc.	• Fatigue, weakness, fracture, hyporeflexia, hypo responsiveness, polyuria, polydipsia, dehydration, dysrhythmias.	• Encourage fluid intake among the clients • Use laxatives and stool softeners to treat constipation. • Promote mobility and emphasize its importance in preventing demineralization and breakdown of bone.

Leukemia

- It is the malignancy of the blood forming cells.
- Leukemia is the uncontrolled proliferation of leukocyte which cause bone marrow to be replaced by immature and undifferentiated cells.
- Immature blast cell proliferation will result in proliferation of blood cells which leads to deficiency of healthy RBC, WBC and Platelets.

Acute Lymphoid Leukemia (ALL)

- Uncontrolled proliferation of immature cells from lymphoid stem cell is known as ALL.
- **It is most common in young children; boys are affected more than girls.**
- Infiltration of leukemic cells in the liver and spleen cause enlarged liver and spleen. CNS manifestations also seen.
- **Management**
  - Chemotherapy is the treatment of choice

Chronic Lymphoid Leukemia (CLL)

- **It is most common malignancy seen among older adults.**
- Pancytopenia and related manifestations can be seen.
- Clients with CLL develops B symptoms such as fever, drenching sweats and unintentional weight loss

Acute Myeloid Leukemia (AML)

- It is the malignancy of myeloid stem cell.
- Pancytopenia and related manifestations can be seen.
- **Manifestations:** Enlarged spleen and liver, Lymphadenopathy can be also seen
- **Diagnosis:** CBC and bone marrow aspiration are the diagnostic test
- **Management:**
  - Chemotherapy and hematopoietic stem cell transplantation

Chronic Myeloid Leukemia (CML)

- Uncontrolled proliferation of blast cells from myeloid stem cell.
- Pancytopenia related symptoms and lymphadenopathy can be seen.
- **Diagnosis:** CBC and bone marrow aspiration
- **Management:** Chemotherapy and bone marrow transplantation

Lymphoma

- These are the neoplasm of the lymphoid origin.
- Classified as Hodgkin lymphoma and Non-Hodgkin lymphoma.

Hodgkin Lymphoma

- It originates in a single lymph node and spreads along the lymphatic system.
- Malignant cells in HL are **Reed Sternberg cells.**
- Most common site for lymphadenopathy are cervical, supraclavicular and mediastinal.
- B-symptoms are the characteristics of HL and they include fever without chills, drenching sweats and unintentional weight loss.
- **Diagnosis:** Excisional lymph node biopsy shows **Reed Sternberg cell.**
- **Management:** Chemotherapy and radiation therapy

Non-Hodgkin Lymphoma

- Neoplastic growth of the lymphoid tissue which involve **malignant B lymphocyte.**
- **Lymphadenopathy** is one of the clinical manifestations.
- One third of the client will be having **B symptoms.**
- **Management:** Chemotherapy, radiation therapy or combination of both.

Multiple Myeloma

- Malignancy of plasma B cells
- These malignant plasma B cells infiltrate bone marrow and cause destruction.
- The infiltrated B cells produce excessive amount of immunoglobulin (myeloma protein)
- Accumulation of myeloma protein affect hematopoiesis and leads to anemia, increased chance for infection and bleeding tendencies.
- **Most common presenting complaint is bone pain.**
- Cell destruction leads to hypercalcemia and renal stone.
- **Diagnosis:** Radiographic studies, bone marrow examination, blood and urine studies.

Scanned with CamScanner

- **Management:** Autologous bone marrow and peripheral blood stem cell transplantation and high dose chemotherapy

BONE MARROW TRANSPLANTATION (BMT)

- BMT helps to replace unhealthy blood forming cells with healthy ones.
- Hips, breast bone, spine, ribs, and skull are usually the site of choice for bone marrow aspiration.
- **Autologous bone marrow transplant:** Bone marrow is taken from one person and transfused back to the same person.
- **Allogeneic bone marrow transplant:** Bone marrow is taken from one person and transfused to another person of same species.
- **Umbilical Cord Blood Transplant:** Umbilical cord blood is harvested immediately after delivery and this blood has the capacity to provide stem cells and can be used in future if child need.
- Human leukocyte antigen (HLA) matching need to be checked before BMT.

Golden points to remember

- Benign tumors are confined to a specific, localized area (Encapsulation) and does not metastasize (spread).
- Cell division is uncontrolled and abnormal in malignant tumors (cancer).
- Malignant tumors are not encapsulated.
- Malignant tumors metastasize to surrounding area via blood stream or lymphatic system.
- A **1 cm** tumor that is detectable by palpation contains 1 billion cancer cells.
- A **0.5 cm** tumor is the smallest that can be detected by MRI.
- **Asthenia** is abnormal physical weakness or lack of energy.
- Most common type of prostate CA is **Adenocarcinoma**.
- Most common site of metastasis from prostrate CA is **Vertebrae**.
- Most common tumor to metastasize to bone:
  - Males → CA prostate (osteoblastic secondaries)
  - Females → CA breast (osteoblastic secondaries)
- Radiation dose was expressed in units called **rads** (radiation absorbed doses).
- Radiation can be delivered externally (**teletherapy**), and internally (**brachytherapy**).
- Most radiosensitive cell in the blood: **Lymphocyte**.
- Least radiosensitive cell in the blood: **Platelet**.
- Least radiosensitive cell of the body: **Neurons**.
- **Xerostomia** means dry mouth. It is a common side-effect of head and neck radiation therapy.
- Palmar–plantar erythrodyesthesia (PPE) or hand foot syndrome is a cutaneous toxicity that occurs mainly due to targeted chemotherapy.
- Temporary hair loss occurs at 30 GY, and permanent at 55 Gy of radiation exposure.
- The **four hallmark signs** of tumor lysis syndrome are **hyperuricemia, hyperphosphatemia, hyperkalemia and hypocalcemia.**
- **Hodgkin's lymphoma** is a malignant condition characterized by proliferation of abnormal giant, multinucleated cells, called **Reed-Sternberg cells.**
- **Pel-Ebstein Fever** is characteristic feature of Hodgkin's lymphoma.
- **Triad of B-symptoms of Hodgkin's lymphoma**: Fever, night sweats and weight loss
- **Chemotherapy** is the first treatment recommended for multiple myeloma. Common regimen is VAD—vincristin, doxorubicin, and dexamethasone.
- Common side-effect of chemotherapy is **nausea**.
- **CRAB criteria** are used to distinguish smoldering myeloma and monoclonal gammopathies of undetermined.
- Screening for CA prostrate is commonly done by: Digital Rectal Examination+ PSA.
- Normal level of PSA in male: <4 ng /mL.
- Palliative surgery is performed to reduce the intensity of illness by debulking tumors so as to relieve several symptoms.
- Breast Cancer is the **most common cancer** in women (India and World).
- Lung cancer is the most common cancer among male worldwide.
- Lip/Oral cavity cancer is the most common cancer among male in India.
- Lung cancer is the most common cancer death in India and world.
- Most common type of colon cancer is **adenocarcinoma**.
- **Pancreatic cancer** has the poorest prognosis. It usually does not show early symptoms and diagnosed at late stage. Survival rate is only 8% (Source: American Cancer Society).

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

INTRODUCTION

2649. Increase in number of cells in a tissue is called: *(Banaras HU 2015)*
a. Hypertrophy b. Hyperplasia
c. Aplasia d. Hypoplasia

2650. Hypertrophy is
a. Increase in number of cells
b. Increase in size of cells
c. Uncontrolled multiplication
d. Spreading to other site

2651. Qualitative alteration of differentiation of cells is known as
a. Anaplasia b. Metaplasia
c. Hypoplasia d. Aplasia

2652. Transformation of one type of differentiated cell type to another differentiated cell type is known as
a. Anaplasia b. Metaplasia
c. Hypoplasia d. Aplasia

2653. The most important characteristics of malignant tumor as compared to a benign tumor is .....
a. Hyperplasia b. Metastasis
c. Hypertrophy d. Poor differentiation

2654. Energy deriving process that take place in cancer cell is ...
a. Glycolysis
b. Krebs cycle
c. HMP shunt
d. Pentose phosphate pathway

2655. Which of the following is not a typical difference factor between benign and malignant tumors? *(ESIC 2019)*
a. Growth rate b. Encapsulation
c. Cell differentiation d. Size of the tumor

Explanation: Size of the tumor is not a typical difference factor whereas characteristics such as growth rate, encapsulation, cell differentiation, morphology of cells and treatment differs.

Table: Key features of benign and malignant tumors

Benign tumors	Malignant tumor
Cells tend not to spread	Cells can spread
Rate of cell division is slow (Cell differentiation)	Cell division is uncontrolled and abnormal.
The tumor Confined to a specific, localized area (Encapsulation)	Mostly, malignant tumors are not encapsulated.
Do not metastasize (spread) to other parts of the body	Often invade basal membrane that surrounds nearby healthy tissue. Can spread via bloodstream or lymphatic system
Shape, chromosomes, and DNA of cells appear normal	Cells have abnormal chromosomes and DNA characterized by large, dark nuclei; may have abnormal shape
Do not secrete hormones or other substances (except pheochromocytomas)	Can secrete substances that cause fatigue and weight loss (paraneoplastic syndrome)

Contd...

2656. Any deformity in the organ or structure is termed as .....
a. Malformation b. Mutation
c. Amputation d. Association

2657. All among the following are cellular adaptations except-
a. Hypertrophy b. Hyperplasia
c. Neoplasia d. Metaplasia

2658. Difference between benign and malignant neoplasm is
a. Extent of tissue invasiveness
b. Metastasis
c. Both a and b
d. None of the above

2659. Which is not cancer: *(ESIC Chennai May 2012)*
a. Glaucoma b. Leukaemia
c. Carcinoma d. Sarcoma

2660. Absence of differentiation among the cell is known as .....
a. Anaplasia b. Metaplasia
c. Mutation d. Hypertrophy

2661. Malignant tumor of fibrous tissue is .....
a. Primitive cell tumor b. Myoma
c. Lymphoma d. Fibrosarcoma

2662. Major difference between benign and malignant neoplasms is
a. Rate of hyperplasia
b. Incidence rate
c. Complicity of diagnosis
d. Characteristic of tissue invasiveness

2663. Benign tumor of fat is .....
a. Primitive cell tumor b. Myoma
c. Lymphoma d. Lipoma

2664. Spread of malignant cells from one part to other part of the body is known as .....
a. Invasion b. Spreading
c. Metastasis d. Seeding

2665. In which phase of cell cycle is DNA replicated?
a. C1 phase b. S phase
c. G2 phase d. M phase

2666. During metaphase of mitosis, chromosomes .....
a. Undergo coiling b. Move towards the poles
c. Line up at the equator d. Break & disintegrate

Ans.

2649.	b
2650.	b
2651.	a
2652.	b
2653.	b
2654.	a
2655.	d
2656.	a
2657.	c
2658.	c
2659.	a
2660.	a
2661.	d
2662.	d

2665.	b
2666.	c

Scanned with CamScanner

2667. UV rays commonly damages .....
a. Heart b. Liver
c. Pancreas d. Skin

2668. Identify tumor suppressor gene among the following
a. APC b. NF1
c. RB d. All of the above

2669. Which of the following statement regarding epithelial dysplasia is NOT TRUE
a. Nuclear hyperchromatism
b. Enlarged nucleoli
c. Cellular pleomorphism
d. Decreased normal and abnormal mitosis

2670. All are the examples of malignant tumor. EXCEPT
a. Leukemia
b. Fibrosarcoma
c. Leiomyoma
d. Lymphoma

2671. The tumor of the hyaline cartilage is called *(AIIMS Raipur Grade-II)*
a. Osteochondroma b. Osteosarcoma
c. Enchondroma d. Chondrosarcoma

Explanation: An enchondroma is a type of noncancerous bone tumor that begins in cartilage. Osteochondroma is an overgrowth of cartilage and bone that happens at the end of the bone near the growth plate. Osteosarcoma (OS) or osteogenic sarcoma (OGS) is a cancerous tumor that arises from primitive transformed cells of mesenchymal origin which exhibits osteoblastic differentiation and produces malignant osteoid. Chondrosarcoma is a cancer composed of cells derived from transformed cells that produce cartilage

Ans.
2667. d
2668. d
2669. d
2670. c
2671. c
2672. a
2673. a
2674. d
2675. d
2676. d
2677. d
2678. d
2679. b
2680. d
2681. d
2682. c
2683. b
2684. c
2685. c

ASSESSMENT, DIAGNOSIS AND INVESTIGATION

2672. Taking out a small piece of tissue for diagnostic purpose is known as .....
a. Biopsy b. Dissection
c. Reconstruction d. Extraction

2673. Which among the following is diagnosed based on Reed Sternberg cell type? *(AIIMS Bhopal Grade-I 2018)*
a. Hodgkin's disease b. Non-Hodgkin's disease
c. Nephroblastoma d. Hepatoblastoma

Explanation: Reed Sternberg cells are large, abnormal lymphocytes that may contain more than one nucleus and are essential to the diagnosis of Hodgkin's lymphoma

2674. Which of the following tumors causes elevated carcino-embryonic antigen (CEA) levels?
a. Breast b. Gastric
c. Lung d. All of the above

2675. The most useful circulating marker for patient with hepatocellular carcinoma is
a. CA 50 b. Level of vit B12
c. CEA d. AFP

2676. In patients with colorectal cancer serum CEA level is clinically useful for all of the following reasons EXCEPT
a. Prognosis
b. Detection of recurrence
c. Guiding treatment response
d. Early diagnosis

2677. Identify example of tumor markers .....
a. Alpha-fetoprotein b. Thyroglobulin
c. β2-microglobulin d. All of the above

ETIOLOGY

2678. Smoking causes .....
a. Chronic bronchitis b. Lung cancer
c. Emphysema d. All of the above

COMMON SIGNS AND SYMPTOMS

2679. The severe weight loss accompanied by progressive weakness, loss of appetite and anemia that is usually associated with advanced cancer is called: *(AIIMS Raipur Grade II 2017)*
a. Carcinomatosis b. Cachexia
c. Anaplasia d. Dysplasia

Explanation: Cachexia is loss of weight, muscle atrophy, fatigue, weakness and significant loss of appetite in someone who is not actively trying to lose weight. Carcinomatosis is a condition in which cancer is widespread in the body. Anaplasia is a condition of cells with poor cellular differentiation. Dysplasia is an abnormality of development or epithelial anomaly of growth and differentiation.

2680. Which among the following is not present in tumor lysis syndrome?
a. Hyperkalemia b. Hyperphosphatemia
c. Hyperuricemia d. Hypercalcemia

2681. Identify the features of malignant tumors among the following
a. Poor prognosis
b. Metastasize easily
c. They do not show encapsulation
d. All of the above

2682. Identify the feature of benign tumor among the following
a. They are invasive and destructive
b. Their constituent cells shows anaplasia
c. They are usually well circumscribed
d. They are usually not encapsulated

2683. Most common route of initial metastasis for carcinomas is:
a. Direct invasion b. Lymphatic spread
c. Hematogenous spread d. None of the above

2684. Which type of cancer has the poorest prognosis? *(NCFL 2019)*
a. Squamous cell carcinoma
b. Breast cancer
c. Pancreatic cancer
d. Gastric cancer

Explanation:
- As per the data of National Cancer Institute's Surveillance, Epidemiology& End Results program as well as American Cancer Society (ACS). Type of cancer has the poorest prognosis are arranged in order as follows:
  - **Pancreatic cancer**
  - **Liver and intrahepatic bile duct cancer**
  - **Lung and bronchus cancer**
  - **Esophageal cancer**
  - **Stomach cancer (or) Gastric cancer**

CNS

2685. Tumor of blood vessel of brain is:
a. Glioma b. Meningioma
c. Hemangioma d. Astrocytoma

Scanned with CamScanner

2686. **The commonest tumor associated with type I neurofibromatosis is .....**
a. Optic nerve glioma b. Meningioma
c. Schwannoma d. Oligodendroglioma

2687. **Most commonly seen meningeal tumor is .....**
a. Meningioma b. Glioma
c. Schwannoma d. Neurofibroma.

ENDOCRINE

2688. **Glandular tissue cancer is known as .....**
a. Adenocarcinoma b. Liposarcoma
c. Neuroblastoma d. Osteogenic sarcoma

2689. **Which of the following is used for the treatment of thyroid cancer?**
a. I131 b. 99m Tc
c. 32P d. 1311–MIB2

2690. **Calcitonin is used as a marker in .....cancer**
a. Prostate cancer b. Cancer of thyroid
c. Cancer of lung d. Cancer of oral cavity

DIGESTIVE SYSTEM

2691. **Predisposing factors for development of oral carcinoma is:**
a. Smoking b. Alcohol
c. Syphilis d. All of the above

Explanation: Predisposing factors for development of oral carcinoma inculde:

- Tobacco use (Smoking)
- Alcohol
- Prolong sun exposure
- HPV infection
- Male gender
- Fare skin
- Measured age
- Poor oral hygiene
- Marijuana use
- Weak immune system

2692. **Most common part of oral cavity affected with oral cancer is .....**
a. Hard palate b. Lower lips
c. Soft palate d. Tongue

2693. **Risk factor for the development of cancer of the tongue is**
a. Poor oral hygiene
b. Oral candidiasis
c. Consumption of preserved food items
d. Consumption of alcohol

2694. **Barrett's esophagus represents which of the following findings?**
a. Cellular hyperplasia b. Cellular hypertrophy
c. Metaplasia d. Carcinoma in situ

2695. **Tylosis is associated with which cancer**
a. Pancreas b. Esophagus
c. AML d. ALL

2696. **Commonly seen carcinoma in the middle 1/3rd of the esophagus**
a. Adeno carcinoma b. Squamous cell carcinoma
c. Meningioma d. Leiomyoma

2697. **Risk factor for Ca. esophagus is .....**
a. Chronic Achalasia b. Achalasia cardia
c. Smoking d. All of the above

2698. **Metastasis to the left supraclavicular lymph node (Virchow's node) is commonly seen in:**
a. Carcinoma stomach b. Carcinoma of lung
c. Wilms tumor d. Leukemia

2699. **Which part of the pancreas is at risk for developing cancer the most:**
a. Head
b. Body
c. Tail
d. Equal chance in all part

2700. **Which among the following is the most radio sensitive cancer?**
a. Ca ovary b. Ca Kidney
c. Ca Pancreas d. Ca Cervix

2701. **Which of the following is NOT a risk factor for gastric carcinoma?**
a. Chronic gastritis
b. H.Pylori infection
c. Higher socioeconomic class
d. Hereditary Nonpolyposis colon cancer syndrome

2702. **Risk for gastric carcinoma includes all, EXCEPT**
a. Chronic gastritis and undergone surgery for gastric ulcer
b. Consuming preserved and smoked food
c. Cigarette smoking
d. Increased consumption of citrus fruits

2703. **Risk factor of colonic cancer includes all, EXCEPT**
a. Altered intestinal bacterial flora
b. High-intake of refined carbohydrate
c. Intake of red meat
d. Intake of high-fiber diet

2704. **Constipation and early obstructive symptoms are the typical clinical presentation of**
a. Right-sided colonic cancer
b. Left-sided colonic cancer
c. Both A and B
d. None of the above

2705. **Which of the following is a feature of Lynch syndrome**
a. Left sided colon cancer
b. Autosomal dominant inherited
c. Multiple polyps beginning in adolescence
d. All of the above

Explanation: Lynch syndrome is also known as hereditary non-polyposis colorectal cancer (HNPCC). Lynch syndrome is an autosomal dominant genetic condition that is associated with a high risk of colon cancer as well as other cancers including endometrial cancer (second most common), ovary, stomach, small intestine, hepatobiliary tract, upper urinary tract, brain etc.

2706. **Earliest symptom of colorectal cancer is .....**
a. Blood in the stools b. Change in the bowel habit
c. Flatulence d. Stetorrhea

2707. **Which of the following is one of the risk factors associated with colorectal cancer?**
a. Low intake of dietary fiber
b. Low intake of red meat
c. Irritable bowel syndrome
d. Aspirin therapy

2708. **Risk factor associated with colorectal cancer includes**
a. Irritable bowel syndrome
b. Low intake of dietary fiber
c. Low intake of red meat
d. Low intake of Aspirin

Ans.

Scanned with CamScanner

2709. Which of the following conditions is a risk factor associated with colon cancer?
a. Gastric ulcer b. Anal fissures
c. Hemorrhoids d. Ulcerative colitis

LIVER AND BILIARY SYSTEM

2710. The most common cause of hepatocellular carcinoma (HCC) in India is
a. Hepatitis B infection b. Hepatitis C infection
c. Alcohol abuse d. HIV infection

2711. Hepatitis-B infection is associated with which of the following malignancy?
a. Burkitt's lymphoma b. Esophageal cancer
c. Hepatocellular cancer d. Gastric cancer

RESPIRATORY

2712. Most common cause of lung cancer is .....
a. Family history b. Mine workers
c. Air pollution d. Smoking cigarettes

2713. Most common cancer in the world among male population is:
a. Prostate cancer b. Lung cancer
c. Colorectal cancer d. Oral cavity cancer

2714. Leading causes of cancer death among men is .....
a. Prostate cancer b. Lung cancer
c. Colorectal cancer d. Oral cavity cancer

2715. Most common cancer in India among men is .....
a. Cancer of oral cavity b. cancer of lung
c. Breast cancer d. Cervical cancer

Ans.
2709. d
2710. a
2711. c
2712. d
2713. b
2714. b
2715. a
2716. b
2717. a
2718. d
2719. c
2720. b
2721. d
2722. a
2723. a
2724. a
2725. b
2726. d
2727. c

Explanation:

Table: Cancer Statistics in India/World

Gender	Category	India	World
Both sexes (overall)	Most common cancer	Breast	Lung
	Second most common cancer	Cervix	Breast
	Most common cancer deaths	Breast	Lung
Men	Most common cancer	Lip/ Oral Cavity	Lung
	Second most common cancer	Lung	Prostate
	Most common cancer deaths	Lung	Lung
Women	Most common cancer	Breast	Breast
	Second most common cancer	Cervix/ Uterus	Colorectum
	Most common cancer deaths	Breast	Breast

Source: ICMR–National Institute of Cancer Prevention and Research, 2012 and World Cancer Research Fund International, 2012 and GLOBOCAN 2012.

2716. Early sign of cancer of lung is .....
a. Hemoptysis b. Persistent cough
c. Hoarseness of voice d. Chest indrawing

2717. Which of the following is a common symptom of lung cancer?
a. Cough or change in a chronic cough
b. Wheezing sound on inspiration
c. Foamy, blood-tinged sputum
d. Dyspnea on exertion

Explanation: Smoke and the carcinogen irritate the respiratory mucosa which in turn lead to cough and change in chronic cough.

2718. Asbestos exposure can cause .....
a. Carcinoma of lung b. Carcinoma of esophagus
c. Gastric carcinoma d. All of the above

2719. Of the following, which is the most common site for metastasis in lung cancer? *(RRB SSNE 2015)*
a. Kidney b. Stomach
c. Liver d. Spleen

2720. Which of the following statement is true about lung cancer?
a. 75% of the lung cancers are small cell in type
b. 80% of the lung cancers are due to smoking
c. Routine screening has proved beneficial
d. 25% of lung cancers are large cell anaplastic

2721. Which of the following symptoms is the most common characteristic of a patient with a cancer of the lung? *(Banaras HU 2015)*
a. Air hunger
b. Exertional dyspnea
c. Cough with night sweats
d. Persistent or intense coughing

2722. All of the following statement regarding squamous cell carcinoma are true, EXCEPT
a. It is the most common type of lung cancer
b. It is more common in males
c. It has a strong association with smoking
d. Exposure to asbestos increases the risk of developing this condition

2723. Identify correct statement regarding bronchioloalveolar carcinoma
a. It affects terminal bronchioles and alveolar region.
b. It may present only as single nodule.
c. Second most common type of lung cancer.
d. Tumor destructs alveolar architecture.

2724. Most common site of metastasis is .....
a. Lung b. Bone
c. Liver d. Uterus

2725. Removal of an entire lung is called as *(DSSSB 2013)*
a. Lobectomy b. Pneumonectomy
c. Segmental resection d. Wedge resection

Explanation: Pneumonectomy (or pneumectomy) is a surgical procedure to remove a lung. Removal of just one lobe of the lung is specifically referred to as a lobectomy, and that of a segment of the lung as a wedge resection (or segmentectomy).

2726. Persistent hoarseness of voice is indicative of
a. Laryngitis b. Tonsillitis
c. Cancer esophagus d. Laryngeal cancer

2727. The most common early symptom of laryngeal cancer is:
a. Dysphagia b. Airway obstruction
c. Hoarseness of voice d. Pneumothorax

Explanation: Persistent hoarseness of voice that is lasting more than two weeks should be evaluated because it is one of the most common warning signs of laryngeal cancer.

Scanned with CamScanner

CARDIOVASCULAR

Hematology and Lymphatic

2728. Which of the following is characteristic of Hodgkin's disease?
a. Excessive vomiting
b. Anorexia
c. Weight loss
d. Painless, movable adenopathy in cervical area

Explanation: Hodgkin's disease is associated with painless adenopathy. Other three options are common in every disease.

2729. Philadelphia chromosome associated with which type of cancer
a. Leukemia b. Nerve
c. Thyroid d. Breast

2730. B symptoms of Hodgkin's disease includes .....
a. Fever b. Night sweats
c. Weight loss d. All of the above

2731. Most commonly initiation of Hodgkin's lymphoma occur from *(AIIMS Rishikesh 2017)*
a. Mediastinum b. Axillary
c. Abdomen d. Neck

2732. Most common Non Hodgkin lymphoma is
a. B cell lymphoma b. T cell lymphoma
c. Ductal d. Burket's

2733. Major difference between Hodgkin's lymphoma and non-Hodgkin's lymphoma is that
a. Hodgkin's lymphoma occurs only in young adults.
b. Hodgkin's lymphoma multi-centric in origin
c. Non-Hodgkin's lymphoma can manifest in multiple organs.
d. Non-Hodgkin's lymphoma is treated only with radiation therapy.

2734. A client comes to the clinic complaining of fever, drenching night sweats, and unexplained weight loss and single enlarged supraclavicular lymph node, most probable diagnosis will be .....
a. Lymphadenopathy b. Thalassemia
c. Wilms' tumor d. Hodgkin's disease

2735. Patient with AIDS are at higher risk of developing _____
a. Meningioma b. Hepatocellular cancer
c. Kaposi's sarcoma d. Colorectal cancer

2736. Which of the following is not the definition of possible neutropenia?
a. Fever 2 consecutive readings >38.0°C for 2 hrs
b. ANC count = 500
c. ANC count < 500
d. Single reading of 100.4°F

2737. Which among the following parameter shows abnormal value in the lab test in a person recently diagnosed with multiple myeloma?
a. Immunoglobulin
b. Electrolytes
c. White Blood Cells (WBCs)
d. All of the above

MUSCULOSKELETAL

2738. Benign tumor of bone is .....
a. Osteoma b. Ewing's sarcoma
c. Rhabdomyosarcoma d. Osteogenic sarcoma

2739. Codman's triangle is typically seen in which of the following tumors:
a. Rhabdomyosarcoma b. Osteosarcoma
c. Neuroblastoma d. Ewing's sarcoma

2740. Correct option regarding primary bone tumors is.....
a. Commonly seen in the first three decades of life and benign tumors are more
b. Leads to osteoporosis
c. Easily metastasis to adjacent bone
d. All of the above

2741. Malignant tumor of bone is .....
a. Osteoma b. Ewing's sarcoma
c. Rhabdomyosarcoma d. Osteogenic sarcoma

2742. "Onion-skin" appearance is present in .....
a. Ewing's sarcoma b. Rhabdomyosarcoma
c. Primitive cell tumor d. Wilms tumor

RENAL

2743. Common clinical feature of renal carcinoma is .....
a. Dysuria b. Pain less haematuria
c. Urgency d. Erythema

2744. Which of following is a risk factor for bladder cancer?
a. High fat diet b. Prolonged bed rest
c. Exposure to dyes and paints
d. High fiber diet

2745. Which among the following is a risk factor for renal and bladder cancer?
a. Certain drugs b. Tobacco use
c. Obesity d. Oral contraceptives

2746. First and common symptom of cancer bladder
a. Painless hematuria b. Oliguria
c. Back pain d. Hesitancy

2747. Painless gross hematuria is the most common clinical manifestation of .....
a. Cancer of prostate b. Renal blastoma
c. Carcinoma-urinary bladder
d. Acute kidney injury

2748. Prognosis of Wilms tumor depends upon .....
a. Histopathology b. Metastasis
c. Age < 1 year d. Treatment taken

2749. WT1 gene is associated with .....
a. Wilms' tumor b. Rhabdomyosarcoma
c. Osteo sarcoma d. Retinoblastoma

FEMALE REPRODUCTIVE SYSTEM

2750. A patient is receiving external beam radiation for treatment of metastatic endometrial cancer. The treatment field includes the entire pelvis. Which of the following tissues within this radiation field is most radiosensitive?
a. Vagina b. Ovary *(Banaras HU 2015)*
c. Rectovaginal septum d. Bladder

2751. Paget's disease is characterized by .....
a. Hypocalcemia b. Hypernatremia
c. Hyperkalemia d. Hypercalcemia

2752. Correct regarding Paget's disease of breast is .....
a. It is a rare form of ductal carcinoma
b. it leads to fissuring and ulceration of skin of nipple and areola
c. The histological hallmark is involvement of epidermis by malignant cells
d. All of the above

Ans.

2728. d
2729. a
2730. d
2731. d
2732. a
2733. c
2734. d

2752. d

Scanned with CamScanner

2753. Which of the following action by a women who was diagnosed as having cancer of cervix indicates that she is using an emotion-focused coping process?
a. Denying the diagnosis
b. Discuss with family members
c. Joins a support group for women with breast cancer
d. Doing further tests to diagnose the condition

2754. BRCA-1 mutation is associated with which cancer?
a. Nerve b. Breast
c. Leukemia d. Lymphoma

2755. Risk factors for breast cancer include?
a. Young age b. Young age at menopause
c. Young age at first births d. Young age at menarche

2756. Which of the following is a good prognostic factor in breast cancer?
a. Estrogens receptor positivity
b. Grade III tumor
c. HER 2 receptor over expressions
d. Lymph node involvement

2757. Which of the following is a risk factor for development of breast cancer? *(Staff Nurse G II 2014)*
a. Late menarche b. Early menopause
c. No pregnancies d. Early first pregnancy

2758. Which of the following statement is true about breast cancer?
a. Life time risk for a woman of developing breast cancer in 1/9
b. A specific cause of the breast cancer is known for each case
c. Incidence of breast cancer is decreasing in the last one decade
d. Prognosis is worse in women of higher socioeconomic status

2759. Which of the following is one of the risk factors for breast cancer?
a. Young age at menopause
b. Young age at menarche
c. Young age at first child
d. Young age at first pregnancy

2760. All of the following assessments may be necessary for a patient who first presents with a breast lump EXCEPT
a. Fine Needle Aspiration (FNA)
b. Examination of axillary lymph nodes
c. Examination of breasts in supine position
d. Chest X-ray

2761. Risk factor for breast cancer is .....
a. Early menarche
b. Going through menopause after age 55
c. Radiation exposure
d. All of the above

2762. In breast self-examination palpation of breast tissue and axillary lymph node is there along with .....
a. Inspection of bilateral breast
b. Mammography
c. Percussion of breast tissue for any dullness
d. Palpation of cervical lymph node

2763. Which of the following is NOT a screening examination for breast cancer? *(AIIMS Bhopal Nursing Officer, 2018)*
a. Breast imaging
b. Intravenous pyelography
c. Breast biopsy
d. Clinical breast examination

Ans.
2753. a
2754. b
2755. d
2756. a
2757. c
2758. a
2759. b
2760. d
2761. d
2762. a
2763. b
2764. b
2765. b
2766. c
2767. a
2768. d
2769. d
2770. b
2771. a
2772. d
2773. a
2774. d
2775. d
2776. c

Explanation: Except intravenous pyelography all others are the screening examination for breast cancer. An intravenous pyelogram (IVP) is an X-ray examination of the kidneys, ureters and urinary bladder

2764. Most accurate test to diagnose cancer of breast is .....
a. MRI b. Mammography
c. Breast self-examination d. myelography

2765. The commonest carcinoma among women is .....
a. Carcinoma of cervix b. Carcinoma of breast
c. Carcinoma of oral cavity d. Carcinoma of lung

2766. Most common site for breast cancer metastasis?
a. Brain b. Liver
c. Bone d. Kidney

2767. Which among the following is a rare site of breast cancer metastases?
a. Kidney b. Brain
c. Bone d. Liver

2768. Which among the following intervention is appropriate for restoring the normal functioning of arm on the affected site after mastectomy?
a. Sleep on the affected side
b. Place daily ice packs to minimize the risk of lymphedema
c. Teach passive exercises with the affected arm in a dependent position
d. Do post mastectomy exercises to increase range of motion

2769. Correct statement regarding fibroadenoma is .....
a. Commonest benign neoplasm of the breast
b. Thought to be due to increased estrogen activity.
c. It is a biphasic tumor of stromal origin
d. All of the above

2770. Carcinoma breast is more commonly seen in ..... Quadrant of the breast
a. Lower inner quadrant b. Upper outer quadrant
c. Upper inner quadrant d. Lower outer quadrant

2771. The commonest type of cancer breast is .....
a. Ductal carcinoma b. Lobular carcinoma
c. Nodular carcinoma d. Segmental carcinoma

2772. Risk factors of carcinoma breast includes .....
a. Mutation in BRCA1 gene
b. Family history of breast cancer
c. Nulliparous women
d. All of the above

2773. Most common histological subtype of cancer of breast is ...
a. Ductal carcinoma b. Medullary carcinoma.
c. Lobular carcinoma d. Mucinous carcinoma.

2774. Factors contributing to poor prognosis of carcinoma breast include .....
a. Lymph node metastasis b. Tumor size
c. Distant metastasis d. Lymphovascular invasion

2775. Which of the following chemotherapeutic agents are used in the treatment of breast cancer?
a. 5 – fluorouracil
b. Cyclophosphamide
c. Doxorubicin
d. All of the above

2776. Psychological need of a women who is scheduled for mastectomy can be achieved through .....
a. Explain about the pre-operative preparations
b. Explain the surgical process
c. Promote an environment for expression of feelings.
d. Teach her how to do BSE

Scanned with CamScanner

2777. Most common germ cell tumor is .....
a. Choriocarcinoma b. Small cell carcinoma
c. Squamous cell carcinoma d. Yolk sac tumor

2778. Risk factor for ovarian cancer include .....
a. Young age b. Nulliparity
c. Multiple pregnancies d. Prolonged use of OCP

2779. All of the following treatment are beneficial for locally advanced epithelial ovarian cancer EXCEPT:
a. Radiation therapy
b. Standard IV chemotherapy
c. Intraperitoneal chemotherapy
d. Surgery

2780. Most common invasive malignancy of the female genital tract is .....
a. Endometrial carcinoma b. Carcinoma ovary
c. Cancer of cervix d. Cancer of uterus

2781. Risk factors for endometrial cancer include .....
a. Increased amount of circulating estrogen
b. Early menarche
c. Presence of other reproductive organ cancer
d. All of the above

2782. Risk factor for endometrial carcinoma type 1 includes .....
a. Unopposed estrogen therapy
b. Obesity
c. Hypertension
d. All of the above

2783. Nursing intervention for a patient receiving brachytherapy for endometrial cancer is .....
a. Maintaining absolute bed rest.
b. Can use common toilet
c. Visitors are allowed daily for 1 hour
d. Limiting direct nurse-to-patient contact to 30 minutes per shift.

2784. Nursing advice to a client during brachytherapy for cancer of cervix is .....
a. Minimize the visitors
b. Need to take radioactive precautions while providing care
c. Both a and b
d. She may experience itching and burning sensation

2785. All of the following are the side effects of hormone replacement therapy with estrogen, EXCEPT
a. Breast tenderness
b. Indigestion
c. Vaginal bleeding
d. Increased risk for osteoporosis

2786. Organism responsible for Ca. Cervix is
a. Myxovirus b. Papilloma virus
c. Rhino virus d. Rota virus

2787. Diagnostic test for Ca Cervix is
a. Pap smear b. Blood test
c. Endometrial biopsy d. PV ultrasonography

2788. Confirmatory diagnosis of cervical cancer is
(AIIMS Rishikesh & Bhopal 2018 SNO)
a. Mammography b. Biopsy
c. Colposcopy d. Pap's smear

2789. Serum marker elevated during choriocarcinoma is .....
a. PSA b. AFP
c. Beta HCG d. CK/MB

2790. Most common histologic type of cancer of cervix is .....
a. Squamous cell carcinoma
b. Ductal cell carcinoma
c. Epithelial cell carcinoma d. Full thickness carcinoma

2791. Which among the following is the risk factor for cervical cancer?
a. Nulliparity b. Early sexual intercourse
c. Both a and b d. Low socio-economic status

2792. All of the following are the clinical features of carcinoma of cervix, EXCEPT
a. Bleeding in between periods
b. Offensive vaginal discharge
c. Low back pain
d. Missed periods

2793. Which among the following is the surgical intervention for cervical cancer?
a. Cryosurgery b. Conization
c. Hysterectomy d. All of the above

2794. Correct regarding uterine fibroid is .....
a. Heavy menstrual bleeding
b. Malignant transformation is rare
c. It causes menorrhagia
d. All of the above

MALE REPRODUCTIVE

2795. Most commonly seen carcinoma in elderly male is
a. Oral b. Lung
c. Tongue d. Prostate

2796. Riskfactorforprostatecancerinclude.....
a. Removal of testicles before age 40 yrs
b. Black race
c. Asian race
d. Young age

2797. All of the following are useful in diagnosing carcinoma of prostate, EXCEPT
a. Free Prostate Specific Antigen
b. Total prostate specific antigen
c. Carcinoembryonic antigen
d. Prostatic Acid Phosphatase

2798. Which of the following is correct about the diagnosis of prostate cancer
a. Digital Rectal Examination (DRE) is performed for the diagnosis of prostate cancer
b. Most patient with PSA >40 ng/ml will have prostate cancer
c. Urinary obstructive symptoms are highly suggestive
d. It is diagnosed with biopsy by FNA

2799. All of the following statements regarding prostate cancer is true, EXCEPT
a. It usually affects men over 50 years of age
b. In 70-80% of cases, it arises in the peripheral zone
c. Burning or pain during urination is an early sign of prostate cancer
d. Low serum calcium levels in advanced stage of prostate cancer

2800. Most specific indicator for diagnosing prostate cancer
a. Prostate specific antigen b. Digital rectal examination
c. CT d. X-ray

2801. Risk for prostatic cancer is .....
a. Older than 65 years
b. Fat rich diet
c. BPH
d. Previous history of urinary stones

2802. Ca prostate develops in which region of the prostate?
a. Transition zone b. Peripheral zone
c. Central zone d. Both a & c

Ans.

2777.	a
2778.	b
2779.	a
2780.	a
2781.	d
2782.	d
2783.	a

2801.	a
2802.	b

Scanned with CamScanner

2803. Treatment of cancer of prostate includes
a. Bilateral orchiectomy
b. Luteinizing hormone releasing hormone agonists
c. Antiandrogen drugs
d. All of the above

2804. Which one of the following cancers does not metastasize commonly to liver? *(NCFL 2019)*
a. Breast
b. Lung
c. Colon
d. Prostate

Explanation: Prostate Cancer does not commonly metastasize to liver. It commonly metastasizes to bone.

2805. Principle behind hormonal therapy in prostate cancer is ...
a. Reduce testosterone production
b. Improve testosterone production
c. Improve 5 alpha reductase production
d. Reduce 5 alpha reductase production

2806. Hormonal therapy used in cancer of prostate is also known as .....
a. Androgen deprivation therapy
b. Testosterone therapy
c. Estrogen therapy
d. Antagonizing therapy

2807. Testicular cancer is often presented with .....
a. Dysuria
b. Cryptorchidism
c. Dyspareunia
d. Painless mass and heaviness sensation over the scrotal sac

2808. Earliest sign in testicular cancer is .....
a. Frequency of urine
b. Painless enlargement of testes
c. Urgency
d. Dysuria

2809. True about penile carcinoma is .....
a. Most of the penile cancers are squamous in origin.
b. Total incidence is less than 1% of all cancers in male.
c. Chance is more with HPV
d. All of the above

COMMON INTERVENTIONS AND DRUGS

2810. Respite care refers to: *(AIIMS BPL NO 2018)*
a. Palliative care
b. Rehabilitation
c. Part-time supervision of patients with chronic conditions
d. End-of-life care

Explanation: **Respite care** is the short term or temporary care of the sick or disabled for a few hours or weeks.

2811. The treatment that uses light and energy aimed at an exact tissue location and depth to vaporize cancer cells is:- *(AIIMS Raipur Grade II 2017)*
a. En bloc dissections
b. Photoablation
c. Debulking
d. Diathermy

Explanation: Laser ablation or photoablation is the process of removing material from a solid (or occasionally liquid) surface by irradiating it using high energy UV photons. En bloc dissections are autopsy techniques in which visceral organs are removed in large bulk. Debulking is the process of reducing the volume of tumour as much as possible. Diathermy is the use of high-frequency electromagnetic currents as a form of physical or occupational therapy and in surgical procedures

2812. Match the following regarding types of cancer treatment

I. Primary treatment	A. Treatment as a first step to shrink a tumor before main treatment
II. Adjuvant treatment	B. Aimed at relief of symptoms and improve quality of life
III. Neo-adjuvant treatment	C. Radiation therapy is the main treatment
IV. Palliative treatment	D. Surgery followed by chemo- or radiotherapy to prevent recurrence

	I	II	III	IV
a.	C	D	A	B
b.	C	A	B	D
c.	D	C	B	A
d.	A	B	C	D

Explanation:
- **Primary treatment:** When radiation is the main treatment for the cancer
- **Adjuvant treatment:** Surgery followed by chemo- or radiotherapy to help decrease the risk of the cancer recurring
- **Neo-adjuvant treatment:** Treatment given as a first step to shrink a tumor before the main treatment
- **Palliative treatment:** Designed to relieve symptoms, and improve the quality of life

2813. Palliative treatment is *(AIIMS Raipur NO 2019)*
a. Radiation therapy used to treat cancer
b. Surgery followed by chemo and radiation
c. Given as a first step to shrink the tumor before giving main treatment
d. Relieve symptom and improves quality of life

Explanation: Palliative care is an interdisciplinary approach focuses on providing relief from the symptoms, pain, physical stress, and mental stress at any stage of illness.

2814. Radio sensitive tissue is minimum in ..... Tissue
a. blood
b. Bone
c. Lung
d. Thyroid

2815. Least affected by radiation therapy is .....
a. Neurons
b. Gonads
c. Cartilage
d. Lymphocytes

2816. Radioisotope used for cancer treatment is .....
a. Strontium-89
b. Samarium-153
c. Radium-223
d. All of the above

2817. Insertion of radioactive implants directly into the tissue is known as .....
a. Teletherapy
b. Brachytherapy
c. Chemotherapy
d. Microwave therapy

2818. Most common side effect associated with radiation therapy to the neck is .....
a. Alopecia
b. Dermatitis
c. Hemoptysis
d. Sore throat

Ans.
2803. d
2804. d
2805. a
2806. a
2807. d
2808. b
2809. d
2810. c
2811. b
2812. a
2813. d
2814. b
2815. c
2816. d
2817. b
2818. d

Scanned with CamScanner

2819. An external source of ionizing radiation is pointed at a particular part of the body is known as .....
a. Teletherapy b. Brachytherapy
c. Chemotherapy d. Microwave therapy

2820. Nursing responsibilities for either external or internal radiation therapy include: *(ESIC Chennai May 2012)*
a. Assist in documenting the results of therapy
b. Carefully assess and manage any complications, in collaboration with the radiation oncologist
c. Provide emotional support
d. All of the above

2821. Priority nursing intervention while caring for a terminally ill client is .....
a. Provide psychological support
b. Maintain nutritional status
c. Provide pain control
d. Maintain hydration

2822. After a radical mastectomy with lymph node removal, which of the following measures help to prevent lymphoedema? *(Staff Nurse G II 2014)*
a. Warm moist heat application
b. Restricting all movements of the arm
c. Raising arm above heart on pillows
d. Placing arm close to body in sling

2823. Post operative teaching points to decrease lymphedema in a mastectomy client includes .....
a. Avoid wearing tight elastic or jewellery on the affected arm
b. Sleep on back or nonsurgical side
c. Avoid lifting heavy objects during the first 4 to 6 weeks after surgery
d. All of the above

2824. A nurse is caring for a 45-year-old female patient who undergone mastectomy. Which of the following intervention is appropriate to prevent the lymphedema as a post-operative complication?
a. Ensuring patency of wound drainage tube
b. Frequently elevating the arm of the affected side above the level of the heart
c. Placing the arm on the affected side in a dependent position
d. Restricting movement of the affected arm

Explanation: Elevation of the affected arm above the level of the heart promotes lymphatic drainage and venous return thus preventing chances of lymphedema.

2825. Correct regarding cryosurgery is .....
a. Use of extreme cold to destroy abnormal cells, such as tumor cells
b. Often involves the use of liquid nitrogen, although carbon dioxide and argon may also be used
c. It is also called as cryotherapy
d. All of the above

2826. For a patient getting methotrexate, what should be the specific nursing intervention?
a. Use soft bristle tooth brush
b. Teach how to check urine pH
c. Avoid IM injection
d. Teach hand washing

2827. For administering methotrexate urine pH should be .....
a. <6 b. 7
c. 8 d. >9

2828. Dosage of chemo drugs is calculated based on
a. Height
b. Weight
c. BMI
d. BSA

2829. Which of the following formula can be helpful for calculating Body Surface Area (BSA)
a. $\frac{Wt\ (kg)}{Ht\ (m^2)}$
b. $\sqrt{\frac{Height\ (cm) \times weight\ (kg)}{3600}}$
c. $\sqrt{\frac{W\ (kg) \times 6}{Ht\ (m^2)}}$
d. W (kg) × Ht (m) × 60

2830. A chemo drug which can be administered intrathecally is
a. Cytarabine b. Vincristine
c. Vinblastine d. 5-Flurouracil

2831. Chemo port is used to administer chemo drugs in case of
a. Drug to be administered to artery
b. Lung cancer patients
c. Long-term use
d. All of the above

2832. Chemo drugs will attack which of the following tissues/cells in our body ?
a. Bone marrow b. Skin
c. Nails d. Blood vessel

2833. Most effective and safe way to administer chemotherapy drug is by.....
a. Enteral b. Any parenteral route
c. Intra osseous d. Central venous catheter

2834. Following chemotherapy, which instruction needs to be given to the client
a. Avoid direct sun exposure
b. Perform activity as tolerated
c. Avoid crowded places
d. All of the above

2835. Most common complication that requires alterations of planned chemo regimen is
a. Pulmonary fibrosis
b. GI ulcerations
c. Hematologic suppression
d. Hepatotoxicity

2836. Allopurinol and well hydration given to a client before chemotherapy for .....
a. Pneumocystis carinii pneumonia
b. Coagulopathy
c. Tumor lysis syndrome
d. Vena cava syndrome

2837. Which among the following assessments need to be performed by the nurse before administering chemotherapy?
a. Back flow in the central line
b. Concurrent infection
c. Anthropometric measurement
d. All of the above

2838. The most serious long-term side effect of bleomycin therapy is .....
a. Pulmonary fibrosis
b. Cataract formations
c. Cardiomyopathy
d. Aplastic anemia

Ans.

2819. a
2820. d
2821. c
2822. c
2823. d
2824. b
2825. d
2826. b
2827. c
2828. d
2829. b
2830. a
2831. c
2832. a
2833. d
2834. d
2835. c
2836. c
2837. a
2838. a

Scanned with CamScanner

2839. Which of the following interventions is effective to treat breathlessness in end-stage cancer patients?
a. Fanning the face
b. Morphine administration
c. Inhaled furosemide
d. All of the above

2840. Most common radioisotope used in brachytherapy is .....
a. 125I
b. 14C
c. 3 H
d. 34 P

2841. Interval which is required for PICC line dressing:
a. 1 day
b. 2 day
c. Weekly
d. Bi weekly

2842. Management of tumor lysis syndrome is: .....
a. Antidotes
b. IV hydration
c. Blood transfusion
d. Calcium gluconate

2843. Drug of choice to treat cancer pain is .....
a. NSAID
b. Opioids
c. Diclofenac sodium
d. Diversion therapy

2844. Which of the following is not a chemotherapeutic drug?
a. Doxorubicin
b. Etoposide
c. Rasburicase
d. Cisplatin

2845. Which of the following should be avoided by patients taking cyclosporine?
a. Grape juice
b. Orange juice
c. Apple juice
d. Banana

limit potassium

2846. Which among the following is not an adverse effect of cyclosporine
a. Gum hyperplasia
b. Anorexia
c. Flushing
d. Hypoglycemia

2847. All among the following hormones are used in chemotherapy to treat cancer EXCEPT
a. Glucocorticoids
b. Estrogens
c. Progesterone
d. Thyroxin

2848. Examples for glucocorticoids hormones used in chemotherapy include .....
a. Prednisone
b. Methyl prednisolone
c. Dexamethasone
d. All of these

eye cancer

2849. Permanent management of retinoblastoma is .....
a. Teletherapy
b. Brachy therapy
c. Enucleation — Removal of eye
d. Chemotherapy

Ans.

2839. d
2840. a
2841. c
2842. b
2843. b
2844. c
2845. a
2846. d
2847. d
2848. d
2849. c

MALE REPRODUCTIVE SYSTEM

ANATOMY AND PHYSIOLOGY OF MALE REPRODUCTIVE SYSTEM

- Male reproductive organ consists of:
  - Paired testicles in the scrotum
  - Epididymis
  - Vas deference (seminal duct)
  - Spermatic cord
  - Seminal vesicles
  - Ejaculatory ducts
  - Cowper's gland (bulbourethral glands)
  - Prostate gland
  - Penis
- Among the male reproductive structures only scrotum and penis are external and other structures are internal.
- Male perineum is the area between scrotum and anus.

Figure 93 ■ Male reproductive organs

Penis

- It is both sexual organ as well as organ for urination.
- Portion of the penis between its attachment to the pubic bone and to the head of the penis is known as shaft.
- External opening of the urethra is in the glans and is covered by foreskin or prepuce.
- Penis is homologous to female clitoris
- Penis is flaccid but during the time of erection it become rigid because corpora cavernosa fill with blood.
- Following ejaculation blood leaves the penis and it became flaccid.

Scrotum and Testes

- Scrotum is a double pouch hanging at the base of penis.
- Scrotal pouch internally separated as two halves by muscular contractile tissue known as tunica dartos, externally separated into two halves by raphe (ridge).
- Each half of the scrotum contains testicle with its epididymis and part of spermatic cord held together by spermatic fascia.
- Vas deference is the excretory duct of the testicle, and is the target in vasectomy
- Vas deference is the continuation of epididymis and it continues with the ejaculatory duct and that conveys semen into urethra.
- Testicles produce male hormone testosterone and sperm.
- Sperms are produced at seminiferous tubules and stored in epididymis.

Sperm

- They are mature male sex cells.
- Sperms have self-propelling capacity with the help of flagella.
- A normal sperm has oval shaped flattened head with nucleus, middle piece or protoplasmic neck and a tail.
- During fertilization sperm head penetrates the ovum and tail part is lost.

Figure 94 ■ Structure of sperm

Prostate and Related Structures

- Prostate gland surrounds male urethra and urinary bladder.
- Adult prostate gland weighs 15-20gm and is 4-6 cm long.
- Posterior surface of the prostate is in close contact with rectal wall, and is the surface available for digital examination.
- Portion of urethra passes through the prostate is known as prostatic urethra.

MALE SEXUAL DEVELOPMENT AND FUNCTION

- Development of male genitalia require two hormones:
  - Mullerian duct inhibitory factor secreted by sertoli cells
  - Testosterone secreted by Leydig cells.
- Hypothalamus secretes GNRH which stimulates pituitary gland to produce LH and FSH.
  - LH stimulate leydig cells to produce testosterone.
  - Testosterone and FSH stimulate sertoli cells to start and compete spermatogenesis.
- Inhibin released from sertoli cells gives negative feedback to anterior pituitary.

Spermatogenesis

- Production and maturation of sperm in the seminiferous tubules is known as spermatogenesis.
- This process starts at puberty because of stimuli from anterior pituitary.
- Spermatogonia is the germinal cells and a portion continues to develop as sperm.
- During 24 days, when it is in contact with sertoli cells spermatogonia changes and enlarges to form primary spermatocyte.
  - Primary spermatocyte divides and forms two secondary spermatocyte each with half number of chromosome.
  - Secondary spermatocyte undergo next division after 2-3 days and become four spermatids each with half number of chromosome.

Scanned with CamScanner

The production of mature sperm from spermatogonia takes 74 days.

Figure 95 ■ Spermatogenesis

Maturation in the Epididymis

- Sperms are produced in seminiferous tubules, these sperms are then stored in epididymis.
- After spending 24 hours in epididymis they become motile and capable of fertilization.
- Sperms can be stored up to a month.

Prostatic Fluid

- Prostate gland secrete milky fluid that forms the part of semen.
- This fluid keeps the sperm alive supplying nutrition to them.

Semen

- It is the thick secretion discharged by males at the end of sexual activity or orgasm.
- It contains both sperms and other secretions.
- It is slightly alkaline with a pH of about 7.5.
- Sperms live in the vagina for about 24-48 hours after the ejaculation.

DIAGNOSTIC TESTS

Table 88

Diagnosis	Description	Points to remember
Prostate specific antigen	• Screening test for cancer of prostate. • Normal PSA levels are less than 0.2-4 ng/ml. • PSA can be elevated during BPH and prostatitis.	• Prostatic massage, urethral instrumentation, ejaculation or rectal examination within 48 hours before assay can cause elevated PSA level.
Digital rectal examination	Help to assess size, shape and consistency of prostate gland. Helps to screen for prostate cancer.	
Semen analysis	Normal semen analysis shows following values Volume : 1.5-2 ml Concentration > 20 million sperm/ml Total sperm count>50-60 million Motility 60% grade 2 or higher Morphology 60% normal	

Contd...

DISORDERS OF MALE REPRODUCTIVE SYSTEM

Benign Prostatic Hyperplasia (BPH)

- It is the benign enlargement of prostate gland.
- The enlargement of prostate gland is sufficient to obstruct the urethra and to cause lower urinary tract symptoms, urinary tract infection, and hematuria or compromised urinary tract function.
- In the prostate testosterone is converted as dihydrotestosterone (DHT) by 5 alpha reductase. DHT suppresses the prostate growth and development throughout the life.
- In a person with BPH, the balance between DHT and 5 alpha reductase is lost.
- Man with BPH complain urinary symptoms such as nocturia, increased day time urinary frequency, urgency, hesitancy, decline in force of urinary stream, incomplete bladder emptying.
- Urinary obstruction leads to urinary retention and client may complain of dribbling of urine.
- Digital rectal examination is performed to differentiate between benign enlargement of prostate from prostatitis or adenocarcinoma.
- Urine test to rule out other condition such as infection which may cause similar symptoms.
- **Prostate specific antigen:** PSA values are elevated in a person with BPH.
- **Urinary flow test:** To measure the strength and amount of urinary flow
- **Post void residual volume test:** To measure the amount of urine in bladder after voiding.
- Medications such as alpha blockers (these medication relax bladder neck muscles and makes urination easier), 5 alpha reductase inhibitors (these medications shrink the size of prostate gland preventing the hormonal change)
- **Surgery transurethral resection of the prostate (TURP):** Through the bladder, scope is inserted and prostate is removed. Soon after the removal, client may have a stronger urinary flow.
- **Transurethral incision of the prostate (TUIP):** Two small incisions or cuts given in prostate gland after it is accessed via urethra.

After TURP continuous irrigation is needed, the fluid of choice is glycerol for irrigation.

PROSTATE CANCER

- Carcinoma of the prostate gland which can spread to other body tissues such as bones and lymph nodes.
- Exact cause of prostate cancer is not known, but family history is believed as a risk factor.

Scanned with CamScanner

- Digital rectal examination and prostate specific antigen have 50% accuracy in diagnosing this condition.
- Trans-rectal ultrasound and biopsy is also useful for diagnosing the condition.
- Radical prostatectomy is the treatment of choice for client with localized prostate cancer. Radical surgery involves removal of entire prostate gland, its outer capsule, the seminal vesicle, sections of vas deference, adjacent lymph nodes and in many cases bladder neck.
- **Cryosurgical ablation:** In this, surgeon inserts cryoprobes under transrectal ultrasound guidance, then freeze and destroy the tissue.

Immediate post-operative period reddish colored urine is anticipated, but if it became brisk bleeding or passage of clots occur promptly contact the urologist.

Testicular Cancer

- Cancerous growth in the testicle.
- Family history, exogenous estrogen and cryptorchidism are the known risk factors.
- Most common clinical manifestation is painless enlargement noted as heaviness in the testicle described as dragging sensation.
- Pain is rarely felt in this condition.
- Metastasis can occur to retroperitoneal lymph nodes and lungs.
- Alpha fetoprotein, beta human chorionic gonadotropin and lactic acid dehydrogenase are the tumor markers to detect testicular cancer.
- Radical orchiectomy is the surgery of choice in which testis, epididymis and vas deference are removed.
- Retroperitoneal lymph node dissection will be done if there is lymph node involvement.

Testicular Torsion

- It occurs when the testicle is mobile and spermatic cord twists which causes cutting off blood supply.
- Acute scrotal swelling and severe pain are the manifestations.
- Testicular scan and Doppler ultrasonography are useful diagnostic tests.
- If torsion happens emergency surgery is needed to untwist spermatic cord and immobilize testicle in scrotal sac by suturing them.
- Without emergency surgery testicle may be atrophied or abscess can develop.

Orchitis

- Inflammation of testicle caused by viral infection.
- Mumps orchitis is developed by man who had mumps infection after puberty and usually both testicles are affected.
- Clinical manifestations include fever, reddened scrotal skin, extremely tender testicle and prostration
- Management includes bed rest, scrotal support local heat application, and symptomatic management for pain, fever and infection.
- Permanent sterility can occur if both testicles are affected.

Epididymitis

- Inflammation of epididymis is known as epididymitis.
- Most often caused by bacteria.
- Warm, red and swollen scrotum, discharge from penis, painful urination or urge to urinate

Hydrocele: Painless collection of clear, yellow fluid in the scrotum
Hematocele: collection of blood in the tunica vaginalis caused by trauma.
Spermatocele: Cystic dilation of part of epididymis that contains a milky fluid and dead spermatozoa

Varicocele

- Dilation of network of vein (pampiniform plexus) supplying the testicle within the scrotum
- Most commonly it is seen in left side than right side because in the left side spermatic vein enters the renal vein at 90 degree.
- Right sided vericocele suggests tumor or retroperitoneal fibrosis.
- Pain is there and is relieved by masturbation, or sexual intercourse.
- Palpation of vericocele done with man in standing. On palpation, vericocele feels like a mass above and posterior to testicle.

Vasectomy

Figure 96 ■ Vasectomy

- It is the permanent method of contraception among men.
- Cutting of vas deference is done in the surgery after cutting tips are ligated or tucking into the adjacent tissue to prevent re anastomosis.
- Slight pain, swelling and bruising occurs post operatively and these symptoms can be controlled with ice packs and mild analgesics.
- Scrotal support also helps to provide comfort to the client.
- Client can resume sexual activities and heavy lifting after two weeks of surgery.

Client must practice alternative contraceptive method until the semen analysis shows azoospermia.
Vasovasostomy is the surgical reversal of vasectomy. It is expensive and fertility is not granted.

Undescended or Malpositioned Testis

- Testes descend from abdomen into the scrotum before birth.
- Undescended testis is known as cryptorchidism.
- A retractile testis descend into the scrotum and pull back into the inguinal canal because of hyperactive cremasteric reflex.

Infertility

- It means pregnancy doesn't occur even after having regular unprotected sex over 12 months period.
- **Pre-testicular cause:** Problem is with the hormone. Example there is some problems with pituitary or adrenal cortex.

Scanned with CamScanner

- **Testicular:** Problem with testicles itself such as vericocele, torsion etc
- **Post-testicular:** Problem with structures distal to testis such as congenital blockage of vas deference.
- Certain infection, exposure to certain chemicals, faulty intercourse practices are also responsible for infertility.

Phimosis

- Retraction of foreskin is impossible or difficult.
- Edema, erythema, tenderness, purulent discharge are the manifestations.
- Circumcision is the surgical management of choice.

Paraphimosis

- Tight foreskin once retracted cannot return to the normal position.
- Circulation may be affected and cause edema and swelling rapidly.
- Condition is painful.
- Surgical incision over the foreskin is the management.

Posthitis

- Inflammation of the foreskin
- Good hygiene is recommended to prevent the condition

Balanitis

- Inflammation of the glans penis and mucous membrane beneath it
- Good hygiene is the preventive measure.

Priapism

- Prolonged persistent erection of penis without sexual desire
- Condition is painful.
- Occur as a result of self-injection of medication such as papaverine (to treat impotence), use of certain medications such as phenothiazine, anticoagulants etc.
- Two types are there, first high flow arterial priapism (less common and less painful) second veno-occlusive priapism (more common and painful).

Erectile Dysfunction

- Inability to achieve and maintain erection sufficient for sexual activities.
- Psychological factors like performance anxiety, stress, fatigue, low-self-esteem, depression and change in relationship can cause this.
- Physiological factors like decrease in testosterone level, increase in estragon and prolactin level, reduced libido can also contribute to this.

Golden points to remember

- **Spironolactone** is the drug causing **gynecomastia** by decreasing testosterone production.
- Orchitis is the complication of mumps.
- Most common zone of origin for CA Prostate: Peripheral zone.
- Most common lobe involved in CA prostrate: Posterior lobe.
- Earliest symptoms of prostatism: Nocturia.
- Irrigant of choice in Transurethral Resection of Prostate (TURP): **1.5% glycine.**
- Irrigant of choice in TURP with Bipolar cautery (plasmakinetics): **Normal saline (NS).**
- Most common complication after TURP: Retrograde ejaculation OR Dry ejaculation.
- **Undescended testes** are more common on: Right side [**Mn**: RUN]
- **Varicocele** is predominantly seen on: Left side.
- Congenital hydrocele is best treated by **Herniotomy.**
- Absence of fructose in semen indicates obstruction to seminal vesicle.
- Most common cause of urethritis is **C. trachomatis.**
- Absence of living spermatozoa in semen is called **Azoospermia.**
- Inability to retract the prepuce to reveal the glans penis is called **Phimosis.**
- **Descent of the testes** into the scrotum normally occurs before birth.
- **Cryptorchidism** is a condition in which one or both the testicles do not descend into the scrotum.
- The main cause of **genital warts** (Condylomata Acuminata) is human papilloma virus (HPV).

—Socrates

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

ANATOMY AND PHYSIOLOGY

2850. In male individuals, testosterone is normally produced by: *(AIIMS-BBS SNO 2019)*

a. The Sertoli cells
b. The interstitial cells of Leydig
c. The vas deferens
d. The epididymis

2851. What is the WHO criterion for minimum sperm count in normal semen? *(RAK MSc 2018)*

a. 60 Million
b. 15 Million
c. 20 Million
d. 30 Million

Explanation: A *normal sperm count* is at least 15 million sperm per milliliter of semen.

2852. All of the following enzymes are present in Leydig cells except: *(Safdarjung NO 2018)*

a. CYPscc
b. 17-alpha hydroxylase
c. 17, 20 lyase
d. 21- hydroxylase

Explanation:

- CYPscc is not present in Leydig cells
- The biosynthesis of testosterone requires the activities of four enzymes, cholesterol side-chain cleavage enzyme (P450, c), 3-hydroxysteroid dehydrogenase/A5 -A4 isomerase (3PHSD), 17alpha-hydroxylase/ 17-20 lyase (P45017), Steroid 21-hydroxylase, also called steroid 21-monooxygenase and 17-ketosteroid reductase.

2853. Find out the correct statement regarding Bartholin's glands

a. Homologous to bulbourethral glad in males
b. Found posteriorly and to right and left of the opening of vagina
c. They secrete mucous
d. All of the above

2854. Of the 46 chromosomes in the human cells, _____ are autosomes, and _____ are sex chromosomes.

a. 40, 6
b. 42, 4
c. 43, 3
d. 44,2

2855. Males are determined by

a. The presence of only one type of X chromosome
b. The presence of a Y chromosome
c. A gene carried on chromosome pair number 21
d. A gene carried on chromosome pair number 1

2856. The testes are located in the scrotum outside the body cavity because they

a. Are closer to the penis than they would be in the body cavity
b. Are originally developed in the scrotum
c. Must be at a lower temperature than the body cavity for sperm production
d. Are pushed out because there is no room in the body cavity

2857. Erection of the penis occurs as a result of

a. Contraction of the bulbourethral muscles
b. Movement of internal bones
c. Accumulation of lymphatic fluid
d. Engorgement of erectile tissue with blood

2858. The forceful expulsion of semen from the urethra caused by the contraction of the smooth muscle in the urethra and skeletal muscle surrounding the base of the penis is called

a. Ejaculation
b. Emission
c. Climax
d. Neutralization

2859. The size of a prostate is about the size of

a. Pea
b. Lime
c. Walnut
d. Grape

2860. Function of prostate gland:

a. Makes fluid that nourishes sperm
b. Sterilizes urine in men
c. Filters urine in men
d. Backup storage for sperm

2861. The testes are suspended in the scrotum in order to:

a. Protect the sperm from high abdominal temperature
b. Protect the testes from traumatic injuries
c. Facilitate blood flow to testes during embryonic period
d. All of the above

2862. Normal pH of Semen is .....

a. Acidic
b. Alkaline
c. Neutral
d. Some-times acidic and some-time alkaline

2863. Most commonly performed test for assessing the adequacy of sperm is .....

a. Sperm morphology
b. Sperm motility
c. Sperm count
d. Semen volume

Explanation: Sperm motility is the most significant criterion when assessing male infertility. As per WHO 1 mL of semen contain 15 million sperm.

2864. Huhner test is used for .....

a. To determine the number, motility and activity of sperm
b. To determine ABO incompatibility reaction between mother and newborn
c. To assess the respiratory maturity of newborn
d. To assess the respiratory distress of newborn baby

Explanation: It is a test used in sterility studies that involves postcoital examination of fluid aspirated from the vagina and cervix to determine the presence or survival of sperm in these areas

Ans.

2850. b
2851. b
2852. a
2853. d
2854. d
2855. b
2856. c
2857. d
2858. a
2859. c
2860. a
2861. a
2862. b
2863. b
2864. a

Scanned with CamScanner

2865. Abnormal communication between the urinary and genital tract is called genitourinary_____ *(RRB SSNE 2015)*
a. Fistula b. Tumor
c. Atresia d. Prolapse

2866. Length of male urethra is:
a. 4 cm b. 10 cm
c. 15 cm d. 20 cm

Explanation: length of male urethra is 20 cm and that of female is 4 cm.

2867. Capacitance of sperm takes place in
a. Vas deferens b. Uterus
c. Epididymis d. Testis

2868. Ejaculatory duct opens into
a. Membranous urethra
b. Prostatic urethra
c. Penile urethra
d. Seminal vesicles

2869. Fructose, a source of energy for spermatozoa, is found primarily in secretions from
a. Bulbourethral glands b. Epididymus
c. Prostrate d. Seminal vesicles

2870. Which among the following is present in male with hypospadias
a. Unable to produce healthy sperm
b. Sperm count will decreases
c. Hematuria
d. Unable to deposit sperms high in vagina

2871. The narrowest part of male urethra is the
a. Prostatic part
b. Membranous part
c. External urethral meatus
d. Internal urethral orifice

2872. The process of maturation of sperm is referred as
a. Spermatogenesis b. Oogenesis
c. Orthogenesis d. Ovogenesis

2873. Correct order of spermatogenesis?
a. Germ cells → spermatogonia → primary spermatocyte → secondary spermatocyte → spermatids
b. Germ cells → primary spermatocytes → secondary spermatocytes → sperms
c. Germ cells → primary spermatocytes → spermatogonia → secondary spermatocytes → sperms
d. Germ cells → primary spermatocytes → secondary spermatocytes → sperms → spermatogonia

2874. Capacitation of sperm means .....
a. They become motile
b. Able to fertilize secondary oocyte
c. They can penetrate the cervical mucosa
d. All of the above

2875. Time duration for maturation of spermatogonia to mature spermatozoa .....
a. 14 days b. 28 days
c. 61 days d. 280 days

2876. Sperms are produced by the process of
a. Spermatogenesis
b. Ovulation
c. Oogenesis
d. Gestational

2877. During intra-uterine life of fetal development majority of testicles descend into the scrotum by
a. 24 weeks b. 26 weeks
c. 28 weeks d. 30 weeks

Ans.
2865. a
2866. d
2867. b
2868. b
2869. d
2870. d
2871. c
2872. a
2873. a
2874. b
2875. c
2876. a
2877. c
2878. b
2879. a
2880. b
2881. b
2882. c
2883. b
2884. d
2885. a
2886. b
2887. c
2888. a
2889. a

DISORDERS OF MALE REPRODUCTIVE SYSTEM

2878. Vaccination against mumps can prevent: *(AIIMS Nagpur NO 2018)*
a. Hydrocele b. Orchitis
c. Varicocele d. Undescended testes

Explanation: Most common cause of viral orchitis is the mumps. Vaccination against mumps can prevent orchitis.

2879. Complete absence of seminal fluid upon ejaculation is known as:
a. Aspermia b. Azoospermia
c. Asthenospermia d. Teratozoospermia

2880. Absence of sperm in the ejaculate is known as:
a. Aspermia b. Azoospermia
c. Asthenospermia d. Teratozoospermia

Explanation: Azoospermia is a condition in which there is no sperm in the ejaculate. A patient has azoospermia if microscopic examination of two separate concentrated semen samples reveals no sperm. Aspermia is the complete absence of seminal fluid upon ejaculation.

2881. Presence of sperm with abnormal morphology that affects fertility in males:
a. Azoospermia b. Teratozoospermia
c. Asthenospermia d. Aspermia

2882. Asthenospermia is .....
a. Failure to produce semen
b. Absence of sperms from the semen
c. Reduced sperm motility
d. Presence of sperm with abnormal morphology

2883. Necrospermia refers to
a. Absence of sperm b. Dead sperm
c. Immotile sperm d. Low sperm count

2884. Causes of infertility in males include
a. Defective spermatogenesis
b. Sexual dysfunction
c. Obstruction of the efferent ducts
d. All of the above

2885. Hydrocele is .....
a. Collection of clear yellow fluid in scrotum
b. Collection of blood in the tunica vaginalis layer of testes
c. Dilation and varicosity of the network of veins supplying the testicles
d. All of the above

2886. Hematocele is .....
a. Collection of clear yellow fluid in scrotum
b. Collection of blood in the tunica vaginalis layer of testes
c. Dilation and varicosity of the network of veins supplying the testicles
d. All of the above

2887. Dilatation of the pampiniform venous plexus and the internal spermatic vein is known as
a. Varicose veins b. Varicosities
c. Varicocele d. Hematocele

2888. "Bag of worms" feel in testis is characterstic of
a. Varicocele b. Hydrocele
c. Rotation of testis d. Testicular malignancy

2889. Varicocele is most commonly seen in
a. Left side b. Right side
c. Always occurs on both side together
d. Equally on left and right side

Scanned with CamScanner

Explanation: Most varicoceles occur on the left side as a result of the left spermatic vein draining into the left renal vein at a 90-degree angle, compared to the right spermatic vein, which drains more directly into the inferior vena cava.

2890. What is the common complication of varicocele? *(Kerala PSC, Nov 2014)*
a. Phimosis b. Erectile dysfunction
c. Infertility d. Cancer

2891. Infertility is defined as pregnancy doesn't occur even after having regular unprotected sex over the period of
a. Six months b. Nine months
c. Twelve months d. Eighteen months

2892. Post-testicular cause of infertility includes
a. Hormonal problems
b. Testicular torsion
c. Congenital blockage of vas deferens
d. Varicocele

Explanation: Post-testicular cause of infertility in male includes problem with structures distal to testis such as congenital blockage of vas deference. Hormonal problems are pretesticular, varicocele and testicular torsion are testicular cause of infertility.

2893. In vasectomy, which of the following structure is cut
a. Epididymis b. Pampiniform plexus
c. Vas deferens d. Ejaculatory duct

Explanation: Cutting of vas deference is done in the surgery after cutting tips are ligated or tucking into the adjacent tissue to prevent re anastomosis.

2894. The nurse should explain to the patient who underwent vasectomy that
a. Immediately after the surgery you are sterile
b. No need to use any other contraceptive methods
c. Normal erection and ejaculation functions will be there
d. An alternative form of contraception will be necessary for 6 to 8 weeks

2895. Undescended testes known as .....
a. Cushingoid appearance b. Hypoaldosteronism
c. Cryptorchidism d. Phimosis

2896. Which of the following is true about cryptorchidism
a. It is also known as undescended testis
b. In most of the cases testes lie at inguinal ring
c. Orchidopexy is the surgical management
d. All of the above

2897. Testicular atrophy is caused by .....
a. Atherosclerotic narrowing of testicular blood vessels
b. Testicular inflammation
c. Poor nutrition
d. All of the above

2898. Most common location of undescended testes is .....
a. The retro-peritoneum b. The inguinal ring
c. Upper scrotum d. Inguinal canal

2899. Twisting of spermatic cord which leads to cutting off blood supply to testicle is known as
a. Varicosities b. Testicular torsion
c. Orchitis d. Cryptorchidism

2900. Orchitis is most commonly associated with which of the following infection
a. Measles b. Mumps
c. Syphilis d. Gonorrhea

2901. Best indication of testicular biopsy is .....
a. Oligospermia b. Azoospermia
c. Dyspareunia d. BPH

2902. Retraction of foreskin is difficult or impossible is known as .....
a. Cushingoid appearance b. Hypoaldosteronism
c. Cryptorchidism d. Phimosis

2903. Foreskin cannot be returned to its normal position, once retracted is known as .....
a. Balanitis b. Paraphimosis
c. Posthitis d. Cryptorchidism

2904. Surgery of phimosis is .....
a. Orchidopexy b. Circumcision
c. Shunting surgery d. Dilatation

2905. The urethra which opens on the dorsal surface of the penis is termed: *(DSSSB PHN, 2015)*
a. Epispadias b. Hypospadias
c. Cryptorchidism d. Anorchidism

2906. Inflammation of glans penis is .....
a. Balanitis b. Paraphimosis
c. Posthitis d. Cryptorchidism

2907. Inflammation of foreskin of penis is .....
a. Balanitis b. Paraphimosis
c. Posthitis d. Cryptorchidism

2908. Persistent and prolonged penile erection without sexual desire is known as .....
a. Phimosis b. Paraphimosis
c. Cryptorchidism d. Priapism

2909. Management for scrotal edema following penile implant is
a. Cold application
b. Trendelenburg position
c. Maintain strict I/O chart and report to physician
d. Elevate the scrotum using a soft support

Explanation: Scrotal elevation using soft support will help us to reduce the edema. T-bandage is commonly used.

2910. Semen collection technique include
a. Coitus interruptus b. Condom collection
c. Epididymal extraction d. All of the above

2911. Correct regarding semen collection include .....
a. Provide a fresh sample
b. Sample should be refrigerated.
c. Patient can continue with sexual activity, no need of any abstinence
d. All of the above

2912. Gross examination of semen does include
a. Volume b. Color
c. Viscosity d. All of the above

2913. Which of the following is NOT a microscopic examination of semen
a. Counting b. Motility
c. pH d. Viability

2914. Semen pH level is .....
a. 3.2-4.8 b. 4.2-5.8
c. 5.2-6.8 d. 7.2-7.8

2915. Education to a client who is undergoing antibiotic therapy for chronic bacterial prostatitis include .....
a. Surgery is needed
b. Prolonged hospital stay is recommended
c. Long-term therapy may be indicated in immune-compromised client
d. It can lead to BPH

Ans.

2890. c
2891. c
2892. c
2893. c
2894. d
2895. c
2896. d
2897. d
2898. d
2899. b
2900. b
2901. b
2902. d
2903. b
2904. b
2905. a
2906. a
2907. c
2908. d
2909. d
2910. d
2911. a
2912. d
2913. c
2914. d
2915. c

Scanned with CamScanner

2916. Early clinical manifestations of Nodular Hyperplasia of Prostate (NHP) include .....
a. Frequency of urine b. Nocturia.
c. Overflow dribbling d. All of the above

2917. BPH is
a. Hyperplasia of stromal cells
b. Hyperplasia of epithelial cells
c. Hyperplasia of endothelial cells
d. Both a & b

2918. BPH develops from which zone of prostate gland?
a. Peripheral zone b. Transition zone
c. Central zone d. Both a and c

2919. Hormonal cause behind BPH is .....
a. Oestrogen
b. Testosterone
c. Dihydrotestosterone
d. Progesterone

2920. Which of the following drug can aggravate BPH
a. Inhalational Ipratropium
b. Timolol
c. Oral hypoglycemic agents
d. Calcium channel blockers

2921. Major clinical finding in prostatic enlargement is
a. Red blood cell casts in urine
b. Pain in the groin
c. Increased urinary frequency in an old man
d. General malaise

2922. Which of the following test is used to assess size, shape and consistency of prostate?
a. PSA b. DRE
c. TURP d. Proctoscope

Ans.
2916. d
2917. d
2918. b
2919. c
2920. a
2921. c
2922. b
2923. d
2924. a
2925. b
2926. d
2927. d
2928. a
2929. b
2930. a
2931. c
2932. c

Explanation: In a male patient, Digital Rectal Examination (DRE) is used to examine prostate for its size, shape and consistency by palpating the prostate through rectal wall as shown in the picture below.

2923. Which among the following sign and symptom can be seen in BPH?
a. Difficulty in initiating voiding
b. Incomplete bladder emptying
c. Dribbling at the end of urination
d. All of the above

2924. In BPH difficulty in initiating voiding and a feeling of incomplete bladder emptying is because of .....
a. Urethral obstruction
b. Inflammation of the prostate
c. Low bladder tone d. VUR

2925. Which of the following statement regarding relationship between prostate cancer and BPH is true?
a. Prostate cancer is caused by BPH
b. BPH and prostate cancer are unrelated
c. BPH is a symptom of prostate cancer
d. None of the above

2926. Which of the following is true about benign prostatic hypertrophy (BPH)
a. It causes urethral obstruction
b. Hydronephrosis and renal failure are its complication
c. Digital rectal examination is used for diagnosing this condition
d. All of the above

2927. Aim of medical management of benign prostate hyperplasia (BPH) is:
a. Improve symptoms and relief obstruction
b. Improve bladder emptying
c. Prevent UTIs and avoid renal insult
d. All of the above

2928. Patients who have been operated for BPH .....
a. Require routine rectal examination to detect development of ca prostate
b. Do not require prostate examination
c. Have lesser incidence of ca prostate
d. Have a greater incidence of Ca prostate

2929. Surgical removal of prostate through an endoscope is called
a. TUNA b. TURP
c. PVP d. PUJO

2930. The following are the important preoperative nursing care for a patient with benign prostatic hypertrophy, EXCEPT *(ESIC 2019)*
a. Hormonal therapy
b. Assure nutrition and correct fluid and electrolyte balance
c. Promoting urinary drainage
d. Acid-ash diet to treat infection

Explanation: Hormone therapy is not advised for a client with benign prostatic hypertrophy, it can further increase the growth of prostatic cells.

2931. Important nursing management following transurethral resection of prostate is ..... *(AIIMS 1996)*
a. Assess the surgical site for signs of infection
b. Assess the vital signs
c. Maintaining patency of a three-way Foleys catheter for hemostasis
d. Administer ordered analgesics

Explanation: Catheter provide decompression to the bladder and it prevent bladder distention and bleeding and thus promote hemostasis

2932. Solution used for bladder irrigation during TURP is .....
a. NS b. RL
c. Glycine d. Sterile water

Explanation: 1.5% Glycine Irrigation is used as a urologic irrigating fluid with endoscopic instruments during transurethral procedures

Scanned with CamScanner

requiring distension, irrigation, and lavage of the urinary bladder. It may be used for lavage of an indwelling catheter to maintain patency.

2933. Which among the following will be affected in a client with prostatectomy?
a. Erection function
b. Spermatogenesis
c. Production of seminal fluid
d. Ejaculatory function

2934. Which of the following complication require immediate attention in a patient who underwent prostatectomy?
a. Abdominal pain
b. Hemorrhage
c. Oliguria
d. Urinary incontinence

2935. Normal level of PSA is
a. 5–8 ng/ml
b. 0.3–0.8 ng/ml
c. 1–4 ng/ml
d. 4–5 ng/ml

2936. During bladder irrigation with a three-way urinary catheter following prostatectomy client complains of bladder spasms with the catheter in place. The best nursing advice is .....
a. Remove the catheter
b. Insert new catheter
c. Educate Kegel exercises
d. This feeling is normal and he should not try to urinate around the catheter

2937. Congenital factor related to male that is responsible for infertility includes
a. Undescended testes
b. Hypospadias
c. Kartagener syndrome
d. All of the above

2938. All among the following are characterized by raised scrotal temperature EXCEPT
a. Varicocele
b. Big hydrocele
c. Filariasis
d. BPH

2939. Genetic condition characterized by azoospermic male is ...
a. Down's Syndrome
b. Edward syndrome
c. Klinefelter's Syndrome
d. Neurofibromatosis

2940. Male intersex is .....
a. Male gonads with female external genitalia
b. Female gonads with male external genitalia
c. Sex between two males
d. Sex between one male and one female

2941. Gonadotropin deficiency leads to testicular failure is known as .....
a. Exstrophy bladder
b. Kallmann Syndrome
c. Male pseudohermaphroditism
d. Bloom syndrome

2942. Gynaecomastia is present in .....
a. Altered ratio of estrogens to androgens
b. Klinefelter's syndrome
c. Increase in estrogen production
d. All of the above

Ans.

2933. c
2934. b
2935. c
2936. d
2937. d
2938. d
2939. c
2940. a
2941. b
2942. d

PERIOPERATIVE NURSING CARE

INTRODUCTION

- Peri-operative nursing is the roles and responsibilities during the three phases of surgery (pre-operative, intra-operative and post-operative) of the patients.
  - **Pre-operative:** This phase starts from the decision of surgery till the time the patient reaches on OT table.
  - **Intra-operative:** Starts from the time when the patient is brought inside OT till the time patient is transferred to the recovery area.
  - **Post-operative:** Begins when the patient is transferred to recovery area till the time patient undergoes a follow-up check up either in hospital setting or at home.
    - **Immediate postoperative stage:** 1–4 hour after surgery
    - **Intermediate postoperative stage:** 4–24 hour after surgery
    - **Extended postoperative stages:** 1–4 days after surgery
- Metformin is usually held 48 hour before surgery and restarted when full food and fluid intake has restarted and normal renal function has been resumed.
- Incentive spirometry contraindicated in some surgeries such as **craniotomy, eye, ear surgery.**
- **Deep breathing and coughing exercises** in the pre-operative and post-operative period helps to reduce respiratory complications in the client.

TYPES OF SURGERIES

- **Emergent:** Delay can be fatal e.g. Head-injury, intestinal obstruction, heavy bleeding, Gunshot injury etc.
- **Urgent:** Surgery can be delayed only up to 24 hrs. e.g. Ureteral stones, appendicitis etc.
- **Elective:** Surgery can be planned. e.g. Gall bladder stones, Total hip replacement, cataract etc.
- **Optional:** Decision to undergo surgery is optional e.g. Cosmetic surgeries

SURGICAL APPROACHES

- **Curative:** Treats disease/disorder
- **Ambulatory:** Patient gets discharge within 24 hours after surgery
- **Palliative:** Relieves symptoms only
- **Laparoscopic:** Uses small incisions and fiberoptic instruments. Requires insufflation of body cavity with CO_2.
- **Robotic:** Provides 3D view. Requires laparoscopic cameras, computer and robotic instruments. High quality of precision.

PREOPERATIVE NURSING CARE

Table 89

Preoperative nursing care	Description
Informed consent	• Obtaining informed consent is a surgeon's responsibility • Nurse has to verify that informed consent is taken • Nurse must ensure that patient has understood all aspects of surgery. • Minors, elderly, psychiatric patients may need a legal guardian to provide consent.
Preoperative Assessment	• Perform thorough physical examination and notify physician for any peculiar findings. • Take thorough history to assess any allergy to latex, rubber items, food substance, iodine, any medication etc.
Nutrition/ Elimination	• Check physician's orders for NPO status. • Withhold solid foods 6 hours before general anesthesia and 3 hours before local anesthesia. • Insert a large I/V cannula to administer fluids or blood products in case of emergency or for subsequent use. • Check physician's orders for bowel preparation especially in case of abdominal surgeries. • Administer laxatives/enema as per the hospital policy. • Document last meal or drinks taken along with time.
Preparation of Patient and Surgical site	• Instruct patient to remove nail-polish, jewellery, dentures contact lenses (if any), pins, any metal item. • Assess patient for any history of metal implant, pacemaker, prostheses etc. • Surgical site should be shaved and cleaned with anti-septic solution one day before surgery. • Put an identification band over patient's wrist. • Obtain all lab reports, ECGs, X-rays, CT scan etc and attach with patients file. • Administer pre-operative medication/ perform sensitivity test as prescribed by surgeon before shifting the patient to OT.
Patient centred teaching	• Teach deep breathing and coughing exercises • Teach diaphragmatic breathing. • **Incentive spirometry** ▪ Place mouthpiece tightly inside mouth. ▪ Inhale gently and try to lift all three balls/ flow rate indicator from 600 to 900. ▪ Try to hold balls for at-least 5 sec. ▪ Breathe out through pursed lips. • **Leg exercises** ▪ Gastrocnemius (calf –muscles) exercise- Point your toes up and down. ▪ Quadriceps (Thigh-muscles) exercise – Press and relax the back of the knee against bed alternatively. • **Foot exercise:** Rotate foot in circle (clockwise and anti- clock wise). • **Pain management** • Inform patient about pain-medications, side-effects, use of opioids. • Demonstrate the use of patient controlled analgesia (PCA), if preferred.

Contd...

Scanned with CamScanner

PREOPERATIVE PERIOD: NURSING RESPONSIBILITY

- Ensure NPO status of the client
- Assist the surgeon while getting informed written consent
- Ask about any known allergy
- Ask about previous and current medical history
- Collect current medication history such as anti-hypertensive, hypoglycaemic agents, anti-coagulants etc.
- Make sure that ordered investigations are done for the clients such as coagulation profile, CBC etc.
- Confirm the identification of patient before receiving him/her on the OT table.

INTRAOPERATIVE PERIOD: NURSING RESPONSIBILITY

Scrub Nurse

- Ensure surgical asepsis
- Provide all the instruments and materials required by surgical team for the surgery.
- Keep a count of instruments, sutures, needles and sponge used during surgery
- Coordinate with circulatory nurse

Circulatory Nurse

- Arrange supply and articles needed by surgical team
- Communicate the progress about the surgery to patient's relatives and recovery room staff.

PAIN

- Pain is defined as an unpleasant sensory perception caused by injury or illness.
- Pain is the fifth vital sign (although it is a symptom; not a sign)
- Pain theories
  - **The specificity theory:** There are specific pain receptors and pathways which exist to transmit pain signals to pain center in the brain.
  - **The pattern theory:** This theory asserts the existence of rapid and slow conduction pathway which conducts pain signal to the brain through spinal cord.
  - **The gate control theory:** This theory emphasizes that non-painful signal (input) closes the gates to painful signal (input). This prevents pain information from travelling to CNS. Hence non-painful stimulus can suppress the pain perception. This theory forms the basis for some non-pharmacological pain management techniques, i.e. distraction, acupressure and cutaneous stimulation, etc.
- Pain assessment
  - Wong-baker Pain Rating Scale

- Used in children aged more than three years to rate pain severity
  - Numerical rating scale

- Used among children and adult aged more than 10 years.

Dolorimeter: It is the instrument used to measure pain threshold and pain tolerance

  - Visual analogue scale
- This pain rating scale consists of a straight line between two extreme sensations of pain. i.e no pain at all to the most severe pain

Pain Management

TYPES OF ANESTHESIA

Table 90 Methods of administration of anesthesia

Types of anesthesia	Effects	Methods of administration
General anesthesia	• Loss of sensory perception of the entire body • Produce unconsciousness	• IV Infusion or inhalation
Regional anesthesia or nerve block anesthesia	• Loss of sensation over specific region of the body • No unconsciousness	• Spinal block • Epidural block • Regional block
Local anesthesia	• Loss of sensation over a small/limited area of the body • No unconsciousness	• Topical application or infiltration

Scanned with CamScanner

COMMON POSITIONS USED DURING SURGERIES

Table 91

Position	Picture	Surgeries used for
Supine/Dorsal position		Most common operative position, e.g. Laparotomy, certain Gynecological and Orthopedic cases.
Prone		Laminectomy, rectal surgery, surgery involves cervical spine, back and dorsal extremities
Trendelenburg Position (Head tilted down 15 degree)		Common position for laparoscopic surgery in pelvic or lower abdominal region

Contd...

Scanned with CamScanner

Position	Picture	Surgeries used for
Reverse Trendelenburg Position		Used for Head and Neck surgery to reduce venous congestion
Lateral of Kidney position		Renal surgery
Lithotomy		Vaginal surgery, vaginal delivery, perineal or rectal surgeries
Fracture Position (Supine with the pelvis stabilized against well padded vertical perineal post)		Common position for ORIF of hip or closed femoral nailing

Contd...

Scanned with CamScanner

Position	Picture	Surgeries used for
Knee-Chest Position		Sigmoidoscopy and laminectomy procedure
Semi-Fowler's & Fowler's positions		Craniotomies, Shoulder or breast reconstruction, ENT surgeries
Jacknife position		Common position for Hemorrhoidectomy or pilonidal sinus procedures.

SUTURES

- **Sutures or stitches:** As a method for closing cutaneous wounds.
- **Type A: According to nature of absorption**
  - **Absorbable suture:** Those which are absorbable and will break down harmlessly in the body within 60 days are known as absorbable. **Absorbable sutures include:** Polyglycolic acid sutures, Polyglactin 910, Catgut, Poliglecaprone 25 and Polydioxanone sutures.
  - **Nonabsorbable suture:** Manually removed if they are not left indefinitely. **Non-absorbable suture includes:** Polypropylene sutures, nylon (poylamide), polyester, PVDF, silk and stainless steel sutures.
- **Type B: On the basis of material structure**
  - **Monofilament** sutures and **multifilament** or **braided** sutures. Braided sutures provide better knot security whereas monofilament sutures provide better passage through tissues.
  - **Polyglycolic** acid is known for high quality and undoubted performance. Made-up of braided and coated 100% polyglycolic acid.
  - **Catgut** is pliable, absorbable, sterile, surgical suture composed of highly purified connective tissue. Chromic catgut lasts for 2–3 weeks and is used for ligatures and tissue suture.

Scanned with CamScanner

- **Braided suture** is usually made of natural products (silk, linen or cotton). It is acceptable in many situations, but is contraindicated in a wound that is, or may be, contaminated.
- **Poliglecaprone** suture is a fast absorbing suture made of a synthetic absorbable monofilament composed of glycolide and epsilon-caprolactone copolymer (usually called PGCL suture). It comes both dyed (violet) and un-dyed (clear), and is a monofilament suture.

SURGICAL NEEDLES

All surgical needles have three basic components:

- Eye (or Swage)
- Body
- Point

Figure 101 ■ Basic needle design

- **Round bodied:** For soft (subcutaneous) tissues such as muscle, fascia, mucous membrane. The middle of the needle is flat for better seating in the needle holder and easy entry.
- **Cutting:** For firm tissue, sclerotic vessels and prostheses.
- **Trocar:** Trocar needles have a sharp tip but a round body. They are useful necessary to perforate tough tissue.
- **Spatula needle:** For ophthalmic and microsurgery flattened needle body hand ground lateral.

Target High Extra Edge

Golden points to remember

- **Synalgia** is also called referred pain.
- The most common preventable complication of abdominal surgery is **Atelectasis**.
- Aspirin has a prolonged anti-platelet activity, therefore it should be stopped for at least 7 days prior to surgery.
- A common physiologic effect of spinal anesthesia is **Hypotension**, primarily due to blockade of the sympathetic nervous system causing arterial and venous vasodilation with subsequent "functional" hypovolemia.
- Postoperatively, a patient is started on **Clear Fluids** once bowel sounds can be heard.
- **NSAIDs** block the action of **Cyclooxygenase (COX)**, thereby interfering the production of prostaglandins and reducing pain.
- **Intrathecal** administration of analgesics involves insertion of catheter into **Subarachnoid Space**.
- **Eutectic Mixture of Local Anesthetics (EMLA)** (a combination of prilocaine and lidocaine) cream is applied to the site 30-60 minutes before the surgical procedure. It is used in minor surgeries.

"Feed a cold and starve a fever."

—C. Morley

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

PREOPERATIVE

2943. Pre-operative instructions to the client would include the following. EXCEPT *(AIIMS Bhopal Grade-I 2018)*
a. Deep breathing and coughing exercise
b. Continue anticoagulants
c. Lower limb exercises
d. Reassuring the client

2944. The reason why lipstick and nail-polish is removed before surgery is: *(RRB SSNE 2015)*
a. Surgery becomes easier
b. Surgery becomes more successful
c. Psychological benefits to the patient
d. Cyanosis is checked

2945. Which among the following pre-operative order is the most important order one day prior to the surgery?
a. Inform the family
b. Informed consent form
c. Physical examination
d. Respiratory exercises

2946. First nursing intervention while implementing pre-operative teaching to a client is .....
a. Assess the client's basic knowledge regarding the surgical procedure
b. Provide pre-medications
c. Assist the doctor for performing PAC
d. Get informed consent from the client

2947. All among the following are the components of pre-operative check list EXCEPT
a. NPO status
b. Checking for allergy
c. Part preparation
d. Completion of history and physical examination

2948. The last preoperative assessment of a client going for elective splenectomy will be:
a. Name band
b. Signed consent
c. Empty bladder
d. Vital signs

Explanation: Elective surgical procedure is planned and scheduled in advance. Checking of name band, obtaining consent and emptying bladder will be completed ahead of time. Vital signs assessment will be the last and final assessment before the surgery commences in elective procedure.

2949. The important nursing intervention prior to administration of pre-anesthetic medication is: *(ESIC Chennai May 2012)*
a. Ask patient to empty the bladder
b. Do deep breathing and coughing exercises
c. Shave the skin
d. Regulate IVF accurately

2950. To decrease the likelihood of bradyarrhythmias in children during endotracheal intubation, succinylcholine (Anectine) is used with which of the following agents?
a. Epinephrine (Adrenalin)
b. Isoproterenol (Isuprel)
c. Atropine sulfate
d. Lidocaine hydrochloride (Xylocaine)

2951. Alternative for skin closure rather than suture is .....
a. Glue
b. Staple
c. Dressing
d. Acticoat

2952. Nursing intervention to manage fear and anxiety associated with postoperative pain in pre-operative period is .....
a. Teach diversion activity
b. Allow the patient to communicate with another patient who underwent for the same procedure
c. Explain the procedures associated with pain assessment and management
d. Help the patient to ventilate the feeling

2953. Which among the following history increases the risk during surgical procedure?
a. Drug abuse
b. Previous surgery
c. Daily taking thyroxin
d. All of the above

2954. Atropine is a premedication given to the patient before surgery. Which among the following is the expected actions of atropine?
a. Reduce secretions
b. Prevent bradycardia
c. Prevent hypotension
d. All of the above

2955. In the preanesthetic orders a patient is to receive 6 mg of morphine sulphate, the ampoule contains 15 mg/mL. The nurse should administer approximately how much amount?
a. 0. 3 mL
b. 0. 4 mL
c. 0. 5 mL
d. 0. 6 mL

Explanation: Amount to be administered (A) – (desired dose/dose in hand)*amount in which the drug comes A = (6 mg/15 mg) *1 ml = 0. 4 ml

INTRAOPERATIVE

2956. Intravenous induction for general anesthesia is more commonly practiced because .....
a. Easy to administer
b. Cost effective
c. Induction is rapid and pleasant
d. Last for long time with fewer complications

2957. Dissociative anesthesia produced by .....
a. Haloperidol
b. Imipramine
c. Ketamine
d. Formaldehyde

Ans.
2943. b
2944. d
2945. b
2946. a
2947. d
2948. d
2949. a
2950. c
2951. b
2952. c
2953. a
2954. d
2955. b
2956. c
2957. c

Scanned with CamScanner

2958. In regional anesthesia patient
a. Become unconscious rapidly
b. Is conscious
c. Is able to recognize pain
d. Is having long term effects of anesthesia

Explanation: Regional anesthesia is the use of local anesthetics to block sensations of pain from a large area of the body, such as an arm or leg or the abdomen. Regional anesthesia allows a procedure to be done on a region of the body without being unconscious.

2959. Spinal anesthesia is given at
a. L1-L2 b. L2-L3
c. L3-L4 d. L4-L5

Explanation: Spinal needle is introduced at L3-L4 because the spinal cord ends before this level which helps to avoid injury to spinal cord.

2960. Which of the following is most dangerous complication during induction of spinal anesthesia? *(ESIC Chennai May 2012)*
a. Hyperthermia
b. Bradypnea
c. Tachycardia
d. Hypotension

2961. Common complications associated with spinal anesthesia includes all EXCEPT
a. Hypotension b. Hypothermia
c. Headache d. Urinary incontinence

2962. While scrubbing, nurse should .....
a. Scrub from hands to elbow
b. Scrub with mechanical friction.
c. Hold the hands higher than the elbows.
d. All of the above

2963. Who is responsible for coordinating all the activities with the surgical team and family while the surgery is going on?
a. Scrub nurse b. Circulatory nurse
c. Anesthetist d. Surgeon

2964. Which of the following procedure always requires surgical asepsis? *(Staff Nurse G II 2014)*
a. Colostomy irrigation b. Vaginal irrigation
c. Urinary catheterization d. Nasogastric tube insertion

2965. The most common, preventable complication of abdominal surgery is:
a. Thrombophlebitis b. Fluid and electrolyte imbalance
c. Urinary retention d. Atelectasis

Explanation: Atelectasis refers to a partial collapse of the small airways. The majority of post-operative patients will develop some degree of atelectasis, resulting in abnormal alterations in lung function or compromise to the lung's immune defense. Current theories suggest that airway collapse is due to a combination of airway compression, alveolar gas resorption intraoperatively and impairment of surfactant production. General anesthesia is another common cause of atelectasis.

POSTOPERATIVE

2966. Which of the parameter indicates infection in a postoperative patient? *(Daman & Diu NO 2018)*
a. White blood count of 6,000 cells/cu.mm
b. Presence of an indwelling urinary catheter
c. Rectal temperature of 37.8°C
d. Red, warm and tender incision site

Explanation:
- Surgical site infections (SSI) are most commonly caused by Staphylococcus aureus. Red, warm and tender incision site indicates infection in a postoperative patient. Any SSI may cause redness, delayed healing, fever, pain, tenderness, warmth, or swelling.
- WBC > 11000 indicates infection. Rectal temperature > 38°C is an indication for infection. Presence of urinary catheter is unrelated to surgical site infection.

2967. Which among the following parameter of a patient in postoperative unit require immediate attention?
a. Oxygen saturation of 85%
b. Respiratory rate of 14/min
c. Temperature of 980 F (38°C)
d. Blood pressure of 110/80 mm Hg

2968. Patient recovering from general anaesthesia should be positioned in: *(JIPMER 2012)*
a. Supine position b. Fowler's position
c. Trendelenburg position d. Side lying position

2969. In the immediate postoperative period nursing interventions are directed to prevent which of the following respiratory complication?
a. Atelectasis b. Emphysema
c. COPD d. ARDS

2970. Which among the following is the most appropriate intervention in the postoperative client to prevent respiratory complications?
a. Deep breathing and coughing
b. Use of an incentive spirometer
c. Both a and b
d. Oxygen administration

2971. How frequent should the nurse monitor the vital signs of the patient in the recovery room? *(ESIC Chennai May 2012)*
a. Every 15 minutes
b. Every 60 min
c. Every 30 min
d. Every 45 min

Explanation: Every 15 minutes the vitals need to monitor to find out the occurrence of any complication as early as possible.

2972. On the first post-operative day of a patient with abdominal resection procedure has been ordered opioid for pain relief. Which of the following critical aspects has to be considered before administration of an opioid injection to prevent respiratory depression? *(AIIMS Bhopal Grade-I 2018)*
a. Bowel movements b. Post-surgical blood loss
c. Level of consciousness d. Oxygen saturation

Explanation: Opioid induced respiratory depression is potentially life threatening and the cause of substantial morbidity and mortality. So, before administering opioid patient's oxygen saturation level should be monitored to assess the level of oxygenation or to prevent the complications due to respiratory depression.

2973. Which of the following would the nurse assess following assessment of vital signs in a patient who has undergone epidural anesthesia? *(ESI 2009)*
a. Ability to move legs sideways
b. Bladder distension
c. Dizziness
d. Headache

Ans.

2958. b
2959. c
2960. d
2961. d
2962. d

Scanned with CamScanner

Explanation: After epidural anesthesia, perineal area is the last area to return to sensation. So the nurse should monitor the patient for distended bladder to determine if the sensation is returned.

2974. A child in postoperative ward under observation after tonsillectomy is suspected to have postoperative hemorrhage when the child: *(Banaras HU 2015)*

a. Snores noisily
b. Become pale
c. Complains of thirst
d. Swallows frequently

2975. A patient has just returned from the post anesthesia care unit (PACU) after hemorrhoidectomy. His postoperative order includes sitz bath every morning. The nurse understand that sitz bath is necessary for *(Banaras HU 2015)*

a. Relive tension
b. Promote healing
c. Lower body temperature
d. Reduce pain

Explanation: Anticoagulants may increase the risk of bleeding post-operatively. Pre-operatively client is advised based on type of anticoagulant he/she used or about the associated risks. Example, if warfarin is used by the patient it should be discontinued 5 days before the surgery because of its long acting effect.

2976. The most important factor in the prevention of post-operative infection is: *(ESIC Chennai May 2012)*

a. Frequent change of wound dressings
b. Proper administration of antibiotics
c. Fluid intake of 2-3 L/day
d. Practice of strict aseptic techniques

2977. Most important postoperative teaching for a client scheduled for a vaginal hysterectomy?

a. Deep breathing and leg exercises
b. Kegel exercises
c. Vaginal pessaries
d. Sitz bath

Ans.

2974. d
2975. b

2977. a
2978. a
2979. a
2980. b
2981. d
2982. c

2978. In the recovery room patient is shivering uncontrollably. The first nursing intervention is .....

a. Provide blanket and continue oxygen
b. Take temperature of the patient
c. Provide warm IVF
d. Inform the surgeon

2979. Following surgery gas can be expelled out through .....

a. Ambulation and moving around
b. Insertion of flatus tube
c. Bearing down
d. Taking bed rest

2980. Which of the following is a function of prostaglandin I_2 or prostacyclin *(PGI2)*

a. Vasoconstriction
b. Inhibition of platelet aggregation
c. Helps in wound healing
d. Piloconstriction

2981. Risk factors for deep vein thrombosis (DVT) are .....

a. Prolonged surgery
b. Overweight and obesity
c. Hormonal contraceptive
d. All of the above

2982. After a child returns from post anesthesia care unit after surgery. Which of the following would the nurse assess first? *(RAK MSc 2018)*

a. The intravenous fluid access site
b. The child's level of pain
c. Surgical site dressing
d. Functioning of the nasogastric tube

Explanation:

- After Surgery, the child will be shifted to post anesthesia care unit or recovery Room. When assessing the postoperative patient, it is vital that the patient is observed for signs of hemorrhage, shock, sepsis and the effects of analgesia and anesthesia. So, the priority is to check the surgical site dressing for bleeding and drainage.
- While a child returns from post anesthesia care unit after surgery usually fluids are running.
- Level of pain can assess by pain scale when the child came out from anesthesia.
- While a child received with nasogastric tube after surgery usually X-ray is done for confirmation of nasogastric tube on site.

HOMEOSTASIS, EMERGENCY AND CRITICAL CARE NURSING

STRESS

- It is a physical or psychological reaction to real or perceived threat.
- Stress reaction increases cortisol (glucocorticoids and mineral-ocorticoids) levels in the blood.
- Prolonged physiologic stress responses may contribute to gastric ulcers, decreased immunity, infections, renal failure and result in damage to the body, resulting in problems such as kidney failure, gastric ulcers, and aggravation of an existing illness.
- The term "stress" was first used by the endocrinologist ***Hans Selye*** *(1930s)*
- General adaptation syndrome is a three-stage response that the body has to stress.

General Adaptation Syndrome (GAS)

There are three stages of GAS:

1. **Alarm stage**
   - It is the emergency response of the body in response to the stressor
   - There is a flight- or fight response.
   - Mainly mediated by sympathetic nervous system
     - Anxiety or fear; sorrow or depression; shock or confusion
2. **Resistance Stage**
   - If continuous stressor is present body tries to resist the effects
   - Hormonal responses of the body comes to play (adrenocorticotropic-ACTH- axis)
     - Cortisol secretion
   - But high level of Cortisol in the blood for longer time causes immune suppression, high BP
3. **Exhaustion Stage**
   - Inability to defend against stressors
   - Body's capacity to respond to stressors is been seriously compromised.
   - Person may become ill or can even die (due to the high Cortisol)

SHOCK

- Shock is a condition in which the systemic blood pressure is inadequate to deliver oxygen and nutrients to cellular function and vital organs.
- It is an acute medical condition associated with reduced perfusion to body tissues.

Stages of Shock

1. **Initial stage**
   - Decreased cardiac output results in reduced mean arterial pressure.
   - Increase in heart rate due to stimulation of sympathetic nervous system
   - Characterized by increased heart rate, decreased blood pressure, thirst, pale, cool, moist skin over the face.
2. **Compensatory stage**
   - Stimulation of sympathetic nervous system releases epinephrine and norepinephrine to maintain homeostasis.
   - Peripheral vasoconstriction caused by stimulation of α_1 adrenergic fibers assures more blood available for heart and brain.
   - Coronary and cerebral artery dilation occurs due to stimulation of beta adrenergic fibers. This results in increased cardiac output.
   - Increased renal sodium and water reabsorption results in increased cardiac output.
3. **Progressive stage**
   - Compensatory mechanisms become ineffective.
   - Impaired perfusion results in anerobic metabolism and cellular hypoxia
   - Renal ischemia stimulates renin-angiotensin-aldosterone system which further causes vasoconstriction.
4. **Irreversible stage**
   - Compensatory mechanisms are ineffective.
   - Coronary and cerebral tissue perfusion drops, and organ systems fail.

Classification of Shock Based on Etiology

- Hypovolemic shock
- Cardiogenic shock
- Circulatory or Disruptive shock

Table 92 Description of different types of shocks and their management

Type of shock	Description	Management
Hypovolemic shock	Occurs because of low blood volume **Causes** • **External fluid loss** such as vomiting, diarrhea, diuresis, Diabetes Insipidus, Trauma, surgery. • **Internal fluid shift** such as hemorrhage, burns, ascites, peritonitis and dehydration **Manifestations** • Rapid, irregular, and thready pulse. • Urine output less than 20 mL/hr or 480 ml/24 hrs.	**Crystalloids:** RL and NS are commonly used for fluid replacement **Colloids:** Albumin, Dextran and Hectastarch can also be used to replace fluid volume. Blood transfusion, if the cause is hemorrhagic shock **Position:** Trendelenburg is preferred because it promotes venous return **Medication:** Vasoactive drugs, e.g. Dobutamine, Dopamine, Epinephrine, Norepinephrine, vasopressine, Amrionone.

Contd...

Scanned with CamScanner

Type of shock	Description	Management
Cardiogenic shock	Heart is not able to perform its function. **Causes:** Myocardial infarction, cardiomyopathy, valve disease, cardiac tamponade, arrhythmia **Manifestations** • Anginal pain • Dysarrhythmia • cyanotic skin • jugular vein distension • pulmonary crackles	Supplemental oxygen Pain management Selected fluid support Vasoactive medications, e.g. Dobutamine, Nitroglycerine, Dopamine, Epinephrine, Norepinephrine, vasopressine, Amrionone and antiarrhythmic drugs. ***Cardiac supportive measures such as** pacemaker, ventricular assistive devices, Intra-aortic balloon pump (IABP), or Extracorporeal cardiopulmonary bypass*
Circulatory or Distributive shock (It includes septic shock, anaphylactic shock, neurogenic shock and hypodynamic shock)	• Results from excessive vasodilation and impaired distribution of blood flow. • Cardiac output is usually normal. • **Septic shock is the most common cause of disruptive shock.** • **Other causes:** Systemic inflammatory response syndrome (SIRS) • **Other non-infectious causes** include toxic shock syndrome, anaphylaxis, insect bites, transfusion reaction etc.	
	Septic shock: Occurs because of infection. Manifestation include rapid heart rate, warm, pink extremities and widening pulse pressure	Treat the underlying cause by administering broad spectrum antibiotics
	Anaphylactic shock: Occurs because of allergic reaction. Manifestation include feeling warm, abdominal pain, diarrhea, flushing, pruritus, urticaria.	Remove the causative antigen Epinephrine to restore vasoconstrictive action Diphenhydramine Albuterol (if histamine induced bronchospasm present)
	Neurogenic shock: Dilation of blood vessels because of the damage to sympathetic nervous system controlling it. Signs and symptoms include **bradycardia**, hypotension, hypothermia, dry warm skin.	Treatment of the underlying cause and restore sympathetic tone
	Hypodynamic shock: Narrowing pulse pressure, oliguria, cold extremities.	

Key Points

If the cause for hypovolemic shock is hemorrhage, then the use of Dextran is contraindicated because it interferes with the platelet aggregation.

Note

Calculation of Mean Arterial Pressure

There are two methods:

Method 1

Mean Arterial Pressure (MAP) = DBP + 1/3 (SBP – DBP)

Where, SBP – Systolic Blood Pressure and DBP – Diastolic Blood Pressure.

For e.g. if the SBP = 120 mm Hg and DBP = 75 mm Hg, the MAP is:

MAP = 75 + 1/3 (120 – 75)
= 75 + 45/3
= 75 + 15
= 90

Method 2

$$\text{Mean Arterial Pressure (MAP)} = \frac{\text{SBP} + (2 \times \text{DBP})}{3}$$

e.g. if the SBP = 120 mm Hg and DBP = 75 mm Hg, the MAP is

$$\text{MAP} = \frac{120 + (2 \times 75)}{3}$$
= (120 + 150)/3
= 270/3
MAP = 90

ANAPHYLAXIS

- Anaphylaxis is an acute allergic (immunologic) reaction to an antigen.
- **Release of IgE mediated chemicals** trigger rapid immune response.
- **Causes**
  - Common substances that causes anaphylaxis includes food, medications, contrast dyes, insect stings and latex.
  - Pea nuts, shellfish, fish, milk, soy, wheat and eggs are common food stuffs that causes anaphylactic reactions
- **Mild reaction:** Symptom begin within 2 hours of exposure. Characterized by fullness in the mouth, a warm sensation, sweating, clammy skin, peripheral tingling, nasal congestion, sneezing, pruritus, periorbital swelling, and tearing eyes.
- **Moderate reaction:** In addition to milder symptoms, itching, anxiety, warmth, and flushing may occur.
- **Severe reaction: Abrupt onset.** Symptom proceeds with bronchial spasm, laryngeal edema, dyspnoea, cyanosis, and fall in blood pressure. Cardiac arrest and coma may follow.
- **Treatment**
  - Epinephrine, antihistamines, and corticosteroids
  - **IV fluids:** Vasopressor agents and volume expanders to maintain blood pressure.
  - Corticosteroids and aminophylline to improve airway patency.

Scanned with CamScanner

- **Management**
  - Establish patent airway and maintain ventilation
  - Maintain patent IV access and administer **epinephrine**
  - **Antihistamines** to counter the effect of histamine
  - **Aminophylline** and **Albuterol** to reverse bronchospasm and wheezing
  - **Vasoactive drugs: Dopamine** to improve cardiac output
  - **Corticosteroids**
  - Vital signs monitoring
  - Teach the patient and family about specific allergen which caused anaphylaxis.

FLUID IMBALANCES

(Basics of Fluid and electrolyte balance have been discussed under chapter-I: Fundamentals of Nursing)

Types of Parenteral Solutions

Table 93 Types of solutions and their indications

Type of solution	Example	Indications
Isotonic solution	Normal saline (NS) or 0.9% sodium chloride lactated Ringer's solution (RL) 5% dextrose in water	• To increase extracellular fluid volume • To treat hypovolemia for electrolyte replacement
Hypotonic solution	Half-normal saline (0.45% sodium Chloride)	To expand the intracellular fluid compartment
Hypertonic solution	Dextrose 5% in normal saline solution (DNS) 10% dextrose in water 3% sodium chloride	• To correct severe hyponatremia • To treat hypoglycaemia

EDEMA

- Edema refers to excess fluid in the body tissues mainly in the ECF, may also present in ICF.
- It is an accumulation of fluid in interstitial space.
- Generalized edema is called anasarca.
- **Grading of edema**
  - 0+ : No pitting edema
  - 1+ : mild pitting edema .2 mm depression
  - 2+ : Moderate pitting edema .4 mm depressions
  - 3+ : Moderate severe pitting edema .6 mm depressions
  - 4+ : Severe pitting edema, 8 mm depressions

UNDERSTANDING ACID-BASE IMBALANCE

Table 94 Normal ABG values

Analyze	Normal value	Normal range
pH	7.40	7.35–7.45
$PaCO_2$ (mm Hg)	40	35–45
HCO_3^- (mmol/L)	24	21–28
PaO_2 (mm Hg)	100	80–110

Interpretation of ABG Values

The following chart explains how to interpret the lab results of ABG analysis:

Table 95

Acid-base disorders	pH	Primary change	Compensatory change
Metabolic acidosis	↓	HCO_3 ↓	$PaCO_2$ ↓
Respiratory acidosis	↓	$PaCO_2$ ↑	HCO_3 ↑
Metabolic alkalosis	↑	HCO_3 ↑	$PaCO_2$ ↑
Respiratory alkalosis	↑	$PaCO_2$ ↓	HCO_3 ↓

ROME – Respiratory Opposite; Metabolic Equal (relationship between pH and other parameters)

Figure 97

Scanned with CamScanner

CAUSES OF OTHER ACID-BASE DISORDERS

Table 96

Metabolic acidosis	Metabolic alkalosis	Respiratory acidosis	Respiratory alkalosis
• GI loss of HCO_3 ▪ Diarrhea, Cholera, Fistula • Renal loss of HCO_3 • Pancreatitis • Ureterosigmoidostomy • Ileostomy fluid loss • Metabolic disorders ▪ Lactic acidosis ▪ DKA ▪ Alcoholic ketoacidosis	• **Vomiting/gastric suction** • Pyloric stenosis • Diuretics • Hyperaldosteronism/ Conn's syndrome • **Cushing syndrome** • Bartter syndrome • **Hypokalemia** • $NaHCO_3$ infusion • **Multiple blood transfusion**	• **Asthma** • **COPD** • **ARDS** • **Obesity** • **Hypoventilation** • Myasthenia • Pneumothorax • Pulmonary edema	• **Normal pregnancy** • **High altitude residence** • CHF • **Hyperventilation syndrome** • Hepatic failure • Salicylate intoxication

ELECTROLYTES

Table 97

Electrolyte (Normal range)	Functions	Deficit leads to	Excess leads to
Sodium (135–145 mEq/L)	• Osmotic balance maintenance • Regulation of acid base balance. • Normal muscle irritability • Initiates and maintain heart beat	**Hyponatremia** **Causes** • Low sodium consumption • Increased loss of sodium • Over hydration • Use of diuretics • Increased ADH hormone • Addison's disease • Hypoaldosteronism. **Signs and symptoms** • Confusion, drowsiness, muscle weakness, seizure	**Hypernatremia** **Causes** • Dehydration • Diabetes insipidus • Cushing syndrome • Hyperaldosteronism ▪ *Prolonged cortisone use.* **Signs and Symptoms** • Thirst • Confusion • Neuromuscular excitability • Hyperreflexia Seizures • Coma
Potassium (3.5 – 5 mEq/L)	• Maintain intracellular osmotic pressure • Transmission of nerve impulse • Cardiac muscle activity • Regulation of acid-base balance.	**Hypokalaemia** **Causes** • Cushing syndrome • Prolonged cortisone use • Diuretics • Diarrhea • Vomiting. **Signs and symptoms** • Fatigue • Confusion • Cramps • Paralysis • Muscle weakness • Arrhythmia • ST wave depression and abnormal U wave.	**Hyperkalemia** **Causes** • Kidney failure • Potassium sparing diuretics • Burn wound • Tissue injury • Addison's disease. **Signs and symptoms** • Prolonged PR interval, spiked/peaked T wave.

Contd...

Scanned with CamScanner

Electrolyte (Normal range)	Functions	Deficit leads to	Excess leads to
Calcium (8.5-10.5 mg/dL).	• Development of bones and teeth • Nerve impulse transmission • Important role in muscle contraction	**Hypocalcemia** **Causes** • Deficiency of vitamin D • Hypoparathyroidism **Signs and symptoms** • Tetany • Positive **Chvostek sign** • Positive Trousseau's sign • Cramps • Neuromuscular irritability • Numbness • Spasm • Convulsion • Seizure • Osteoporosis	**Hypercalcemia** **Causes** • Bone cancer (Paget's disease) • Hyperparathyroidism • Hyperthyroidism • Sarcoidosis • Hypervitaminosis D **Signs and symptoms** • Excess urination • Dehydration • Nausea and vomiting • Muscle cramps and weakness • Flank pain • Bone pain • Confusion and coma (severe cases)

HEMORRHAGE

- Hemorrhage, also known as bleeding, refers to escape of blood from circulatory system through damaged blood vessels
- Most Common cause of Hypovolemic shock
- **Manifestations**
  - Cool and moist skin, fall in BP, tachycardia, increased capillary refill time and decreased urinary output
- **Management**
  - Control of external hemorrhage
    - Direct pressure over bleeding area
    - Injured part is elevated to arrest venous and capillary bleeding
    - **Tourniquet** is to be used only when all other methods fail to control bleeding (**as a last resort**)
  - Control of Internal bleeding
  - Fluid and blood volume replacement
  - Packed RBC is administered in case of severe blood loss.

Note

Use packed RBC in emergency situation when same group RBC is not available or cross matching is not possible

Table 98

Age/Gender criteria	Group of packed RBC
All patients under 16 years of age	Type O, Rh negative RBC's
Female of child bearing age (<50 years)	Type O, Rh negative RBC's
Male (>16 years) and Female (post menopausal)	Type O, Rh positive*

*Used only in life-threatening emergencies; there is a positive D-Immunization if When Rh-positive RBC's are used in an Rh-negative patient.

EMERGENCY NURSING - PRIORITIZATION OF CARE

- Airway with cervical spine protection
- Breathing and ventilation
- Circulation with hemorrhage control
- Disability-GCS
- Exposure, event and hypothermia

Figure 98 ▪ Triad of trauma death

PRIORITIES OF CARE AND TRIAGE CATEGORIES

Level 1 : Resuscitation (immediate clinical assessment)
Level 2 : Emergent
Level 3: Urgent (time critical)/potential life threatening
Level 4: Semiurgent /situational urgency
Level 5: Less/ nonurgent

- The patient who has been resuscitated is at risk for another episode of cardiac arrest.
- Orogastric tube is inserted if basilar skull fracture is expected.
- Antidotes generally have a shorter half-life, repeated dosing is often necessary.

Compartment syndrome is a painful, limb-threatening event. Do not elevate limb above the level of heart. Emergency fasciotomy is often required.

COMMON EQUIPMENT IN CRITICAL CARE AREA

Ventilator

It is a machine designed to provide artificial respiration to patients who are unable to breathe themselves.

Types of Ventilator

- **Transport ventilator:** They are small ventilators run with the help of AC or DC and the main purpose of this ventilator is to shift or transport patient from one area of hospital o other hospital.

Scanned with CamScanner

- **Intensive care ventilator:** They are large sophisticated equipment with greater control over parameters.
- **Neonatal ventilator:** These are the ventilators designed for small preterm babies to provide precise amount volume, pressure etc as needed by the baby.

Forms of Mechanical Ventilation

Positive Pressure Ventilator

- These ventilators achieve positive pressure in the airway of client through ET or tracheostomy tube.
- Positive pressure allows the air to flow into the lungs.

Negative Pressure Ventilator

- This type of ventilator creates negative pressure around patient's trunk and helps in breathing.

High Frequency Oscillatory Ventilation

- These types of ventilators provide respiratory rate four times that of the normal.

Terminologies Related to Ventilator

Fraction of inspired oxygen (FiO_2): Concentration of oxygen in the inspired air. Atmospheric air contain 21% of oxygen.
Tidal volume: Volume of air delivered to patient during each breath.
Respiratory rate/frequency: Number of breaths per minute.
Minute volume: Total volume of air move into the lung in a minute. It is the product of multiplication of tidal volume and respiratory rate /frequency.
Exhaled tidal volume: Volume of air coming out of patient's lung during exhalation.
Positive end expiratory pressure (PEEP): Positive pressure maintained in the airway at the end of expiration.

Modes of Ventilation

Volume Modes

- **Controlled mandatory ventilation (CMV):** Ventilator delivers set number of breaths at set volume which is independent of patient's effort.
- **Assist/controlled ventilation (ACV):** Ventilator provides pre-set number of breaths at pre-set volume. When the patient initiate breathing effort ventilator will provide pre-set volume of assisted breath.
- **Synchronized intermittent mandatory ventilation (SIMV):** In this mode there are mandatory breaths as well as spontaneous breaths. Ventilator provides pre-set number of breaths with pre-set volume. In between these mandatory breaths, patient will try to have spontaneous breaths. If patient's spontaneous breath is near to the time of mandatory ventilation, both breaths will be synchronized.

Pressure Modes

Continuous positive airway pressure (CPAP): Positive airway pressure is applied throughout the respiratory cycle of a spontaneous breathing patient. **Positive pressure applied at the end of the expiration helps to prevent the collapse of the alveoli.**

Bi-level positive airway pressure: Two level of airway pressure is applied. A higher level of inspiratory airway pressure and a lower level of expiratory airway pressure.

DEFIBRILLATOR

- Application of pre-set electrical current to myocardium which converts dysrhythmia to normal rhythm.
- **Indication:** Definitive treatment for ventricular fibrillation, pulseless ventricular tachycardia.

Types

- Manual external defibrillator
- Automated external defibrillator
- Implantable cardiac defibrillator

Figure 99 ■ Manual external defibrillator

Figure 100 ■ Automated external defibrillator (AED)

Energy Levels for Defibrillator

- Monophasic: 360 J
- Biphasic: 120-200 J

Electrodes Placement

- **Anteroapical:** One pad/paddle is placed to the right of the sternum just below the clavicle, and the other is centered lateral to the normal cardiac apex in the anterior or midaxillary line (V5-6)
- **Anteroposterior:** The anterior pad/paddle is placed over the praecordium or apex, and the posterior pad/paddle is placed on the back in the left or right infrascapular region.

Scanned with CamScanner

Figure 101 ■ Placement of electrodes

STAGES OF DEATH AND DYING (KUBBLER ROSS STAGES OF DYING)

Stages (DABDA)

- **Denial (D):** Shock, doubt and disbelief about the loss are the primary response.
- **Anger (A):** Characterized by anger often towards others. This stage is often very short-lived.
- **Bargaining (B):** When denial and anger fail to work, people make an effort to bargain for a better outcome rather than a current situation.
- **Depression (D):** When it becomes obvious that the loss/death is obvious, people feel depressed characterized by persistent sadness. This stage is important one to go through. If a person is able to complete the stage of depression successfully, the acceptance will follow.
- **Acceptance (A):** In this stage, the person gradually and peacefully accepts death. He quietly accepts the arrival of death.

Nursing Management

- Assist the client make final plans towards death.
- Encourage reminiscence
- Help the client in validation of self-image.
- Use touch as a communication tool if it is acceptable to the client.
- Provide spiritual support.

Nursing Next Live & visit the section
Target High Extra Edge

Golden points to remember

- **General Adaptation Syndrome (GAS)** is composed of 3 stages (in sequence):
  1. Alarm reaction
  2. Stage of resistance
  3. Stage of exhaustion
- An increased metabolic rate intensifies water loss. There is a **7%** increase in metabolism for every **1°F** increase in temperature above **100°F** or a **13%** increase for every **1°C** increase.
- Causes of **Hypokalemia** include vomiting, diarrhea, prolonged GI suction and prolonged IV therapy.
- **Hypokalemia** is deficiency of potassium in blood.
- **Signs of Hypocalcemia:** Trousseau's sign/carpopedal spasm, Chvostek's sign.
- **Trousseau's Sign** is a sign of tetany in which carpal spasm can be elicited by compressing the upper arm and causing ischemia to the nerves distally.
- **Sulkowitch Test** is used to measure the calcium content in urine mainly in hypocalcemia.
- Do not use sterile water to flush the NG tube, as it has a pH of **4.5** and could cause **Metabolic Acidosis**.
- **Perineal Hematoma** after trauma occurs due to Rupture of bulbar urethra.
- If the cause for hypovolemic shock is hemorrhage, then the use of **Dextran** is contraindicated because it interferes with the platelet aggregation.
- **IgE mediated chemicals** are associated with **Anaphylactic** reaction.
- **Alarm reaction, Resistance and Exhaustion** (in same sequence) are the three stages of General Adaptation Syndrome (GAS) of stress.
- Sympathetic nervous system is responsible for **Fight of Flight response.**
- During compensatory stage of shock, **sympathetic nervous system releases epinephrine** and norepinephrine to maintain homeostatic.
- Cardiac output is usually normal in **Circulatory/Distributive Shock.**
- Most frequently encountered acid base disorder is **Respiratory Alkalosis.**

Contd...

Scanned with CamScanner

- Acid base disorder seen in normal pregnancy is **Respiratory Alkalosis.**
- Fever of >41.5°C (>106.7°F) is called hyperpyrexia.
- The pathway through which a cell produces the maximum number of ATP molecules is **TCA cycle.** It produces 38 ATPs in total (34 from oxidative phosphorylation + 4 from substrate level phosphorylation).
- **Atropine** is the antidote for **organophosphorus poisoning.**
- The antidote for atropine positioning is **Physostigmine.**
- A food item commonly associated with Bacillus cereus food poisoning is **Fried Rice.**
- K bind is given for patients with **Hyperkalemia** to reduce the serum potassium level.
- **The Revised Trauma Score (RTS)** is made up of a combination of results from three categories: Glasgow coma scale, systolic blood pressure, and respiratory rate.
- A 25-year-old male presents with road traffic accidents with a BP of 100/80 mm Hg and a pulse of 84/min. Best fluid for resuscitation is Crystalloid.
- In Salicylates (Aspirin) overdose there is metabolic acidosis with respiratory alkalosis.
- The commonest drug which is administered during an anaphylactic reaction is injection **Epinephrine/Adrenaline.**
- **Capnography** is a noninvasive method for monitoring the level of CO_2 in exhaled breath to assess a patient's ventilatory status. The CO_2 detector should change color from purple to yellow.
- The elderly individual is at greater risk for **Dehydration** because the compensatory mechanism works less efficiently in old age.
- In a stroke patient, the best position for the insertion of NG tube is **High Fowler's position.**
- **Pulse pressure** is the difference between the systolic and diastolic blood pressure. Normal is 30-50 mm Hg.
- **Assessment of Client's Response** is the first step when a nurse finds a collapsed patient.
- **For Adult CPR:** Chest compression to ventilations ratio is 30:2. (single or two rescuer)
- **For Child CPR:** Chest compression to ventilations ratio is 30:2 for single rescuer. 15:2 for two rescuers.
- **Positive End-Expiratory Pressure (PEEP)** is the positive pressure that will remain in the airways at the end of the respiratory cycle (end of exhalation) that is greater than the atmospheric pressure in **Mechanically Ventilated Patients.**
- **Positive-End-Expiratory Pressure (PEEP)** in ventilator is given to prevent collapse of alveoli.
- **Normal Intracranial Pressure** (ICP) is 5-15 mmHg.
- **Morphine** is contraindicated in a patient with head injury. Morphine should only be used in head injury patients if it is extremely essential.
- Symptoms of "**Opioid Overdose Triad**" is pinpoint pupils, respiratory depression and unconsciousness.
- Drastic drop in blood pressure may be seen in **Neurogenic Shock.**
- Increased heart rate or pulse rate is the early sign of **Hemorrhagic Shock.** It happens as a compensatory mechanism due to the release of epinephrine.
- Protecting the client from injury is the immediate priority during a **Seizure.**

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

FLUID AND ELECTROLYTE BALANCE

2983. In healthy individuals, plasma osmolality ranges from: *(AIIMS-BBS SNO 2019)*
a. 300-310 mOsm/kg of H_2O
b. 270-280 mOsm/kg of H_2O
c. 280-295 mOsm/kg of H2O
d. 320-325 mOsm/kg of H_2O

2984. Physiological process which is responsible for maintaining fluid balance across the intracellular and extracellular compartments mainly by
a. Osmosis
b. Facilitated diffusion
c. Simple diffusion
d. Active transport

2985. Which of the following is the function of sodium in the body? *(Kerala PSC, Nov 2014)*
a. Formation of bones
b. Functioning of skeletal muscle
c. Functioning of cardiac muscle
d. Maintenance of serum osmolarity

2986. The percentage of water in human body is: (JIPMER 2012)
a. 60%
b. 80%
c. 35%
d. None of these

2987. The blood contains: *(LNJP H D 2012)*
a. 95% of water
b. 60% of water
c. 90% of water
d. 80% of water

2988. Fluid compartment of blood is .....
a. Lymph
b. Plasma
c. Intracellular fluid
d. Extra cellular fluid

2989. Which of these statements is TRUE regarding total body water?
a. The intra cellular fluid compartment constitutes ½ of the total body water.
b. The ECF compartment comprises about 40% of the body weight.
c. About 10% of ECF compartment is comprised of plasma.
d. The interstitial fluid constitutes about ¾ of the ECF compartment.

2990. Hyperkalaemia refers to
a. High chloride
b. High potassium
c. High calcium
d. High sodium

2991. All the following systems are involved in maintaining fluid and electrolyte balance EXCEPT
a. Muscle system
b. Urinary system
c. Integumentary system
d. Digestive system

2992. Movement across fluid compartments is controlled by
a. ATP
b. Sodium
c. Osmatic and hydrostatic pressures
d. Potassium

2993. One among the following is the reason for developing edema that is .....
a. Dehydration
b. Excessive water intake
c. Hyponatremia
d. Lymphatic blockage

2994. Aldosterone is directly regulating the concentration of ..... electrolyte
a. Calcium
b. Potassium
c. Sodium
d. Chlorine

2995. Active transport requires .....
a. ATP
b. ADP
c. Electrolyte
d. Buffer system

2996. The ability of an organism to maintain internal stability to compensate for environmental changes is termed as
a. Adaptation
b. Homeostasis
c. Tolerance
d. Survival

Explanation: The tendency of the body to maintain a condition of balance or equilibrium within its internal environment, even when faced with external changes. A simple example of homeostasis is the body's ability to maintain an internal temperature around 98. 6°F, whatever the temperature outside.

2997. Movement of particles (ions or molecules) from an area of higher concentration to an area of lower concentration is referred as
a. Inhibition
b. Ultrafiltration
c. Diffusion
d. Osmosis

2998. Diffusion of water from a hypotonic solution into a hypertonic solution across and selectively permeable membrane is referred as
a. Active transport
b. Osmosis
c. Diffusion
d. Filtration

2999. Administration of 3 L of 5% dextrose solution will provide
a. 400 kilocalories
b. 600 kilocalories
c. 900 kilocalories
d. 1200 kilocalories

Explanation: 1 L of 5% dextrose contains 50 g of glucose. Each gram of glucose (carbohydrate) provides 4 kcal. Therefore 3 L × 50 g × 4 kcal = 600 kcal.

3000. Which complication of IV infusion can cause pulmonary edema or heart failure? *(RRB SSNE 2015)*
a. Infiltration
b. Circulatory overload
c. Infection
d. Pyrogenic reactions

3001. Potassium intake is restricted in: *(Staff Nurse G II 2014)*
a. Cardiac failure
b. Liver failure
c. Renal failure
d. Lung failure

3002. Parenteral preparation of potassium should be administered slowly to prevent: *(JIPMER 2012)*
a. Acidosis
b. Cardiac arrest
c. Respiratory arrest
d. Over load

Ans.
2983. c
2984. c
2985. d
2986. a
2987. d
2988. b
2989. d
2990. b
2991. a
2992. c
2993. d
2994. c
2995. a
2996. b
2997. c
2998. b
2999. b
3000. b
3001. c
3002. b

Scanned with CamScanner

3003. The IV fluid of choice in a patient with severe dehydration *(ISRO)*
a. 5% Dextrose
b. Dextrose Normal Saline (DNS)
c. IV albumin
d. Ringer Lactate

3004. Which of the following is the best guide for fluid administration?
a. Urine output
b. CVP
c. HR
d. Blood pressure

Ref: S Pandya 2/e, P. 47

Explanation:
- The best single indicator of adequate fluid resuscitation is the urine output on an hourly basis. Adequate end-organ perfusion is best indicated by urine output of > 0.5 to 1 mL/kg/h.
- Hypotension is a late finding in hypovolemic shock; so, pulse rate is a much more sensitive monitoring parameter than arterial blood pressure.

3005. Which type of solution causes water to shift from the cells into the plasma?
a. Hypertonic
b. Hypotonic
c. Isotonic
d. Alkaline

3006. Which can be given in hemorrhagic stroke?
a. Isotonic fluids
b. Colloids
c. Blood transfusion
d. Packed RBC

3007. In hypoalbuminemia there is
a. Increase in extra cellular fluid
b. Decrease in extra cellular fluid
c. Increases in intracellular fluid
d. Decrease in intracellular fluid

3008. Calculate set rate in an infusion pump to administer 100 ml of NS over 2 hours?
a. 20 ml/hour
b. 40 ml/hour
c. 50 ml/hour
d. 100 ml/hour

3009. After IV fluid administration balance between intracellular and extra cellular fluid is established through ..... process
a. Osmosis
b. Diffusion
c. Active transport
d. All of the above

3010. Poorly controlled diabetes with blood sugar of 450 mg% is associated with:
a. Hyponatremia
b. Hypernatremia
c. Hypokalemia
d. Hypomagnesemia

Explanation: Glucose produces a drop in the serum sodium concentration by a factor of 1.6 mEq/L–2.4 mEq/L for each 100mg/dL increase in serum glucose greater than 100 mg/dL. [Ref: Harrison's 19th/e pg. 299]

3011. Hypokalemia causes death due to
a. Diastolic arrest
b. Bidirectional Tachycardia
c. Respiratory insufficiency
d. Systolic arrest

3012. Important nursing intervention while caring for a client with hyponatremia includes
a. Fluid restriction
b. Provide isotonic saline
c. Administer potassium as ordered by physician
d. Provide NG feed

3013. All are used for management for hypernatremia except?
a. 5 % dextrose in water
b. Indomethacin
c. Nil by mouth
d. N/2 in 5% dextrose

3014. Most common cause of hypernatremia?
a. Sweating
b. Carcinoid syndrome
c. Primary hypodipsia
d. Renal losses

3015. Ideal fluid to provide in fluid volume deficit is .....
a. DNS
b. 0.45% saline
c. Lactated Ringer's
d. 5% dextrose in 0.45% saline

3016. A convulsion during diarrhea is because of?
a. Hypokalemia
b. Hyponatremia
c. Hyperkalemia
d. Hypernatremia

3017. In hyperphosphatemia, the electrolyte that needs to be provided is
a. Potassium
b. Calcium
c. Sodium
d. Magnesium

3018. Hypokalemia is seen in all, EXCEPT
a. Vomiting
b. Hyperaldosteronism
c. Administration of loop diuretics
d. Rhabdomyolysis

3019. Which among the following signs need to be reported to the physician of a client receiving loop diuretic?
a. Restlessness and agitation
b. Irregular cardiac rhythm
c. Weak, irregular pulse and poor muscle tone
d. Chvostek's sign

3020. Electrolyte needs to be replaced in a client receiving furosemide (Lasix) is .....
a. Sodium
b. Potassium
c. Chlorine
d. Magnesium

3021. The Maximum concentration of potassium delivered via central vein is?
a. 20 mmol/hr
b. 40 mmol/hr
c. 60 mmol/hr
d. 100 mmol/hr

(Ref: Harrison's 19th ed. pg. 307)

Explanation:
- IV potassium therapy:
  - Via peripheral vein = 20-40 mEq of KCl per liter.
  - Via central vein = 10–20 mEq of KCl per hour

3022. Identify the electrolyte imbalance which is responsible for weakness, vertigo and convulsions?
a. Hypomagnesemia
b. Hypocalcemia
c. Hypokalemia
d. Hypophosphatemia

3023. Hypotonic solution among the following is .....
a. 0.45 NS
b. 0.9% NS
c. 10% Dextrose
d. 25% Dextrose

3024. Isotonic solution among the following is .....
a. 0.33% NS
b. 0.9% NS
c. Dextran
d. 50% Dextrose

3025. Hypertonic solution among the following is .....
a. 0.33%NS
b. 0.9%NS
c. 5% Dextran
d. 50% Dextrose

3026. Colloid solution among the following is .....
a. 0.33%NS
b. 0.9%NS
c. Dextran
d. 50% Dextrose

Ans.

3003. d
3004. a
3005. a
3006. a
3007. a
3008. c
3009. a
3010. a
3011. c
3012. a
3013. c
3014. d
3015. c
3016. b
3017. b
3018. d
3019. c
3020. b
3021. a
3022. a
3023. a
3024. b
3025. d
3026. c

Scanned with CamScanner

3027. Nurse Hema is totaling the intake and output for a patient. The patient diagnosed with septicemia who is on a clear liquid diet. The client intakes 4 oz of orange juice, 900 ml of water, 8 oz ml of soup, and 1000 ml of half-normal saline solution and outputs 1,400 ml of urine during the shift. How many milliliters should the nurse document as the patient's intake.

a. 2160 ml b. 2260 ml
c. 2500 ml d. 2380 ml

Explanation: 1 oz = 30 ml

Total input:

4 oz of Orange juice	= 120 ml
8 oz of soup	= 240 ml
Water	= 900 ml
Half NS	= 1000 ml
Total	**= 2260 ml**

3028. Fluid loss first occurs from .....

a. Intracellular b. Intravascular
c. Extravascular d. Interstitial

3029. Insensible losses of water per day are:

a. 400 ml per day b. 1200 ml per day
c. 800 ml per day d. 1500 ml per day

3030. In an adult, fever increases water losses by ..... ml/day/°C:

a. 70 b. 175
c. 350 d. 600

Explanation: With fever, each degree rise in temperature above 98.6°F (37°C) adds 2.5 mL/kg/day to normal insensible water loss. Average weight of an adult is 70 kg. So 70 × 2.5 = 175 ml. Normal daily insensible water loss is nearly 600-900 mL.

3031. Immediate management of choice to restore B.P. and peripheral circulation is .....

a. Trendelenburg position b. Ringer lactate
c. Colloids d. Inotropes

3032. Hypercalcemia can cause all EXCEPT

a. Confusion b. Muscle weakness
c. Oliguria d. Loss of appetite

3033. Hypercalcemia can cause .....

a. Fracture b. Muscle spasms
c. Renal insufficiency d. Seizure

3034. Cause of hypercalcemia

a. Hypoparathyroidism b. Renal tubular acidosis
c. Less intake of vit D d. Increased calcitriol

3035. Select the cause of hypercalcemia from the following

a. Primary hyper parathyroidism
b. Excess vitamin D
c. Acute pancreatitis
d. Both a and b

3036. Signs related to hypocalcaemia is .....

a. Chvostek's sign
b. Trousseau's sign
c. Tenderness at McBurney's point
d. Both a and b

3037. Twitching of the facial muscles in response to tapping over the area of the facial nerve.

a. Chvostek's sign
b. Trousseau's sign
c. Tenderness at McBurney's point
d. Allen's test

3038. Carpopedal spasm caused by inflating the blood-pressure cuff to a level above systolic pressure for 3 minutes

a. Chvostek's sign b. Trousseau's sign
c. Mac Burney's point pain d. Allen's test

3039. Positive Chvostek's and Trousseau's signs are early indications of: *(Kerala PSC, Nov 2014)*

a. Rickets b. Addison's disease
c. Tetany d. Cushing's syndrome

3040. Hyperkalemia is caused due to all of the following EXCEPT:

a. Addisons disease
b. Acute renal failure
c. Excess hemolysis
d. Alkalosis

3041. Hyperkalemia can be managed with

a. Sodium b. Dextrose with insulin
c. Dextrose with calcium d. Sodium nitroprusside

3042. K Bind is given for patients with: *(Daman & Diu NO 2018)*

a. Hypernatremia b. Hypokalemia
c. Hyperkalemia d. Hyponatremia

Explanation: K Bind Sachet contains Calcium Polystyrene Sulfonate as an active ingredient. K Bind Sachet works by swapping calcium for potassium in large intestine. It is used for the treatment of hyperkalemia (high potassium levels) associated with kidney conditions.

3043. Non-inflammatory edema occurs due to .....

a. Raise in intravascular hydrostatic pressure
b. Decreased plasma oncotic pressure
c. Obstruction in the lymphatic flow channels
d. All of the above

3044. When administering large volume of colloids nurse need to monitor for .....

a. Adventitious respiratory sounds
b. Interstitial edema
c. Hypotension
d. Both a and b

3045. Abrupt stoppage of vasoactive medication will lead to .....

a. Hemodynamic instability
b. Increase in cardiac output
c. Anaphylactic reaction
d. All of the above

3046. Which of the following electrolyte is most frequently administered in conjunction with furosemide?

a. Sodium b. Chloride
c. Calcium d. Potassium

3047. Which among the following electrolyte imbalance manifest with confusion and lethargy?

a. Hyperkalemia b. Hypermagnesaemia
c. Hypercalcemia d. Hypocalcemia

3048. The electrolyte imbalance that needs to be suspected in a client receiving furosemide is

a. Hyperkalemia b. Hyperphosphatemia
c. Hypokalemia d. Hypernatremia

3049. Phosphorus binders are administered

a. 1 hour after food b. 1 hour before food
c. With food d. Bed time

3050. Choose phosphate binder drug from following

a. Calcium carbonate
b. Calcium acetate
c. Sevelamer hydrochloride
d. All of the above

Ans.

3027. b
3028. b
3029. c
3030. b
3031. b
3032. c
3033. c
3034. b
3035. d
3036. d
3037. a
3038. b
3039. c
3040. d
3041. b
3042. c
3043. d
3044. d
3045. a
3046. d
3047. c
3048. c
3049. c
3050. d

Scanned with CamScanner

ACID-BASE IMBALANCES

3051. Regulation of pH within the body is done by: *(AIIMS Nagpur NO 2018)*

a. Spleen b. Liver
c. Heart d. Kidney

Explanation: *Kidneys* help control acid-base balance by excreting hydrogen ions and generating bicarbonate that helps *maintain* blood plasma *pH* within a normal range

3052. What is the normal pH of blood? *(Kerala PSC, Nov 2014)*

a. 6.65-6.45 b. 5.35-6.0
c. 7.35-7.45 d. 6.35-7.0

3053. Most abundant buffer in blood is

a. Bicarbonates b. Hemoglobin
c. Protein d. Phosphate

3054. Which lab test is useful to find out the blood pH

a. Arterial blood gas (ABG) levels
b. X-ray
c. Ventilation perfusion match
d. Blood electrolyte

3055. Features of metabolic acidosis?

a. Low plasma bicarbonate
b. High plasma CO_2
c. pH above 7.45
d. Both a and b

3056. ABG values pH: 7.6 $PaCO_2$: 30 mm Hg, HCO_3: 24 mEq and normal PaO_2 suggests .....

a. Respiratory acidosis b. Respiratory alkalosis
c. Metabolic acidosis d. Metabolic alkalosis

3057. ABG analysis of an adult patient is as follows: pH = 7. 29, $PaCO_2$ = 47, and HCO_3 = 24. This can be interpreted as

a. Metabolic acidosis b. Metabolic alkalosis
c. Respiratory acidosis d. Respiratory alkalosis

Explanation: pH below 7.35 indicates acidosis. An elevated $PaCO_2$ indicates the acidosis is due to respiratory problem. So the condition is respiratory acidosis.

3058. pH= 7.55, pCO_2 = 38, HCO_3 = 33, what is the primary abnormality:

a. Respiratory alkalosis b. Metabolic acidosis
c. Respiratory acidosis d. Mixed alkalosis

(Ref: Harrison's 19th ed. pg. 322)

Explanation:

- Interpretation of ABG
  - pH = 7.55 Alkalosis (>7.4)
  - PCO_2 = 38 Low (<40) → Hence alkalosis
  - HCO_3 = 33 High (>24) → Hence alkalosis
- Thus, this ABG shows mixed acid base disorder with both respiratory and metabolic alkalosis [Hint: Think of mixed disorder when "Same direction rule" does not follow]

3059. Which of the following nursing intervention is the most appropriate for the client who is developed respiratory alkalosis due to hyperventilation?

a. Encourage slow, deep breath
b. Start low-flow oxygen therapy
c. Administer Sodiumbicarbonate
d. Administer Ringer Lactate solution

Explanation: The carbondioxide level of hyperventilated patient is low that lead to respiratory alkalosis. In order to increase the carbon-dioxide concentration, the patient should be encouraged to slow, deep breath which will retain carbondioxide and reverse alkalosis.

3060. The cause for respiratory acidosis among the following is: *(AIIMS BPL NO 2018)*

a. Hyperventilation b. Excessive vomiting
c. Respiratory obstruction
d. Diabetic ketoacidosis

Explanation: Respiratory acidosis develops when the lungs do not expel carbon dioxide adequately (inadequate ventilation), a problem that can occur in disorders that severely affect the lungs (such as chronic obstructive pulmonary disease, severe pneumonia, and asthma).

3061. Reason behind metabolic alkalosis after massive blood transfusion is .....

a. Anticoagulant sodium citrate will be metabolized to sodium bicarbonate
b. Because of hemolysis of RBCs
c. Electrolyte imbalance in potassium will cause this
d. All of the above

3062. Which among the following metabolic abnormality is seen in a client with vomiting?

a. Metabolic acidosis b. Metabolic alkalosis
c. Hypokalemia d. Both b and c

3063. Interpret the following lab report of ABG analysis: pH = 7.27, HCO3– = 10 mEq/dl pCO_2 = 23 mm Hg:

a. Respiratory alkalosis b. Metabolic alkalosis
c. Respiratory acidosis d. Metabolic acidosis

3064. Best for management of respiratory alkalosis?

a. Mechanical ventilation
b. IPPV
c. Normal saline
d. Rebreathing in paper bag

(Ref: Harrison's 19th/e pg. 324)

Explanation:

Treatment	Metabolic Acidosis	Bicarbonate administration
		Correction of hydration and electrolytes
	Metabolic Alkalosis	Correction of hydration & electrolytes
		H_2 blocker/Proton pump inhibitor
		IV isotonic saline/KCl (avoid Ringer lactate)
		Dilute HCl (rarely)
		Dialysis
	Respiratory Acidosis	Potent airway and adequate oxygenation
		Mechanical ventilation
		Alkali therapy
	Respiratory Alkalosis	O_2 supplementation
		Rebreathing in paper bag
		Pretreatment with acetazolamide before going to high altitude.

3065. When Allen's test is performed?

a. Before venous line insertion
b. Before CVP line insertion
c. Before femoral arterial line insertion
d. Before ABG sampling

Ans.

3051. d
3052. c
3053. a
3054. a
3055. a
3056. b
3057. c
3058. d
3059. a
3060. c
3061. a
3062. d
3063. d
3064. d
3065. d

Scanned with CamScanner

SHOCK AND ITS MANAGEMENT

3066. **Vasoconstrictors should not be used in:** *(Safdarjung NO 2018)*
a. Neurogenic shock
b. Hemorrhagic shock
c. Secondary shock
d. Hypotension due to spinal anesthesia

Explanation:

- Vasoconstrictors should not be used in hemorrhagic shock as it may lead to severe arteriolar vasoconstriction causing tissue ischemia. In hemorrhagic shock, the body's normal response is vasoconstriction to divert blood towards the vital organs, severe vasoconstriction may cause the tissue hypoxia and anaerobic respiration and death.
- While in other shocks, vasoconstrictors are recommended to combat the hypotension.

3067. **In shock primarily, there is:**
a. Metabolic waste accumulates
b. Poor perfusion of tissues
c. Decreased cardiac contraction
d. Skeletal muscle become fatigue

3068. **Shock resulting from severe allergic reaction is**
a. Septic shock
b. Anaphylactic shock
c. Neurogenic shock
d. Traumatic shock

3069. **Shock due to overwhelming infection is known as .....**
a. Anaphylactic shock
b. Cardiogenic
c. Neurogenic shock
d. Septic shock

3070. **Shock due to spinal cord injury is known as .....**
a. Anaphylactic shock
b. Cardiogenic
c. Neurogenic shock
d. Septic shock

3071. **What should the initial action of a medical-surgical nurse be if a patient develops slurred speech and disorientation to time and place' who sustained a head injury 24 hours ago?** *(AIIMS BPL SNO 2018)*
a. Recheck the patient's neurologic status in 15 minutes
b. Prepare the patient for emergency surgery
c. Continue the hourly neurologic assessments
d. Inform the neurosurgeon of the patient's status

Explanation: Slurred speech and disorientation to time and place reflects the sign of concussion which should be treated as early as possible, so the neurosurgeon should be notified soon. Prepare the patient for emergency surgery only if neurosurgeon orders.

3072. **After falling from a 10 feet ladder, a patient is brought to the emergency department. The patient is alert, reports back pain, and difficulty moving the lower extremities. Which additional observation is an indication the patient may be experiencing neurogenic shock?** *(NCFL 2019)*
a. Cool and pale skin
b. Bradycardia
c. Poor skin turgor
d. Increased systolic blood pressure

Explanation:

- Neurogenic shock is an emergency situation caused by impaired blood circulation due to trauma of spine. It leads to the drastic **drop in blood pressure**. Symptoms includes fainting, nausea, vomiting, increased sweating, anxiety, pale skin, dizziness etc. In severe patients – **bradycardia, hypotension**, hypothermia, feeble pulse and cyanosis is seen.
- Bradycardia is seen in neurogenic shock because the blood vessels are relaxed and so the heart doesn't beat fast.
- Skin remains warm in the neurogenic shock.

3073. **Drug of choice in anaphylactic shock is .....**
a. Atropine
b. Adrenaline
c. Amiodarone
d. Propofol

3074. **Important nursing responsibility during anaphylactic reaction is**
a. Administering oxygen
b. Administer adrenaline
c. Provide antidote
d. Monitor vitals

3075. **Mediator of Anaphylactic shock is .....**
a. Histamine
b. Cytokines
c. Dopamine
d. Adrenaline

3076. **Most important nursing intervention in a client who is experiencing anaphylactic reaction following antibiotic administration is**
a. Administer anti dote
b. Maintain a patent airway
c. Provide RL
d. Record the reaction

3077. **Which of the following symptoms is NOT considered to be compensatory mechanism associated with hypovolemia due to hemorrhage?**
a. Tachycardia
b. Tachypnea
c. Oliguria
d. Hypertension

Explanation: In hypovolemia, activation of the sympathetic nervous system increases the respiratory rate (tachypnea) and pulse rate (tachycardia) and help restore the BP to maintain tissue perfusion but does not cause a hypertension. SNS stimulation also play a role in decreased glomerular filtration and increased reabsorption of water and sodium which leads to oliguria.

3078. **Emergency treatment of hypovolemic shock include**
a. Relief of pain
b. Administration of vasodilators
c. Administration of IV fluids or blood product
d. Administration of antibiotics

3079. **Position given to a client experiencing shock is .....**
a. Fowler's Position
b. Trendelenburg
c. Prone Position
d. Supine Position

3080. **Which among the following is present in the patho-physiology of septic Shock?**
a. Vasodilatation
b. Decreased Cardiac output
c. Increased capillary permeability
d. All of the above

3081. **The acid-base imbalance which commonly accompanies shock is**
a. Respiratory acidosis
b. Respiratory alkalosis
c. Metabolic acidosis
d. Metabolic alkalosis

3082. **True about shock**
a. In early stage cardiac output and BP are maintained
b. perfusion to the cells is inadequate to supply oxygen and nutrient
c. Activation of sympathetic nervous system
d. All of the above

3083. **Which among the following parameter need to monitor in a client at risk for shock?**
a. Temperature
b. Pulse
c. Respiration
d. Blood pressure

Ans.

3066.	b
3067.	b
3068.	b
3069.	d

Scanned with CamScanner

3084. Systolic BP is .....in cardiac shock
a. <60 mm of Hg b. <70 mm of Hg
c. <80 mm of Hg d. <90 mm of Hg

3085. Type of shock seen in burns cases:
a. Hypovolemic b. Cardiogenic
c. Neurogenic d. None of the above

Explanation: Causes of hypovolemic shock: (the most common form of Shock)

Hemorrhagic	Nonhemorrhagic
Trauma	Dehydration
	Vomiting
	Diarrhea
	Diabetes having urinary loss
	Evaporation in Burns
	Third space loss pancreatitis, bowel obstruction

3086. In stage 3 hypovolemic shock, the patient will have blood loss of
a. 10-20% b. 20-30%
c. 30-40% d. 40-50%

3087. Ms. Babita is in the emergency room after being involved in a traffic accident. What would be an early sign of hemorrhagic shock? *(NCFL 2019)*
a. Increased blood pressure b. Pallor
c. Increased heart rate d. Deep breathing

Explanation: Hemorrhagic shock is a sudden circulatory shock happens because of the huge blood loss. Increased heart rate or pulse rate is the early sign of hemorrhagic shock. It happens as a compensatory mechanism due the release of epinephrine which makes the heart to beat faster and also promotes vasoconstriction.

Ans.
3084. d
3085. a
3086. c
3087. c
3088. a
3089. b
3090. a
3091. b
3092. a
3093. d
3094. b
3095. d
3096. a
3097. b
3098. a
3099. c

3088. Which among the following is the management modality for cardiogenic shock?
a. Dobutamine to increase the heart's pumping capacity
b. Antibiotics to treat the infection
c. Colloids to increase the blood volume
d. NTG to dilate coronary blood vessels

3089. Client is experiencing tachycardia, decreased blood pressure, and decreased peripheral pulses. These manifestation suggests .....
a. Anaphylactic shock
b. Cardiogenic shock
c. Hypovolemic shock
d. Cardio myopathy

3090. Which among the following client is at risk for developing cardiogenic shock?
a. Acute myocardial infarction (MI)
b. Coronary artery disease (CAD)
c. Pulmonary edema
d. Micro vascular thrombi

3091. Earliest sign of cardiogenic shock is .....
a. Peripheral vascular resistance
b. Altered level of consciousness
c. Pitting edema
d. Heart murmurs

3092. Drug of choice to treat cardiogenic shock is .....
a. Dopamine b. Adrenaline
c. NTG d. Lidocaine

3093. .....is the diagnostic and monitoring tool for determining the severity of a shock state
a. CVP line b. Indwelling urinary catheter
c. IABP d. Pulmonary artery catheter

3094. Adequacy of fluid replacement in hypovolemic shock can be assessed through .....
a. Skin turgor b. Urine output
c. Blood pressure d. Distal pulse

Explanation: Most accurate information regarding the fluid replacement adequacy will be given by the urine output in the person.

3095. Mr. Amit is on fluid replacement therapy. Which of the following assessment findings by the nurse indicates adequate tissue perfusion to vital organs?
a. Blood pressure readings from 50/30 to 80/50 in an hour
b. Central venous pressure reading of 2 cm H_2O
c. Pulse rate of 120 and 110 in a 15 minute period
d. Urinary output is 30 mL in an hour

Explanation: Urinary output of 30 mL/hr or more is one of the key indicators of adequacy of blood flow to vital organs such as heart, brain and kidney.

EMERGENCY AND CRITICAL CARE NURSING

3096. The nurse suspect the patient is in shock after craniotomy. Which would be the appropriate nursing action ?
a. Inform the physician
b. Increase intravenous fluids
c. Give trendelenburg's position
d. Monitor vital signs continuously

Explanation: Nurse should inform the physician immediately because she should not give intravenous fluids without doctor's prescription. Trendelenburg's position may increase intracranial pressure and monitoring vital signs will not alleviate shock.

3097. The process of assessing patients who come to emergency department and determining the management priorities is called? *(RAK MSc 2018)*
a. Mirage b. Triage
c. Lavage d. Collage

Explanation:
- Triage is the sorting of patients by priority for treatment, evacuation or transport. Conventionally, casualties are divided into the categories.
- **Immediate category:** These casualties require immediate life-saving treatment.
- **Urgent category:** These casualties require significant intervention as soon as possible.
- **Delayed category:** These patients will require medical intervention, but not with any urgency.
- *Refer Appendices for detailed information on color coding of Triage (Page no. A-73).*

3098. Which can be safely given in hemorrhagic stroke?
a. Normal Saline b. Hypertonic fluids
c. Colloids d. Blood transfusion

3099. The most common cause of embolic stroke:
a. Paradoxical embolism
b. Carotid artery atherosclerosis
c. Non rheumatic atrial fibrillation
d. LV aneurysm

Scanned with CamScanner

3100. Commonest cause of cerebro vascular accident:
a. Hemorrhage b. Aortic dissection
c. Embolism d. Infarction

3101. Which among the following is a priority nursing intervention in a client experiencing stroke?
a. Maintain air way
b. ROM exercises
c. Maintain tissue perfusion
d. Nutritional maintenance

3102. A client is admitted to neuro emergency with brain stem infarction. The important nursing intervention is to assess for.....
a. Aphonia b. Bradypnea
c. Cushing triad d. Weakness

3103. Following C5 injury, which among the following is the important nursing intervention?
a. Patent airway
b. Peripheral circulation
c. Skin cared
d. Bladder distention

3104. Pain is .....
a. Unpleasant experience b. Subjective in nature
c. Both a and b d. Maladaptive behavior

3105. Release of which of the following chemical causes pain at injury site
a. Prostaglandins b. Serotonins
c. Norepinephrine d. Endorphins

3106. Appropriate non-opioid analgesics for mild pain is .....
a. Oxycodone b. Ibuprofen
c. Lorazepam d. Tramadol

3107. Most common side effect associated with morphine administration is .....
a. Cardiac arrest b. Coma
c. Paralytic ileus d. Respiratory arrest

3108. A patient presenting to the ED with complains of chest pain aggravated by coughing and relieved by sitting upright may have additional physical examination finding of .....
a. Pericardial friction rub b. Pulses paradoxes
c. Crackles d. Wheezing

Explanation: This may be due to pericardial effusion or pericarditis. Pericardial friction rub can be auscultated in these conditions.

3109. Which of the following is not a cause/risk factor for cardiac arrest?
a. Hyperkalemia b. Hyperglycemia
c. Hypovolemia d. Hypoxia

Explanation: Hypoglycemia is one of the risk factor for cardiac arrest, not hyperglycemia.

Potential causes to consider cardiac arrest (6H's and 6T's) are
- Hyper/hypokalemia
- Hypoglycemia
- Hypovolemia
- Hypoxia
- Hydrogen ion (acidosis)
- Hypothermia
- Toxin
- Thrombosis (coronary or pulmonary)
- Tension pneumothorax
- Tamponade
- Tablets (overdose or ingestion)
- Trauma

3110. The most important finding which causes concern during examination of a patient in the emergency department *(ISRO)*
a. Difficulty in arousing the patient
b. Oxygen saturation at room air of 89%
c. Respiratory rate of 12/minute
d. Peripheral cyanosis

3111. Which of the following CANNOT cause a low pulse oximetry reading in a patient with respiratory distress? *(AIIMS-BBS SNO 2019)*
a. Inadequate peripheral circulation
b. Edema
c. Hyperthermia
d. Nail polish

Explanation: Inadequate peripheral circulation is the principal cause for failure to obtain a satisfactory signal by the probe attached to finger tips. Edema or venous congestion of the limb can also interfere with readings of pulse oximetry. Nail polish of black, blue and green color disturbs the sensor in the probe, hence lower oximeter readings.

Hyperthermia will not affect readings of pulse oximeter.

3112. The first priority in the management of trauma patient is: *(AIIMS Bhopal Grade-I 2018)*
a. Maintenance of an adequate airway
b. Control of hemorrhage
c. Maintenance of adequate arterial blood pressure
d. Ruling out a spinal injury

Explanation: The airway is the most important priority in the management of the severely injured patients. It is essential to open and clear the airways to allow free access of air to the distal endotracheal tree. Once the airway is maintained, it is important to ensure adequate oxygenation and ventilation through the airways.

3113. During intubation administration of succinylcholine can cause bradycardia. Which of the following agent used to overcome this effect?
a. Adrenaline
b. Lidocaine
c. Calcium gluconate
d. Atropine

Explanation: Use of Succinylcholine can result in Bradycardia, especially in children. Atropine is the drug of choice in treating succinylcholine-induced bradycardia. Lidocaine is used in adults only.

3114. Which of the following is NOT an essential finding for brain death
a. Loss of pupillary reflex
b. Loss of brain stem function
c. Negative Apnea test
d. Loss of deep tendon reflexes

3115. Compression of bleeding carotid artery immediately leads to: *(AIIMS BPL SNO 2018)*
a. Vomiting
b. Stroke
c. Blindness
d. Loss of sense of smell

Explanation: The compression of bleeding carotid artery leads to failure of brain perfusion due to thromboembolic events leading to devastating **stroke.** Vomiting, blindness and loss of sense of smell is not present in the patient with carotid artery injury.

Ans.

3100.	d
3101.	a
3102.	b
3103.	a
3104.	c
3105.	a
3106.	b
3107.	d
3108.	a
3109.	b
3110.	b
3111.	c
3112.	a
3113.	d
3114.	d
3115.	b

Scanned with CamScanner

3116. Nurse giving oxygen therapy should know that it has to be humidified because: *(NCFL 2019)*
a. Oxygen is a hot air and it may burn trachea
b. Oxygen is a dry gas and thickens the mucus
c. Oxygen gets cleaned of pathogens by humidification
d. Oxygen is easily absorbed because humidification adds H-ion to it

Explanation: Oxygen has a drying effect on mucus membrane that results in damage to the airways, secretions may become thick and difficult to clear. Oxygen is humidified before administration by flowing through a humidifier.

3117. What is the full explanation of ATLS
a. Advanced trauma life support
b. Advanced tertiary life support
c. Advanced trauma life salvage
d. Advanced tertiary long-term safety

Explanation: ATLS- Advanced Trauma Life Support is followed in all cases in management of trauma.

3118. Prakash, a 32-year-old male has been admitted to the intensive care unit following a motor vehicle accident. Assessment found a positive Cullen sign. What does this indicate?
a. Pelvic fracture
b. Skull fracture
c. Retroperitoneal hemorrhage
d. Hemothorax

3119. The Heimlich maneuver (abdominal thrust), for acute airway obstruction, attempts to: *(Kerala PSC 1992)*
a. Force air out of the lungs
b. Induce emptying of the stomach
c. Put pressure on the apex of the heart
d. All of the above

Explanation: The Heimlich maneuver (abdominal thrusts) is an emergency technique for preventing suffocation when a person's airway (windpipe) becomes blocked by a piece of food or other object. The pressure from thrusts lifts the diaphragm and forces enough air from the lungs that expels the aspirated material.

3120. Most Common injury in blunt abdominal trauma
a. Kidney
b. Liver
c. Bladder
d. Spleen

Explanation: Spleen is the most commonly injured organ in abdominal trauma.

The small intestine takes up a large part of the abdomen and is likely to be damaged in penetrating injury.

3121. Saleem, 25-year-old male has been admitted to the intensive care unit following a motor vehicle accident. Bowel sounds are audible while auscultating Saleem's lungs. This indicates
a. Ruptured Liver
b. Ruptured lungs
c. Diaphragmatic injury
d. Ruptured Aorta

3122. When an elderly patient complains of pain, the attending nurse should be careful because *(ISRO)*
a. Elderly patients are expected to experience chronic pain
b. Elderly patients experience reduced sensory perception
c. Elderly patients have indifferent pain threshold
d. Elderly patients have altered mental function

3123. CPAP stands for _____
a. Continuous Permanent Airway Pressure
b. Continuous Positive Airway Pressure
c. Continuous Prolonged Airway Pressure
d. Continuous Passive Airway Pressure

3124. PEEP in ventilator helps to .....
a. Prevent collapse of alveoli *(AIIMS Raipur NO 2019)*
b. Help to prevent oxygen toxicity
c. Helps to prevent ventilator fighting
d. Avoid over ventilation

3125. All of the following is true about positive-end expiratory pressure (PEEP) except? *(AIIMS-BBS SNO 2019)*
a. It reduces venous return
b. It improves alveolar gas exchange
c. It prevents alveolar collapse
d. It decreases mean airway pressure

Explanation: Positive end-expiratory pressure (PEEP) is the positive pressure that will remain in the airways at the end of the respiratory cycle (end of exhalation) that is greater than the atmospheric pressure in mechanically ventilated patients. PEEP is applied to recruit lung volumes, elevate mean airway pressure, and improve oxygenation.

3126. Which among the following is a non-invasive ventilation method?
a. SIMV
b. Bi PAP
c. Laryngeal mask airway
d. Pressure support ventilation

3127. Which one of these is not a weaning mode?
a. CMV
b. C-PAP
c. BiPAP
d. PSV

3128. Patient's fighting with the ventilator is called
a. Bucking
b. Weaning
c. Kinking
d. Distress

3129. Why pressurized bag is used in arterial line monitoring?
a. To prevent the backflow of blood in the tubing
b. To prevent blood leakage
c. To maintain the shape of saline bag
d. To provide bolus dose

3130. What is the effect of atherosclerosis on arterial waveform?
a. Increase in systolic waveform
b. ↓ in the size of diastolic wave
c. Decrease in the size of dichotic notch
d. All of the above

3131. Which of these can provide 100% O_2?
a. Bag value mask alone
b. Bag valve mask with supplemental O_2
c. Oxygen via facemask
d. Partial rebreather mask

3132. What is the area under arterial pressure waveform denotes?
a. Systolic pressure
b. Coronary artery pressure
c. End diastolic pressure
d. Mean arterial pressure

3133. C wave in the CVP waveform denotes
a. Onset of atrial systole
b. Onset of Ventricular diastole
c. Onset of ventricular systole
d. Onset of arterial diastole

3134. ROSE questionnaire is used for?
a. Alcohol addiction
b. Sex addiction
c. Angina assessment
d. Deep Vein thrombosis Assessment

(Ref: Braunwald 8th edn Ch 57)

Ans.

3116. b
3117. a
3118. c
3119. a
3120. d
3121. c
3122. b
3123. b
3124. a
3125. d
3126. b
3127. a
3128. a
3129. a
3130. d
3131. b
3132. d
3133. c
3134. c

Scanned with CamScanner

Explanation: ROSE Questionnaire is used to evaluate the subjective severity of ischemic heart pain and intermittent claudication in patients with Coronary Artery Disease.

3135. A patient received Atropine sulphate as a premedication 30 minutes ago and is now complaining of dry mouth. On assessment the nurse found the pulse rate is higher, than before Atropine was administered. The nurse understands that this is:

a. An allergic reaction to Atropine
b. Due to higher dose of Atropine
c. Due to anxiety of patient about upcoming surgery
d. Normal side effect of Atropine

Explanation: Atropine is an anticholinergic drug with expected side effects of dryness mouth and tachycardia. So complains of dry mouth and increased pulse rate is considered to be normal and expected after a dose of Atropine sulphate.

3136. Hydrophobia is seen in .....

a. Scorpion bite b. Dog bite
c. Snake bite d. Spider bite

3137. Branch of science that determines the cause and manner of death is .....

a. Immunopathology b. Hematopathology
c. Forensic pathology d. Histopathology

3138. Which among the following is a criterion to classify a death as brain death? *(AIIMS BPL NO 2018)*

a. Presence of EEG activity b. Cessation of breathing
c. Responsive to deep pain d. Hypothermia

Explanation: Brain death is defined as the irreversible loss of all functions of the brain, including the brainstem. The three essential findings in brain death are coma, absence of brainstem reflexes, and apnea.

3139. The suction of the internal fluids, of the corpse and the injection of embalming chemicals into body cavities, using an aspirator and trocar is the method of: *(AIIMS Raipur Grade II 2017)*

a. Surface embalming b. Cavity embalming
c. Hypodermic embalming d. Arterial embalming

Explanation: Surface embalming involves application of embalming fluid to the skin of the deceased body to preserve damage suffered during autopsy, the removal of organs for donation, or disease. Arterial embalming involves injecting the embalming fluid into the carotid artery using a centrifugal pump to displace the blood, which drains through the right jugular vein. Hypodermic embalming refers to the injection of embalming chemicals into tissue with a hypodermic needle and syringe, which is used to treat areas where arterial fluid has not been successfully distributed during the main arterial injection

3140. Client receiving TPN via CVP complains of chest pain and dyspnea, tachycardia and hypertension. Which among the following complication nurse need to suspect in this client?

a. Hypoglycemia b. Electrolyte imbalances
c. Sepsis d. Air embolism

3141. Important nursing intervention for a client who has been sexually assaulted is .....

a. Treat urgent medical problems
b. Inform the NGO
c. Psychological support to the client
d. Recording and reporting

Poisoning/Overdose/Toxicity

3142. An emergency room nurse is assessing a 22-year-old male who has been using opioids. What symptoms indicate that the client has over dosed? *(NCFL 2019)*

a. Constricted pupils and hypotension
b. Vomiting and Tachypnea
c. Pupillary dilatation and hypertensive crisis
d. Tremors and ataxia

Explanation:

- Symptoms of "opioid overdose triad" is pinpoint pupils, respiratory depression and unconsciousness. Acute intoxification symptoms of opioids are hypothermia, hypotension, bradycardia apathy, Pinpoint Pupil, delay in reflexes and coma
- Nausea and Vomiting may be present, but it is not a typical symptom of opioid overdose.

3143. Anti-dote of opioid is .....

a. Administer adrenaline
b. Administer I.V. naloxone
c. Maintain hydration
d. Give charcoal

3144. Antidote to benzodiazepine poisoning is

a. N-Acetylcysteine
b. Naltrexone
c. Flumazenil
d. Barbiturates

3145. The drug used in paracetamol (acetaminophen) poisoning is

a. Naloxone
b. Acetyl salicylic acid
c. Flumazenil
d. N-Acetylcysteine

3146. Symptoms of Central nervous system depression, cardiac depression and optic nerve atrophy in methanol poisoning is due to

a. Acetic acid
b. Acetaldehyde
c. Pyridine
d. Formaldehyde and formic acid

3147. The most useful bedside diagnostic test to suggest snake bite envenomation is

a. Platelet count
b. Bleeding time
c. International normalized ratio
d. 20 min whole blood clotting time

3148. Antidote for anticholinergic poisoning is

a. Atropine
b. Physostigmine
c. Pyridoxine
d. Beta blockers

3149. Deferoxamine is an antidote of

a. Lead
b. Iron
c. Calcium
d. Magnesium

3150. Clinical manifestation of cocaine overdose include .....

a. Lacrimation, restlessness, and irritability.
b. Agitation, cardiac dysrhythmias, and seizures.
c. Euphoria, nausea and vomiting.
d. Altered respirations; hyporeflexia and blurred vision.

Ans.

3135. d
3136. b
3137. c
3138. b
3139. b
3140. d
3141. a
3142. a
3143. b
3144. c
3145. d
3146. d
3147. d
3148. b
3149. b
3150. b

Scanned with CamScanner

3151. Substances poorly absorbed by activated charcoal includes all, EXCEPT

a. Lead
b. Lithium
c. Cyanide
d. Phenobarbital

Explanation:

- Substances poorly absorbed by Activated charcoal includes
- **Heavy metals:** Iron, Lead, Lithium, Mercury
- **Chemicals: Petroleum distillates,** Ethanol, Methanol, Mercury, Ethylene glycol, Cyanide, Saline cathartics,
- **Corrosive chemicals:** Acids, Alkalis
- Gastric lavage is contraindicated in poisoning with ingestion of Acids, Alkalis, and Petroleum distillates.

3152. A 12-year-old child was brought to the emergency department 30 minutes after accidental ingestion of 12 tablets of Paracetamol 650 mg. Which of the following intervention is the priority for this child?

a. Administer N-Acetylcysteine
b. Administer activated charcoal
c. Perform gastric lavage
d. Administer 5% dextrose in half normal saline

Explanation: Treatment guidelines for oral Paracetamol (acetaminophen) ingestion in Children

- Less than 4 **hours** after ingestion - Consider activated charcoal if dose is >150 mg/kg (activated charcoal is not advised if the ingested dose is unknown)
- **4 to 24 hours** – Obtain plasma acetaminophen level as soon as possible. Start with N-Acetylcysteine (NAC) administration.
- **Longer than 24 hours** – NAC administration

3153. Lead poisoning is also known as *(DSSSB 2013)*

a. Asterixis
b. Plumbism
c. Plummer-Vinson syndrome
d. Prader-Willi syndrome

Explanation: Lead poisoning is a type of metal poisoning and a medical condition in humans and other vertebrates caused by increased levels of the heavy metal lead in the body. Lead poisoning is also known as plumbism, colicapictonum, saturnism, Devon colic, or painter's colic.

3154. Warfarin (Coumadin) toxicity can be treated with

a. Phytonadione (vitamin K)
b. Protamine sulfate
c. Acetyl cysteine
d. Heparin

Explanation: Vitamin K is an antidote of warfarin. Since warfarin has a much longer duration of action than vitamin K, vitamin K may need to be re-administered in patients with massive warfarin overdose or ongoing bleeding.

Ans.

3151. d
3152. b
3153. b
3154. a

Image-Based Questions (Including All Topics)

1. Identify the refractive error

(Refer explanation at the end)

a. Myopia
b. Hypermetropia
c. Presbyopia
d. Astigmatism

2. Identify the type of cataract depicted in the image?

a. Posterior polar cataract
b. Blue dot cataract
c. Coronary cataract
d. Zonular cataract

3. Identify the pathology depicted in the given Image?

a. Corneal ulcer
b. Aniridia
c. Circumcorneal congestion
d. Kayser-Fleischer ring

4. The following picture exhibit which cranial nerve palsy?

(Refer explanation at the end)

a. Oculomotor nerve
b. Trochlear nerve
c. Abducent nerve
d. Vestibulocochlear nerve

5. Identify the instrument depicted in the image?

a. Tonometer
b. Perimeter
c. Operating microscope
d. Synoptophore

6. A patient was suffering from ptosis and hypotropia. After giving an IV drug to the patient, in 6 minutes his ptosis & hypotropia improved. What is the probable diagnosis?

a. 6th nerve palsy
b. Tolosa-Hunt syndrome
c. Third nerve palsy
d. Myasthenia gravis

7. Identify the pathology depicted in the image?

a. Foreign body
b. Anterior staphyloma
c. Bitot's spots
d. Normal anatomical variant

8. Identify the instrument given in the image?

a. Tonometer
b. Pachymeter
c. Keratometer
d. Ophthalmometer

Ans.

1. a
2. d
3. d
4. c
5. d
6. d

9. The following CXR shows:

- In which heart situated on right side of body

a. Dextrocardia
b. Pneumothorax
c. Pneumomediastinum
d. Pulmonary hamartoma

10. ECG given below is of

Irregular QRS complex
Absence P wave

a. Atrial fibrillation
b. Atrial flutter
c. Sinus tachycardia
d. PSVT

11. Procedure shown below is

a. Transverse colostomy
b. Hartman procedure
c. Ileostomy
d. Descending colostomy

12. Radio image shown technique of:

- white liquid called barium contrast

a. Barium meal follow through
b. Enteroclysis
c. Barium enema
d. Barium swallow

13. A patient of ESRD is being performed hemodialysis. Central dialysis catheter is placed at which site?

a. Right internal jugular vein
b. Left internal jugular vein
c. Right subclavian vein
d. Right subclavian artery

14. Peripheral smear is suggestive of which anemia?

a. Iron deficiency anemia
b. Macrocytic anemia
c. HUS
d. Hereditary spherocytosis

15. Lady presents with joint pain in both knees and low grade fever off and on. On examination she has a rash on sun exposed parts. Image shown below. What is the clinical diagnosis?

a. Lupus vulgaris
b. SLE
c. Photodermatitis
d. CREST syndrome

16. Inheritance shown in diagram depicted in photograph is

a. X linked dominant
b. X linked recessive
c. Autosomal dominant

a. Streptococcus
b. Pneumococcus
c. E. coli
d. Salmonella

34. **Identify the worm shown in the photograph:**

a. Round worm
b. Hook worm
c. Tape worm
d. Guinea worm

35. **Type of venom produced by snake shown in photograph is:**

a. Myotoxic
b. Neurotoxic
c. Hemolytic
d. Proteolytic

36. **Type of venom produced by snake shown in photograph is:**

a. Myotoxic
b. Neurotoxic
c. Hemolytic
d. Proteolytic

37. **Kit shown in photograph is used for diagnosis of:**

a. Kala-azar
b. Malaria
c. Lymphatic filariasis
d. Dengue

38. **Mask shown in photograph was used for prevention of:**

a. Tuberculosis
b. Swine flu
c. SARS
d. Pneumonia

39. **Instrument shown in photograph is sued to assess:** *[Recent Question 2016]*

a. Environmental heat measurement
b. Cooling power of air
c. Mean radiant temperature of surroundings
d. Relative humidity of air

40. **Test of color vision shown in photograph is known as:**

a. Ishihara plates
b. Edridge Green lantern test
c. Farnsworth-Munsell 100 hue test

41. Identify the paranasal sinus being tested by technique as shown in photograph

a. Frontal sinus
b. Maxillary sinus
c. Ethmoid sinus
d. Sphenoid sinus

42. Identify the instrument shown in the photograph: *[Recent Question 2016]*

a. Hazek's punch forceps
b. Irwin Moore's forceps
c. Asch's septum forceps
d. Luc's forceps

43. Identify instrument shown in Photograph

a. Freer's elevator
b. Denis Browne Tonsil holding forceps
c. Doyen's mouth gag
d. Hagen's Cheek retractor

44. Identify the instrument shown in the photograph: *[Recent Question 2014]*

a. Siegel's pneumatic speculum
b. Vienna nasal speculum
c. Thudicum nasal speculum
d. Beckmann nasal speculum

45. Identify the Instrument shown in the photograph: *[Recent Question 2017]*

a. Siegel's pneumatic speculum
b. Pilcher's nasal speculum
c. Thudicum nasal speculum
d. Killian's nasal speculum

46. Identify the instrument shown in the photograph:

a. Foley's catheter
b. Nasogastric tube
c. Malecot catheter
d. Stomach tube

47. Nerve tested by using clinical test shown in photograph *[Recent Question 2013]*

a. Median nerve
b. Radial nerve
c. Axillary nerve
d. Ulnar nerve

48. Identify the instrument shown in photograph, used during general anesthesia: *[Recent Question 2016]*

a. Laryngoscope
b. Endotracheal tube
c. Laryngeal mask airway
d. Fibro-optic laryngoscope

Ans.

41.	c
42.	d
43.	c
44.	b
45.	d
46.	d
47.	d
48.	d

Scanned with CamScanner

49. **Identify the condition (arrow) as shown in photograph:** *[Recent Question 2013]*

a. Testicular hematoma
b. Testicular torsion
c. Testicular hydrocele
d. Testicular carcinoma

50. **Identify the nerve being tested in maneuver shown in the photograph is:** *[Recent Question 2015]*

a. Radial nerve
b. Ulnar nerve
c. Median nerve
d. Musculocutaneous nerve

51. **Underlying nail disorder shown in the photograph is:**

a. Leukonychia
b. Melanonychia
c. Clubbing
d. Koilonychia

52. **Chief cells are mainly found in .....part of organ shown in photograph.** *[Recent Question 2013]*

a. 1
b. 2
c. 3
d. 4

53. **Type of joint seen in region in pelvis (encircled) of the photograph is:** *[Recent Question 2013]*

a. Fibrous
b. Cartilaginous
c. Synovial
d. Gomphosis

54. **Movement of thumb (arrow) as shown in photograph is lost in injury to** *[Recent Question 2014]*

a. Median nerve
b. Radial nerve
c. Ulnar nerve
d. Axillary nerve

55. **Which of the following combination is incompatible** *(Refer explanation at the end)*

a. A only
b. B only
c. A and B
d. A and C

56. **Which of the following combination is compatible for IV infusion?** *(Refer explanation at the end)*

a. A only
b. B only
c. A and B
d. A, B and C

Ans.

49.	b
50.	b
51.	c
52.	a
53.	b
54.	c
55.	c
56.	b

Scanned with CamScanner

57. The solution shown in the picture is used for disinfection of instruments in hospitals. Dry instruments should be soaked for ..... at 20°C for effective disinfection. ***(Refer explanation at the end)***

a. 3 min
b. 12 min
c. 20 min
d. 30 min

58. What is the purpose of blue color thread present in the gauze swab.

a. It is radiopaque
b. For easy counting
c. Easy visibility when soaked in blood
d. For designing purpose

59. Severe pain in the area shown in the picture indicates .....

a. Appendicitis
b. Ureteral colic
c. Hydrocele
d. Renal colic

60. Severe pain in the area indicated by arrow mark indicates

a. Appendicitis
b. Ureteral colic
c. Hydrocele
d. Renal colic

61. Severe pain in the area indicated by arrow mark indicates problem with.....

a. Lungs
b. Liver and gallbladder
c. Heart
d. Duodenum

62. Identify following instrument which used in diagnostic procedures

a. Pleural tapping needle
b. Tru-cut biopsy needle
c. Punch biopsy
d. Lumbar puncture needle

63. The instrument given in the picture is used in .....

a. Laryngectomy
b. Thoracotomy
c. Cesarean section
d. Thyroidectomy

64. Identify the equipment given in the image

a. Single use tongue depressor
b. Disposable thermometer
c. Percutaneous Bilirubin meter
d. Disposable SpO_2 probe

Ans.

57.	b
58.	a
59.	b
60.	d
61.	b
62.	b
63.	d
64.	b

Scanned with CamScanner

Identify the procedure performed in the given picture: *(Refer explanation at the end)*

a. Perfusion index test
b. Allen's test
c. LEAT test
d. None of the above

Type of dressing shown in the picture is ..... *(Refer explanation at the end)*

a. Foam dressing
b. Sponge dressing
c. Positive pressure dressing
d. Negative pressure dressing

69. Identify the name of the tube

a. Freka tube
b. Nasogastric tube
c. Sengstaken Blakemore tube
d. Linton Blackmore tube

67. The medication given in the picture is used for..... *(Refer explanation at the end)*

a. Endotracheal intubation
b. NG tube insertion
c. Oral procedures
d. All of the above

70. Identify the equipment

a. Chest tube drainage system
b. Penrose drainage system
c. Surgery wound drainage
d. Tru-close drainage system

68. Identify this instrument

a. Jolly's retractor
b. Morris retractor
c. Langenback retractor
d. Thompson liver retractor

71. Identify the following instrument

a. Laryngeal mask airway
b. Nasal pranx
c. Endotracheal tube
d. Single lumen airway

Ans.

65.	b
66.	d
67.	d
68.	b
69.	c
70.	a
71.	a

Scanned with CamScanner

72. Identify the PR interval in the given ECG strip

a. 0.12
b. 0.18
c. 0.24
d. 0.40

73. What is the name of this catheter?

a. Foley
b. Malecots
c. Seldinger
d. Fogarty

74. The instrument shown here is used for

a. IV line access
b. Closed technique of laparoscopy
c. Liver abscess aspiration
d. Tru-cut biopsy

75. Identify the procedure

a. Endoscopy
b. Laparoscopy
c. NOTES
d. VATS

76. Identify the type of pelvic prolapse (arrow) shown in photograph

a. Cystocele
b. Rectocele
c. Enterocele
d. Uterine prolapse

77. Identify the type of Fistula '1' shown in the photograph

a. Vesicovaginal fistula
b. Vesicouterine fistula
c. Urethrovaginal fistula
d. None of the above

78. Identify the type of pelvic prolapse (arrow) shown in photograph

a. Cystocele
b. Rectocele
c. Enterocele
d. Uterine prolapse

79. Spermatic structure (arrow) shown in the photograph is

a. Head
b. Neck
c. Middle piece
d. End piece

Ans.

72. a
73. d
74. b
75. c
76. c
77. b
78. a
79. c

Scanned with CamScanner

80. Identify the type of pelvic prolapse (arrow) shown in photograph

a. Cystocele
b. Rectocele
c. Enterocele
d. Uterine prolapse

81. Identify the Device/ Instrument shown in the photograph

a. Das Cervical dilator
b. Hegar's Cervical dilator
c. Hawkin Ambler Cervical dilator
d. Female metal catheter

82. Use of Instrument shown in the photograph is

a. Pap smear
b. Cervical dilation
c. Punch biopsy
d. Curetting

83. Identify the Device/ Instrument shown in the photograph

a. Doyen's retractor
b. Deaver retractor
c. Anterior vaginal wall retractor
d. HSG canula

84. Identify the device/instrument shown in the photograph

a. Doyen's retractor
b. Deaver retractor
c. Anterior vaginal wall retractor
d. HSG cannula

85. Identify the Device/ Instrument shown in the photograph

a. Doyen's retractor
b. Landon's retractor
c. Anterior vaginal wall retractor
d. Carman's suction cannula

86. Identify the testicular structure (arrow) shown in the photograph

a. Vas deferens
b. Rete testes
c. Seminiferous tubules
d. Epididymis

87. The bacteria shown in the microscopic image below is most likely

a. Streptococus aureus
b. Staphylococcus perfringens
c. Clostridium tetanus
d. Mycobacterium tuberculosis

Ans.

80.	b
81.	b
82.	c
83.	a
84.	b
85.	b
86.	c
87.	d

Scanned with CamScanner

88. Condition (arrow) shown in photograph is due to:

a. Klumpke's paralysis
b. Erb's palsy
c. Long thoracic nerve palsy
d. Thoracic outlet syndrome

89. True about part (encircled) shown in photograph is:

a. Longer/ narrow than Left part
b. Shorter/ narrow than Left part
c. Longer/ wider than Left part
d. Shorter/ wider than Left part

90. Identify the blood vessel (arrow) shown in photograph:

a. Brachiocephalic artery
b. Left common carotid artery
c. Left subclavian artery
d. Right subclavian artery

91. Weight of Organ (Blue arrow) as shown in photograph is:

a. 600 – 800 grams
b. 1000 – 1200 grams
c. 1400 – 1600 grams
d. 1800 – 2000 grams

92. Structure (Box) shown in photograph develops from:

a. Endoderm
b. Ectoderm
c. Tubule cell
d. Neural crest cells

93. Structure shown in photograph develops from:

a. Endoderm
b. Ectoderm
c. Somite
d. None

94. The name of the bones encircled in the images is

a. Scaphoid
b. Lunate
c. Hamate
d. Capitate

95. Complex shown in the photograph is due to:

a. Atrial depolarization
b. Conduction through AV node
c. Ventricular depolarization
d. Ventricular repolarization

Ans.

88.	b
89.	d
90.	c
91.	c
92.	[illegible]
93.	c
94.	a
95.	c

Scanned with CamScanner

96. S2 shown in the photograph is due to:

a. Atrial contraction
b. Right ventricular filling
c. Inthrushing of blood
d. Closure of Aortic valve

97. Atrial depolarization in ECG is represented by:

a. 1
b. 2
c. 3
d. 4

98. Normal value of interval shown in the photograph is:

a. 0.12 – 0.20 seconds
b. 0.08 – 0.12 seconds
c. 0.40 – 0.45 seconds
d. 0.80 – 0.95 seconds

99. In the photograph of organ shown, arrows represents sites of:

a. Gastric carcinoma
b. Gastric ulceration
c. Fat absorption
d. Pepsin production

100. Deficiency causing manifestation (arrows) shown in photograph:

a. Vitamin Thiamine
b. Vitamin Riboflavin
c. Vitamin Niacin
d. Vitamin Ascorbic acid

101. The skin condition shown in the image is known as

a. Ecchymosis
b. Blisters
c. Psoriasis
d. Warts

102. Scientist shown in photograph is credited with discovery of:

a. First vaccine
b. First antibiotic
c. First Bacterium
d. First Virus

103. Identify the Instrument shown in the photograph:

a. Direct Ophthalmoscope
b. Indirect Ophthalmoscope
c. Retinoscope
d. Slit lamp

Ans.

96. d
97. a
98. c
99. b
100. b
101. b
102. b
103. d

Scanned with CamScanner

104. Identify the instrument shown in the photograph:

a. Slit lamp microscopy
b. Synoptophore
c. Indirect ophthalmoscope
d. Hess screen

105. Instrument shown in the photograph is used for measurement of:

a. Corneal diameter
b. Visual field
c. Visual acuity
d. Intraocular pressure

106. Identify the instrument shown in the photograph:

a. Siegel's pneumatic speculum
b. Rhinoscope
c. Otoscope
d. Laryngoscope

107. Identify the instrument shown in the photograph:

a. Frazier's straight Suction tube
b. Nasal Hopkin endoscope
c. Atomizer
d. Tilley antral trocar and cannula

108. Identify the Instrument shown in the photograph:

a. Hazek punch forceps
b. Irwin Moore's forceps
c. Asche septal forceps
d. Luc's forceps

109. Identify the type of hearing aid device shown in photograph:

a. Body-worn hearing aid
b. Behind-the-ear hearing aid
c. Eyeglass integrated hearing aid
d. In-the-ear hearing aid

110. Identify the condition of oral cavity shown in the photograph:

a. Reparative granuloma
b. Gingival hyperplasia
c. Hemangioma
d. Papilloma

111. Diagnose the underlying medical disorder by ECG change in photograph:

a. Hypokalemia
b. Hyperkalemia
c. Hypercalcemia
d. Hypocalcemia

Ans.

104. b
105. d
106. c
107. b
108. d
109. b
110. b
111. b

Scanned with CamScanner

112. **Diagnose the underlying medical disorder by ECG change in photograph:**

a. Sinus arrhythmia
b. Atrial flutter
c. Atrial fibrillation
d. AV block

113. **Diagnose the underlying medical disorder by ECG change in photograph:**

a. Sinus arrhythmia
b. Atrial flutter
c. Atrial fibrillation
d. AV block

114. **Identify the ECG type shown in the photograph:**

a. P-mitrale
b. Sinus tachycardia
c. Atrial ectopics
d. PSVT

115. **Best line of management of condition shown in photograph is:**

a. IABP
b. Vasopressors
c. Reperfusion therapy
d. Thrombolysis

116. **Most common cause of the Aortic condition as shown in the photograph is:**

a. Idiopathic
b. Trauma
c. Atherosclerosis
d. Arteriosclerosis

117. **Contraindication for procedure shown in the photograph:**

a. Wilson's disease
b. Autoimmune Hepatitis
c. Hemangioma
d. Chronic Hepatitis B & C

118. **Primary survey shown in photograph is mainly used for:**

Airway
Breathing
Circulation
Disability
Exposure

a. Post-operative care
b. Pre-opeartive care
c. Trauma care
d. Immunization care

119. **Identify the instrument shown in photograph, used during surgery:**

a. Scalpel blade
b. Sterile micro scalpel
c. Microsurgical knife
d. Disposable mini scalpel

Ans.

112. c
113. b
114. b
115. c
116. c
117. c
118. c
119. a

Scanned with CamScanner

120. Identify the condition shown in the photograph:

a. Perianal abscess
b. Fistula in ano
c. Rectal prolapse
d. Rectal cancer

121. Identify the surgical procedure shown in photograph:

a. Billroth I gastrectomy
b. Billroth II gastrectomy
c. Gastroenterostomy
d. Truncal vagotomy

122. Surgical instrument shown in photograph is:

a. Debakey forceps
b. Gillies forceps
c. Adson forceps
d. Spencer wells forceps

123. Identify the device shown in the photograph:

a. Vascular ring connector
b. Cardiac pacemaker
c. Cardiac shunt
d. Coronary stent

124. Surgical instrument shown in photograph is:

a. Surgical blade
b. Bard Parker Handle
c. McIndoe scissors
d. Ashley probe

125. Identify the type of traction shown in the photograph:

a. Hamilton Russell traction
b. Gallows traction
c. Buck's traction
d. Balanced skeletal traction

126. Identify the type of traction shown in the photograph:

a. Hamilton Russell traction
b. Gallows traction
c. Buck's traction
d. Balanced skeletal traction

127. Deformity shown in photograph is characteristic of:

a. Osteoarthritis
b. Rheumatoid arthritis
c. Ankylosing spondylitis
d. Psoriatic arthritis

Ans.

120. c
121. b
122. c
123. d
124. b
125. b
126. a
127. b

Scanned with CamScanner

128. **The condition shown in the image is known as**

a. Warts
b. Psoriasis
c. Blisters
d. Mole

129. **What is the use of the instrument shown below?**

a. Intestinal anastomosis
b. Vascular anastomosis
c. Neurosurgery
d. Urology surgery

130. **What is the instrument shown below?**

a. Urethral dilator
b. Tracheal dilator
c. Aneurysm needle
d. Urethral dilator

131. **What is the instrument shown below?**

a. Aneurysm needle
b. Veress needle
c. Trucut biopsy needle
d. Cobbler needle

132. **Identify this forceps**

a. Allis
b. Babcock
c. Debakey
d. Kocher

133. **What is the use of the instrument shown here?**

a. To catch bleeding artery
b. Occlude bowel
c. Vascular clamp
d. Clip the towel

134. **What is the name of this retractor?**

a. Deavers
b. Langenbeck
c. Czerny
d. Thomson

135. **Identify this forceps**

a. Allis
b. Babcock
c. Debakey
d. Kocher

Ans.

128. a
129. a
130. b
131. a
132. b
133. d
134. a
135. a

Scanned with CamScanner

136. What is the use of the clamp shown in the image below?

a. Soft occlusion of bowel
b. Crush occlusion of bowel
c. Used to stop bleeding vessels
d. Used to retract

137. The skin condition shown in the picture is known as

a. Ecchymosis
b. Ichthyosis
c. Warts
d. Petechiae

138. Identify the Instrument/device shown in photograph:

a. Uncuffed Endotracheal tube
b. Cuffed Endotracheal tube
c. Endotracheal tube Double lumen
d. Water's airway

139. Identify the Instrument/device shown in photograph:

a. Reservoir bag
b. Face mask
c. LMA
d. Ambu bag

140. Identify the instrument:

a. Kocher forceps
b. Babcock forceps
c. Allis forceps
d. Russian tissue forceps

141. Identify the instrument:

a. Kelly retractor
b. Doyan retractor
c. Deaver retractor
d. Harrington retractor

142. Identify the instrument:

a. Female urethral sound
b. Hang dilators
c. Hegar dilators
d. Uterine dilators

143. The given instrument is commonly used for:

a. D & C
b. Vaginal hysterectomy
c. Both
d. None of the above

Ans.

136. a
137. b
138. a
139. d
140. a
141. a
142. a
143. c

Scanned with CamScanner

144. The given instruments are used during:

a. D & C
b. S & C
c. D & E
d. All of the above

145. Identify the given instrument:

a. Halstead head forceps
b. Kelly forceps
c. Crile forceps
d. None of the above

146. The given instrument is commonly used to hold:

a. Tonsils
b. Ovaries
c. Ureters
d. Appendix

147. The given instrument is used for providing exposure for visualization of:

a. Vagina
b. Uterus
c. Rectum
d. None of the above

148. What does the following ECG indicates?

a. Complete heart block
b. First degree heart block
c. Second degree heart block
d. Third degree heart block

149. What does the following ECG indicates?

a. Atrial flutter
b. Atrial tachycardia
c. Ventricular tachycardia
d. Functional tachycardia

150. What does the following ECG indicates?

a. Severe right ventricular hypertrophy
b. Left ventricular hypertrophy
c. Right atrial hypertrophy
d. Left atrial hypertrophy

151. Interpret the following ECG.

a. Paroxysmal atrial tachycardia
b. Multifocal atrial tachycardia
c. Atrial flutter
d. PSVT

Ans.

144. d
145. b
146. a
147. a
148. b
149. a
150. b
151. a

Scanned with CamScanner

152. Interpret the following ECG.

a. Sinus arrest
b. Normal sinus rhythm
c. Sinus tachycardia
d. Sinus bradycardia

153. What does ST elevation suggest?

a. Bundle branch block
b. Myocardial infarction
c. Heat murmur
d. Heart block-Mobitz type

154. Most common Fracture site of the bone shown in photograph is:

a. Condyle
b. Angle
c. Mandible
d. Coronoid process

155. Type of Graft shown in photograph is:

a. Isograft
b. Autograft
c. Allograft
d. Xenograft

156. Identify the fluid bag shown here:

a. Jejunostomy bag with milk
b. Albumin
c. TPN
d. Astymin

157. Identify the condition depicted in the figure:

a. Goiter
b. Submandibular lymph node enlargement
c. Ludwig's angina
d. Hyoid bone displacement

158. Identify the use of the tube shown here:
(Refer explanation at the end)

a. Venous cannulation
b. Feeding Gastrostomy by surgery
c. PEG
d. Feeding jejunostomy

159. A 55-year-old male came with complaints of bleeding per rectum, diagnosed to be Carcinoma colon underwent right hemicolectomy. Identify the instrument in the given picture: *(AIIMS Nov 2016)*
(Refer explanation at the end)

a. Hyfrecator
b. Ligasure vessel ligator
c. Harmonic scalpel
d. Monopolar cautery

Ans.

152. d
153. b
154. a
155. d
156. c
157. a
158. c
159. d

Scanned with CamScanner

160. A patient admitted in casualty after RTA- shows bruising behind the mastoid- This sign is known as: *(Refer explanation at the end)*

a. Prehn sign
b. Battle sign
c. Catel Sign
d. Dietel's sign

161. Use of the tube shown here: *(Refer explanation at the end)*

a. CBD drainage
b. Drainage of stomach
c. Feeding jejunostomy
d. Pelvic drain

162. What is the name of this catheter? *(Refer explanation at the end)*

a. Malecot's
b. Foleys
c. Sengstaken
d. Hudd's

163. What is this? *(Refer explanation at the end)*

a. Intravenous fluid infusion set
b. Blood set
c. Arterial line
d. CVP line

164. Identify the type of fracture shown in the photograph *(Refer explanation at the end)*

a. Transverse
b. Spiral
c. Oblique
d. Comminuted

165. Identify the deformity shown in the picture *(Refer explanation at the end)*

a. Trigger finger
b. Mallet finger
c. Boutonniere deformity
d. Swan neck deformity

166. Identify the Instrument/device shown in photograph: *(Refer explanation at the end)*

a. IV transfusion set
b. IV cannula
c. Scalp vein
d. Ryle's tube

167. Technique shown in Photograph is *[Recent Question 2014] (Refer explanation at the end)*

a. Thermography
b. Mammography
c. USG
d. MRI

Ans.

160. b
161. a
162. a
163. b
164. d
165. c
166. c
167. b

Scanned with CamScanner

168. Sign shown in photograph is pathognomonic of *(Refer explanation at the end)*

a. Spondylolisthesis
b. Spondylosis
c. Deep vein thrombosis
d. Peroneal nerve injury

169. Diagnose the knee deformity as shown in the photograph *(Refer explanation at the end)*

a. Genu varum
b. Genu valgum
c. Genu recurvatum
d. Clergyman's knee

170. Identify the procedure performed on a patient as shown in photograph *(Refer explanation at the end)*

a. Cricothyroidotomy
b. Tracheostomy
c. Intubation
d. Hyodotomy

Ans.

168. c
169. b
170. b

Explanations of Image-Based Questions

1. Ans. (a) Myopia

- Myopia (Near-sightedness/short-sightedness), is a dioptric condition of the eye where light focuses in front of, instead of on, the retina.

4. Ans. (c) Abducent nerve

- 6th cranial nerve (abducent nerve) palsy leads to abduction of the eyeball as it supplies LR muscle.

To Summarize

- 6th nerve palsy – failure of lateral gaze
- 3rd nerve palsy – eyeball down and out, dilated pupil, ptosis
- 4th nerve palsy – vertical diplopia on looking down – difficulty in going downstairs, reading book

55. Ans. (c) A and B

- Phenytoin precipitation caused by mixing with a solution that lowers its pH (e.g. glucose 5%).
- With Amphotericin B, avoid electrolyte solutions (e.g. sodium chloride); use glucose 5% infusions where possible, and solutions which have a pH > 4.2

56. Ans. (b) B only

- Furosemide potentially precipitates out in low pH solutions (e.g. glucose 5% solutions). So option A and C is incompatible.
- Liposomal Amphotericin has to be diluted with refrigerated normal saline only.

57. Ans. (b) 12 minutes

- **Soak instruments** in Cidex solution for 12 minutes at 20°C to achieve high-level disinfection.
- The solution is reusable for up to 14 days.

65. Ans. (b) Allen's test

- The **Allen test** is a first line standard **test** used to assess the arterial blood supply of the hand.
- A **positive Allen test** means that the patient does not have an adequate dual blood supply to the hand which would be a negative indication for catheterization, removal of the radial artery or any procedure which may result in occlusion of the vessel (e.g. sample collection for ABG)

Scanned with CamScanner

66. Ans. (d) Negative pressure dressing

- **Negative-pressure wound therapy** (NPWT), also known as a vacuum dressing or vacuum assisted closure, is a therapeutic technique using a suction **dressing** to remove excess exudation and promote **healing** in acute or chronic **wounds** and second- and third-degree burns.

67. Ans. (d) All of the above

- **Lidocaine spray** is used to numb the lining of the **mouth, nasal cavity** and **throat** before certain medical procedure (e.g., intubation).
- It is a local anesthetic that numb the lining of the mouth and throat 1-2 minutes after application. It also helps prevent the urge to close the throat (gag reflex), which might make the procedure more difficult.

158. Ans. (c) PEG

- PEG – percutaneous endoscopic gastrostomy is an endoscopic method of inserting gastrostomy tube for patients who cannot take oral diet.
- For those who need Ryle's tube for more than 4 weeks we will put PEG tube.
- Infection around the PEG tube is a common complication.

159. Ans. (d) Monopolar diathermy

Ref: Bailey and Love Page 47

- This is the monopolar diathermy handle- Blue color is for coagulation and Yellow for cutting of tissues

Bipolar Diathermy Handle:

- Bipolar is used for coagulating only, any vessel in between the two limbs gets coagulated.
- No earth plate needed for bipolar.

160. Ans. (b) Battle sign

- Battle sign is due to Fracture of base of skull*
- **Middle cranial fossa fracture**** is associated with Battle sign*

161. Ans. (a) CBD drainage

- This is T –Tube.
- Used to drain Bile after CBD Exploration.
- T Tube cholangiogram done on 7th POD and if Normal Tube can be removed.
- T- tube tract matured for 6 weeks to remove the Stone via T- tube tract is BURHENNE TECHNIQUE**

162. Ans. (a) Malecot's

- This is self-retaining Malecot's catheter.
- Used to drain the abscess
- It has capacity to get retained once placed in a cavity
- It has also been used for feeding purpose*

Other catheters:

Foley's catheter:

- Foley's catheter- Used to drain urine.
- The Balloon when inflated gets retained in the Bladder*

Central Venous catheter:

- Central venous Catheter is inserted via Subclavian or IJV for giving Total parenteral nutrition.
- Separate channels are used for IV fluids, Antibiotics and TPN.

163. Ans. (b) Blood set

- This is blood transfusion set with Filter seen inside the IV set collector and the needle is red color in Blood set.

164. Ans. (d) Comminuted

Multiple fractured fragments are present.

165. Ans. (c) Boutenniere deformity

Flexion at PIP joint and extension at DIP joint is Buttonhole or Boutenniere deformity.

166. Ans. (c) Scalp vein

[Ref. Pediatric Emergency Procedures by King, 1/e p734]

Scanned with CamScanner

- A winged infusion set also known as butterfly or scalp vein **(Photograph)** set is a device specialized for venipuncture i.e. For accessing a superficial vein for either intravenous injection or phlebotomy
- Consists, from front to rear, of a hypodermic needle, two bilateral flexible wings, flexible small-bore transparent tubing (20–35 cm long), and lastly a connector (female Luer); this connector attaches to syringe / another device

167. Ans. (b) Mammography

[Ref. Park, 23/e p389]

- Mammography **(Photograph)** is most useful for screening of Breast cancer
- Not useful in younger females below age 35 years

168. Ans. (c) Deep vein thrombosis

[Ref. Maheshwari, 5/e p44]

Homan's Sign

- Pathognomonic of DVT
- Leg swelling and calf tenderness are usual signs
- The calf tenderness may get exaggerated by passive dorsiflexion of the ankle this is called as Homan's sign **(Photograph)**

169. Ans. (b) Genu valgum

[Ref. Maheshwari, 5/e p324, 301]

- Knock-knee deformity (genu valgum) **(Photograph)**: This is a condition where the knees are abnormally approximated and the ankles abnormally divergent

Topper's edge

- Bow legs (Genu Varum) This is a condition where the knees are abnormally divergent (bow like) and the ankles abnormally approximated.
- Genu recurvatum: hyperextension at the knee joint. It may be congenital or acquired. Polio is the commonest cause of acquired genu recurvatum.
- Clergyman's knee: Infrapatellar bursitis

170. Ans. (b) Tracheostomy

- A tracheostomy is a surgical procedure to create an opening through the neck into the trachea (windpipe)
- A tube is usually placed through this opening to provide an airway and to remove secretions from the lungs
- This tube is called a tracheostomy tube or trach tube

Scanned with CamScanner

"One day in perfect health is much."

—Arabic

2 FUNDAMENTALS OF NURSING

SYNOPSIS

INTRODUCTION

- **Florence Nightingale,** also known as the **"Lady with the lamp,"** was a philosopher and **founder of modern nursing.**
- She was born in Florence, Italy on May 12, 1820 and died on August 13, 1910.
- Every year, **International Nurses Day** is celebrated on 12th May.

NURSING IN INDIA

- 1908, The Trained Nurses Association of India (TNAI) was formed.
- In 1871, the first School of Nursing was started in Government General Hospital, Madras (now Chennai) with 6 months Diploma in Midwives program.
- In 1926, Madras State (now Tamil Nadu) formed the first registration council to provide basic standards in education and training.
- In 1946, the first four year bachelor's degree program was established at the RAK College of Nursing in Delhi and Christian Medical College (CMC), Vellore.
- The Indian Nursing Council Act was passed by ordinance on December 31, 1947.
- Nursing Council Act came in existence in 1948 to constitute a council of nurses.
- In 1960, the first master's degree course, a two-year postgraduate program was started at the RAK College of Nursing, Delhi.

CODE OF ETHICS FOR NURSES

- Code of ethics serves as a means of self-regulation and set the standard of individual behavior for the profession. Professional codes of ethics are a system of rules and principles for its members and nurses adhere to the professional practice standards by following these.
- The Nurses code was first established by the **International Council of Nurses Codes** in 1953. The ICN code of ethics for nurses, most recently revised in the year 2012.
- **Four principle elements of ICN code of ethics:**
  1. Nurses and people
  2. Nurses and practice
  3. Nurses and the profession
  4. Nurses and co-workers.
- The fundamental responsibility of the nurse is in four areas namely, to promote health, to prevent illness, to restore health, and to alleviate suffering.

Legal and Ethical Aspects in Nursing Practice

Torts

- It is a wrongful act committed against a person or property. Torts may be classified as Intentional and Unintentional torts.

Intentional Torts

A purposeful act that violates another person's rights:

- **Assault:** It is an act of unlawful threat or attempt to do bodily injury to another, e.g. threaten to give injection without consent.
- **Battery:** It is any unlawful or intentional touching of a person without consent that may or may not cause harm.
- **Invasion of privacy:** It is an unwanted intrusion into person's private affairs.
- **Defamation of character:** It is communication of false statements that result in damage to the reputation of a person. There are two types of defamation. It includes:
  1. **Libel:** This type of defamation can take place in the form of print, writing or picture
  2. **Slander (Oral):** Defamation occurs in the form of spoken words or false words.
- **Fraud:** It is a deliberate deception intended to secure unfair or unlawful gain.
- **Intrusion:** It is an act of invasion into another person's private affairs.
- **Public disclosure:** It is an act of revealing or some information about a person's private life.
- **Malice:** Person knows information is false and still publisher it.
- **Appropriation:** It refers use of a person's name or image for unauthorized commercial use without his/her knowledge.

Unintentional Torts

- **Negligence:** It is an act or conduct that falls below the standard of care. The standard is established by law for the protection of others against an unreasonably great risk of harm.
- **Malpractice:** It is professional negligence or carelessness committed by a professional person. If the professional does not meet the standard while performing care, they may be held liable for negligence.

Crime

An act committed for violation of law where the consequence of conviction by a court is punishment, especially where the punishment is a serious one such as imprisonment. It can be classified as:

- **Felony:** It is a crime of serious nature which involves a potential punishment of one year or longer in prison.
- **Misdemeanor:** It is a lesser criminal act which is punished less severely than felony (<1 year imprisonment).

Good Samaritan Law

It generally provides basic legal protection to the Healthcare provider who renders first aid in an emergency to an injured person, e.g. Good Samarital law protects rescuer who voluntarily perform CPR on a victim.

Scanned with CamScanner

Ethics

Set of law or principles that govern the right conduct or behavior.

- **Autonomy:** Self-determination
- **Accountability:** Taking responsibility for one's own action
- **Beneficence:** It is an action that is done for the benefit of others
- **Confidentiality:** Keep the patient information private and maintain the privacy
- **Fidelity:** The quality of being faithful to one's commitments
- **Justice:** To treat equal or fairly
- **Nonmaleficence:** It is nonharming or inflicting the least possible harm possible to reach a beneficial outcome
- **Veracity:** The quality of being truthful or honest privacy.

PROFESSIONAL VALUES

Professional values are the guiding beliefs and principles that influence work behavior.

- **Altruism:** Selfless concern of a nurse for the wellbeing of patients and others, e.g. advocating for vulnerable patients and mentoring other healthcare professionals.
- **Autonomy:** Right to self-determination, e.g. Nurse should respect patient's rights to make decisions on their treatment, e.g. plan of care in consultation with patients.
- **Integrity:** The quality of being honest and act in accordance with code of ethics, e.g. providing honest information to patients and family, taking responsibility for own actions and accurate documentation.
- **Human dignity:** Respect for the uniqueness of individuals/people, e.g. culturally competent care to patient, respecting patient's privacy and maintaining confidentiality of patient information.
- **Social justice:** "Acting in accordance with fair treatment regardless of economic status, ethnicity, age, citizenship, disability, or sexual orientation" (American Association of College of Nursing, 2007), e.g. facilitate universal access to healthcare and nondiscrimination in delivery of nursing care.

NURSING THEORIES

- "Theories are a set of interrelated concepts that give a systematic view of a phenomenon (an observable fact or event) that is explanatory and predictive in nature" —**Kerlinger**
- Nursing theories provide rationale and for nursing interventions.
- Four concepts (**metaparadigms of nursing**) **of nursing theory are:**
  1. **Person**
  2. **Environment**
  3. **Health**
  4. **Nursing**

Note

The most important concept is the **'person'**

Classification of Nursing Theories

- **Metatheory:** It refers to 'theory of theories'. It focuses on philosophical issues and methodological issues of nursing theory, e.g. J. Dickoff's and P. James's Theory of Theory
- **Grand theory:** They are most complex and broadest in scope. Therefore, focuses on nonspecific and abstract concepts. Concepts lack operational definition, e.g. Orem, Roy and Roger's theory.
- **Middle range theory:** It targets specific concepts or phenomena, e.g. Hildegard Peplau theory of interpersonal relations
- **Practice theory:** Least complex in nature. It addresses specil goals and explores specific actions needed to achieve it.

Table 1 Summary of nursing theories

Nursing theorist	Year of theory	Central theme
Florence Nightingale	1860	• Environmentalist theory • Focuses on environmental cleanliness and concerns for ventilation, temperature, light and noise.
Hildegard Peplau	1952	• Theory of Interpersonal relationship • Interventions are directed to support therapeutic interpersonal relationship
Virginia Henderson	1955	• Nursing need theory • Focus is on assisting the client in performance of those activities contributing to health or its recovery • Theory focuses on increasing the patient's independence.
Faye Abdullah	1960	• Focus on providing nursing care for the whole person to meet health-related needs of the client and family. • 21 nursing-care problems were determined to determine patient needs
Ida Jean Orlando	1961	• Theory focuses on providing solutions to problems in order to diminish the distress of the client that will enhance the wellbeing.
Myra E. Levine	1967	• Conservation Model • Conservation of energy, structural integrity, personal integrity and social integrity
Martha Rogers	1970	• Science of Unitary human beings • Major concepts are Energy field, open field, pattern and pan dimensionability.
Dorothea Orem	1971	• Self-care deficit theory • Self-care deficits require nursing interventions.
Imogene King	1971	• Theory of **Goal Attainment** • Nurses and patients communicate to manage mutually set goals
Betty Newman	1972	• Systems model • Based on individual's reaction to stressors in the environment • Focuses on keeping the client system stable and assisting client adjustments to stressors
Sr. Callista Roy	1974	• Roy Adaptation Model • Human beings strives to maintain a balance between Biological, psychological and social systems • Nursing interventions are needed when client demonstrate ineffective adaptive response to environment.

Contd...

Scanned with CamScanner

Nursing theorist	Year of theory	Central theme
Madeline Leininger	1978	• Theory of Transcultural Nursing or Culture care theory • Caring is the central theme of Nursing (care, knowledge and practice)
Jean Watson	1979	• Holistic health care is central to the practice of Nursing care

NURSING PROCESS

Assessment

It is the collection of data to determine the actual and potential problem of the client.

Types of Data

- **Objective** (observable and measurable data): These are the observations or measurements regarding client's health status. **Signs of a disease** conditions are objective data.
- **Subjective** (feelings, sensations and perception obtained from clients through interview): These are the client given information regarding his/her own health status. **Symptoms of a disease** conditions are subjective data.

Sources of Data

- **Primary** (patient) and **secondary** (family members, significant others, medical records and reports laboratory diagnostic analyses, health care team members, literature review, etc.).
- Methods of data collection can be interviewing, physical assessment, observation of client's behavior, diagnostic and laboratory data.

Nursing Diagnosis

- Nursing diagnosis states the actual or potential problem that results from the disease process.
- Nursing diagnoses are written for the physical, emotional, social, developmental, intellectual, and spiritual aspects of the patient.
- **An actual diagnosis:** Indicate the problem that exists
- **Potential diagnosis:** Indicate the problem does not yet exist
- **Possible nursing diagnosis:** Indicate a situation in which a problem could arise unless preventive action is taken.
- **Wellness diagnosis:** Indicate the client expression of desire to attain a higher level of wellness.
- **Risk nursing diagnosis:** Problem does not exist but there are risk factors indicating that a problem is likely to develop if the nurse does not intervene.

Few Examples of Common Nursing Diagnoses

- Ineffective breathing pattern
- Impaired gas exchange
- Impaired verbal communication
- Risk for impaired skin integrity
- Deficit fluid volume
- Imbalanced nutrition
- Disorganized infant behavior
- Ineffective coping
- Deficient knowledge
- Impaired nutritional status less than body requirement.

Tips

Understanding the priority of nursing interventions will help solving many MCQs even if you do not exactly know the answer.

When a question requires you to identify appropriate nursing intervention or nursing action, you will find four interventions listed and all four may be appropriate for the given patient and or condition. You must know what the priority nursing intervention among all is given options. In order to find the most important and priority nursing intervention, you must use the knowledge of Maslow's Hierarchy of need model to identify the important one. Use the technique of A (Airway), B (Breathing) and C (Circulation) and choose the interventions related to A or B or C in the same order of priority.

Question & Answers

For Example

Q. Which of the following is the most important assessment during the acute stage of an unconscious patient?

a. Coherence and sense of hearing
b. Level of awareness and response to pain
c. Papillary reflexes and response to sensory stimuli
d. Patency of airway and adequacy of respiration

A. (d) Patency of airway and adequacy of respiration

If you are not able to use ABC or if it is not applicable, use actual to potential concept. The intervention which addresses the actual problem (at present) should be given priority over the interventions which concerns about the future risk (potential risk).

Q. A client with head injury is confused, drowsy and has unequal pupils. Which of the following nursing diagnosis is a priority at this time?

a. Altered level of cognitive function
b. High risk for injury
c. Altered cerebral tissue perfusion
d. Sensory perceptual alteration

A. (c) Altered cerebral tissue perfusion

Tips: High risk for injury is a potential risk which comes after actual risks are taken care. Use Maslow's hierarchy of needs model to choose from remaining 3 options. Maintaining perfusion is a priority compared to cognitive function and perception.

Planning

- The list of nursing diagnosis prioritized and client goals are determined, nursing intervention are written and expected outcomes are developed.
- Outcomes are defined as expected changes in client's activity, behavior or physical state and evaluates the nursing intervention. Outcomes should be based on **SMART**: Specific, measurable, attainable, realistic and time bound.
- Goals include prevention, rehabilitation and address the crisis or urgent needs of the client.
- While planning goals and expected outcome, it should be:
  - Client oriented
  - Observable
  - Time-limited
  - Realistic
  - Singular goal or outcome
  - Measurable
  - Mutual factors

Scanned with CamScanner

Implementation

- Execution of the nursing care plan.

Evaluation

- Assess client's response to care.
- Determining whether the client goals have been met, partially met or not met.

TYPES OF NURSING MODALITIES

Primary Nursing

- Each nurse is assigned to a small group of patients
- The nurse assumes 24-hour responsibility for each patient's total care continuously until discharge (even when the nurse is technically off duty)
- She may be assisted by an associate nurse, but the primary nurse is contacted if needed.
- Common use areas: Hospice care and home health

Figure 1 ■ Primary nursing structure

Team Nursing

- A head nurse or Nurse Manager supervises and coordinates a team of nurses.
- The Nurse Manager assigns a group of patients to an individual nurse [Registered Nurse (RN)]
- Each nurse is responsible for most of the each patient's care. Some of the duties are assigned to other nurses or nursing assistants.
- Includes nurses at all levels of knowledge, i.e. Registered Nurses, Practical Nurses and Nursing Assistants.

Figure 2 ■ Structure of team nursing

Modular Nursing

- Modification of team nursing
- Patient unit is divided into modules (geographical area/unit) with an RN as team leader
- The same team of caregivers is consistently assigned to same geographic area

Functional Nursing

- Nurses are assigned a specific task and do only that duty
- The nurse performs a particular task for every patient in the ward. For example, Medication Nurse, Dressing Nurse, IV Nurse, etc.
- Common use area: Operating theater

Figure 3 ■ Structure of functional nursing

Scanned with CamScanner

Nursing Case Management

- Role of nurse is a case manager
- A Registered Nurse as case manager advocates, manages and coordinates care for patients.
- Applicable in Clinics, Hospitals and in Community.

Private Duty Nursing

- The nurse is responsible for the total care of one individual patient generally at home.

MEDICAL AND SURGICAL ASEPSIS

- **Asepsis:** Free from infection
- **Medical asepsis:** Reduction in number of disease causing agents and their spread.
- **Surgical asepsis:** Complete elimination of disease causing agents.
- **Antiseptic:** The substances that are applied to living tissue or skin to reduce the possibility of infection, sepsis or putrefaction.
- **Bacteriostat:** Substance which inhibits the growth of micro-organisms
- **Culture:** Used to promote the growth of microorganisms for the purpose of identification
- **Cross infection:** Spread of infection from one person to another.
- **Carrier:** Person who carries microorganism without showing the signs and symptoms
- **Disinfection:** Destroy most of the pathogenic organisms
- **Concurrent disinfection:** All articles are disinfected immediately after the use
- **Terminal disinfection:** Articles are disinfected once the client is discharged or death of the client occurred
- **Sterilization:** Killing microorganism including spores is known as sterilization.

CHAIN OF INFECTION

Six components of infection cycle are presented in the picture below:

Figure 4 ■ Chain of infection

Infectious Agent

Bacteria, viruses, and fungi are the common agents that cause infections. Most common infection-causing agents in hospitals are Bacteria.

Reservoir

The reservoir is the source of natural habitat of the microorganism. Reservoirs to pathogenic organisms include human, animals, food, water, milk, animals and inanimate objects.

Portal of Exit

Portal of exit is the site from where the microorganisms leave the host (reservoir). Common portals of exit in humans include the respiratory (nose or mouth), gastrointestinal (feces), genitourinary, and breaks in the skin.

Modes of Transmission

An organism can be transmitted from its reservoir through various modes of transmission.

Figure 5 ■ Modes of transmission

Portal of Entry

The portal of entry is the point where the microorganism enters the susceptible host. The point of entry is almost as same as the point of exit. Pathogens enter the body through mucos membranes, skin, respiratory, gastrointestinal, urinary and reproductive tracts.

Susceptible Host

The person who is at risk for developing a disease from an infection is known as susceptible host. Factors that make the person more susceptible to infections include age (young and elderly), weakened immune system, malnutrition, certain medications and chronic illnesses.

STAGES OF INFECTION

Most infectious diseases have 4 stages:

1. **Incubation period:** Time from initial contact with infectious agent to first signs of symptoms.
2. **Prodromal stage:** Early signs and symptoms of the disease are present. Mild and generalized symptoms (fatigue, malaise, headache, and low-grade fever.
3. **Clinical stage/invasive stage/full stage of illness:** Signs and symptoms specific to the disease appear.
4. **Convalescent period:** Recovery period from the disease.

Scanned with CamScanner

Figure 6 ■ Stages of infection

STRATEGIES FOR PREVENTION OF CROSS INFECTION IN HOSPITAL

- Hand washing
- Maintain good ventilation
- Maintain general cleanliness of hospital
- Safe food and water supply
- Safe disposal of excreta
- Destruction of microorganism through disinfection and sterilization.

Barrier Nursing

Table 2 Barrier used in nursing

Types of isolation	When it is required	Technique used
Respiratory isolation	Droplet infection	Wear mask
Enteric isolation	Pathogens are transmitted via feces	Wear gloves and gowns while handling soiled article
Wound and skin isolation	Pathogens are present in wound and can be transmitted while coming in contact with infected wound	Wear gown and gloves
Blood isolation	Pathogens are found and spread via blood	Wear gloves while coming in contact with blood

- **Medical aseptic practices:** It includes practices that protect client and his environment from transmission of disease. Practices include:
  - Cleaning of articles
  - Hand washing (medical hand washing)
  - Wear all personal protective equipment.
- **Surgical asepsis:** These are the procedure used to keep areas and article completely free from microorganism. Practices include:
  - Hand washing (surgical hand washing)
  - Opening sterile packages properly
  - Use of sterile gloves and gown.

Handwashing

There are five moments of Hand Hygiene in healthcare.

Figure 7 ■ Five moments of hand hygiene

Source: WHO Guidelines on Hand Hygiene in Health Care: A Summary (2009).

Scanned with CamScanner

Steps of Handwashing (Six Steps of Handwashing as per WHO are Highlighted)

Figure 8 ■ Hand hygiene technique with soap and water
Source: WHO Guidelines on Hand Hygiene in Health Care: A Summary (2009).

Basic Principles of Surgical Asepsis

- Only a sterile object is used to touch another sterile object
- While opening a sterile package, the first edge of the wrapper is to be projected away from the nurse to prevent the sterile surface touching unsterile clothing.
- The outer surface of the sterile package is considered as is contaminated
- One inch (2.5 cm) of the outside edge of a sterile field to be considered as contaminated.
- A wet field is considered as contaminated if the surface below (paper or cloth used as a field for sterile set up) is unsterile.
- Avoid spilling any solution/liquid on a paper or cloth used as a field for sterile set up. This will allow moisture to penetrate through the sterile cloth and carries microorganism along.
- Sterile objects are to be held **above the level of waist.**
- To prevent contamination from droplet, the nurse should avoid coughing, sneezing, talking or reaching over a sterile field.
- The nurse should not turn her back on a sterile field that may prevent contamination of sterile field while it is out of her view.
- Forceps soaked in disinfectant are not to be considered as sterile.
- If there is any doubt on object about its sterility, considered it as unsterile.

Scanned with CamScanner

Methods of Sterilization and Disinfection

Figure 9 ■ Methods of sterilization and disinfection

Table 3 Sterilization methods of articles/instruments

Sterilization method	Articles/instruments sterilized	Advantages	Disadvantages
(Boil water for 10-15 minutes; add 2% sodium carbonate to boiling water to kill spores)	Syringes, needles, bowls, trays, rubber articles, cautery wires and metallic instruments	Easy, cheap and no special gadgets required	Spores are not killed Instruments rattle; damage to sharpness of instruments
Autoclaving	Blunt metallic instruments; rubber and glass articles; linen and bandages; non-absorbable suture materials	Kill spores; no rattling of instruments; storage possible for 5-6 days	Special gadgets required; expensive; thermolabile articles cannot be sterilized
Hot-air Sterilization (dry heat)	Talcum powder; glass items; Culture media	No rattling; used in microbiology	Needs special gadget; not fit for endoscope
Chemical Sterilization (carbolic acid, cetrimide, lizol, formalin, iodine, 70% alcohol)	Sharp metallic instruments	Easy; no special gadget required;	
Gas Sterilization (Ethylene Oxide; Formaldehyde)	Respirators; endoscopes; Heart lung machines; Glass and rubber articles. Fumigation of wards, theatres, furniture and clothing's	Shelf life is more	Expensive Special chambers and gases are required
Gamma Radiation (Gobalt-60 is used)	Gloves, catheters, Tubes, syringes, drapes	Cheap; indefinite storage	Available in selected centers only

Table 4 Indicators for sterilization methods

Sterilization method	Biological indicator	Mechanical indicator	Chemical indicator
Steam (autoclaving)	*Bacillus stearothermophilus spore strips*	Time and temperature recorders Pressure gauges	Chemically treated strips for temperature and humidity. Pellet in glass for time and temperature (Bowie Dick test for pre-vacuum)
Dry heat (Hot air oven)	*Bacillus subtilis spore type*	Time and temperature recorders	–
Ethylene oxide gas	*Bacillus subtilis spore type*	Time and temperature graphs, Humidity gauge, Gas pressure gauge	Exposure sensitive tapes Chemically treated strips for temperature, humidity and pH
Liquid chemical glutaraldehyde	–	–	Reagent strips for appropriate chemical concentrations

Scanned with CamScanner

PREPARATION OF CLIENT'S ENVIRONMENT

Need to check and maintain the following things optimally for the promotion of client's health status. They are as follows:

- Atmospheric temperature
- Humidity
- Air movement
- Lighting
- Less noise
- Purity of air
- Avoid unpleasant odors
- Proper water supply
- Facility for sewage disposal
- Esthetic factors

Factors of Safety

The client should be free from

- Mechanical injury
- Thermal injury
- Chemical injury
- Radiation
- Bacteriological injury
- Allergens

PRINCIPLES INVOLVED IN BED MAKING

- Microorganisms are present everywhere, so nurse needs to take care for the prevention of transmission of microorganism from source to new host
- A safe and comfortable bed will ensure rest, sleep and prevent several complication in bedridden client
- Good body mechanism followed by the nurse will maintain good body alignment and prevent fatigue
- Systematic way of functioning saves time, energy and material

Types of Bed

Table 5 Types of bed and their description

Bed	Description
Closed bed	It is an empty bed, which is not occupied by any patient. After the admission of patient closed bed is converted to open bed.
Open bed	This bed is about to be occupied by a new client or an ambulatory client
Admission bed	The bed is made as an open bed, the client gets into the bed after thorough bath and changing into hospital dress.
Occupied bed	This bed is for those client who cannot move out of the bed
Operation bed/ Postanesthesia bed/recovery bed	This bed is for those client who is getting recovered from the effect of anesthesia
Cardiac bed	This kind of bed helps the client to attain a sitting position with least strain and also helps to relieve dyspnea
Fracture bed	The bed is prepared for client with fracture. It provides support to the fractured part using a firm mattress which rests on fracture board or bed board
Amputation bed/ stump bed	This bed helps to take off the weight of bed linen on the amputated part
Burn bed	It consists of a long bed cradle which takes of bed linen weight from all over the body

Contd...

Principles Involved in Hospital Admission

- Sudden changes in the environment and strangers produce anxiety
- Entering in the hospital is threat to one's personal identity
- People have different habits and behaviors
- Illness can bring stress on physical and mental health.

HEALTH ASSESSMENT

It includes health history and physical assessment.

Types of Health Assessment

- **Initial assessment:** Helps to determine the nature of the problem.
- **Comprehensive:** It includes health history and physical examination. All aspects of client's health will be examined and it will provide data for base line assessment.
- **On-going:** It is conducted on regular interval in order to know the effect of treatment or intervention provided to the client.
- **Focused:** It is conducted to collect more information regarding any specific problem that the client suffering from.
- **Emergency assessment:** Rapid focused assessment conducted to determine potentially fatal situation.
- **Time-lapsed assessment:** To compare a patient's current status to baseline data obtained earlier.

Techniques of Physical Examination

- **Inspection:** It means observing the client properly and collecting information regarding client's health status.
- **Palpation:** The act of feeling with the hand; application of the fingers with light pressure on the surface of the body for the purpose of determining the conditions of the parts beneath. Bimanual palpation refers to palpation with both hands.
- **Percussion:** Tapping any part of the body and assessing the sound produced to collect information.
- **Auscultation:** Listening to different body sounds using instruments such as stethoscope.

Key Points

- *Do physical examination in a sequence of inspection, palpation, percussion and auscultation except for abdominal examination.*
- *In **abdominal examination**, palpation and percussion can alter bowel sounds, so auscultate, percuss, then palpate an abdomen.*

Inspection, Auscultation, Percussion, Palpation

Scanned with CamScanner

Table 6 Instruments used for physical examination

Instruments	Purpose	Pictures of the instrument
Ophthalmoscope	Examining the eyes	
Otoscope	Examining ear	
Stethoscope	Auscultation (Listening to body sounds)	
Sphygmomanometer	To measure BP	Thermometer	To measure the body temperature	Urinometer	To measure the specific gravity of urine	
Contd...

Scanned with CamScanner

Instruments	Purpose	Pictures of the instrument
Glucometer	To measure the blood glucose level	
Snellen chart	To measure the visual acuity	
Tongue depressor	To examine the oral cavity, by suppressing the tongue	
Laryngoscope	To visualize larynx	
Nasal speculum	To examine the nasal cavity	
Percussion hammer	To check the reflexes	

Scanned with CamScanner

Reflexes

Table 7

Name of the reflex	Response	Picture of procedure
Biceps reflex	Tapping of biceps tendon cause contraction of muscle	Triceps reflex	Tapping over olecranon process cause straightening of upper arm	
Patellar reflex	Tapping just below the knee (patella) cause forward kicking movement of leg	
Achilles reflex	Tapping over the Achilles tendon cause downward jerky movement	
Plantar reflex (Babinski reflex)	Stroking over the sole cause toe to bend downward, it is negative Babinski and is normal for adult. But in children stroking over the sole cause toe to move upward and outward, that is called as positive Babinski and is normal for children up to 2 years of age. Positive Babinski is considered as abnormal for adults	

Scanned with CamScanner

Romberg's Test/Romberg's Sign (for Balance)

In this test, ask the person to stand with feet together and eyes closed. If the patient is able to maintain the equilibrium then test is normal. But if the person falls down then Romberg's test is positive which means patient has balancing problem.

SPECIMEN COLLECTION

Urine Collection

Table 8 Types of urine collection methods

Type of urine specimen	Remarks
Randomly collected specimen	• Not regarded as specimen of choice • Chance of dilution of specimen if collected after patient has consumed large amount of fluid
First morning specimen	• Considered as specimen of choice for urinalysis and microscopic analysis • Generally more concentrated specimen
Mid-stream clean catch specimen	• Recommended for microbiological culture and sensitivity test • Before collecting the urine, the genitalia should be cleaned properly with soap and water
Timed collection specimen	• Required for quantitative measurement of certain analytes, e.g. Creatinine, urea, sodium, potassium, uric acid, amino acids, calcium, citrate, cortisol etc.
Collection from catheter And Collection during catheterization	• Syringe is used to collect sample followed by transfer to a specimen tube or cup • Urine can also be drawn directly from the catheter to an evacuated tube using an appropriate adaptor.
Suprapubic aspiration	• A needle is inserted through the abdominal wall and into the bladder in order to obtain the specimen. • It may be necessary for a non-ambulatory patient who cannot be catheterized or if there is any problem in obtaining a sterile specimen through conventional sampling methods
24 hours collection	• A variety of preservative agent (E.g. boric acid, concentrated HCl, formalin and chloroform) need to be added to the collection bag/bottle
Pediatric specimens (bag collection)	• A special urine specimen collection bag can be adhered to the skin surrounding genitalia

Table 9 Color of the urine and conditions

Color	Details
Pale yellow	Dilute urine
Milky white	Pyuria (pus in the urine)
Bright yellow	Multivitamins
Pink to red	Hematuria, rifampicin
Blue	Dyes in urine
Orange	Concentrated, jaundice, Nitrofurantoin
Black	Old RBC, porphyrin

Table 10 Various types of urine tests

Test	Done to determine
Cold test/hot test	Urine albumin
Benedict Test/Fehling's test	Sugar
Sulphur Test (Hay's test)/Iodine test (Smith's test)	Bile
Rothera Nitroprusside Test	Ketone bodies/Acetone

Scanned with CamScanner

Sputum Collection

Sputum is examined for:

- Gross appearance
- Microscopic
- Gram staining
- Cytology

Key Points

- For most examination first morning sample is considered the best.
- Ask the patient to rinse the mouth with plain water to remove contaminants from mouth.
- Sputum mug or wide mouthed specimen container with cover is used to collect sputum sample
- Instruct the patient to bring out sputum by deep cough.
- Sputum for culture should be collected in sterile container.
- Label the specimen container before collection of sample
- Transport to the laboratory immediately
- For sputum AFB throat swab patient can be told to hold the tongue out with paper.
- Swab for AFB can be kept in a test tube and sterile cotton swab should be used to cover the test tube.
- Patient should not be receiving any antibiotic before collecting sample for AFB or culture sensitivity.
- Do not send saliva. It may give false negative results

Stool Collection

Definition

- It is the process of obtaining a sample of a patient's feces for diagnostic purpose.
- It is used to identify infectious organisms, mucus, fat, parasites, or blood in the stool (melena).

Procedure

- A specimen of freshly passed feces of 1/2 to 1 ounce (15–30 g) is collected, without contamination of urine or toilet tissue, into a small container with a small spatula for easier collection of the sample.
- Adults/older children can collect the specimen by passing feces into a plastic bag stretched loosely over the toilet bowl. A portion from the sample can then be transferred into the container.
- With young children and infants wearing diapers, a plastic wrap can be lined with the diaper. A urine bag can be attached to the child to ensure that the stool specimen is not contaminated with urine.
- Specimen bottle should not be over filled. Avoid contamination of outer surface of specimen bottle.
- Label the container before collecting sample.
- The specimen should be sent for lab examination as soon as possible.
- Stool specimen for culture should be collected in sterile container.
- For best result, stool should be examined for three consecutive days.

Preparation of Patient

- If suspicious of occult blood, a mild laxative should be given to the patient and he should avoid eating foods rich in meat extracts or leafy vegetables three days prior to the test.
- In case of bleeding of gums, the mouth should be cleansed with mouthwash and wiped with a cloth to avoid blood entering the digestive system. This will prevent contamination of stool specimen.
- The patient should avoid having antacids, oily foods and drugs and antibiotics as they may interfere with stool analysis.
- Barium sulfate should be excluded two weeks prior to the test, and medical procedure dyes three weeks prior to the test.
- If fat in the stool is suspected, the patient is asked to collect the samples in preweighed airtight containers.
- Feces passed in a 24-hour period is collected for 2 or 3 days consecutively and is sent daily for analysis.

Nursing Responsibilities

- Watery feces will not be suitable for a test to identify fat present in stool.
- Delay in sending the specimen for testing may give false reading because it results in either death or multiplication of organisms present in the feces.
- Patient should be educated to inform medical staff of any medications that he is taking currently, as sometimes elements of the drugs may also be present in the feces.

Blood Collection

Blood may be tested for:

- Complete blood study: Hb, TLC, DLC, ESR, CT, grouping and cross match, etc.
- Culture and sensitivity
- Urea, sugar, LFT, Lipid profile and Enzymes
- Electrolyte
- Antigens and Antibodies.

Table 11 Blood collection containers guide

Cap color	Additives	Volume required	Suitable for
	Plain, Clot Activator	6 mL	• Cryoproteins Cold Agglutinin Cryoglobulin + EDTA. • Immunohematological test that require clotted blood.
	K2EDTA (Di-Potassium Ethylene Diamine-tetraacetate)	6 mL	• Group and Cross Match • Antibody Screen • Blood Group • Coombs Test • Cryofibrinogen + Red Top • Transfusion Testing

Contd...

Scanned with CamScanner

Cap color	Additives	Volume required	Suitable for
	K2EDTA	3 mL	• Most hematological tests including Hgm, TLC, DLC, PS for MP, MF, electrophoresis, typhoid • HbA1C, Cyclosporine, Homocysteine and molecular genetics test • Malaria • Lymphocyte Surface Markers • HFE Gene
	Lithium Heparin	4 mL	• They are used for plasma determinations in chemistry • Chromosome Studies • Lead • Lymphocyte Surface Markers • Vitamin B1 • Vitamin B6
	Sodium Citrate	2.7 mL	• Coagulation studies • Prothrombin Time (PT), Activated Partial Thromboplastin Time (APTT); INR-International Normalized Ratio; BT-Bleeding Time; Clotting Time (CT)
	Sodium Fluoride/ Potassium Oxalate	6 mL	• Blood Sugar Levels • Glucose • Glucose Tolerance Tests • Blood Alcohol
	Plain, ST II, Clot activator and serum gel separator	3–5 mL	• Biochemistry and Serology • S. Electrolytes • Liver Function Test (LFT), Kidney Function Test (KFT), Serum urea, Serum creatinine, Serum bilirubin, • Thyroid Function Test • Lipid Profile, Iron Studies, Immunology • HIV, hepatitis, dengue serology, virology, rheumatoid factor • Vitamin D, Troponin-T, Insulin, Iron studies, Digoxin

DOCUMENTATION (RECORDING AND REPORTING)

Key Points

- **Document:** It is a written legal document pertaining to client care.
- **Documentation:** It includes all written and/or electronic entries regarding all aspects of patient care communicated, planned, recommended or provided to the patient.
- **Admission assessment:** Comprehensive nursing assessment completed at the time of admission which includes patient history, general appearance, physical examination and vital signs.
- **Shift assessment:** Brief nursing assessment at the beginning of each shift OR if patient condition changes at any other time of the shift.
- **ISBAR (Identify, Situation, Background, Assessment and Recommendation):** It is a framework for clinical communication
- **'Real time' progress notes:** Nursing documentation is written in a timely manner during the shift.
- **'End of shift' progress notes:** Nursing documentation written as a summary at the end of shift.

Purpose of Documentation in Nursing

- Communication
- Quality assurance
- Reimbursement
- Legal protection
- Research and evidence based practice
- Further planning
- Education
- Incidence and prevalence monitoring
- To calculate vital statistics.

Principles of Documentation

- Date and time-stamped by the persons who created the entry
- Legible and Readable
- Correct Spelling and Appropriateness
- Accuracy and Completeness
- No unnecessary cuts and corrections
- Signature
- Confidentiality.

Methods of Documentation

- **Sources oriented record (SOR):** For each discipline data is recorded in separate sheets. For example, medicines detail in one record, laboratory investigations in other record.
- **Problem oriented medical record (POMR):** Organize record according to the problem identified.

Scanned with CamScanner

PERSONAL HYGIENE

Oral Hygiene

Table 12 Oral diseases with their description

Problem	Description
Halitosis	Bad odor of breath
Dental caries	Destructive process causing decalcification of enamel which leads to cavitation
Dental plaque	Soft thin layer of debris and epithelial cell deposited in the teeth which provide a medium for the growth of microorganism
Calculus/tartar	Dental plaque become hard and form calculus
Bottle mouth syndrome	Dental caries occur in children because of use of bottles with liquids other than water
Periodontal disease/ pyorrhea	Socket of teeth filled with pus is known as pyorrhea
Sordes	Brown crust formed on teeth and lips is known as sordes
Cheilosis	Cracking and ulceration of the lips and angles of the mouth
Glossitis	Inflammation of tongue
Stomatitis	Inflammation of mucos membrane of mouth

Pediculosis Treatment

Pesticides used for pediculosis treatment:

- DDT 5% or 10%
- Carbonic lotion 1:40
- Equal part of kerosene and equal part of hair oil

VITAL SIGNS

- The four primary vital signs are temperature, pulse, respiratory rate (RR), and blood pressure (BP)
- **A fifth vital sign is pain.**

Average acceptable ranges for adults

- Normal body temperature is 98.6°F (37°C).

Temperature normal level:

- **Normal oral:** 37°C (98.6°F)
- **Normal rectal:** 37.5°C (99.5°F), which is 1°F (0.6°C) higher than an oral temperature.
- **Normal axillary:** 36.5°C (97.7°F) which is 1°F (0.6°C) lower than an oral temperature.

Conversion from Celsius (°C) to Fahrenheit (°F)

- **The formula is** (°C × 9/5) + 32 = °F or (°F – 32) × 5/9 = °C
- Let us convert 37°C to Fahrenheit
  - 37°C × 9/5 + 32 = 98.6°F
- Let us convert 98.6°F to Celsius
  - (98.6°F – 32) × 5/9 = 37°C

Ways of Losing Heat

- **Conduction:** Transfer of heat from hot object to cold object when coming in direct contact.
- **Convection:** Transfer of heat through circulating air.
- **Radiation:** Transfer of heat from hot to cold object when it is in not contact with each other.
- **Evaporation:** Loss of heat occur when liquid is converted to vapor.

Types of Temperature Variation

- **Pyrexia**

Mild pyrexia : 99–100°F **Moderate pyrexia** : 100–103°F
Severe pyrexia : 103–105°F **Hyperpyrexia** : Above 105°F

- **Intermittent fever:** The elevated temperature is present only for some hours in a day and remains normal for the remaining hours. Temperature spike occurs either daily (quotidian) or every alternate day (tertian) or every third day (quartan). Intermittent fever is seen in **malaria, kala-azar, pyemia, septicaemia** etc.
- **Remittent:** The temperature remains above normal throughout the day. Temperature variation is more than 2°C between morning and evening. This type of fever is more common in typhoid infection and infective endocarditis.

Note

With **intermittent fever**, the temperature is elevated but falls to normal (37.2°C or below) each day, while in a **remittent fever** the temperature falls each day but not to normal.

- **Relapsing fever:** It is a variant of intermittent fever. Fever episodes are separated by intervals of normal temperature for days or weeks. It is typically seen in Borrelia infections.
- **Inverse fever:** It is characterized by temperature rises in the early morning rather than in the evening.
- **Low Grade Fever:** Temperature is slightly elevated — **between 98.7°F and 100.4°F (37.5°C and 38.3°C)** — and lasts for more than 24 hours. It is commonly present in Tuberculosis.
- **Crisis:** Sudden return of temperature to the normal range from a very high temperature.
- **Lysis:** Temperature falls in a zigzag manner (step-ladder pattern) for days or week before reaching the normal temperature.
- **Continuous fever:** It is also known as constant fever in which temperature variation is not more than 2°C between morning and evening and the temperature does not reach the normal.
- **Rigor:** Sudden rise in body temperature along with shivering as seen in malaria.

Various Sites for Taking Pulse

Figure 10 ■ Various sites on human body for taking pulse

Scanned with CamScanner

- **Pulse:** Normal adult heart beat is 60–100 beats per minute.
- **Pulse deficit:** It is the difference between apical pulse and radial pulse.
- **Pulse pressure:** Difference between systolic blood pressure and diastolic blood pressure is known as pulse pressure.

Altered Breathing Pattern

- **Bradypnea:** Respirations that are regular in rhythm but slower than normal in rate. Normally less than 10 bpm.
- **Dyspnea:** Difficulty in breathing or labored breathing
- **Tachypnea:** It is abnormally rapid breathing pattern greater than 20 breaths per minute.
- **Apnea:** Absence of spontaneous respirations for more than 20 seconds.
- **Hyperpnea:** It is increased depth of breathing when required to meet metabolic demand of body tissues, such as during or following exercise, or when the body lacks oxygen (hypoxia), for instance on high altitude or as a result of anemia.
- **Orthopnea:** Patient can breathe only in upright position. Shortness of breath (dyspnea) occurs when lying flat.
- **Hyperventilation:** Hyperventilation is rapid or deep breathing that can occur with anxiety or panic. It is also called over breathing.
- **Hypoventilation:** The state in which a reduced amount of air enters the alveoli in the lungs, resulting in decreased levels of oxygen and increased levels of carbon dioxide in the blood.
- **Cheyne-Stokes respirations:** Cheyne-Stokes respiration is also known as periodic respiration, with cycles of respiration that are increasingly deeper then shallower with possible periods of apnea.
- **Kussmaul's respiration:** Kussmaul breathing is a deep and labored breathing pattern often associated with severe metabolic acidosis.
- **Bitot's respiration:** Breathing characterized by irregular periods of apnea alternating with periods in which four or five breaths of identical depth are taken; seen in patients with increased intracranial pressure associated with spinal meningitis and other central nervous system disorders.
- **Hypercapnia:** Hypercapnia, also known as CO_2 retention, hypercapnia, and hypercarbia, is a condition of abnormally elevated carbon dioxide (CO_2) levels in the blood.
- **Hypoxia:** Hypoxia (also known as hypoxiation) is a condition in which the body or a region of the body is deprived of adequate oxygen supply.
- **Hypoxemia:** It is an abnormally low level of oxygen in the blood.
- **Normal Respiratory Rate:** 12–16 breaths per minute

Blood Pressure

- **Normal Blood Pressure:** 120/80 mm Hg.
- **Pulse pressure:** 30–50 mm Hg (Pulse pressure = Systolic blood pressure diastolic blood pressure).
- **Cuff size:** Width of the cuff should be 40% of the arm circumference and length of the cuff should be 80% of the arm circumference.
- **Hypertension:** Blood pressure is above the normal range for a sustained period. (Specific classification of Hypertension is described in Medical-Surgical Synopsis)
- **Hypotension:** Abnormally low BP (less than 90/60).
- **Orthostatic hypotension:** It is also known as postural hypotension. In this a sudden fall in BP occurs when the person assumes upright position from supine position. In orthostatic hypotension, SBP falls at least 20 mm Hg or DBP falls at least 10 mm Hg within three minutes of standing.

Also Know

Assessing Vital Signs

- Before the thermometer is used for another patient it should be disinfected with 1:40 strength of dettol or 1:20 strength of savlon for 5 minutes and with Lysol and carbolic with 1:40 for 3 minutes.
- Rectal method is the most reliable method for taking temperature.
- If the patient has just had a very hot or cold drink, wait 10–20 minutes before taking the temperature.
- The most accurate assessment of pulse rate is apical pulse, and for measurement stethoscope is required.
- A weak thready pulse with a significant fall in blood pressure may indicate circulatory failure.

COMFORT DEVICES

- **Back rest:** Mechanical device that provides support to the patient while sitting.
- **Knee rest:** Gives relaxation and relieves pain on abdominal muscles and tendons beneath the knees.
- **Foot rest:** Device placed in a way that the feet rest firmly against it.
- **Bed cradle:** Supports and takes off the weight of the bed clothing.
- **Bed blocks:** Made up of wood or metal used to raise the foot end or head end of the bed.
- **Sand bags:** Used to immobilize a part and relieve discomfort as in fractures.
- **Air cushion:** Generally are made up of rubber and can be inflated with air. Used to take off the weight of the body and relieve pressure on certain parts of the body.
- **Rubber and cotton rings:** Used to relieve pressure on certain parts of the body like elbow and heels.
- **Air and water mattresses:** Used for very thin and very obese patients. Also used for those who are at higher risk of developing pressure sores.
- **Cardiac table:** Patient can lean forward and take rest.
- **Hand rolls:** Maintain fingers in slightly flexed position.

Scanned with CamScanner

VARIOUS POSITIONS

There are various positions which are considered during assessing patient under medical intervention.

Figures 11 A to H ■ Various positions of human body for observation

TYPES OF APPLICATION

There are two types of applications: Hot application and Cold application.

Hot Application

Hot application is the application of a hot agent either in a moist or dry form on the surface of the body.

Purposes:

- To relieve pain and congestion
- To provide warmth
- To promote suppuration (pus formation) and soften the exudates
- To promote healing
- To decrease muscle tone

Figure 12 ■ Classification of hot application

Scanned with CamScanner

Cold Application

Cold application is the application of cold agent, either in a moist or dry form, on the surface of the skin.

Purposes:

- To reduce pain, inflammation and body temperature
- To anesthetize body area
- To control the growth of bacteria
- To control hemorrhage
- To prevent edema and gangrene

Figure 13 ■ Classification of cold application

Table 13 Temperature for hot and cold application

Types of application	Description	Temperature	Application
Cold application	Very cold	Below 15°C	Ice bag
	Cold	15°C to 18°C	Cold packs
	Cool	18°C to 27°C	Cold compresses
	Tepid	27°C to 37°C	Alcohol sponge bath
Hot application	Warm	37°C to 40°C	Warm bath
	Hot	40°C to 46°C	Hot soak, hot compresses
	Very Hot	Above 46°C	Hot water bag for adults

Table 14 Comparison between cold and hot application

Effects	Hot application	Cold application
Effect on blood vessels	Vasodilation	Vasoconstriction
Capillary permeability	Increased	Decreased
Oxygen consumption	Increased	Decreased
Local metabolism	Increased	Decreased
Blood and lymph flow	Increased	Decreased
Motility of WBC	Increased	Decreased
Blood viscosity	Decreased	Increased
Muscle tone	Decreased	Increased

DRUG ADMINISTRATION

- Administration of medication is a basic nursing function which requires knowledge as well as skills. The safe and accurate administration of medication is one of the basic and most important responsibility of the nurse.
- Follow **Ten rights**: Right patient, right dose, right route, right time, right drug and right documentation, right history and assessment, right to refuse, right drug-drug interaction and evaluation and right education and information.

Scanned with CamScanner

Routes of Administration

- **Oral administration**: The most common and easy route of administration.
- **Sublingual administration:** These drugs are administered by placing under the tongue e.g. Tab. sorbitrate administration.
- **Inhalation:** Drugs in spray form and fumes of the drugs are inhaled into the lungs
- **Inunction:** Application of drug on the skin.
- **Instillation:** Putting liquid form of medication into body cavity.
- **Insertion**: Introducing solid kind of drug into body orifices, e.g. suppository.
- **Insufflation:** Administration of drug in the form of powder, vapor or air into the body cavity by blowing with an insufflator.
- **Parenteral administration:** Giving medication outside the alimentary tract.
  - **Intramuscular:** Into the muscles (90)
  - **Subcutaneous (hypodermic):** Into the subcutaneous tissue (45)
  - **Intradermal:** Under the epidermis (15)
  - **Intravenous:** Into the vein (25)
  - **Intracardiac:** Into the cardiac muscle
  - **Intrathecal/intraspinal:** Into the spinal cavity
  - **Intraosseous:** Into the bone marrow
  - **Intraperitoneal:** Into the peritoneal cavity.

Types of Orders

Table 15 Types of order and their description

Type	Description
Standing order	Order needs to be carried out for specified number of days till next order comes or order finishes
PRN order	Whenever required
One time order	Administer these medication only once
Stat order	Administer medication immediately

FLUID AND ELECTROLYTE

Fluid

Fluid compartments: ICF and ECF

- **Intracellular fluid (ICF)**
  - Found within the cells of the body
  - Constitutes 2/3 of total body fluid in adults
  - Major cation is potassium
  - Major anion is phosphate
- **Extracellular fluid (ECF)**
  - Found outside the cells
  - Accounts 1/3 of total body fluid
  - Major cation is sodium
  - Major anion is chloride
- **The extracellular fluid**
  - **Interstitial fluids:** Fluid in between the cells and outside the blood vessels, e.g. lymph
  - **Intravascular fluid:** Blood plasma
  - **Transcellular fluid:** Consists of cerebrospinal fluid, pleural, peritoneal, and synovial fluid.

Table 16 Types/Tonicity of IV fluids

Type of solution	Description	Examples
Isotonic solution	A solution that has the same salt concentration as cells and blood	• Normal Saline (0.9% NaCl) • Ringer Lactate Solution (RL) • 5% Dextrose in Water (D5W)
Hypotonic	A solution that has lower salt concentration than cells and blood	• Saline (NaCl) solutions with less than 0.9% concentration • 2.5% Dextrose (less than 5% dextrose concentrations)
Hypertonic	A solution that has the higher salt concentration than cells and blood.	• DNS (Dextrose (5%) in NS) • D5RL (Dextrose in Ringer Lactate 3% NS) • D5 in 0.45% NaCl

Fluid Transport

- **Osmosis:** Movement of water between extracellular and intracellular through a semipermeable membrane. Movement is controlled by osmolarity of two compartments. Sodium—regulator of extracellular osmolarity. Potassium—regulator of intracellular osmolarity.
- **Diffusion:** It is passive transport of solute and electrolytes across the cell membrane. Solute move from higher concentration to lower concentration. Movement continues till equilibrium is achieved.
- **Facilitated diffusion:** Movement of water soluble solutes across the cell membrane with assistance of proteins.
- **Active transport:** Movements of solute and electrolytes against the concentration gradient. Requires energy in the form of ATP. For example, sodium potassium pump.

Scanned with CamScanner

Electrolytes

Table 17 Functions deficiencies and excessiveness of electrolytes

Electrolyte (Normal Range)	Functions	Deficit leads to	Excess leads to
Sodium (135–145 mEq/L)	• Osmotic balance maintenance • Regulation of acid base balance. • Normal muscle irritability • Initiates and maintains heart beat	**Hyponatremia** **Causes** • Low sodium consumption • Increased loss of sodium • Over hydration • Use of diuretics • Increased ADH hormone • Addison's disease • Hypoaldosteronism. **Signs and symptoms** • Confusion, drowsiness, muscle weakness, seizure	**Hypernatremia** **Causes** • Dehydration • Diabetes insipidus • Cushing syndrome • Hyperaldosteronism ▪ *Prolonged cortisone use.* **Signs and Symptoms** • Thirst • Confusion • Neuromuscular excitability • Hyperreflexia Seizures • Coma
Potassium (3.5 – 5 mEq/L)	• Maintain intracellular osmotic pressure • Transmission of nerve impulse • Cardiac muscle activity • Regulation of acid-base balance.	**Hypokalemia** **Causes** • Cushing syndrome • Prolonged cortisone use • Diuretics • Diarrhea • Vomiting. **Signs and symptoms** • Fatigue • Confusion • Cramps • Paralysis • Muscle weakness • Arrhythmia • ST wave depression and abnormal U wave.	**Hyperkalemia** **Causes** • Kidney failure • Potassium sparing diuretics • Burn wound • Tissue injury • Addison's disease. **Signs and symptoms** • Prolonged PR interval, spiked/ peaked T wave.
Calcium (8.5-10.5 mg/dL).	• Development of bones and teeth • Nerve impulse transmission • Important role in muscle contraction	**Hypocalcemia** **Causes** • Deficiency of vitamin D • Hypoparathyroidism **Signs and symptoms** • Tetany • Positive **Chvostek sign** • Positive Trousseau's sign • Cramps • Neuromuscular irritability • Numbness • Spasm • Convulsion • Seizure • Osteoporosis.	**Hypercalcemia** **Causes** • Bone cancer (Paget's disease) • Hyperparathyroidism • Hyperthyroidism • Sarcoidosis • Hypervitaminosis D **Signs and symptoms** • Excess urination • Dehydration • Nausea and vomiting • Muscle cramps and weakness • Flank pain • Bone pain • Confusion and coma (severe cases)

Scanned with CamScanner

ACID-BASE BALANCE

- Normal blood pH is 7.35-7.45
- Decrease in pH less than 7.35 is acidosis, and increase in pH more than 7.45 is known as alkalosis.
- **Acid:** Any substance that yield H^+ ion in a solution
- **Alkali (Base):** Any substance that yields OH^- in the solution.

Buffer System

- Buffer is any solution which contains a weak acid, weak base and their salts.

Mechanism of Regulation of pH

Front Line Mechanism

- Buffer in the blood
- Respiratory buffer.

Second Line Buffer Mechanism

- Renal mechanism.

Dilution Defense

- Acid/base entered or produced in the body will be equally distributed throughout the ECF and thereby change in pH will be negligible.

Note

More details regarding Acid-Base balance/acidosis/alkalosis are described in Medical-Surgical Synopsis

BASIC AND ADVANCED LIFE SUPPORT

[Refer Appendices for comparison of components for adults, children, and infants BLS/CPR (Page no. A-91)] 97

NURSES ROLE IN IMPORTANT PROCEDURES

Tracheostomy Suction

- Assess the patient and look for any special instructions
- Explain procedure to the patient
- Gather the equipment and provide privacy to the patient
- Wash your hands
- Assist the patient to semi-Fowler's or Fowler's position
- Place the clean towel across the patient's chest
- Turn the suction apparatus on
- **Adult:** 100–120 mm Hg
- **Child:** 95–110 mm Hg
- **Infant:** 50 mm Hg
- Wear the goggles/mask/gown
- Prepare the sterile articles
- Hyper-oxygenate the patient
- Wash hands
- Wear the sterile gloves
- Connect the sterile suction catheter to suction tubing which is held using unsterile hand
- Moisten the catheter unless it is prelubricated using sterile N/S
- Remove oxygen delivery system if present
- Using sterile hands gently and quickly insert the catheter into the trachea (10–12.5 cm or until the patient coughs). Do not occlude the 'Y' port and apply pressure
- Apply intermittent suction by occluding 'Y' port with thumb of unsterile hand, gently rotate the catheter as it is being removed. Do not allow for more than 10 seconds.
- Hyperventilate or encourage the patient to cough or take deep breath
- Clean the catheter with the sterile gauze
- Flush the catheter with saline and repeat if necessary
- After procedure turn off the suction apparatus and disconnect the catheter and discard
- Remove the previously applied soiled dressing with unsterile hand
- Apply clean dressing
- Dip cotton applicator in saline and clean stoma under faceplate
- Apply betadine
- Apply dressing
- Change the tracheostomy tape
- Remove gloves and discard
- Wash hands
- Assess patient's respiratory status
- Provide oral care
- Document the procedure.

Lumbar Puncture (Spinal Tap)

- Get the consent signed after explaining the procedure along with the physician
- Provide fetal position (knee chest position) during the procedure
- It is important to insert the spinal needle below the conus medullaris at the L3/L4 or L4/L5 interspinous levels
- Provide supine position after the procedure
- Apply pressure and a dressing to the puncture site
- Transfer the CSF specimen immediately to the laboratory
- Measure blood glucose level immediately after or just before the procedure
- Headache and pain at puncture site are the most common side effects

Complication of O_2 therapy
Retrolental Fibroplasia - Fibrosis in eye
Paul Bert effect - O_2 toxicity in CNS
Lorrain Smith - O_2 toxicity in pulmonary

Scanned with CamScanner

Most common method of O2 in clinical practice - Nasal catheter (cannula)

Oxygen Therapy

Low Flow System

Device	Picture	Suggested flow rate	Advantages	Disadvantages
Nasal cannula		1-4 L/min 24-44% concentration	Inexpensive Comfortable	Drying of nasal mucosa Dislodged easily Use for long time
Nasopharyngeal catheter		1-6 L/min	Does not require tracheostomy Inexpensive - Emergency situation - Use for short time	Mucosal irritation
Simple mask		6-8 L/min 40-60%	Simple to use, Inexpensive	Poor fitting

High Flow System

Device	Picture	Suggested flow rate	Advantages	Disadvantages
Transtracheal Catheter (TTO)		1-4 L/min	More comfortable	Frequent cleaning Surgical intervention required

Contd...

Scanned with CamScanner

O2 Tent - 2 lit
O2 hood - 6-12 lit

Device	Picture	Suggested flow rate	Advantages	Disadvantages
Venturi mask		2-15 L/min 24 - 60% Blue - 2 white - 4 orange - 6 yellow - 8 Red - 10 Green - 15	Additional humidity	Must remove for eating and drinking - Most accurate - Fix concentration
Face tent		8-10 L/min	Good humidity	Bulky

sedative - sleep
Astrinsent - inflammation
Purgative - peristalsis mov
Stimulant - poison, shock

Enema

- **Definition:** The administration of a substance in liquid form into the rectum for the evacuation of feces or for drug administration.
- The enema should be administered at room temperature (40.5-43.3°C).
- Quantity should not be more than 100–250 mL while giving retained enema so that rectum is not distended to cause peristalsis.
- The small lubricated tube is inserted 3–4 inches (7.5–10.0 cm) into the adult rectum and 1–1.5 inches into the child's rectum.
- Insert suppositories about 4 cm into the rectum, usually using the index finger.
- Normally hang *the solution 30 cm (12 in) above the rectum.*
- 12–18 inches or 30–45 cm height should be maintained from the bed level for giving high cleansing enema.
- 20 cm or 8 inches height should be maintained from rectum in retention enema.
- **Carminative enema:** This type of enema releases tension or swelling in the colon and rectum. When waste builds and sits in the colon, a carminative enema allows the wastes and toxins to leave the body.
  (Antispasmodic) (gases)
- **Retention enema:** This type of enema is used to administer medication and oil into the patient's rectum. The types of oil and medications include nutritive, antibiotics, and anthelmintics.
  parasite
- **Temperature** of enema solution
  - For adults: 105°F
  - For child 98.6°F
- For giving cleansing enema use 22 French (F) for adults, 14-18F for school age child and 12°F for an infant.

SUTURE

- **Sutures** or stitches: As a method for closing cutaneous wounds
- **Type A: According to nature of absorption**
  - **Absorbable suture:** Those which are absorbable and will break down harmlessly in the body within 60 to 90 days are known as absorbable. ***Absorbable sutures include** Polyglycolic acid sutures, Polyglactin 910, Catgut, Poliglecaprone 25 and Polydioxanone sutures.*
  - **Nonabsorbable suture:** Manually removed if they are not left indefinitely. **Non-absorbable suture includes:** Polypropylene sutures, nylon (poylamide), polyester, PVDF, silk and stainless steel sutures.
- **Type B: On the basis of material structure**
  - **Monofilament** sutures and **multifilament** or **braided** sutures. Braided sutures provide better knot security whereas monofilament sutures provide better passage through tissues.
  - **Polyglycolic** acid are known for their high quality and undoubted performance. Made-up of braided and coated 100% polyglycolic acid.
  - **Catgut** is pliable, is an absorbable, sterile, surgical suture composed of highly purified connective tissue. Chromic catgut lasts for 2–3 weeks and is used for ligatures and tissue suture.
  - **Braided suture** is usually made of natural products (silk, linen or cotton). It is acceptable in many situations, but is contraindicated in a wound that is, or may be, contaminated.
  - **Poliglecaprone** suture is a fast absorbing suture made of a synthetic absorbable monofilament composed of glycolide and epsilon-caprolactone copolymer (usually called PGCL suture). It comes as dyed (violet) and un-dyed (clear) forms, and is a monofilament suture.

Scanned with CamScanner

Needle

Surgical Needles

All surgical needles have three basic components:

- Eye (or Swage)
- Body
- Point

Figure 14 ■ Basic needle design

- **Round bodied:** For soft (subcutaneous) tissues such as muscle, fascia, mucos membrane. The middle of the needle is flat for better seating in the needle holder and easy entry.
- **Cutting:** For firm tissue, sclerotic vessels and prostheses.
- **Trocar:** Trocar needles have a sharp tip but a round body. They are useful, necessary to perforate tough tissue.
- **Spatula needle:** For ophthalmic and microsurgery, flattened needle body hand ground lateral.

GRIEVING PROCESS

- Loss is experienced when something of value like object, person is changed or gone.
- **Actual loss** can be validated by others (e.g. death).
- **Perceived loss** can be experienced internally; cannot be verified by others (e.g. loss of confidence).
- **Anticipatory loss** occurs before the loss is experienced (e.g. scheduled mastectomy, pending divorce).
- **Expected loss** (such as a death after a long illness) can take a short time to absorb.
- Mourning occurs in response to an individual's own terminal illness, the loss of a close relationship, or to the death of a valued being, human or animal.
- Grief is a characteristic pattern of psychological and physical responses experiencing after the loss of significant person, object, belief, or relationship.
- **Bereavement** is a state of desolation that occurs as a result of loss, particularly death of a significant other.
  - Bereavement is the state of grieving during which a person goes through grief reaction.
- **Mourning** encompasses socially prescribed behaviors after the death of other (vary as per culture). The period of acceptance of loss and grief during which the person learns to deal with the loss.

Stages of Grieving (DABDA)

- **Kubler-Ross:** (a) Denial, (b) anger, (c) bargaining, (d) depression and (e) acceptance.
  - **Denial:** A protective mechanism. Helps in coping. May lasts for a few minutes or even months.
  - **Anger:** Self-blame or blaming of others may lead to anger towards self, God, others, environment, healthcare settings.
  - **Bargaining:** Tries, to bargain with God for a second chance. Represents clients' attempt to postpone death.
  - **Depression:** Full impact of loss is experienced. "I'm too sad to do anything."
  - **Acceptance:** Effort to take personal and financial affairs in order.

TRIAGE

- At the time of disaster, **Simple Triage and Rapid Transport (START)** can be used to categorize clients

Figure 15 ■ Categories of clients in Triage

INTRAVENOUS FLUID ADMINISTRATION DROP RATE CALCULATION

When intravenous fluid is administered to patient and regulated manually, the nurse should be able to calculate IV flow rate (drops per minute to be administered). It can be calculated from amount of liquid, time period and a drop factor (gtts/mL).

Formula

$$\frac{\text{Volume (mL)}}{\text{Time (min)}} \times \text{Drop factor (gtts/mL)} = \text{Y (Flow rate in gtts/min)}$$

Question & Answers

For Example

Q. Calculate the IV flow rate for 1000 mL of NS to be infused in 8 hours. The infusion set is calibrated for a drop factor of 20 gtts/mL.

$$\frac{\text{Volume (mL)}}{\text{Time (min)}} \times \text{Drop factor (gtts/mL)} = \text{Y (Flow rate in gtts/min)}$$

Convert 8 hours to minutes

8 hours × 60 min = 480 minutes

$$\frac{1000 \text{ mL}}{480 \text{ min}} \times 20 \text{ gtts/mL} = 41.66 = 42 \text{ gtts/min}$$

Q. Calculate the IV flow rate for 500 mL of 5% dextrose over 4 hours. Infusion set has drop factor of 15 gtts/mL.

$$\frac{\text{Volume (mL)}}{\text{Time (min)}} \times \text{Drop Factor (gtts/mL)} = \text{Y (Flow Rate in gtts/min)}$$

$$\frac{500 \text{ (mL)}}{4\text{hr} \times 60 \text{ min}} \times 15 \text{ gtts/mL} = 31.25 = 31 \text{ gtts/min}$$

Scanned with CamScanner

Note

Because it is not possible to give a patient a fraction of a drop, it is typical to round off answers for these problems (up or down) to the nearest whole number.

HEMOGLOBIN

Hemoglobin	
Male :	13.5–17.0 g/dL
Female:	11.5–16.0 g/dL
Hematocrit	
Male :	0.40 - 0.51 or 40% to 51%
Female:	0.34 - 0.48 or 34% to 48%
RBCs	4.5 to 6 million/mm³ or 4.5 - 6.0 x 10^{12}/L of blood
WBCs	4000–11000 cells/mm³
Platelets	1,50,000–4,00,000 cells/mm³ of blood

Interpretations of Abnormal CBC

- Decrease in haemoglobin (anemia) is due to iron or other deficiency, bleeding or marrow suppression such as chemotherapy. Haemoglobin increased in polycythemia vera
- WBC increases are due to steroid use, infection or leukemia, decrease due to marrow suppression.
- Platelet decreases are due to increased consumption of Platelet in ITP or splenomegaly, or decreased production due to marrow suppression. Platelet count drops in case of Dengue.

COAGULATION STUDIES

INR (International Normalized Ratio of PT or prothrombin time)	0.9–1.1
Therapeutic Coumadin (Warfarin)	2.0–3.0
Mechanical heart valves	2.5–3.5
PTT (Partial thromboplastin time)	21–33 seconds
Therapeutic heparin	60–85 seconds
PT	10–14 seconds
Bleeding Time	3–7 minutes
Thrombin time	11–15 seconds

Note

INR and PTT may be elevated due to loss of factor production in liver disease, due to congenital deficiency such as hemophilia or suppression with drugs such as coumadin or heparin.

RENAL FUNCTION

Sodium	135–145 mEq/L
Potassium	3.5–5.5 mEq/L
Chloride	98–107 mEq/L
Bicarbonate	24–28 mEq/L
BUN (Blood Urea Nitrogen)	7–20 mg/dL or 2.5–8.0 mmol/L
Creatinine	0.6–1.2 mg/dL or 60–125 umol/L

- Electrolyte disturbances may be due to renal failure, alterations in hydration (hypo or hyper), drug use (diuretics), alterations in pH (acidosis or alkalosis), diabetic ketoacidosis, adrenal disease, etc.
- Renal failure (and increasing BUN and creatinine) may be due to acute tubular necrosis (due to hypotension), glomerulonephritis, diabetic nephropathy, urinary tract infection, etc.

Contd...

LIVER FUNCTION TEST (NORMAL VALUES)

Albumin	3.5–5.0 g/dL
Total bilirubin	0.3-1.2 mg/dL
Direct bilirubin (Conjugated)	0.1-0.4 mg/dL
Indirect bilirubin (Unconjugated)	0.2-0.8 mg/dL
AST (Aspartate Aminotransferase)	10– 42 U/L
ALT (Alanine Aminotransferase)	10–40 U/L

- In liver failure (due to hepatitis or cirrhosis) serum albumin will be decreased due to reduced production, serum bilirubin will be increased due to loss of liver metabolic function, serum enzymes will be increased due to "leakage" of contents of damaged cells

PULMONARY FUNCTION TEST

PFTs (Pulmonary Function test)

FEV_1 (Forced Expiratory Volume in one second/percentage of predicted based on total forced expiratory volume)

Normal	>75%
Mild disease	<60%
Moderate disease	40–60%
Severe disease	<40%

ENDOCRINE FUNCTION

- **Normal Calcium level** : 9–10.5 mg/dL
- Calcium levels will be reduced with dietary vitamin D or calcium deficiency, loss of parathyroid function (for example post thyroid surgery), etc.

Thyroid Function Test

- **Normal TSH** : 0.35 – 5.00 mIU/L
  Suppressed : < 0.10 mIU/L
  Elevated : > 15.0 mIU/L
- TSH is elevated in hypothyroidism due to primary thyroid deficiency.
- TSH is depressed with excess exogenous thyroid hormone, Grave's disease or a secreting thyroid adenoma.
- Normal TSH level during pregnancy is lower than the normal non-pregnancy level

Scanned with CamScanner

BLOOD SUGAR PROFILE

Random Blood Glucose (Random)	70–125 mg/dL
Glucose (Fasting)	70–100 mg/dL
Glucose (Post Prandial)	<140 mg/dL
HbA1c (Glycated Hemoglobin) *(To identify the three-month average plasma glucose concentration)*	4–6%
HbA1c level 5.7 to 6.4: High risk for diabetes. HbA1c level >6.4: Diabetes.	

- Increased serum glucose may be related to either undiagnosed diabetes, or poorly controlled diabetes due to noncompliance or the "brittleness" of the underlying disease.
- Decrease serum glucose is typically due to insulin overdose or inadequate dietary intake of calories in the face of insulin or oral hypoglycemic use.

CARDIAC MARKERS

Cardiac markers and the normal ranges have been given as tabular form.

Cardiac markers	Normal range and onset
Troponin I	0–0.1 ng/mL (onset: 4-6 hours, peak: 12-24 hours, return to normal: 4-7 days)
Troponin T	0–0.2 ng/mL (onset: 3-4 hours, peak: 10-24 hours, return to normal: 10-14 days)
Myoglobin (Male)	10–95 ng/mL (onset: 1-3 hours, peak: 6-10 hours, return to normal: 12-24 hours)
Myoglobin (Female)	10–65 ng/mL (onset: 1-3 hours, peak: 6-10 hours, return to normal: 12-24 hours)
Troponin I	0–0.1 ng/mL (onset: 4-6 hours, peak: 12-24 hours, return to normal: 4-7 days)
Creatinine kinase Index (CK-Index)	0–3
Creatinine Kinase-MB (CK-MB)	0–3 ng/mL
Total creatinine kinase	38–120 ng/mL

URINE ROUTINE AND MICROSCOPY

The normal values of urine have been given as follows:

Color	Straw
Specific gravity	1.005 to 1.030
pH	4.6–8.0
Na	40–220 mEq/24 hours
K	25–125 mEq/24 hrs
Cl	80–250 mEq/day
Total Nitrogen	10–20 g/24 hrs
Creatinine	1.0 – 2.0 g/24 hrs
Calcium	0.1 – 0.7 g/24 hrs
Protein	1–15 mg/dL
Osmolality	80–1300 mOsm/L
Urine bilirubin	Negative
Urine blood	Negative
Urine ketone	Negative
Urine leukocytes	Negative
RBC's	0–2/HPF
WBC's	0–2/HPF
RBC casts	0/HPF

CEREBROSPINAL FLUID (CSF)

Appearance	Clear
Glucose	40–80 mg/dL
Osmolality	290–298 mOsm/L
Pressure	70–80 mm/H_2O
Protein	15–45 mg/dL
Total cell count	0–5 cells
WBC's	0–6 / µL

NEUROLOGICAL VALUES

Cerebral perfusion pressure	70–90 mm Hg
Intracranial pressure	5–15 mm Hg or 5–10 cm H_2O

ARTERIAL BLOOD GAS VALUES (ABG)

pH	7.35–7.45
$PaCO_2$	35–45 mm Hg
HCO_3	22–26 mEq/L
O_2 saturation	96–100%
PaO_2	85–100 mm Hg

Nursing Next Live & visit the section
Target High Extra Edge

- **Florence Nightingale** defined Nursing as **"the art of utilizing the environment of patients to assist them in their recovery."**
- **Environment** is the focus of nursing care in Nightingale's theory.
- **According to Virginia Henderson,** "Nurses help client to perform 14 basic needs."
- **Neuman's system model:** Stress reduction is goal of systems model of nursing practice.
- The theory that involves care and helps the client attain total self-care is **Orem's theory.**
- **Peplau's theory** focuses on interpersonal relationship (4 phases of interpersonal relationship).
- **Callista Roy** developed the adaptation model, known as Roy's Adaptation Model.
- **Dorothea Orem:** Self-care deficit nursing theory.
- The type of assessment that includes data related to a client's biological, cultural, spiritual and social need is called **Comprehensive Assessment.**
- **Screening** is a process for evaluating the possible presence of a particular problem. The outcome is normally a simple *yes* or *no*.
- Vital Signs are also known as **Cardinal Signs**
- The **Vital Signs** are: 1. Temperature, 2. Pulse, 3. Respiration, 4. Blood pressure, and 5. Pain.
- Heat loss due to contact with circulating air movement is known as **Convection.**
- Transfer of heat from one object to other without contact is known as **Radiation** (60% heat loss from skin is through radiation).
- Body temperature of a healthy person is higher in the evening than in the morning.
- The range of marking in glass/clinical thermometer is **95°-110° F and 35°-43.3°C.**
- Normal **Oral temperature is 98.6°F** (37°C).
- Normal **Axillary temperature is 97.6° F** (36.4°C) [**1°F** lesser than oral temperature).
- Normal **Rectal temperature is 99.6°** F (37°C) [**1°F** higher than oral temperature].
- Tympanic temperature = Oral temperature.
- **Hypothermia** – Temperature < 95°F.
- **Hyperthermia** – Temperature up to 105°F.
- **Hyperpyrexia** – Temperature > 105°F.
- Best site for assessment of temperature in children is **Axilla.**
- Rectal temperature is the most reliable.
- To assess rectal temperature, the thermometer is inserted 1.5 inch in adult and 1 inch in children. Position – Left lateral.
- Wipe the thermometer from **bulb to stem** with **moist swab before taking temperature.**
- Wipe the thermometer from **stem to bulb** with **dry swab after taking temperature.**
- **Relapsing fever:** Fever episodes are separated by intervals of normal temperature for days or weeks.
- **Lysis:** Temperature falls in a zigzag manner (step-ladder pattern).
- **Crisis:** Sudden return of temperature to the normal range from a very high temperature.
- **Rigor:** Sudden rise in body temperature with shivering as seen in malaria.
- **Inverse fever:** temperature rises in the early morning rather than in the evening.
- Normal Respiratory Rate: 12-18 breaths/min.
- Increased depth of breathing with normal respiratory rate is called **Hyperpnea.**
- Paradoxical respiration is seen in Flail Chest due to **Blunt Chest Trauma.**
- **Cheyne-Stokes Respiration** is characterized by Altered Period of Tachypnea and Apnea.
- **Kussmaul Respiration** (Air Hunger) is associated with Severe Metabolic Acidosis and Diabetic Ketoacidosis.
- Always count pulse for one full minute.
- Suitable site to check pulse in newborn is **Apical Pulse.**
- **Pulse deficit** refers to the difference between apical pulse and radial pulse.
- **Pulse pressure** refers to difference between systolic blood pressure and diastolic blood pressure.
- Pulse Pressure = Systolic Blood Pressure – Diastolic Blood Pressure

Contd...

Scanned with CamScanner

- Width of the cuff should be 40% of the arm circumference and length of the cuff should be 80% of the **arm circumference.**
- A **Blood Pressure Cuff** that is too large will give falsely low reading of BP.
- A **Blood Pressure Cuff** that is too small will give falsely high reading of BP.
- **Nonmaleficence** isan ethical principle that obliges one to not inflict intentional harm (to do no harm).
- **Intentional torts** include assault, battery, false imprisonment, intentional infliction of emotional distress, libel, slander and trespassing.
- **Beneficence:** Doing good for clients and providing benefit balanced against risk.
- **Fidelity:** Being loyal and faithful to commitments and accountable for responsibilities.
- **Veracity:** Telling the truth and not intentionally deceiving or misleading clients.
- **Slander** refers to crime of making false spoken statement damaging to a person's reputation.
- A patient whose life is threatened and who is comatose is assumed to give **Implied Consent.**
- Movement of an extremity away from the body midline is called **Abduction.**
- **Adduction**: Moving toward midline of the body.
- **Extension**: Straightening a joint.
- **Flexion**: Bending motion that decreases the angle of joint.
- **Isotonic solutions** allow free movement of water across the membrane without changing concentration of solutes on either side, e.g. 0.9% NaCl.
- **Hypotonic solution:** Solutions in which solutes are less concentrated than in the cells, e.g. 0.45% NS.
- **Hypertonic solution:** Fluids with solutes more concentrated than in cells, e.g. 5% dextrose.
- Hospital has to keep MLC record up to **Ten Years,** because they serve to demonstrate professional integrity.
- The **order** of techniques during physical examination (except abdominal exam) is **Inspection – Palpation – Percussion – Auscultation.**
- For abdominal exam, the order of examination technique is **Inspection – Auscultation – Percussion – Palpation.** It is because percussion or palpation may alter the bowel sound.
- **Surgical asepsis** or "sterile technique" is used in surgery and invasive procedure and medical asepsis or "clean technique" that involves procedures to reduce the number and transmission of pathogens.
- **Sterilization** aims at killing all microorganisms and their spores. To be effective, the autoclave must reach 121°-123°C and maintain temperature for at least 30 minutes.
- The most unreliable method of sterilization is **Sunlight.** Microbicidal activity takes place due to presence of UV rays. It does not kill spores.
- Gently pulling and inverting **Gloves** when removing them decreases the risk of spreading the pathogens.
- Oxygen has a drying effect on mucous membrane that results in damage to the airways, secretions may become thick and difficult to clear, and it also causes airway obstructions Oxygen has to be humidified before administration.
- Taping the Foley catheter to upper thigh helps to prevent accidental removal, decreases the trauma to urethra/bladder.
- If a patient has taken cold or hot drink, wait for 20-30 minutes in order to measure the right oral temperature.
- If a patient develops chills and headache during blood transfusion, the immediate action is to **stop the transfusion.**
- **Common indication of infiltration** of a peripheral intravenous infusion is cool skin distal to the insertion site. Other signs include swelling, burning sensation, discomfort and feeling of tightness.
- **Redness and swelling** around the insertion site (IV cannula) might indicate the signs of **infection/inflammation.**
- The nurse must stop IV infusion and remove cannula immediately if patient complains of pain and has redness with swelling at the site of IV.
- **Hand washing** is the single most effective method of prevention of microorganism transfer from one person to another in the hospital setting.
- **Mask** is the only PPE needed when the nurse is assigned to a patient who has a bacterial pneumonia and is under droplet precautions (if no other indications).
- The stages of infection in sequence - **Incubation, Prodromal, Illness** and **Convalescence** stages.
- Factors that can produce falsely low reading of Oxygen saturation (SpO_2) by pulse oximetry (SaO_2) include methemoglobinemia, anemia, inadequate peripheral circulation, blue or green nail polish and edema.
- Adult Basal Metabolic Rate (BMR) decreases with an increase in body fat. Normal BMR in women is 1493 calories and normal BMR in men is 1662 calories.

Contd...

Scanned with CamScanner

- Patient's position to perform colonoscopy: **Make the patient lie on his/her left side of the body with legs bent.**
- The ideal length of insertion of rectal suppository in an adult is 4 inches beyond internal sphincter.
- **Vastus lateralis muscle** is the preferred site of intramuscular injections in infants.
- **Intramuscular injection (IM)** is given at an angle of **90°.**
- Maximum volume of medication for a single IM injection in adult is **5 ml.**
- **Subcutaneous injection** is given at an angle of **45°.**
- Maximum volume of medication for a single subcutaneous injection in adult is **1 to 1.5 ml.**
- **Intravenous injection** is given at an angle of **25°.**
- **Intradermal injection** is given at an angle of **10 to 15°.**
- Maximum volume of medication for a single **Intradermal injection** is 0.1 ml.
- Palliative treatment is to **relieve symptom and improve quality of life.**
- Cold application is also known as **Cryotherapy.**
- **Patient incident report** is also known as accidental report which is the documentation of the incidence or any accident in detail.
- **Discharge planning** of a patient ideally begins at the time of the admission of a patient.
- Nursing informatics is a field of nursing that incorporates nursing, computer and information sciences to improve patient care outcomes.
- A **Kardex** or **Rand System** is a medical information system used by nursing staff to communicate a quick summary of individual patient needs that is updated at every shift change.
- Active, inactive potential and resolved problems that serve as the index for charting documentation is known as **Problem List.**
- Traditional **nursing chart** is divided into sections or blocks. It also uses graphics and narrative charting.
- Narrative charting is considered as traditional **charting method**.
- Personal assessment and judgment of incident should not be considered while filling up an **incident report.**
- Using a score that rates each patient by severity of illness is known as **acuity charting.**
- Problem Oriented Charting is focused on the patient's problems.
- Components of SOAP format is Subjective data, Objective data, Assessment and Plan.
- Managed care is a systematic approach to care that provides a framework for the coordination of medical and nursing interventions.

Image-Based Questions

1. Instruments shown in photograph are best sterilized by *[Recent Question 2014]*

a. Irradiation
b. Autoclaving
c. Hot air oven
d. Ethylene dioxide

2. Principle on which instrument shown in photograph cause sterilization

a. Steam under pressure
b. Dry heat
c. Convection current in water molecules
d. Tyndallzation

3. Instrument shown in photograph is used in public health for

a. Head circumference
b. Mid arm circumference
c. Skin fold thickness
d. Cold chain temperature monitoring

4. Identify the apparatus used in pediatrics as shown in photograph

a. Resuscitator
b. Nebulizer machine
c. Irradiance meter
d. Suction machine

5. The response shown by the adult in the following picture is

a. Flexor planter reflex
b. Babinski reflex
c. Ankle reflex
d. Tow reflex

6. The response shown by the adult in the following picture is

a. Extensor plantar reflex
b. Babinski reflex
c. Both a and b are correct
d. Flexor plantar reflex

7. The physician is examining the patient's abdomen to diagnose possible _____

a. Cullen's sign
b. Ulcerative colitis
c. Appendicitis
d. Diverticulitis

8. Name the maneuver

a. Semont maneuver
b. Heimlich maneuver
c. Epley maneuver
d. Chock maneuver

Ans.

1. c
2. b
3. c
4. b
5. a
6. c
7. c
8. b

9. The patient is being assessed for

a. Radial pulse
b. Femoral pulse
c. Carotid pulse
d. Tibial pulse

10. Name the instrument in the following image

a. Patient sling
b. Patient hoist
c. Recline lift
d. Patient Walker

11. Name of the examination shown in image is

a. Digital rectal Examination
b. Manual rectal Examination
c. Proctoscope
d. Rectoscopy

12. The diameter (size) of shown image starts from

a. 4 mm
b. 4.5 mm
c. 5 mm
d. 5.5 mm

13. A nurse is assessing the blood pressure of a hypertensive patient as given in the picture. The recorded BP would be

a. Same as actual BP
b. Higher systolic but lower diastolic
c. Higher systolic and diastolic
d. Lower systolic and diastolic

14. Identify the position shown in the photograph

a. Trendelenburg position
b. Sim's position
c. Fowler position
d. Lloyd Davis position

15. What is this?

a. Intravenous fluid infusion set
b. Blood set
c. Arterial line
d. CVP line

16. Route of drug administration shown in photograph is:

a. Subcutaneous
b. Dermojet
c. Intradermal
d. Pellet implant

26. Identify the instrument shown in photograph, used during general anesthesia:

a. Laryngoscope
b. Endotracheal tube
c. Laryngeal mask airway
d. Fibro-optic laryngoscope

27. Unit shown in the photograph is stored in Blood bank at .... temperature:

a. + 4°C
b. – 4°C
c. + 24°C
d. – 60°C

28. Identify the type of splint shown in photograph:

a. Aeroplane splint
b. Thomas splint
c. Knuckle bender splint
d. Cock-up splint

29. What is the use of this?

a. Circular stapling
b. Linear stapling
c. Pressure instrument
d. ICD system

30. Type of CT scan technology shown in photograph is:

a. Multi-slice CT
b. High resolution CT
c. Electron beam CT
d. Spiral CT

31. Identify the gas cylinder shown in the photograph:

a. Oxygen
b. Cyclopropane
c. Nitrous oxide
d. Thiopentone

32. Identify this tube

a. Ryles
b. Sengstaken blakemore

33. What is the name of this catheter?

a. Mallecot' s
b. Foleys
c. Sengstaken
d. Hudd's

34. Instrument shown in figure is used for measuring:

a. Humidity
b. Temperature
c. Pressure
d. Wind velocity

35. Identify the type of breathing/ventilation shown in photograph

a. Mouth-to-mouth ventilation
b. Mouth-to-airway ventilation
c. Bag and mask ventilation
d. Chest compressions

36. Identify the instrument shown in the photograph *[Recent Question 2013, 2016]* *(Refer explanation at the end)*

a. Foley's catheter
b. Nasogastric tube
c. Malecot's catheter
d. Sangstaken-Blakemore tub

37. Which one of the following statements is TRUE regarding this Instrument? *[Recent Question 2016]* *(Refer explanation at the end)*

a. Prevents tongue from falling on posterior pharyngeal wall or epiglottis
b. It is called Berman oral airway
c. Best inserted during a seizure to prevent tongue bite
d. Inserted into the mouth with concavity towards tongue

38. CPR method shown in photograph is used for *(Refer explanation at the end)*

a. Airway
b. Breathing
c. Circulation
d. None

Ans.

33. a
34. a
35. a
36. a
37. a
38. c

Explanations of Image-Based Questions

36. Ans. (a) Foley's catheter

[Ref. CMDT 2014, p1551]

- A Foley catheter **(Photograph)** is a thin, sterile tube inserted into the bladder to drain urine
- Foley catheter is essential for monitoring urinary output

37. Ans. (a) Prevents tongue from falling on posterior pharyngeal wall or epiglottis

[Ref. Ajay Yadav, 4/e p40]

- Guedel airway **(Photograph)** is the MC type of airway used while also preventing tongue falling back on Posterior pharyngeal wall

38. Ans. (c) Circulation

[Ref: Fundamentals of Anaesthesia, Tim Smith, p.135]

- The American Heart Association uses the acronym of CAB (compressions, airway, breathing) to help people remember the order to perform the steps of CPR
- Cardiopulmonary resuscitation **(Photograph)**, commonly known as CPR, is an emergency procedure that combines chest compression often with artificial ventilation in an effort to manually preserve intact brain function until further measures are taken to restore spontaneous blood circulation and breathing in a person who is in cardiac arrest
- It is indicated in those who are unresponsive with no breathing or abnormal breathing

Scanned with CamScanner

"Sometimes the remedy is worse than the disease."

—Francis Bacon

MULTIPLE CHOICE QUESTIONS
(Including Explained and Practice Questions)

BASICS OF NURSING FOUNDATION

1. The first school of nursing was established by: *(AIIMS Raipur Grade II 2017)*

a. Virginia Henderson
b. Theodor Fliedner
c. Florence Nightingale
d. Isabel Hampton

Explanation: In 1836, Pastor Theodor Fliedner established the Kaiserswerth School for Nursing in his parish in Kaiserswerth, Germany. It was one of the first formally established schools of nursing in the world. Florence Nightingale established St. Thomas' Hospital and the Nightingale Training School for Nurses in 1860.

2. When instructing a patient about proper diet, which among the following would be considered as complete protein? *(AIIMS Raipur Grade II 2017)*

a. Olives
b. Rice
c. Eggs
d. Nuts

Explanation: Meat, poultry, Fish, Animal foods such as red meat, pork, poultry and fish are complete proteins.

3. Which of the following is the responsibilities of the staff nurse? *(AIIMS Raipur Staff Nurse Grade I-2018)*

a. Quality care
b. Observation & reporting
c. Record keeping
d. All of the above

4. The nursing care that focuses on patient care along with the family needs, in the scope of multidisciplinary health care team is called *(AIIMS Bhopal Nursing Officer, 2018)*

a. Team based care
b. Case management
c. Patient navigation care
d. Primary care

Explanation: Above given definition indicate case management. Team based care means redistribution of work among members of a practicing team. Patient navigation care means an individual or patient navigator help the individual to go through treatment and care. Primary care is the day to day health care given by health care provider. Typically this provider act as first level of contacting and principal point of continuing care.

5. International day for nurses is celebrated on .....

a. December 1
b. May 12
c. June 2
d. May 1

Explanation: International nurses day is celebrated on May 12, which is the birth day of Florence Nightingale

6. Which of the following is NOT a heat loss mechanism from the body?

a. Conduction
b. Convection
c. Evaporation
d. Irradiation

Explanation: All the given options except option D are heat loss mechanism from the body. Irradiation is not a mechanism, radiation is the mechanism responsible for heat loss.

- **Conduction:** Heat loss occur when two bodies with different temperature comes in direct contact with each other.
- **Convection:** Air current carry away the temperature.
- **Evaporation:** When water is converted to vapor, the body temperature will be used that induces hypothermia.

7. Highest BMR is found in boys, because their body contains .....

a. Thyroxin
b. Adrenaline
c. Testosterone
d. Estrogen

Explanation: Testosterone hormone present in the males is responsible for highest BMR in them.

8. Blood vessel that extends and branches out from an artery and leads to capillaries is

a. Venule
b. Arteriole
c. Capillary
d. Sinus

Explanation: Arterioles are the blood vessel in the microcirculation that extends and branches out from an artery and leads to capillaries. A very small vein, especially one collecting blood from the capillaries and return to vein. Capillary beds can consist branch from arterioles and provide exchange between cells and the blood, and short vessels that directly connect the arterioles and venules at opposite ends of the beds.

9. A single nurse is assigned for care and she is responsible for directing and coordinating other nurses and other personnel. This type of nursing is known as .....

a. Functional nurse
b. Primary nurse
c. Team nursing
d. Total patient care

Explanation: Option B is the correct answer. Functional nursing is task oriented. Team nursing is decision-making occurs over a single shift; largely by team leader or nurse manager. In total patient care, decision-making occurs over a single shift—either by an RN caring for the patient or by a charge nurse.

10. Vitamin which helps in wound healing is.....

a. Vitamin A
b. Vitamin C
c. Vitamin E
d. Vitamin K

Ans.

1.	b
2.	c
3.	d
4.	b
5.	b
6.	d
7.	c
8.	b
9.	b
10.	b

Scanned with CamScanner

Explanation: Vitamin C (ascorbic acid) helps in wound healing. Vitamin E is known as Anti-Sterility Vitamin. Vitamin K helps in blood clotting. Vitamin A promotes good vision.

11. Largest immunoglobulin is

a. IgG
b. IgA
c. IgM
d. IgE

Explanation: IgM is the largest immunoglobulin. It is also known as Macro-immunoglobulin.

12. Which immunity is affected by HIV infection?

a. Natural immunity
b. Active immunity
c. Cellular immunity
d. Humoral immunity

Explanation: HIV attacks and destroys the T helper lymphocytes, or T-cells, which are crucial to the immune system and immune response. CD4 T cells will be affected which is responsible for cellular immunity.

13. Aneurysm affects which layer of the artery?

a. Tunica intima
b. Tunica media
c. Tunica adventitia
d. All of the above

Explanation: Muscular layer of the artery, i.e. tunica media is most commonly affected with aneurysm

14. All of the following are the manifestation of brain death EXCEPT

a. Diabetes insipidus
b. Pupils do not respond to light
c. Pulse rate unresponsive to atropine
d. EEG shows only delta waves

Explanation: Delta waves in Electroencephalogram (EEG) are usually associated with the deep stage 3 of NREM sleep (also known as slow-wave sleep). In case of brain death, EEG shows no brain activity at all.

- Signs of brain death includes
- Pupil do not respond to light
- No reaction to pain
- Absence of corneal reflex
- Absence of oculocephalic reflex (eyes do not move when head is moved)
- Absence of oculovestibular reflex (Eyes do not move when ice water is poured into the ear)
- Absence of gagging reflex
- Absence of breath when the ventilator is switched off.
- No brain activity in EEG.

15. During infection which among the following value will be elevated?

a. Rb.
b. WBC
c. Platelet
d. ESR

Explanation: WBCs are responsible for fighting against infection, so this value will be elevated first.

16. Identify the lobes of pituitary gland

a. Adenohypophysis
b. Intermediate lobe of the pituitary
c. Neurohypophysis
d. All of the above

Explanation: All of the above are the lobes of pituitary. It has 3 lobe anterior lobe (adenohypophysis), posterior lobe (neurohypophysis) and intermediate lobe.

17. Hormone released from posterior lobe of pituitary

a. Vasopressin
b. Growth hormone
c. Prolactin
d. Thyroid stimulating hormone

Explanation: Vasopressin (ADH) and oxytocin are released from posterior lobe of pituitary.

18. Thyroid releasing hormone is secreted by

a. Thyroid gland
b. Hypothalamus
c. Parathyroid gland
d. Anterior pituitary gland

Explanation: Hypothalamus secrets releasing hormones including Thyrotropin-releasing hormone, Growth hormone-releasing hormone, Gonadotropin releasing hormone, and corticotropin-releasing hormone.

19. Cold calorie test used to check the functioning of .....

a. Heart
b. Hypothalamus
c. Brain stem
d. Pons

Explanation: Caloric stimulation is a test that uses differences in temperature to diagnose damage to the acoustic nerve. This is the nerve that is involved in hearing and balance. The test also checks for damage to the brain stem.

20. Cold calorie test is interpreted as normal if .....

a. Rapid, side-to-side eye movements occur when cold or warm water is placed into the ear
b. Eye movements are similar on both sides when cold or warm water is placed into the ear
c. Rapid, side-to-side eye movements do not occur even after ice cold water is given
d. Both a and b

Ans.

11.	c
12.	c
13.	b
14.	d
15.	b
16.	d
17.	a
18.	b
19.	c
20.	d

Scanned with CamScanner

Explanation: Rapid, side-to-side eye movements should occur when cold or warm water is placed into the ear. The eye movements should be similar on both sides. If the rapid, side-to-side eye movements do not occur even after ice cold water is given, there may be damage to the:

- Nerve of the inner ear
- Balance sensors of the inner ear
- Brain

21. Which nutrient has the highest calorie?

a. Carbohydrate b. Protein
c. Fat d. Vitamin

Explanation: Fat has the highest calorie. The calorie value of carbohydrate and protein is 4 kcal/g whereas calorie value of fat is 9 kcal/g.

22. Most preferred energy source of the body is .....

a. Carbohydrate b. Protein
c. Fat d. Minerals

Explanation: Chief source of energy for the body is carbohydrate.

23. Before the procedure obtaining informed consent is the responsibility of ....

a. Physician b. CNO
c. Head nurse d. Nurse

Explanation: Obtaining informed consent is the responsibility of physician.

24. What is the full form of LAMA?

a. Leave against medical advice
b. Leave and medication advice
c. Leave alone with medical application
d. Leave against medication apply

Explanation: Option A is the correct full form of LAMA. In this the patient chooses to leave the hospital before the treating physician recommends discharge.

25. Which of the following is a type of nursing modality in which the principal idea is that nurses to be assigned tasks, not patients?

a. Team nursing
b. Functional nursing
c. Primary nursing
d. Case method nursing

Explanation: In functional nursing, Nurses are assigned to specific task and do that duty only. The nurse performs a particular task for every patient in the ward. For example, Medication Nurse, Dressing Nurse, IV Nurse etc. In team nursing, nurse is responsible for most of the each patient's care. Some of the duties are assigned to other nurses or nursing assistants.

26. In triage, yellow color indicates: *(DSSSB PHN, 2015)*

a. Emergent b. Urgent
c. Nonurgent d. Dead

27. Florence Nightingale was born on: *(Recent Question 2012)*

a. May 12th 1820 b. May 12th 1832
c. April 7th 1820 d. June 7th 1842

28. Germ theory of disease was propounded by: *(Staff Nurse G II 2014)*

a. Darwin b. Freud
c. Louis Pasteur d. Erickson

29. In 1860 Nightingale set up the first nursing training school at: *(ESIC Chennai May 2012)*

a. St. Thomas' Hospital, London
b. University of Edinburgh
c. Petersburg, Virginia
d. None of the above

30. Total number of facial bone

a. 12 b. 10
c. 14 d. 16

31. ICN theme for International Nurses day 2017 is

a. Nurses: A Force for Change— A vital resource for health
b. Nurses: A Force for Change— Care Effective, Cost Effective
c. Closing the Gap: Millennium Development Goals
d. Nurses: A voice to lead – Achieving the sustainable development goals

32. ICN theme for International Nurses day 2016 was

a. Nurses: A Force for Change – A vital resource for health
b. Nurses: A Force for Change: Improving Health Systems
c. Closing the Gap: Millennium Development Goals
d. Nurses: A voice to lead – Achieving the sustainable development goals

33. The theme of World Health Day 2017 is

a. Depression: Let's talk
b. Diabetes: Scale up prevention, strengthen care, and enhance surveillance
c. Vector-borne diseases
d. Healthy heart beat, Healthy blood pressure

34. The theme of World Health Day 2016 was

a. Depression: Let's talk
b. Diabetes: Scale up prevention, strengthen care, and enhance surveillance
c. Vector-borne diseases
d. Healthy heart beat, Healthy blood pressure

35. Which of the following concept of health is associated with germ theory of disease

a. Biomedical concept b. Holistic concept
c. Psychosocial concept d. Ecological concept

36. Which of the following type of patient care model is the most common for student nurses

a. Primary nursing b. Task nursing
c. Team nursing d. Total patient care

37. Which of the following patient care model is suitable when there are many patients but very few nurses

a. Total patient care b. Functional nursing
c. Team nursing d. Advanced Nursing

38. Which of the following phrase best describes 'the science of nursing'?

a. Application of clinical skills
b. Holistic approach in patient care
c. Body of nursing knowledge
d. Art of specialized nursing care

39. Which of the following response to stress is due to negative feedback mechanism?

a. Neurophysiological response
b. Hypothermia
c. Hyperventilation
d. Altered level of consciousness

40. In a hospital setting, who is responsible for informing the patient about surgery along with possible outcome, risk, complications and benefits?

a. Nurse b. Nurse in-charge
c. Surgeon d. ANS

Ans.

21.	c
22.	a
23.	a
24.	a
25.	b
26.	b
27.	a
28.	c
29.	a
30.	c
31.	d
32.	b
33.	a
34.	b
35.	a
36.	d
37.	b
38.	c
39.	a
40.	c

Scanned with CamScanner

41. **Which of the following poisoning that form a strong bond with hemoglobin and creates a functional anemia?**
    a. Carbon monoxide poisoning
    b. Atropine poisoning
    c. Organophosphorus poisoning
    d. Arsenic poisoning
42. **Nutrient that helps in tissue repair is**
    a. Fat b. Protein
    c. Vitamin d. Carbohydrate
43. **Nutrient that helps in wound healing process is**
    a. Fat b. Protein
    c. Vitamin B12 d. Carbohydrate
44. **The primary response of a nurse during admission of a client is to**
    a. Orient the client to hospital routine
    b. Prepare admission sheet
    c. Receive the client in a courteous manner
    d. Fill consent form
45. **Following an accident client is admitted to a health care facility. This type of admission is .....?**
    a. Routine admission b. Therapeutic admission
    c. Emergency admission d. Accidental admission
46. **Macrophages are responsible for**
    a. Phagocytosis b. Pinocytosis
    c. Apoptosis d. Endocytosis
47. **Neutophils are responsible for-**
    a. Apoptosis b. Pinocytosis
    c. Phagocytosis d. Endocytosis
48. **A toxin or other foreign substance that induces an immune response in the body is known as**
    a. Complement b. Antigen
    c. Antibody d. All of the above
49. **Movement of a body part towards the body's midline is termed as**
    a. Abduction b. Adduction
    c. Extension d. Pronation
50. **Movement of a body part away from the body's midline is termed as**
    a. Abduction b. Adduction
    c. Extension d. Pronation
51. **Bending of a part, or decreasing the angle between two parts is known as**
    a. Abduction b. Adduction
    c. Flexion d. Extension
52. **Increasing the angle between two parts is known as**
    a. Abduction b. Adduction
    c. Flexion d. Extension
53. **Inward movement of the foot is termed as**
    a. Flexion b. Extension
    c. Pronation d. Supination
54. **Health promotion activities can include all EXCEPT**
    a. Balanced nutrition
    b. Habitual drinking of alcohol
    c. Exercise
    d. Safe sexual practice
55. **Discharge planning of the patient begins**
    a. When the physician orders for discharge
    b. When patient starts showing positive response to the treatment
    c. At the time of initiation of treatment
    d. At admission
56. **Clients are referred to as 'residents' in**
    a. Day care centers b. Long-term care facilities
    c. Hospitals d. Custodial care centers
57. **Thirst control center is located in**
    a. Cerebrum b. Hypothalamus
    c. Cerebellum d. Medulla oblongata
58. **A plaster cast applied to the trunk of the body and one or both legs**
    a. Hip spica b. Thumb spica
    c. Body spica d. None
59. **Identify the correct order of Kubler Ross grieving stages**
    a. Depression – anger – bargaining – denial – acceptance
    b. Denial – bargaining - anger - depression - acceptance
    c. Denial – acceptance – bargaining – depression – anger
    d. Denial – anger – bargaining – depression – acceptance
60. **Which of the following statements accurately defines the term 'health'?**
    a. Health is a state of optimal functioning.
    b. Health is an absence of illness
    c. Health is always an objective data
    d. Health is not determined by the patient
61. **Which of the following is NOT true about female urethra?**
    a. It is about 4 cm long
    b. It is shorter than the male urethra
    c. Its posterior to vaginal orifice
    d. It is straight and offers minor resistance for catheterization
62. **Trachea starts at the level of**
    a. 4th cervical vertebra b. 5th Cervical vertebra
    c. 6th Cervical vertebra d. 7th Cervical vertebra
63. **Cardiac muscle differs from skeletal muscle by**
    a. It is an involuntary muscle b. It has automaticity
    c. It has conductivity d. All of the above
64. **All the following enzymes are secreted by gastrointestinal system, EXCEPT**
    a. Ptyalin b. Pepsinogen
    c. Gastric lipase d. Angiotensin
65. **Which of the following hormones is secreted by anterior pituitary?**
    a. Prolactin b. TSH
    c. GH d. All of the above
66. **All of the following hormones are secreted by anterior pituitary EXCEPT**
    a. ACTH b. ADH
    c. FSH d. LH
67. **Which of the following hormone is secreted by posterior pituitary?**
    a. ACTH b. LH
    c. FSH d. ADH
68. **Backflow of content from stomach to mouth is called as .....**
    a. Vomiting b. Nausea
    c. Regurgitation d. Reflex
69. **Identify correct statement in relation to hiccup**
    a. It is also known as diaphragmatic breathing
    b. 3-10% carbon dioxide is the management
    c. Both a and b
    d. None
70. **Identify the risk factors for bed sore**
    a. Shearing force
    b. Moisture
    c. Impaired peripheral circulation
    d. All of the above

Ans.

71. Identify the wound healing phases among the following
a. Inflammatory phase b. Proliferative phase
c. Maturation phase d. All of the above

72. Patient's health is determined based upon .....
a. Behavior b. Family support
c. Knowledge d. Education

73. Characteristic of a chronic illness is .....
a. Has reversible pathologic changes.
b. Has a predictable clinical course and prognosis.
c. Results in permanent deviation from normal.
d. Always starts with an acute illness and then gradually deteriorates

74. Health promotion in the older adult are primarily focused on .....
a. Adherence to medication
b. Avoid smoking
c. Teaching positive health behaviors
d. Talking to others

75. Iatrogenic infections are infections developed due to .....
a. Hospital admission b. Therapeutic procedure
c. Exposure to affected person
d. Low immunity

COMMUNICATION AND THERAPEUTIC RELATIONSHIP

76. Choose the most therapeutic response to Mr. Sham's question: "Am I going to die?" *(NCFL 2019)*
a. "We all are going to die one day."
b. "What has your doctor told you?"
c. "You really don't want to talk about death, do you?"
d. "Would you like to talk about your condition and prognosis?"

Explanation:
- The response, would you like to talk about your condition and prognosis? make the patient to ventilate his/her feelings thereby it leads clarification why the patient thinking out that 'he is going to die' (Therapeutic techniques used here is mental ventilation)
- Other responses are antitherapeutic communication techniques.

77. Which of the following would not promote trust in the nurse-patient relationship? *(ESIC 2019)*
a. Examining a wound without providing privacy
b. Fulfilling promises
c. Returning at the stated time
d. Maintaining confidentiality

Explanation: The client may experience the exploitation of privacy if wound examination is done without providing privacy. This feeling may result in lack of trust in the nurse-patient relationship. Other given actions are the measures to promote trust in nurse-patient relationship.

78. The following are the barriers of Therapeutic relationships: *(AIIMS Raipur Grade II 2017)*
A. Too many questions B. Assertive style
C. Stereotyping D. Patronizing
a. A, B, C b. B, C, D
c. A, C, D d. A, B, C, D

Explanation: The barriers of therapeutic relationship include Physiological barriers, environmental barriers, psychological barriers, social barriers, cultural barriers, semantic barriers, Organizational barriers and communication process related barriers.

79. The principles of communication in the workplace includes: *(AIIMS Raipur Grade II 2017)*
A. Use language that is easily understood
B. Do not repeat phrases
C. Do not use indirect mode of communication
D. Encourage Feedback
a. A, B, C b. B, C, D
c. A, C, D d. A, B, C, D

Explanation: The principles of communication include principle of clarity, brevity, attention, feedback, informality, consistency, timeliness and adequacy.

80. Providing health education about the environmental hygiene to the community people is an example of: *(AIIMS Raipur Grade II 2017)*
a. Social communication
b. Structural communication
c. Therapeutic communication
d. Formal communication

Explanation: Structural Communication is an instructional approach that provides a simulated dialogue between an author of instructional materials and the students. Social communication or pragmatics is the way in which children use language within social situations. Therapeutic communication is a collection of techniques that prioritize the physical, mental, and emotional well-being of patients opens in new window. The Formal Communication is the exchange of official information that flows along the different levels of the organizational hierarchy and confirms to the professional rules, policy, standards, processes and regulations of the organization.

81. Which phase of the nurse - patient relationship focuses to develop clarity about the patient's preconceptions and expectations of nurses and develop acceptance of each other and respond to people who can offer help is? *(AIIMS Raipur Grade II 2017)*
a. Orientation phase b. Working phase
c. Exploitation phase d. Termination phase

Explanation: In orientation stage therapeutic environment is established, trust develops, roles, goals, rules and limitations are defined. In working/exploration/identification stage the client's problems are identified and solutions are explored, applied and evaluated. In termination stage/resolution stage relationship is terminated when the mutually agreed goals are met, the patient is discharged or transferred there than in the usual plan.

82. A strategy commonly used to improve therapeutic communication skills is called: *(AIIMS Raipur Grade II 2017)*
a. Active listening b. Restating and clarifying
c. Validating d. Process recording

Explanation: Active Listening is to be attentive what client is saying verbally and nonverbally. Clarifying is to check whether understanding is accurate or to understand better. The nurses restates an unclear or ambiguous message to clarify senders meaning. Restating is repeating the main idea in different words. Validating is searching for mutual understanding, for accord in the meaning of words.

Scanned with CamScanner

83. Which is the example of one-way communication?
(AIIMS Raipur Staff Nurse Grade I-2018)
a. Class Lecture b. Group discussion
c. Conference d. Workshop

Explanation: Class lecture is an example of one way communication. Here teacher will takes class and students will listen. In all other methods both speaker and listener will actively interact, so all other methods are examples of two way communication.

84. Which is the most important factor in a therapeutic relationship?
a. Trust b. Knowledge
c. Respect d. Motivating

Explanation: Trust is the most important factor in therapeutic relationship as it is very important to build rapport between patient and nurse.

85. Response from a receiver to sender is known as:
(AIIMS Raipur Staff Nurse Grade I-2018)
a. Message b. Context
c. Feedback d. Stimulus

Explanation: Information send by sender to receiver is message and from receiver to sender is feedback.

86. Following radiation therapy nurse is providing health education to a client. Which of the following is not included in the health teaching?
a. Protect the skin from direct sunlight, chlorine, and extreme temperature
b. Wear loose-fitting cloths
c. Shave with an electric razor only
d. Avoid foods which are rich in protein

Explanation: Healthy eating tips for a client undergoing radiation therapy are as follows:
- Eat slowly, eat small meals several times a day
- Eat food high in protein and calories
- Drink plenty of water and other fluids
- Consult the doctor before taking any OTC medications or vitamin supplements

87. A Community Health Nursing is providing health education to a diabetic patient regarding how to self-monitor blood glucose level. Which of the following level of prevention is practiced here:
a. Primordial prevention b. Primary prevention
c. Secondary prevention d. Tertiary prevention

Explanation: Tertiary prevention aims to soften the impact of an ongoing illness or injury that has lasting effects. This can be achieved by helping people to manage long-term illness and complex health problems in order to improve their functionality. In this case scenario, the patient is already diagnosed to have diabetes which is chronic disease. Health education is provided to improve the patient's quality of life and reduce the symptoms of diabetes. So this is considered to be tertiary prevention.

88. Which of the following questioning technique provides opportunity to discuss
a. Restating b. Probing
c. Closed-ended questions d. Open-ended questions

89. "How do you describe your experience of being alone?" This is an example of
a. Probing b. Close-ended question
c. Open-ended question d. Structured question

90. "Do you feel discomfort now?" This is an example of
a. Open ended question b. Close-ended question
c. Probing d. Restating

91. Cultural barrier of communication includes
a. Knowledge b. Language
c. Anxiety d. Fear

92. The most important characteristic of a verbal communication is
a. Appearance b. Clarity
c. Eye contact d. Posture

93. Which strategy is effective while communicating with a client having hearing impairment?
a. Speak slowly and allow the client to do lip reading
b. Face the patient when speaking
c. Speak slower and in a normal pace
d. All of the above

94. During the orientation phase of the relationship, what would the nurse talk to a patient who is awaiting for amputation of foot?
a. Summarize previous sessions
b. Talk with him about his favorite hobbies
c. Allow him to express his feelings
d. Review his medical record

95. Communication means
a. Sharing ideas
b. Sharing belief
c. Sharing thought
d. All of the above

96. All are the element of communication process, EXCEPT
a. Source b. Message
c. Channel d. Physical barrier

97. All are physical barrier of communication, EXCEPT
a. Noise b. Attention
c. Environment d. Visibility

98. Which of the following is an an example of non-verbal communication
a. Facial expression b. Posture
c. Gesture d. All of the above

99. All are therapeutic communication techniques, EXCEPT
a. Silence b. Accepting
c. Offering self d. Feedback

CODE OF ETHICS

100. Which of the following is NOT a value essential for a professional nurse? *(AIIMS-BBS SNO 2019)*
a. Human dignity b. Dependence
c. Social Justice d. Integrity

Explanation: Dependence is the state of relying on or being controlled by someone and it is an undesirable quality. The nurse is expected to have professional nursing values such as principles of human dignity, integrity, altruism, and justice.

101. The doctrine of informed consent deals with:
(AIIMS BPL NO 2018)
a. Full disclosure of all relevant facts to the patient
b. Informing higher authorities about the patient's condition
c. Notification of diseases
d. Patient confidentiality

Explanation: Informed consent is taken from the patient or significant others before conducting any type of invasive procedure to communicate full disclosure of relevant facts regarding the procedure. In this the patient and/or their attendants are informed

Ans.

83.	a
84.	a
85.	c
86.	d

about the condition of the patient along with the possible treatment strategies and the expected prognosis.

102. Patient whose life is threatened and who is comatose is assumed to give what kind of consent for life sustaining treatment. *(AIIMS Raipur NO 2019)*

a. Informed
b. Implied
c. Direct
d. Expressed

Explanation: Implied consent is an assumption of permission to do something that is inferred from an individual's actions rather than explicitly provided. In case of emergency when delayed treatment would be dangerous, informed consent is not needed.

103. Which of the following is NOT an ethical principle? *(AIIMS-BBS SNO 2019)*

a. Autonomy
b. Non-maleficence
c. Justice
d. Non-beneficence

104. Principles of ethical practice includes the following, EXCEPT *(ESIC 2019)*

a. Maleficence
b. Beneficence
c. Justice
d. Respect for autonomy

Explanation: **Maleficence** means to harm some and is opposite of non-maleficence which means "to not harm". Maleficence should not be used as principle for performing nursing action. Nonmaleficence is an ethical principle that obliges one to not inflict intentional harm.

Beneficence Refers to taking positive actions to help others.

Ethical principles include principal of respect for autonomy, principle of nonmaleficence, principle of beneficence, principle of justice, principle of veracity, etc.

Ans.

102. b
103. d
104. a
105. a
106. a
107. a
108. a
109. a
110. c
111. a
112. b
113. c
114. d
115. a

105. All of the following are true regarding deontology except? *(AIIMS-BBS SNO 2019)*

a. It focuses on the consequences of actions
b. It encompasses natural law.
c. It incorporates dutiful actions of an individual.
d. It is also known as formalism

Explanation: Deontology is an ethical theory that says the morality of an action should be based on whether that action is right or wrong under a series of rules, rather than based on the consequences of the action.

106. When a nurse enters the patient's room for administering medications, she notices that the patient's food remained on the table. Helping the patient in providing food and then administering the medication is an act of: *(AIIMS Raipur Grade II 2017)*

a. Beneficence
b. Nonmaleficence
c. Maleficence
d. Empathy

Explanation: Beneficence is defined as an act of charity, mercy, and kindness with a strong connotation of doing good to others including moral obligation. Non-maleficence means to do no harm. Maleficence is the act of harming or evil. Empathy is the ability to understand and share the feelings of another.

107. Which ethical principle promotes self-determination by the client?

a. Autonomy
b. Non-maleficence
c. Justice
d. Fidelity

Explanation: Option A autonomy means self-determination by the client. It means let the client and significant others to determine what they wish to do. Non-maleficence means doing no harm, justice means treat everyone equally, fidelity means faithfulness.

108. Which of the following ethical principles refers to doing good to the client?

a. Beneficence
b. Nonmaleficence
c. Autonomy
d. Justice

Explanation:

- **Beneficence:** Doing good for the client
- **Non-maleficence:** Doing no harm
- **Autonomy:** Self-determination of client
- **Justice:** Treat equally

109. Nurse fails to administer correct medication to the patient. This action is known as .....

a. Negligence
b. Crime
c. Tort
d. Battery

Explanation: Negligence is a type of malpractice. It refers to doing of something which a reasonably prudent person would not do, or the failure to do something which a reasonably prudent person would do, under circumstances similar to those shown by the evidence.

- Crime is an action or omission which constitutes an offence and is punishable by law.
- A tort, in common law jurisdictions, is a civil wrong that unfairly causes someone else to suffer loss or harm resulting in legal liability for the person who commits the tortious act, called a tortfeasor.
- Battery is the unlawful and unwanted touching or striking of one person by another, with the intention of bringing about a harmful or offensive contact.

110. An intentional touching of the patient's body without consent is termed: *(DSSSB PHN, 2015)*

a. Negligence
b. Assault
c. Battery
d. Malpractice

111. A patient who decides to leave the hospital against medical advice (LAMA) must sign a form. What is the purpose of this form? *(LNJP H D 2012)*

a. To release the physician and hospital from legal responsibility for the patient's health status
b. To ethically illustrate that the patient has control of his or her own care and treatment
c. To use in the event of readmission
d. To indicate the patient's wishes

112. Immunization cause pain in child but it will also provide protection against certain disease. Which of the following ethical principle is applicable here?

a. Justice
b. Beneficence
c. Nonmaleficence
d. Autonomy

113. The ethical principal to 'do no harm' is considered to be _____ principle

a. Justice
b. Beneficence
c. Nonmaleficence
d. Autonomy

114. Physician ordered blood transfusion for a client, but her father refused blood transfusion. Which among the following is the appropriate action by health care workers?

a. Try to make the father willing for blood transfusion
b. Get court order for blood transfusion
c. Do blood transfusion without listening to father
d. Abide by the father's wishes and inform the health care provider

115. A nurse administered a wrong dose of medication to a client. Upon realizing the mistake she immediately reported to the authority and did incidental reporting. This shows .....

a. Accountability
b. Responsibility
c. Authority
d. Decision making

Scanned with CamScanner

116. Which of the following nursing action is considered as malpractice
a. Improper administration of medication
b. Failing to notify a doctor when something is really wrong
c. Injuring a patient with equipment
d. All of the above

117. The patient's right to refuse treatment is an example of
a. Common law
b. Religion clause
c. Statutory law
d. Nursing Council Act

118. Code of ethics for registered nurse defines the _____
a. Uniformity of care to all clients
b. Principles by which nurses' provide care to their clients
c. Protocols to be followed during nursing procedures
d. All of the above

119. Which of the following is the nurse's best legal safeguard?
a. Collective bargaining
b. Competent practice
c. Written or implied contracts
d. Patient education

120. The intention of a nurse to do no harm to the patient while providing care is the ethical principle of
a. Beneficence
b. Justice
c. Nonmaleficence
d. Fairness

NURSING THEORIES

121. Which of the following is a model based on an individual's relationship to stress the reaction to it and reconstitution factors that are dynamic in nature? *(AIIMS-BBS SNO 2019)*
a. Parse's Human Becoming Theory
b. Universality Theory
c. Roy's Adaptation Model
d. Neuman's System Model

122. The theory which intends to provide a unifying focus for approaching a wide range of nursing concerns and for understanding fundamental nursing phenomena: the client, the environment, health and nursing is: *(AIIMS Raipur Grade II 2017)*
a. Roy's theory of nursing
b. Neuman's theory of nursing
c. Nightingale's theory of nursing
d. Scudder theory of nursing

Explanation: The Neuman Systems Model views the client as an open system that responds to stressors in the environment. Roy's theory of nursing sees the individual as a set of interrelated systems such as biological, psychological and social. Florence Nightingale developed Environmental theory of nursing which believed "Healthy surroundings (environment) were necessary for proper nursing care". Scudder theory of nursing describes discipline of nursing should be a human science because it studies how nurses care for patients.

123. The theory that involves care and helps through which the client attains total self-care is: *(AIIMS Raipur NO 2019)*
a. Nightingale theory
b. Orem's theory
c. Paplau's theory
d. Roy's theory

Explanation:

Table

Theorists	Theories
Orem's theory	Self-care deficit theory which helps client to attain total self-care.
Nightingale's theory	Environment as the focus of nursing care.
Peplau's theory	Focuses on interpersonal relationship.
Roy's theory	Roy developed an adaptation model, known as RAM.

124. In Maslow's hierarchy of physiologic needs, the human need of greatest priority is: *(RAK MSc 2018)*
a. Love
b. Elimination
c. Nutrition
d. Oxygen

Explanation: As per Maslow's hierarchy of needs, physiological needs must be met first. These include food, water, oxygen, warmth and rest. Out of all of options, oxygen is the highest priority as it is must for survival. Without oxygen survival is not possible even for few minutes.

125. Highest level of need According to Maslow's hierarchy is
a. Physiologic needs
b. Safety and security
c. Love and belongings
d. Self-actualization

Explanation: Self-actualization is the highest need as per Maslow.

126. The four major concepts in nursing theory are
a. Nursing, Physician, Environment, Patient
b. Nursing, Person, Environment, Cure
c. Nursing, Person, Environment, Health
d. Prevention, promotion, Treatment, Rehabilitation

127. 'Nursing is a theoretical body of knowledge that prescribes analysis and action to care for an ill person'. This is proposed by
a. Callista Roy
b. Virginia Henderson
c. Martha Rogers
d. Betty Neuman

128. Who defined that 'the nurse/patient relationship evolving through *orientation, identification, exploitation and resolution*'
a. Madeleine Leininger
b. Dorothea Orem
c. Hildegard Peplau
d. Betty Neuman

129. A system model that focuses on the response of the client system to actual or potential environmental stressors was developed by
a. Martha Rogers
b. Betty Neuman
c. Dorothea Orem
d. Virginia Henderson

Ans.
116. d
117. c
118. b
119. b
120. c
121. d
122. b
123. b
124. d
125. d
126. c
127. a
128. c
129. b

Scanned with CamScanner

130. Self-care theory was developed by
a. Dorothea orem b. Callista Roy
c. Martha Rogers d. Betty Neuman

131. Four conservation principle, i.e. energy, structural integrity, personal integrity and social integrity was described by
a. Leininger b. Peplau
c. Levin d. Rogers

132. The most basic needs based on Maslow's basic human needs hierarchy is
a. Love and belonging b. Safety and security
c. Physiologic d. Self-actualization

133. Components of paradigm of nursing includes
a. The person, health, environment, and physician
b. Health, theory, concepts, and physician
c. The person, health, environment and nursing
d. Nurses, physicians, health, and concepts

INFECTION CONTROL AND DISINFECTION

134. The best way to decrease the risk of transferring pathogens to a patient when removing contaminated gloves is to: *(AIIMS Raipur NO 2019)*
a. Wash the gloves before removing them
b. Gently pull on the fingers of the gloves when removing them
c. Gently pull just below the cuff and invert the gloves when removing them
d. Remove the gloves and then turn the inside out

135. The nurse is assigned to a patient who has a bacterial pneumonia and is under droplet precautions, which personal protective equipment (PPE) will she wear to deliver the meal tray? *(ESIC 2019)*
a. No PPE required.
b. Only mask is needed.
c. Special filtration mask and gloves.
d. Gown mask gloves shoe covers.

Explanation: Only mask is needed for protection against droplet infection. Gloves or gown are not necessary to protect from droplet infection.

136. Medical asepsis differs from surgical asepsis in that it is aimed at: *(ESIC 2019)*
a. Preventing transmission of microorganisms.
b. Preventing entry of microorganisms into the body
c. Sterilizing all equipment.
d. Killing all microorganisms.

Explanation: Surgical asepsis or "sterile technique" is used in surgery and invasive procedure. It aims to prevent entry of microorganisms into the body, sterilizing all equipment and at killing all microorganism and spores (sterilization). Whereas the medical asepsis or 'clean technique' that involves procedures to reduce the number and transmission of pathogens.

137. In which strength Savlon will be used to carbolize cot and mattress during bed making procedure? *(Safdarjung NO 2018)*
a. 1:40 to 1:50 b. 1:20 to 1:40
c. 1:30 to 1: 1:40 d. 1:40 to 1:60

Explanation: Strength of Savlon (Chlorhexidine Gluconate) to be used for bed cleaning is in the ratio of 1:33 aqueous solution (33 mL made up to in 1 L of water). It is also used for the treatment of wounds and burns, swabbing in obstetrics.

138. The most common site of hospital-acquired infection is: *(AIIMS BPL NO 2018)*
a. Surgical sites b. Respiratory tract
c. Urinary tract d. Eyes

Explanation: Urinary infections are the most common nosocomial infection; 80% of infections are associated with the use of an indwelling urinary catheter.

139. The process by which, medium is placed at 100°C in flowing steam for 30 minutes each on 3 successive days is: *(AIIMS Raipur Grade II 2017)*
a. Steam under pressure b. Autoclave
c. Tyndallization d. Inspissation

Explanation: Autoclaves are used to sterilize equipments and supplies at high pressure saturated steam at 121°C for around 15-20 minutes. Tyndalization is a method of heating article for three successive days, first day at 85°C for 60 minutes, second day 75 to 80°C for 20 minutes and third day 75 to 85°C for 20 minutes.

140. The serological reaction, which sensitizes bacteria for phagocytosis is called: *(AIIMS Raipur Grade II 2017)*
a. Co-agglutination b. Neutralization
c. Opsonization d. Complement fixation

Explanation: Coagglutination is the process of aggregation of particulate antigens bound with agglutinins of more than one specificity. Neutralization is a chemical reaction in which acid and base react quantitatively with each other. Complement fixation test is immunological test that can be used to detect either specific antibody or specific antigen in a patients serum based on occurrence of complement fixation.

141. To sterilize disposable syringes, the method of sterilization used is: *(AIIMS Raipur Grade II 2017)*
a. Ethylene oxide autoclavation
b. Infrared radiation
c. Ultraviolet radiation
d. Gamma radiation

Explanation: Ethylene oxide is used to sterilize devices that incorporate electronic components, plastic packaging or plastic containers. Infrared radiation is used to sterilize articles such as syringes and catheters. UV radiation are used for disinfecting enclosed areas such as operation theatres and laboratories.

142. Sharp instrument should not be sterilized by: *(AIIMS Raipur Staff Nurse Grade I-2018)*
a. Cooling b. Boiling
c. Hot air oven d. Antiseptic solution

Explanation: Boiling the sharp instruments lose their sharpness through repeated boiling. Other methods are suitable for sharp instruments as they keep the instrument functional.

143. What type of isolation precaution is in use when a patient is asked to wear mask? *(AIIMS Raipur Staff Nurse Grade I-2018)*
a. Blood safety b. Contact
c. Droplet d. Standard

Explanation: Droplet infections are transmitted from one individual to another by droplets of moisture expelled from the upper respiratory tract through coughing or sneezing. By wearing the mask this kind of infection can be prevented.

144. Tubes and catheters are disinfected with .....
a. 2% Glutaraldehyde b. 1% hypochlorite
c. Formalin d. Korsolex

Ans.

130.	a
131.	c
132.	c
133.	c
134.	c
135.	b
136.	a
137.	b
138.	c
139.	c
140.	c
141.	d
142.	b
143.	c
144.	a

Scanned with CamScanner

Explanation: 2% Glutaraldehyde - To disinfect tubes and Catheters

1% hypochlorite - Surface disinfection; blood spillage, liquid waste disinfection

Formalin - Used for preservation of tissue and anatomical specimens

Korsolex - Used to disinfect heat sensitive instruments

145. Infection occurs following treatment modality or procedures is known as

a. Iatrogenic infection
b. Nosocomial infection
c. Concurrent infection
d. Fomite infection

Explanation: Iatrogenic infection occurs as a result of diagnostic and or therapeutic procedures on a patient. Nosocomial infection are those infection occur in patient after 48 hours of hospital stay. Concurrent infection is the term used when a patient has two or more simultaneous infections. Fomite infections refers to infections transmitted by objects.

146. Immediate disinfection of all articles and bodily discharge during the course of disease is known as.....

a. Concurrent disinfection
b. Recurrent disinfection
c. Terminal disinfection
d. Sterilization

Explanation: Concurrent disinfection refers to application of disinfective measures as soon as possible after discharge of infectious material from the body of an infected person, or after soiling of articles with such infectious discharges. Concurrent disinfection is done for urine, feces, clothes, dressings etc. throughout the course of illness.

Recurrent (prophylactic) disinfection refers to prevention of an infection by chlorination of water, pasteurization of milk, hand washing etc.

Terminal disinfection refers to application of disinfective measures after the patient has been removed, e.g., by death, or has ceased to be a source of infection.

Sterilization is different from disinfection and bactericidal refers to a, b.

147. Most effective way to prevent cross infection in hospital setting is .....

a. Hand washing
b. Use alcohol based hand rub between patients
c. Screen the visitors
d. Ensure adequate ventilation

Explanation: Hand washing is the most effective way. Alcoholic hand rubs are not a substitute for hand washing.

148. All of the following statements are correct regarding surgical asepsis EXCEPT

a. Sterile objects to be held above the level of waist
b. One inch of the outside edge of the sterile field is considered as contaminated
c. Never reach across the sterile field
d. Forceps soaked in disinfectant are considered to be sterile

Explanation: Forceps soaked in disinfectant are not considered to be sterile. Other important principles of surgical asepsis are:

- Only a sterile object to touch another sterile object
- **One inch (2.5 cm)** of the outside edge of a sterile field to be considered as contaminated.
- A wet field is considered as contaminated if the surface below (paper or cloth used as a field for sterile set up) is unsterile.
- Avoid spilling any solution/liquid on a paper or cloth used as a field for sterile set up.
- Sterile objects to be held **above the level of waist.**
- To prevent contamination from droplet, the nurse should avoid Coughing, sneezing, talking or reaching over a sterile field.
- The nurse should not turn her back on a sterile field that may prevent contamination of sterile field while it is out of her view.
- Never reach across the sterile field
- Forceps soaked in disinfectant are not to be considered as sterile.
- If there is any doubt an object of its sterility, considered it as unsterile

149. What you mean by cold sterilization?

a. Sterilization under a temperature range of 1–80 C
b. Disinfection using disinfectant
c. Sterilization done under minus degree Celsius temperature
d. All of the above

Explanation: *Cold* (chemical) *sterilization* is the use of liquid chemical solutions (disinfectants) to *sterilize* medical instruments. In other words, disinfection done using disinfectant is known as cold sterilization.

150. Most important aspect of hand washing is .....

a. Time
b. Type of soap
c. Surface tension
d. Friction

Explanation: Friction is the most important aspect while doing hand washing.

151. Identify incorrect statement regarding care of rubber article used in hospital setting?

a. Rubber articles will be destroyed by heat
b. Do not fold rubber articles, roll them instead
c. Do not pin on rubber articles
d. Rubber articles are sterilized using dry heat method

Explanation: Rubber articles are sterilized by autoclaving or Ethylene Oxide Gas Method. In autoclaving method, Temperature must not exceed 134°C (250°F) for 15 minutes. All reusable rubber and plastic products with the exception of cushion masks may be sterilized using ETO if sufficient aeration is provided.

152. Arrange the following steps of hand washing in order

1. Wash palm and fingers
2. Wash fingers and knuckles
3. Wash thumbs
4. Wash back of hands

Options

a. 1, 2, 3 and 4
b. 1, 4, 2 and 3
c. 4, 3, 2 and 1
d. 2, 3, 1 and 4

Explanation: Steps of hand washing are as follows. 1. Wash palm and fingers. 2. Wash back of the hands. 3. Wash fingers and knuckles. 4. Wash thumbs. 5. Wash finger tips. 6. Interlocking of hands. 7. Wash wrists

153. All of the following statements regarding boiling as a sterilization method is true EXCEPT

a. Most economical way of sterilizing articles
b. Some bacteria, virus and spores are resistant to boiling
c. It is not a suitable method for those articles which will be destroyed by heat and moist
d. Effective boiling time for articles is 10 minutes

Ans.

145. a
146. a
147. a
148. d
149. b
150. d
151. d
152. b
153. d

Scanned with CamScanner

Explanation: Boiling works on microorganisms by changing the physical properties of proteins, causing them to coagulate and stop functioning. Boiling the object(s) for a minimum of 30 minutes is required for effective sterilization.

154. Sterile technique is also called as .....
a. Medical asepsis b. Surgical asepsis
c. Autoclaving d. Disinfection

Explanation: Surgical asepsis (sterile technique); Practices that keep an area or objects free from all microorganisms non-pathogenic and pathogenic including spores and viruses.

155. What type of isolation is most appropriate for a patient diagnosed with methicillin resistant staphylococcus aureus (MRSA) pneumonia?
a. Standard precautions b. Contact isolation
c. Respiratory isolation d. Reverse isolation

Explanation: The hands of healthcare workers are the principal mode of transmission for MRSA. In the given example, the organism is limited to sputum. As the principal mode of transmission is through hands of healthcare personnel, contact isolation is necessary with a private room, Body Substance Isolation (barrier protection using gloves, mask, gown, goggle etc.), and good hand washing techniques.

156. The solution used to disinfect the bed linen of HIV positive patient is: *(DSSSB 2013)*
a. Dettol b. Lysol
c. Savlon d. Sodium hypochlorite

Explanation: Sodium hypochlorite is used to disinfect the bed linen of HIV patient. Linen should be soaked for 20 minutes. Sodium Hypochlorite is also known as polar solution.

157. Which of the following action has to be avoided to prevent contamination of the environment during bed making?
a. Strip all linens at the same time
b. Embrace soiled linen
c. Fanning soiled linens
d. Finished both sides at the time

158. Which of the following is NOT included in the 5 moments of hand washing?
a. Before touching patient surroundings
b. Before touching a patient
c. After touching patient surroundings
d. After body fluid exposure risk

159. The pressure set in autoclave for sterilization is:
a. 15 lb b. 5 lb *(DSSSB PHN, 2015)*
c. 10 lb d. 20 lb

160. An agent which kills pathogenic bacteria is called: *(RRB SSNE 2015)*
a. Asepsis b. Disinfectant
c. Fomite d. Bacteriostat

161. Inoculating loop is sterilized by: *(Banaras HU 2015)*
a. Hot air oven b. Autoclave
c. Flaming d. Radiation

162. The solution used to disinfect the bed linen of HIV positive patient is *(Staff Nurse G II 2014)*
a. Savlon b. Sodium hypochlorite
c. Dettol d. Lysol

163. The amount of bleaching powder for disinfection of 1000 gallons of water is: *(Recent Question 2012)*
a. 2 oz b. 1 oz
c. 50 gm d. 10 gm

164. All these are sterilized by chemicals except: *(ESIC Chennai May 2012)*
a. Endoscopes b. Gauze
c. Scissors d. Cables

165. Recommended disinfectant used for handling spills is: *(LNJP H D 2012)*
a. 10% sodium hypochlorite
b. 5% bleach solution
c. 1% sodium hypochlorite
d. 2% bleach solution

166. Universal precautions in hospital involve: *(LNJP H D 2012)*
a. Gloving b. Mask, gowning
c. Hand washing d. All of the above

167. Cesol, Lysol and chloroxylenol are: *(LNJP H D 2012)*
a. Acids b. Aldehydes
c. Halogens d. Phenols

168. Which of the following chemical is most powerful disinfectant? *(LNJP H D 2012)*
a. Dettol b. Lysol
c. Phenol d. KMnO4.

169. The heart of the activated sludge process is: *(RRB Feb 2012)*
a. Sludge digester
b. Primary sedimentation tank
c. Aeration tank d. Final setting tank

170. Fresh bleaching powder contains: *(RRB Feb 2012)*
a. 0.033% chlorine b. 33% chlorine
c. 0.33% chlorine d. 3.3% chlorine

171. The most efficient way to break the chain of infection is by
a. Hand hygiene b. PPE
c. Wearing gloves d. Isolation of patient

172. Which of the following technique is appropriate for wound dressing
a. Medical asepsis b. Surgical asepsis
c. Septic technique d. Medical and surgical asepsis

173. HIV contaminated waste products can be decontaminated by
a. Formaldehyde b. Sodium hypochlorite
c. Glutaraldehyde d. All of the above

174. Temperature range used in autoclaving is .....
a. 121-123°F b. 150-200°F
c. 250-254°F d. 260-275°F

175. Pressure range used in autoclaving is .....
a. 10-12 pounds b. 15-17 pounds
c. 18-20 pounds d. 20-22 pounds

176. Solution of choice for disinfecting enamelware item is .....
a. 0.5% chlorine b. 2% glutaraldehyde
c. 50-70% alcohol d. Salvon

177. Fiber optic items are disinfected with .....
a. 0.5% chlorine b. 2% glutaraldehyde
c. 50-70% alcohol d. Salvon

178. Solution used in suction bottle before suctioning with disinfection purpose is .....
a. Sodium hypochlorite b. Savlon
c. Chlorine d. Cidex

179. Agent used to inhibit the growth of bacteria:
a. Antiseptic b. Bacteriostatic
c. Bactericidal d. Disinfectant

180. An agent which has the power to kill bacteria is:
a. Antiseptic b. Bacteriostatic
c. Bactericidal d. Disinfectant

181. Immediate disinfection of all contaminated articles and bodily discharge during the course of illness is .....
a. Concurrent disinfection b. Terminal disinfection
c. Sterilization d. Quarantine

Ans.

154.	b
155.	b
156.	d
157.	c
158.	a
159.	a
160.	b

Scanned with CamScanner

182. **Disinfection of patient's unit after the death/discharge of patient is termed as .....**
   a. Concurrent disinfection b. Terminal disinfection
   c. Sterilization d. Quarantine

183. **Cidex is also known as .....**
   a. Glutaraldehyde b. Formaldehyde
   c. Korsolex d. Hypochlorate

BIOMEDICAL WASTE MANAGEMENT

184. **Yellow color code is used for which type of hospital waste?** *(AIIMS Bhopal Grade-I 2018)*
   a. Body parts b. Glassware
   c. Plastic d. Sharps

Explanation: According to Indian Society of Hospital waste management (ISHWM- July, 2018), Yellow color coded container is used to dispose the Cat 1, 2, 3 and cat 6 waste (Human and animal waste, microbial and biological waste, and soiled waste).

185. **Which of the following colored containers must be used for discarding Human anatomical waste in hospital?**
   a. Yellow b. Red
   c. Blue d. Black

Refer Appendices for complete information on color coding used in biomedical waste management (Page no. A-102).

Explanation: **Yellow bag:** Human Anatomical Waste, Animal tissues, organs, Body parts carcasses, bleeding parts, fluid, blood and experimental animals used in research, Microbiology and Biotechnology waste.

186. **The color of bag in which the infectious solid wastes are disposed is:** *(DSSSB PHN, 2015)*
   a. Red b. Black
   c. Blue d. Yellow

187. **Infectious non sharp waste is collected in:** *(LNJP H D 2012)*
   a. Black bag b. White bin
   c. Yellow bag d. Red bag

188. **Yellow plastic bags containing biomedical wastes are treated by:** *(RRB Feb 2012)*
   a. Microwaving b. Autoclaving
   c. Shredding d. Incineration

189. **Color of the bag used in BMW for discarding human anatomical waste, animal waste and solid waste is**
   a. Yellow b. Black
   c. Blue d. Puncture proof container

190. **Discarded medicine and chemical waste are discarded in ..... color bag**
   a. Yellow b. Black
   c. Blue d. Puncture proof container

191. **In Hospital waste management which colored plastic bag is not used** *(ISRO)*
   a. Green b. Red
   c. yellow d. Blue

VITAL SIGNS

192. **Before taking temperature thermometer need to clean from**
   a. Bulb to stem b. Stem to bulb
   c. Middle to stem d. Middle to bulb

193. **Cleaning of thermometer needs to be done in ..... direction after taking temperature**
   a. Bulb to stem b. Stem to bulb
   c. Mid way between stem and bulb to stem
   d. Mid way between stem and bulb to bulb

Explanation: After taking temperature cleaning has to be done from stem to bulb i.e. more clean to less clean area. Before taking temperature it has to be cleaned from bulb to stem.

194. **The nurse in charge measures a patient's temperature at 102°F. What is the equivalent Centigrade temperature?** *(AIIMS Raipur NO 2019)*
   a. 39 degree b. 49 degree
   c. 38.9 degree d. 48.1 degree

Explanation: To convert Fahrenheit scale to Celsius scale:
$C = (F-32) \times 5/9$ $C = (102-32) \times 5/9$
$C = 70 \times 5/9$ $C = 38.9°$

195. **If a patient's blood pressure is 160/96, his pulse pressure is:** *(AIIMS Raipur NO 2019)*
   a. 64 b. 96
   c. 160 d. 256

Explanation: Pulse pressure is the difference between the systolic and diastolic blood pressure. Normal pulse pressure is 30-50 mm Hg. Pulse pressure = Systolic BP – Diastolic BP = 160-96 = 64 mm Hg

196. **The nurse is examining an 8-year-old boy with tachycardia and tachypnea. Which one of these noninvasive tests can determine the extent of hypoxia?** *(AIIMS Raipur NO 2019)*
   a. Pulmonary function test
   b. Pulse oximetry
   c. Peak expiratory flow
   d. Chest x-ray

Explanation: Arterial oxygen can be monitored noninvasively and continuously using pulse oximeter probe on finger or toe.

197. **What is the term used for normal respiratory rhythm and depth in a client?** *(Safdarjung NO 2018)*
   a. Eupnea b. Apnea
   c. Bradypnea d. Tachypnea

Explanation: Eupnea is normal, good, unlabored ventilation, sometimes known as quiet breathing or resting respiratory rate. It is derived from the words eu-, "well" + pnoia, "breath.

198. **The cardinal signs of the body includes the following, EXCEPT:** *(AIIMS Raipur Grade II 2017)*
   a. Temperature b. Blood pressure level
   c. Blood glucose level d. Heart beat

Explanation: Cardinal signs or Vital signs includes Body temperature, Pulse (Heart rate), Respiration, and Blood Pressure. It may also include pain and oxygen saturation (pulse oximetry). Blood glucose level is not a cardinal sign of the body.

199. **The type of fever in which the temperature fluctuates more than 2°C, all above normal, during a 24 hour period is:** *(AIIMS Raipur Grade II 2017)*
   a. Intermittent fever b. Remittent fever
   c. Recurrent fever d. Relapsing fever

Explanation: Intermittent fever is a type of fever in which there is an interval where temperature is elevated for several hours followed by an interval where temperature drops back to normal. Recurrent fever can be a symptom of various illness such as periodic fevers, aphthous ulcers, pharyngitis and adenopathy. Relapsing fever is a vector-borne disease caused by bacteria in the genus Borrelia, which are transmitted through the bites of lice or soft-bodied ticks.

199.	b

Scanned with CamScanner

200. Which of the following blood pressure reading should be reported immediately to the physician?
(AIIMS Raipur Staff Nurse Grade I-2018)

a. 130/98 mm Hg
b. 140/88 mm Hg
c. 110/70 mm Hg
d. 138/82 mm Hg

Explanation: Among the given values option A has the highest diastolic blood pressure. Diastolic blood pressure gives best idea related to the risk for heart disease or stroke.

201. What is the normal 'oral temperature' of an adult?
(AIIMS Bhopal Nursing Officer, 2018)

a. 90.0°F
b. 98.6°F
c. 91.5°F
d. 90.6°F

Explanation: 98.6°F is the normal 'oral temperature' of an adult. Rectal temperature is 0.5°C or 1°F higher then oral temperature while axillary temperature is 1°F less than the oral temperature.

202. Which site is used to assess the status of circulation to lower arms and auscultate blood pressure?
(AIIMS Bhopal Nursing Officer, 2018)

a. Apical
b. Temporal
c. Axillary
d. Brachial

Explanation: Circulation to lower arms and BP is measured in brachial artery

203. Increased depth of breathing with normal respiratory rate is called
(AIIMS Bhopal Nursing Officer, 2018)

a. Hyperpnea
b. Bradypnea
c. Orthopnea
d. Kussmaul's breathing

Explanation: Increased depth of breathing with normal respiratory rate is known as Hyperpnea

- **Bradypnoea:** Abnormally slow breathing
- **Orthopnoea:** Discomfort in breathing while lying down flat
- **Kussmaul's breathing:** Deep and labored breathing associate with severe metabolic acidosis

204. Gradual increase in rate and depth of respiration is known as.....

a. Hyperventilation
b. Hypoventilation
c. Kussmaul respiration
d. Cheyne-stokes

Explanation: Kussmaul breathing (respiration) is a type of hyperventilation that is the lung's emergency response to metabolic acidosis. In this condition the hydrogen ion combine with bicarbonate and form carbonic acid, it disintegrate and form water and carbon dioxide. The carbon dioxide needs to be eliminate from the body. So the rate and depth of respiration will increase. Kussmal respiration is most commonly associated with conditions that cause metabolic acidosis, particularly diabetic ketoacidosis.

Cheyne-stokes respiration is an abnormal pattern of breathing characterized by progressively deeper and sometime faster breathing followed by a gradual decrease in breathing and apnea.

- Hyperventilation means breathing fast.
- Hypoventilation refers to reduced amount of air enter the alveoli.

205. If a narrow cuff is used for measuring BP, then what will the outcome?

a. Actual reading will be obtained
b. Falsely high reading will be obtained
c. Falsely low reading will be obtained
d. BP can't measure

Explanation: Use of narrow cuff leads to falsely high reading and use of large cuff will cause falsely low reading. The width of the BP cuff should be 40% of the circumference and length of the cuff should be 80% of the circumference.

206. Which of the following method is the most appropriate to measure temperature in a patient who underwent oral surgery?

a. Rectal
b. Axilla
c. Oral
d. Central line

Explanation: Taking temperature from axilla is the most appropriate method and easily accessible site in this client. Oral method is incorrect as the patient underwent oral surgery.

207. Pulse deficit refers to the difference between

a. Apical pulse and radial pulse
b. Radial pulse and femoral pulse
c. Two radial pulse obtained with 5 minutes gap
d. Two apical pulse obtained with 5 minutes gap

Explanation: The pulse deficit (difference between heart beats and pulsations at the periphery) is determined by simultaneous palpation at the radial artery and auscultation at the apex of the heart. In other words, it is the difference between heart rate and pulse rate.

208. What is the difference in temperature between oral cavity and rectum in a patient at same time?

a. 0.5°F
b. 1°F
c. 2°F
d. 3°F

Explanation: Oral temperature is 1°F higher than axillary and 1°F Less than rectum.

209. Location of auscultation for apical pulse is .....

a. 5th intercostal space at the right mid-axillary line
b. 5th intercostal space at the left mid-clavicular line.
c. 5th intercostal space at the right mid-clavicular line
d. 5th Intercostal space at the left mid-axillary line

Explanation: Location of auscultation of apical pulse is 5th intercostal space at the left mid-clavicular line, where the apex of the heart is located.

210. The factors that interferes correct function of pulse oximeter includes all EXCEPT

a. Carbon monoxide poisoning
b. Hypertension
c. Pulse volume
d. Vasoconstriction

Explanation: Several factors can interfere with the correct function of a pulse oximeter including:

- Light – bright light (such as the operating theatre light or sunlight) directly on the probe may affect the reading.
- Shivering – movement may make it difficult for the probe to pick up a signal.
- Pulse volume – the oximeter only detects pulsatile flow. When the blood pressure is low due to hypovolemic shock or the cardiac output is low or the patient has an arrhythmia, the pulse may be very weak and the oximeter may not be able to detect a signal
- Vasoconstriction reduces blood flow to the peripheries. The oximeter may fail to detect a signal if the patient is very cold and peripherally vasoconstricted.
- Carbon monoxide poisoning may give a falsely high saturation reading. Carbon monoxide binds very well to

haemoglobin and displaces oxygen to form a bright red compound called carboxyhemoglobin. This is only an issue in patients following smoke inhalation from a fire.

Source: WHO Pulse Oximetry Training Manual (WHO, 2011).

211. While attaching temperature probe on the skin, most preferred site for a patient with supine position is right hypochondriac region. Why?

a. Liver is located in that region
b. Easy to attach
c. Large surface area
d. All of the above

Explanation: Liver is present in right hypochondriac region, which is the site for metabolism, so by attaching the probe there more accurate information regarding peripheral temperature can be obtained.

212. If highest temperature is recorded in the morning and lowest temperature in the evening. This kind of fever is known as ...

a. Inverse fever
b. Lysis
c. Crisis
d. Remittent fever

Explanation: In inverse fever, the temperature rises in the morning rather than in the evening. Option B means fall in temperature in a zig-zag manner. Option C means sudden return to normal temperature. Option D Remittent fever refers to a fever pattern in which temperature varies during each 24-hour period but never reaches normal.

213. Rectal thermometer needs to be insert up to .....

a. 0. 5-1. 5 inch
b. 1-2 inch
c. 1. 5-2. 5 inch
d. 2-3 inch

Explanation: Rectal thermometer need to insert up to 0. 5-1. 5 inch.

214. Low blood pressure that happens when a person stand up from sitting or lying position is known as .....

a. Postural hypotension
b. Orthostatic hypotension
c. Supine hypertension
d. Both a and b

Explanation: Orthostatic hypotension — also called postural hypotension — is a form of low blood pressure that happens when person stand up from sitting or lying down. Orthostatic hypotension can make the person feel dizzy or lightheaded, and maybe even faint.

215. In a patient with postural hypotension, what is the minimum expected decrease in systolic BP after standing for at least one minute? *(AIIMS MSc 2012)*

a. 5 mm Hg
b. 10 mm Hg
c. 15 mm Hg
d. 20 mm Hg

Explanation: Systolic blood pressure decrease of at least 20 mm Hg or a diastolic blood pressure decrease of at least 10 mm Hg within three minutes of standing.

216. Apical pulse is assessed by placing the diaphragm of the stethoscope at the area of: *(DSSSB 2013)*

a. Aortic area
b. Pulmonic area
c. Mitral area
d. Tricuspid area

Explanation: Fifth intercostal space for adults and the fourth intercostal space for a young child or infant. Stethoscope at the apex of the heart

217. The apex beat is felt at which intercostal space? *(DSSSB PHN, 2015)*

a. 3rd
b. 4th
c. 5th
d. 6th

218. All of the following precautions are true while recording oral temperature of a patient except: *(Banaras HU 2015)*

a. Measurement of temperature should be done on a fixed time of the day
b. It is measured at least 3 min after keeping the thermometer sublingually with lips closed
c. Not to record in patient who have recently smoked
d. In patients on oxygen inhalation, stop the oxygenation before recording oral temperature

219. All of the following are precautions in the care of a patient with high fever except: *(Banaras HU 2015)*

a. Never leave a patient with high fever alone
b. Rigors and convulsions may occur at any time
c. Administer antipyretic drugs
d. Tepid cold sponging is not useful in patient not responding to antipyretics

220. Sudden return to normal temperature from a very high temperature within a few hours: *(Kerala PSC, Nov 2014)*

a. Crisis
b. Lysis
c. Remittent fever
d. Continuous fever

221. The difference between systolic and diastolic blood pressure is known as: *(Staff Nurse G II 2014)*

a. Pulse difference
b. Cardiac pressure
c. Systolic pressure
d. Pulse pressure

222. Sudden fall of temperature is called: *(Recent Question 2012)*

a. Crisis
b. Lysis
c. Relapse
d. Quotidian

223. The correct equipment used for taking temperature is:

a. Stethoscope
b. Sphygmomanometer
c. Thermometer
d. ECG

224. Who invented thermometer: *(ESIC Chennai May 2012)*

a. Celsius
b. Galileo Galilee
c. Lord Kelvin
d. Thomas J. Manning

225. A clinical thermometer indicates temperatures in degree Fahrenheit from: *(ESIC Chennai May 2012)*

a. 94 to 108
b. 94 to 110
c. 96 to 108
d. 96 to 110

226. The normal breath rate of human beings is: *(ESIC Chennai May 2012)*

a. 12–15 per minute
b. 22–25 per minute
c. 15–18 per minute
d. 20–24 per minute

227. Volume remaining in the lungs and airways following a maximum expiratory effort is known as: *(ESIC Chennai May 2012)*

a. Residual volume
b. Total lung capacity
c. Vital capacity
d. Tidal capacity

228. The instrument used to measure blood pressure is: *(ESIC Chennai May 2012)*

a. Electrocardiograph
b. Stethoscope
c. Rotameter
d. Sphygmomanometer

229. The difference between the apical and radial pulse rates is called the: *(LNJP H D 2012)*

a. Rhythm deficit
b. Heart amplitude
c. Pulse deficit
d. Pulse amplitude

230. Patient has intravenous fluids infusing in the right arm when taking a blood pressure on this patient, the nurse would: *(LNJP H D 2012)*

a. Take the blood pressure in the left arm
b. Take the blood pressure in the right arm
c. Use the smallest possible cuff
d. Report inability to take the blood pressure

Scanned with CamScanner

231. When a client change his position from lying down to standup his pulse rate increased from 72 to 120 beats/min and patient become dizzy. It is suggestive of .....
a. Malignant hypertension b. Orthostatic hypotension
c. Primary hypertension d. Rebound hypertension

232. In a child with fever, oxygen demand increases because
a. Metabolic need increases
b. Blood sugar level decreases
c. Patient is less active
d. Patient is more alert

233. The most reliable way to assess the respiratory rate of a patient is
a. Observe the chest rising and falling
b. Listen and feel the air movement
c. Count the respiration 10 sec and multiply with six
d. Use cardiac monitor

234. An abnormally slow breathing rate is called as
a. Bradypnea b. Bradycardia
c. Tachypnea d. Tachycardia

235. Core body temperature is highest at:
a. Early morning b. Noon
c. Later afternoon d. Night

236. Other name for collapsing pulse is .....
a. Thread pulse b. Water-hammer pulse
c. Bounding pulse d. Pulse deficit

237. Normal oral temperature is
a. 97°F b. 97.6°F
c. 98.6°F d. 99.6°F

238. Appropriate time duration to assess pulse is
a. 15 seconds b. 30 seconds
c. 45 seconds d. 1 minute

239. The pulse assessed from the neck to the side of the wind pipe is called as
a. Brachial pulse b. Carotid pulse
c. Nuchal pulse d. Popliteal pulse

240. Temperature regulation is under the control of
a. Lungs b. Pituitary gland
c. Hypothalamus d. Pineal gland

241. Assessment of rectal temperature is recommended if patient
a. Arm in a cast
b. Has nasal packing
c. External haemorrhoids
d. Has gastrostomy feeding tubes

242. Kussmaul breathing is a deep and labored breathing pattern often associated with
a. Diabetic ketoacidosis
b. Hepatitis
c. Hepatomegaly
d. Acute renal failure

243. When assessing blood pressure, the sounds that is heard through a stethoscope placed over the artery is termed as
a. Crackles b. Korotkoff sounds
c. Brachial sounds d. Murmurs

244. Pre-procedural preparation before taking oral temperature includes
a. Make sure that patient performed oral hygiene before the procedure
b. Make sure that patient has not taken anything cold or hot 10-20 min before the procedure
c. Make sure that patient is not wearing any denture while performing the procedure
d. All of the above

245. The fall of temperature step by step in a zig zag manner is termed as
a. Lysis b. Crisis
c. Homeostasis d. Thermostasis

246. A patient in the unit has a 103.7°F temperature. Which intervention would be most effective in restoring normal body temperature?
a. Use a cooling blanket while the patient is febrile.
b. Administer antipyretics on an around-the-clock schedule.
c. Provide increased fluids and have the UAP give sponge baths.
d. Give prescribed antibiotics and provide warm blankets for comfort.

247. Relapsing fever is characterized by
a. Recurring episodes of fever
b. The fall of temperature in zigzag manner to normal
c. In the morning temperature is higher than the evening
d. Temperature comes to normal at least once in a day

248. Which of the following is the characteristics of inverse fever?
a. The sudden fall of temperature from high to normal
b. The fall of temperature in zigzag manner to normal
c. In the morning temperature is higher than in the evening
d. Temperature comes to normal at least once in a day

249. The sudden return to a normal temperature from very high fever is called as
a. Lysis b. Crisis
c. Thermostasis d. Homeostasis

250. Irregular respiration characterized by apnea and hyper-ventilation is known as
a. Cheyne-strokes respiration
b. Hyperventilation
c. Kussmaul's respiration d. Sighing

251. Rate of ventilation exceeding normal range is known as
a. Cheyne-strokes respiration
b. Hyperventilation
c. Kussmaul's respiration
d. Sighing

252. Respiration is abnormally deep but regular is
a. Cheyne-strokes respiration
b. Hyperventilation
c. Kussmaul's respiration
d. Sighing

253. Hypoxia is .....
a. Lack of oxygen in the tissues
b. Lack of oxygen in the blood
c. Bluish discoloration of mucosa
d. None of the above

254. Hypoxemia is
a. Lack of oxygen in the tissues
b. Lack of oxygen in the blood
c. Bluish discoloration of mucosa
d. None of the above

255. Temperature difference between axillary and rectal route is
a. 1°F b. 2°F
c. 3°F d. 4°F

256. Temperature difference between axillary and oral route is ...
a. 0°F b. 1°F
c. 2°F d. 3°f

257. A sudden redness of the skin is termed as
a. Flush b. Jaundice
c. Cyanosis d. Pallor

low pitched, gurgling sound - Rhonchi

258. Appropriate site to verify radial pulse measurement is
a. Temporal artery b. Femoral artery
c. Brachial artery d. Apex of the heart

259. Poor oxygenation of the blood ordinarily will affect the pulse rate and cause it to become
a. Bounding b. Faster than normal
c. Irregular d. Slower than normal

260. While measuring blood-pressure in upper arm korskoff's sound is auscultated in ..... blood vessel
a. Axillary artery b. Brachial artery
c. Femora. d. Ulnar artery

261. While measuring blood-pressure from leg, korskoff's sound is auscultated in .....
a. Femoral artery b. Popliteal artery
c. Ulnar artery d. Axillary artery

262. Bad breath is known as .....
a. Periodontal disease b. Halitosis
c. Cheilosis d. Sordes

263. First heart sound S1 indicate closure of .....valves
a. Mitral and tricuspid b. Aortic and pulmonic
c. Mitral and pulmonic d. Tricuspid and aortic

264. Second heart sound S2 indicates closure of .....valves
a. Mitral and tricuspid b. Aortic and pulmonic
c. Mitral and pulmonic d. Tricuspid and aortic

PHYSICAL EXAMINATION

265. The nurse in charge is assessing a patient's abdomen. Which examination technique should the nurse use first? *(AIIMS Raipur NO 2019)*
a. Auscultation b. Palpation
c. Percussion d. Inspection

Explanation: While performing physical examination, the sequence of techniques: 1. Inspection, 2. Palpation, 3. Percussion, and 4. Auscultation.

While performing abdominal examination, the sequence of techiques: 1. Inspection, 2. Auscultation, 3. Percussion and 4. Palpation. Because palpation and percussion can alter bowel sounds, so auscultation should be performed before percussion and palpation.

266. The nurse is collecting data on a patient with a ruptured appendix that is painful. Where would the nurse expect the patient's pain to be located? *(RAK MSc 2018)*
a. Right upper quadrant b. Right lower quadrant
c. Left upper quadrant d. Left lower quadrant

Explanation: The nurse is collecting data from a patient with a ruptured appendix that is painful. The nurse expects the patient's pain to be located at right lower quadrant. This is known as Rovsing's sign. In ruptured appendix the pain becomes more diffuse and abdominal distention develops as a result of paralytic ileus.

267. During physical assessment of children, asymmetry of the skull indicates: *(AIIMS Raipur Grade II 2017)*
a. Hydrocephalus b. Craniotabes
c. Craniosynostosis d. Osteogenesis imperfect

Explanation: Craniotabes are softening or thinning of skull in infants and children especially seen in newborn. Osteogenesis imperfecta are genetic disorders that affect bones. Hydrocephalous is a condition in which there is an accumulation of CSF in brain.

268. A low-pitched, continuous gurgling sounds caused by secretions in the large airways is called: *(AIIMS Raipur Grade II 2017)*
a. Wheezes b. Rhonchi
c. Coughing d. Stridor

Explanation: Wheezing is a high-pitched whistling sound made while breathing. Stridor is a high-pitched, wheezing sound caused by disrupted airflow.

269. When a nurse is doing a physical examination for a patient, She notices the patient's grimace. The nusring diagnostic process the nurse used here is: *(AIIMS Raipur Grade II 2017)*
a. Data interpretation b. Data clustering
c. Concept mapping d. Data Collection

Explanation: A concept map is a diagram that depicts relationship between concepts mostly used by engineers, designers as a graphical tool to organize and structure knowledge. Data clustering refers to collection and clubbing of data from different sources such as physical examination, observation and laboratory details.

270. Positive Babinski is .....
a. Abnormal for adult
b. Abnormal for children
c. Abnormal for all age group
d. All of the above

Explanation: Stroking over the sole cause toe to bend downward, it is negative Babinski and is normal for adult. But in children stroking over the sole causes toe to move upward and outward, that is called positive Babinski and is normal for children up to 2 years of age. Positive Babinski is considered as abnormal for adult.

271. Instrument used for examining eye is .....
a. Otoscope b. Proctoscope
c. Ophthalmoscope d. Endoscope

Explanation: Ophthalmoscope, also called funduscope, is an instrument used for inspecting the interior of the eye. Otoscope is used for examining ears and proctoscope is used to examine the anal cavity, rectum and sigmoid colon. Endoscope is used to visualize body cavity.

272. Which among the following data will give more accurate information regarding an end stage renal disease client's fluid status?
a. Daily weight of the client
b. Intake and output chart
c. Electrolyte level
d. Bowel movement

Explanation: Daily weight of the client gives more accurate information. 1 L = 1 kg (Approx)

273. Identify the technique used in physical examination
a. Inspection b. Palpation
c. Percussion d. All of the above

Explanation: All are the technique used in physical examination. Inspection refers to observation; palpation means touch and find out; percussion refers to tap the body and listen to the sound produced; auscultation is an technique used in physical examination.

274. Visual acuity can be assessed with .....
a. Ophthalmoscope b. Snellen chart
c. Goniometer d. Refractometer

Scanned with CamScanner

crackling sound - Rales

Explanation: Visual acuity can be assessed through Snellen's chart. Ophthalmoscope is used to see inside the fundus of the eye and other structures. Goniometer is an instrument for the precise measurement of angles, especially one used to measure the angles between the faces of crystals

275. In Weber test and Rinne's test cranial nerve examined is ....
a. Cranial nerve 1 b. Cranial nerve 2
c. Cranial nerve 7 d. Cranial nerve 8

Explanation: Cranial nerve 8, acoustic is examined through these test. Cranial nerve 1 is olfactory which helps in smelling, cranial nerve 2 is optic which is assessed with the help of Snellen's chart. Cranial nerve 7 is facial.

276. Goniometer is used to assess: *(DSSSB 2013)*
a. Auditory faculty
b. Muscle strength
c. Range of motion of joints
d. Visual acuity

Explanation: An instrument for the precise measurement of angles, especially one used to measure the angles between the faces of crystals and it measures range of motion of joints angles of the body, thereby help to track the progress of the rehabilitation program.

277. Lateral curvature of the spine is called as: *(DSSSB 2013)*
a. Kyphosis b. Lordosis
c. Scoliosis d. Pectus Excavatum

Explanation: Anterior curvature of spine = Lordosis
- **Posterior curvature of spine = Kyphosis**
- **Lateral curvature of spine = Scoliosis**

278. The equipment used in the examination of ear is: *(DSSSB 2013)*
a. Laryngoscope b. Ophthalmoscope
c. Otoscope d. Proctoscope

Explanation: An otoscope or auriscope is a medical device which is used to look into the ears. Health care providers use otoscopes to screen for illness during regular check-ups and also to investigate ear symptoms. An otoscope potentially gives a view of the ear canal and tympanic membrane or eardrum.

279. The nurse is auscultating the client's lung fields. The systematic pattern used for comparison is:
a. Anterior to posterior
b. Interspace to interspace
c. Side to side
d. Top to bottom

Explanation: Intensity, pitch, duration and quality of breath sounds are compared side to side on auscultation of lung fields.

280. History and physical examination of a client will help the nurse in .....
a. Evaluation of the therapy
b. Health teaching
c. Assessment
d. Nursing diagnoses and collaborative problems

281. Instrument to detect the color of a solution is: *(Banaras HU 2015)*
a. Calorimeter b. Flame photometer
c. Chromatography d. Colorimeter

282. Which of the following lung sound is predominant in a patient with asthma in exacerbation?
a. Rhonchi b. Crakes
c. Pleural rub d. Wheezes

283. Crackling sounds bilaterally at the bases of lungs is referred as
a. Rhonchi b. Wheezing
c. Rales d. Pleural rub

284. Vivid dreaming most commonly occurs during
a. Stage 2 NREM sleep
b. Stage 4 NREM sleep
c. REM sleep
d. Transition period from NREM to REM sleep

285. The patient has voided only 50-100 mL of urine after the removal of Foley's catheter. What is the priority nursing action?
a. Check for bladder distention
b. Encourage fluid intake
c. Re-catheterize the client
d. Monitor I/O chart

286. Redness over the bony prominence of a bed ridden patient suggests
a. Ulceration b. Bedsore
c. Poor nutritional status d. Wound infection

287. Which of the following strategy is NOT effective in enhancing a patient's impaired vision?
a. Use bright colors around patient
b. Stand in patient's field of vision
c. Use of fluorescent lighting
d. Ensure enough light inside the room

288. All of the following are methods of physical examination, EXCEPT
a. Auscultation b. History taking
c. Inspection d. Palpation

289. Which of the following causes crackles in breath sounds?
a. Pulmonary emboli b. Moisture in air passages
c. Narrowed bronchioles d. Dryness in the upper airway

290. Deep palpation is used to assess _____
a. Internal Organs b. Internal masses
c. Skin turgor d. Both a and b

291. Which of the following substances is likely to increase the urine excretion?
a. Mushrooms
b. Caffeine-containing drinks, such as coffee and cola
c. Urinary analgesics d. NSAIDs

292. Which of the following assessment data is a normal finding when performing percussion of the client's chest?
a. Resonance b. Hyperresonance
c. Tympany d. Dullness

293. Which among the following physical examination technique requires stethoscope?
a. Observation b. Percussion
c. Palpation d. Auscultation

294. Normal biceps reflex response is
a. Flexion of arm at elbow
b. Extension of arm at elbow
c. Extension of leg at knee
d. Flexion of leg at knee

295. Normal triceps reflex response is
a. Flexion of arm at elbow
b. Extension of arm at elbow
c. Extension of leg at knee
d. Flexion of leg at knee

Ans.

275.	d
276.	c
277.	c
278.	c

Scanned with CamScanner

296. Normal patellar reflex response is
a. Flexion of arm at elbow
b. Extension of arm at elbow
c. Extension of leg at knee
d. Flexion of leg at knee

297. Normal achilles reflex response is
a. Flexion of arm at elbow
b. Extension of arm at elbow
c. Extension of leg at knee
d. Plantar flexion of foot

298. Normal plantar (Babinski) reflex response in adult is
a. Flexion of arm at elbow
b. Extension of arm at elbow
c. Extension of leg at knee
d. Bending of toe downward

299. Muscle strength 5 means
a. Normal
b. Good
c. Fair
d. Poor

300. While assessing cranial nerve of a patient, the nurse ask the patient to raise the eyebrow, smile and show the teeth. The nurse is examining _____ cranial nerve
a. Vagus
b. Optic
c. Olfactory
d. Facial

NURSING PROCESS

301. The type of nursing care assignment best suited in an intensive care unit is: *(RAK MSc 2018)*
a. Case method
b. Functional method
c. Primary care method
d. Team method

Explanation: Case method is the oldest method of patient care delivery. One professional nurse assumes total responsibilities of providing complete care or one or more patient. This method is frequently used in ICU's.

302. The nursing care that focuses on patient care along with the family needs, in the scope of multidisciplinary healthcare team is called: *(AIIMS BPL NO 2018)*
a. Team based care
b. Case management
c. Patient navigation
d. Primary care

Explanation: Case management is a collaborative process of assessment, planning, facilitation, care coordination, evaluation and advocacy for options and services to meet an individual's and family's comprehensive health needs through communication and available resources to promote quality cost effective outcomes.

303. The type of assessment that includes data related to a client's biological, cultural, spiritual and social need is called: *(AIIMS-BBS SNO 2019)*
a. Behavioral assessment
b. Screening assessment
c. Comprehensive assessment
d. Focused assessment

Explanation: Comprehensive means including everything. Assessing biological, cultural, spiritual and social needs is called comprehensive assessment. Behavioral assessment is a method used assess behavior. Screening is a process for evaluating the possible presence of a particular problem. Detailed nursing assessment of specific body system(s) relating to the presenting problem is known as screening.

304. Data that includes all the measurable and observable pieces of information is called as: *(AIIMS BPL NO 2018)*
a. Subjective data
b. Hearsay data
c. Objective data
d. Documented data

Explanation: *Objective* data are observable and measurable data ("signs") obtained through observation, physical examination, and laboratory and diagnostic testing. Subjective data is gathered when the patient himself tells the nurse about it.

305. When considering a client's symptoms, how should the nurse categorize a client's complaint of tinnitus? *(RAK MSc 2018)*
a. Objective
b. Subjective
c. Prodromal
d. Functional

Explanation:
- Tinnitus is a ringing sensation experienced in the ears that can only be felt by the person experiencing it and cannot be observed by the health personnel. Hence it is a subjective data. Subjective data is what the patient tells us their symptoms are, including feelings, perceptions and concerns.
- **Objective data** is the one which a nurse can observe in the patient.

306. A method of data interpretation among the following is: *(AIIMS BPL NO 2018)*
a. Interview
b. Observation
c. Prioritization
d. Listening

Explanation: Interview, observation and listening are the method of data collection not data interpretation whereas prioritization is an action (interpretation) that can be done after collection of data.
Strategy: Find the odd one out.

307. How would the nurse record smoking history on a patient who has smoked 2.5 packs of cigarettes per day for 10 years? *(RAK MSc 2018)*
a. Patient has smoked cigarettes for 10 years
b. Patient smokes 2.5 packs of cigarettes per day
c. Patient has a 12.5 pack-year smoking history
d. Patient has a 25 pack-year smoking history

Explanation:
- The formula for calculating "pack years" for a patient who smokes is:

Pack years = No. of packs smoked per day x No. of years person smoked

As per the above data,
Pack years = 2.5 x 10
= 25

So, the nurse record smoking history on a patient who has smoked 2.5 packs of cigarettes per day for 10 years as Patient has a 25 pack-year smoking history

308. Nurse use the nursing process as a method of: *(ESIC 2019)*
a. Planning organizing and delivering patient care.
b. Communicating with patients and families.
c. Meeting the legal requirements and standards in nursing
d. Meeting public expectations of nurse.

Explanation: The purpose of nursing process is primarily to organize and deliver care to the patient. Communicating with patients, meeting legal requirements and standards, meeting public expectations are duties and responsibilities that are part of nursing process.

Scanned with CamScanner

309. ____ is a tool of Nursing Process: *(Safdarjung NO 2018)*

a. Personal history
b. Present illness
c. Socioeconomic status
d. Planning

Explanation:
- The tools of nursing process include Assessment, Nursing diagnosis, Planning, Intervention and Evaluation.
- **Planning** is establishing priories of care and is an important tool or element of nursing process. It is a base for implementation.

310. Nursing care that is based on identifying and meeting the needs of a patient is called: *(AIIMS BPL NO 2018)*

a. Client-oriented
b. Prioritization
c. Goal-oriented
d. Target realization

Explanation: Client oriented approach or patient centered care means that the nursing care is based on assessing and meeting the needs of the client as per the nursing process.

311. Which of the following statement is true about nursing diagnosis? *(AIIMS BPL NO 2018)*

a. It predicts the prognosis
b. It aids in the quality of care to meet the client's needs
c. It studies the cause and effect of the illness
d. It identifies the disease

Explanation: Nursing diagnosis usually points towards the potential problems that can occur in a client. Nursing diagnoses are developed based on data obtained during the nursing assessment. This is need based and is prioritized as per the urgency to provide quality care.

Ans.

309. d
310. a
311. b
312. a
313. a
314. b
315. b
316. d
317. a
318. b
319. b

312. A postoperative patient receives a stat dose of injection Pethidine intramuscularly. After one hour, the nurse checks on pain relief. Which step of the nursing process is the nurse using here? *(Daman & Diu NO 2018)*

a. Evaluation
b. Assessment
c. Implementation
d. Planning

Explanation: Evaluation helps the nurse to assess her own interventions and also give her opportunity to improve it. The aim of the nurse is to evaluate the action of Pethidine on postoperative pain. So, the nurse uses the last step of nursing process that is evaluation. Assessment refers to collection of subjective and objective data, usually before planning for intervention.

313. Which is considered as an internal disaster: *(Safdarjung NO 2018)*

a. Patient fall
b. The massive spread of pneumonia
c. A computer hacking episode
d. Unexpected staff absences due to illness

Explanation:
- WHO defines an internal disaster is an event that occurs within the confines of the hospital, and affects the patient. Patient fall is considered as internal disaster.
- The massive spread of pneumonia is an example of external disaster.
- A computer Hacking episode is an example of information technology disaster.
- Unexpected staff absences due to illness can be considered as staff crisis.

314. Your patient says that he "urinates at night" and it is affecting his daytime alertness. You would document this as: *(AIIMS Bhopal Grade-I 2018)*

a. Oliguria
b. Nocturia
c. Dysuria
d. Polyuria

Explanation: Nocturia or nocturnal polyuria is defined as the need to wake (one or more times) and pass urine at night. It should be distinguished from enuresis, where urine is passed unintentionally during sleep.

315. An example of an objective data is: *(AIIMS Bhopal Grade-I 2018)*

a. Feeling of worry
b. Discoloration of the skin
c. Itching
d. Nausea

Explanation: Objective data are measurable and overt data ("signs") obtained through observations, physical examination and diagnostic examinations. Whereas subjective data are the information from patient's point of views ("symptoms") including feelings, perceptions and concerns obtained through interview.

316. In a hospital there are 4 patients who require attention of the nurse. Whom of the following should the nurse attend first? *(AIIMS Bhopal Nursing Officer, 2018)*

a. 21-year-old post-op patient complaining of pain
b. 34-year-old asthma patient asking to ambulate
c. 66-year-old waiting to be discharged
d. 66-year-old with a pneumothorax complaining of shortness of breath

Explanation: As per ABC rules patient with airway or breathing problem needs immediate attention.

317. Nurse obtains vital signs and determines level of comfort for the patient. Which standard of practice is performed?

a. Assessment
b. Diagnosis
c. Planning
d. Implementation

Explanation: Obtaining vital signs is objective data and determining level of comfort by asking the patient is subjective data. Obtaining subjective and objective data from patient is known as assessment in nursing process. Nursing process includes assessment, nursing diagnosis, planning, implementation and evaluation.

318. Information verbalized or stated by the patient is known as

a. Objective data
b. Subjective data
c. Sign
d. All of the above

Explanation: Subjective data are collected or obtained via personal interactions with patient. Objective data are observable and measurable (signs) through physical examination, observation and or laboratory findings.

319. Type of assessment in which more data is collected about already identified problem is .....

a. Initial assessment
b. Focus assessment
c. Emergency assessment
d. Time lapsed assessment

Explanation: Option B is the correct answer. In initial assessment, the assessment is done when the person enter the health care facility. Emergency assessment refers to assessment which is done in a life-threatening situation/emergency. Time lapsed assessments are carried out after initial assessment.

Scanned with CamScanner

320. Braden scale is a standard tool to assess _____

a. Burn injury
b. Risk of pressure ulcer
c. Muscle strength
d. Anxiety level of patient

Explanation: Braden Scale is used to assess the patient's level of risk for development of pressure ulcers. The evaluation is based on six indicators: sensory perception, moisture, activity, mobility, nutrition, and friction or shear.

321. Level of consciousness of a client is assessed using ..... *(DSSSB 2013)*

a. Lund Browder method
b. Braden Scale
c. Glasgow coma scale
d. Snellen chart

Explanation: Option C is the answer. Lund Browder method is for the assessment of extent of burn injury assessment, Braden scale is used for the assessment of risk of bedsore, and Snellen chart is for assessment of visual acuity. Glasgow Coma Scale (GCS) contain three domain such as eye opening, motor response and verbal response. Maximum score is 15 and minimum is 3.

322. After receiving a patient from OT following cardiac surgery, most priority nursing intervention is .....

a. Connect the patient to cardiac monitor
b. Ensure patent airway
c. Check vital signs of the patient
d. Start the medication and IV fluids

Explanation: ABC are the priority. So ensure that the client is having an open airway.

323. For assessing inguinal hernia what the physician will ask to do? *(AIIMS 2016)*

a. Lie down with leg flexed
b. Sit in squatting position and bear down
c. Stand erect with hands drawn behind the back
d. Sit on a chair with hands drawn behind the back

Explanation: Option B is the correct answer, in this position when the patient bear down or cough or sneeze, hernia protrude easily and doctor can observe it easily.

324. What is the important nursing intervention while assisting for peritoneal dialysis catheter insertion?

a. Explain the procedure and get consent from the patient
b. Check the renal function of the patient
c. Ask the patient to empty the bladder
d. Arrange emergency trolley near to bedside

Explanation: Option C is the correct answer to avoid injury to the bladder, option A is the physician's responsibility.

325. The first part of the nursing diagnosis is .....

a. Problem
b. Etiology
c. Risk factor
d. Evaluation

Explanation: The first part of the nursing diagnosis is problem.

326. Which of the following is used for assessing the pain in children? *(DSSSB 2013)*

a. Verbal descriptor scale
b. Numerical rating scale
c. Visual analogue scale
d. Wong Baker Faces pain rating scale

Explanation:

327. Braden Scale is used for assessing the risk for: *(DSSSB 2013)*

a. Decubitus ulcer
b. Diabetes Mellitus
c. Hypertension
d. Urinary tract infection

Explanation: Braden scale is a tool that was developed in 1987 by Barbara Braden & Nancy Bergstrom. The purpose of this scale is to assess the patient for the risk of pressure ulcer (decubitus ulcer). Braden scale has following six criteria. 1. Sensory perception. 2. Moisture. 3. Activity. 4. Mobility. 5. Nutrition. 6. Friction and shear.

328. Which of the following interventions can best prevent bed sore? *(Kerala PSC 2016, DSSSB 2013)*

a. Massage reddened areas with lotion or oils
b. Change the position every two hourly
c. Use special water mattress
d. Keep skin clean and dry

Explanation: Changing position is the most effective way to prevent bed sore in bed-ridden patient. It is advised to change position of a bed-ridden patient at least every 2 hours and wheelchair-bound patient at least every 15 minutes. Dry skin is more easily damaged.

329. Use of pain scale is an example of adherence to ..... intellectual standard

a. Specificity
b. Accuracy
c. Consistency
d. Responsibility

Explanation: Different nurses use same scale to collect data thus adhere to consistency in data collection.

330. Purpose of assessment is to

a. Make nursing diagnosis
b. To collect basic data regarding client's health status
c. To provide intervention
d. For giving health education

Explanation: Assessment provides basic data regarding the client, which help us to find out the actual and potential problem as well as the changes occur in client's health during the treatment course.

331. Planning phase of nursing process will determine.....

a. Expected outcome
b. Intervention need to be provided
c. Change in client condition
d. Actual problem of client

Explanation: In planning phase, the nurse will determine the goal or expected outcome. Each problem (nursing diagnosis) is assigned a clear, measurable goal for the expected beneficial outcome.

Ans.

332. Which of the following nursing intervention can prevent increase of intracranial pressure (ICP) in an unconscious a child? *(Banaras HU 2015)*
a. Avoid activities that cause pain or crying
b. Lower the position of head (Trendelenburg position)
c. Provide environmental stimulation
d. Turn head side to side every hour

333. If wound eviscerations occurs, the immediate nursing action is: *(ESIC Chennai May 2012)*
a. Cover the wound with sterile dry gauze
b. Leave the wound uncovered and pull the skin edges together
c. Cover the wound with sterile gauze moistened with sterile NS
d. Cover the wound with water-soaked gauze

334. When the patient vomits, the most important nursing objective is to prevent: *(ESIC Chennai May 2012)*
a. Rupture of suture line
b. Metabolic Alkalosis
c. Dehydration
d. Aspiration

335. Which of the following nursing actions should be given highest priority when admitting the patient into the operating room? *(ESIC Chennai May 2012)*
a. Level of consciousness
b. Patient identification and correct operative consent
c. Positioning and skin preparation
d. Vital signs

336. A comprehensive health assessment of an older person includes: *(LNJP H D 2012)*
a. Functional assessment
b. Clinical assessment
c. Psychosocial assessment
d. All of the above

337. The nursing process provides a
a. Basis for nursing theories
b. Knowledge component of nursing
c. Systematic process for delivery of nursing care
d. Basis for acquiring body of knowledge

338. Which of the following is an objective data
a. Chest pain
b. Complaint of dizziness
c. An evaluation of blood pressure
d. Complains of nausea

339. 'The patient will remain free from pain throughout hospitalization'. This statement is an example of a (an)
a. Short term goal
b. Long term goal
c. Nursing diagnosis
d. Expected outcome

340. First step of nursing process is
a. Assessment
b. diagnosis
c. Planning
d. Implementation

341. Collection of subjective data from patient is carried out in
a. Assessment phase
b. Nursing diagnosis phase
c. Implementation phase
d. Planning phase

342. Which of the following is an example of nursing diagnosis?
a. Hypertension
b. Pain
c. Shock
d. Hyperglycemia

343. The interpretation of the information collected about the patient represents the
a. Assessment of the patient
b. Plan of care
c. Health problems of the patient
d. Nursing interventions implemented for the patient

344. Action phase of nursing process includes
a. Subjective assessment
b. Planning
c. Implementation
d. Evaluation

345. Priorities of planning in nursing process is done based on
a. Information processing model
b. Maslow's hierarchy of human needs
c. Erik Erikson's theory
d. Health-Illness continuum model

346. Patient-oriented outcomes should be derived from
a. Nursing diagnosis
b. Assessment
c. Evaluation
d. Planned interventions

347. Which of the following takes priority in planning nursing care for a client?
a. Physician order
b. Nurse's condition
c. Client's condition
d. Hospital policy

348. A postoperative patient is brought to the postsurgical ward. The receiving nurse assessed the patient for patent airway and stable vital signs. Which of the following should be performed next?
a. Complete the admission file work
b. Log roll the patient o evaluate cleanliness of bed linens
c. Assess dressings for bleeding
d. Pain assessment on a scale of 1 to 10

349. The clinical manifestations that are objective is
a. Sign
b. Symptoms
c. Disease
d. Syndrome

350. The clinical manifestations that are subjective is
a. Sign
b. Symptoms
c. Disease
d. Syndrome

351. Which of the Priority concern in a nurse while caring for a client with opioid addiction is .....
a. Difficulty arousing the patient
b. Oxygen saturation of 95%
c. Respiratory rate 12 breaths/min
d. Pain score 50 on scale of 0 to 100

352. The nurse compares the characteristics of acute renal failure with those of chronic renal failure and at the end selects acute renal failure. This process is called as
a. Data collection
b. Data interpretation
c. Data comparing
d. Data lustering

353. The first assessment performed by the nurse while initiating nurse-patient relationship is
a. Vital signs
b. Appearance and behavior
c. Observing specific body systems
d. Collection of a detailed health history

354. Total number of steps in nursing process is
a. Three
b. Four
c. Five
d. Six

355. Which of the following nursing intervention is most appropriate in prevention of pressure sore
a. Provide frequent bath to patient
b. Maintaining the patients' skin moist
c. Frequent turning and repositioning of the patient
d. Frequent feeding

356. Which of the following nursing action takes priority for a patient who is brought to emergency room complaining of mid-sternal chest pain?
a. History collection with emphasis on preceding events
b. Chest examination with auscultation
c. Electrocardiogram
d. Assessment of vital signs

Scanned with CamScanner

357. Reassessment of client is
a. Carried out when the client complains of discomfort
b. Done as per the nurse's convenience
c. Carried out during emergency situations
d. A continuous process

358. The primary source of data for evaluation is:
a. Doctor
b. Nurse
c. Client
d. Family

359. Which of the following is subjective data of nursing assessment?
a. Vomiting, pulse 82/min.
b. Respirations 22/min., blood pressure 120/70 mm Hg
c. Nausea and abdominal pain
d. Pale skin and moist hands

360. The priority nursing intervention for a patient during the immediate post-operative period is
a. Observing for hemorrhage
b. Maintaining a patent airway
c. Recording the intake and output
d. Checking the vital signs every 15 minutes

361. At what time nurse assess the gait of an ambulatory patient?
a. After the neurologic assessment
b. At the end of the physical examination
c. While the patient is lying supine on the examining table
d. When the patient walks into the room

362. The process of assessing patients and determining the management priorities during emergency is known as
a. Collage
b. Lavage
c. Labeling
d. Triage

363. A 42-year-old unconscious patient is brought to the casualty following road traffic accident. His blood pressure was 80/60 mm Hg. What you will do first?
a. Protect the airway
b. Infuse 2 L of crystalloid
c. Order for CT scan of the head
d. Start vasopressor

364. Which of the following is the highest priority nursing intervention for a newly admitted patient who is receiving blood transfusion?
a. Instruct the patient to report any itching, shortness of breath, or chest pain.
b. Warm the blood to room temperature before transfusion
c. Documentation of blood transfusion in the patient's chart
d. Check the vital signs of the patient every 30 minutes from initiation of blood transfusion till completion.

ADMINISTRATION OF MEDICATIONS

365. In a patient receiving IV fluids, sluggish flow, redness and tenderness at the site of cannula indicates: *(AIIMS BPL NO 2018)*
a. Venous spasm
b. Thrombophlebitis
c. Infection
d. Nerve damage

Explanation: Sluggish flow, redness or blanching and tenderness at the venipuncture site are the features of venous spasm, while thrombophlebitis has severe discomfort, redness and hard vein. Infection has an additional feature of local temperature increase at site. Nerve damage is a delayed effect associated with extreme painful numbness and muscle contraction.

366. Which of the following would be a common indication of infiltration of a peripheral intravenous infusion? *(NCFL 2019)*
a. Redness and swelling around the insertion site
b. Blood return in the cannula
c. Difficulty regulating the flow with gravity
d. Cool skin distal to the insertion site

Explanation:
- Infiltration happens when intravenous fluid or medications leak into nearby tissues due to the dislodgment or improper placement of intravenous catheter. The signs of infiltration include swelling, burning sensation, discomfort, feel of tightness, cool skin, blanching, reduced or flow rate stopped.
- Redness and swelling – sign of infection/inflammation.
- Blood return in the cannula and Difficulty regulating the flow with gravity indicates blockage of IV cannula.

367. A nurse has just administered medication via orogastric tube. What is the priority nursing action following nursing action? *(AIIMS Raipur NO 2019)*
a. Check tube placement
b. Re-tape the tube
c. Flush the tube
d. Remove the tube

Explanation:
- Failure to flush the tube before and after both drug administration can result in tube clogging, which may necessitate removal and insertion of new tube.
- Patient must receive the prescribed dose of medication, so the tube is flushed to administer the drug completely.

368. Patient complains of pain and has redness with swelling at the site of IV. The nurse must *(ESIC 2019)*
a. Stop infusion and remove IV cannula
b. Start nasal oxygen
c. Change IV tubing and the solution
d. Apply warm moist pack to the reddened area

Explanation: Pain, redness and swelling and IV site are the signs of thrombophlebitis and further infusion can complicate the condition. The nurse must stop infusion and remove IV cannula.

369. Which of the following is the reason for intradermal injection to be used for testing allergic reactions? *(Daman & Diu NO 2018)*
a. It is less painful
b. It is easy to administer
c. It diffuses rapidly
d. It diffuses slowly

Explanation: The test for allergy requires the medicine to get absorbed slowly else it can result into serious anaphylaxis. So it is given through intradermal route as the blood supply in this layer is less which delays absorption. Additionally, the body's reaction to substances is more easily visible since it is closer to the surface. The layer underneath the epidermis contains a large number of immune cells, mainly dermal dendritic cells.

370. The preferred site for intramuscular injection with Z-track technique in an adult is *(RAK MSc 2018)*
a. Deltoid
b. Rectus femoris
c. Ventrogluteal
d. Vastus lateralis

Explanation: The Z-track method is a type of IM injection technique used to prevent tracking (leakage) of the medication into the

subcutaneous tissue. As the gluteal muscles are the largest muscles, it is considered as the best site for administering intramuscular injection using z-track technique to prevent the passage of medicine into subcutaneous layer and minimizing the local irritation. The Ventrogluteal site provides the greatest thickness of gluteal muscle, is free of penetrating nerves and blood vessels.

371. The method used for administering medication into the ear is called: *(AIIMS Bhopal Grade-I 2018)*

a. Instillation
b. Injection
c. Inhalation
d. Infiltration

Explanation: Instillation is the terms used for administration of medication into the ear. Injection refers to parenteral administration of medication using a needle. Inhalation refers to administration of drugs that are gases or those are dispersed in an aerosol. Infiltration refers to administration of drugs that results in drugs passing into tissue spaces or into cells

372. Which among the following is a complication of spinal anesthesia? *(AIIMS Bhopal Grade-I 2018)*

a. Tachycardia
b. Hypotension
c. Hypertension
d. Dyspnea

Explanation: The most common neurological complications after spinal anesthesia are postural puncture headache and hypotension. Hypotension after spinal anesthesia is a physiological consequence of sympathetic blockade

Ans.

371. a
372. b
373. b
374. a
375. a
376. a
377. b
378. d
379. d
380. b
381. c

373. An immunologic reaction to a drug to which a person has already been sensitized is known as: *(AIIMS Bhopal Grade-I 2018)*

a. Drug tolerance
b. Drug allergy
c. Drug toxicity
d. Drug intolerance

Explanation: A drug allergy is the abnormal reaction of the immune system to a medication.

Drug tolerance refers to patient's reduced reaction to a drug following its repeated use. Drug intolerance or drug sensitivity refers to an inability to tolerate the adverse effects of a medication.

Drug toxicity refers to gradual accumulation of too much of a drug in the blood stream.

374. Which of the following sites is recommended for adults as a safe site for the majority of intramuscular injection? *(AIIMS Bhopal Grade-I 2018)*

a. Ventrogluteal site
b. Vastus lateralis site
c. Dorsal gluteal site
d. Rectus femoris

Explanation: Ventrogluteal I/M injections are considered to be safest because this area is free from major blood vessels and nerves.

375. Which is most important route of excretion of drugs? *(AIIMS Raipur Staff Nurse Grade I-2018)*

a. Kidney
b. Saliva and sweat
c. Exhaled air
d. Feces

Explanation: Kidney is the most common route for excretion of drugs, all others are minimally involved in excretion of drugs.

376. Which of the following drugs induces sleep?

a. Hypotonics
b. Analgesics
c. Antipyretics
d. Antihistamines

Explanation: Hypnotics are the group of drugs which induce sleep. Analgesic relieve pain. Antipyretics brings down temperature and antihistamines are used for treating allergy.

377. What is the ideal length of insertion of rectal suppository in an adult?

a. 2 Inches beyond internal sphincter
b. 4 Inches beyond internal sphincter
c. 9 Inches beyond internal sphincter
d. 10 Inches beyond internal sphincter

Explanation: Ideal length of insertion of rectal suppository in an adult is 4 Inches beyond internal sphincter

378. How should a nurse administer an iron injection to an adult? *(AIIMS Bhopal Nursing Officer, 2018)*

a. Intradermal in the forearm
b. Intramuscular in the deltoid
c. Subcutaneous in the arm
d. Z track intramuscular in the gluteal

Explanation: Iron injection is irritable, so its administered in well-developed muscles as deep I/M. To prevent leak of injection it is administered as deep I/M using Z track technique.

379. Which of the following nursing interventions is incorrect when using the Z-track method of injection? *(DSSSB 2013)*

a. Prepare the injection site with alcohol
b. Use a needle that is at least 1" long
c. Aspirate for blood before injection
d. Rub the injection site vigorously after the injection

Explanation: Z-track method is an intramuscular injection technique. In this procedure, skin and tissue are pulled and held firmly while a long needle is inserted into the muscle. After the medication is injected, the skin and tissue are released. The needle track that forms during this procedure takes the shape of the letter "Z". This zigzag track line prevents medication from leaking from the muscle into surrounding tissue which minimizes skin staining and or irritation.

Rubbing the injection site is contraindicated because it may cause the medication to leak into the surrounding tissue and skin.

380. Which of the following medication ordered is immediately and once only administered? *(DSSSB 2013)*

a. Prn order
b. Stat order
c. Single order
d. Standing order

Explanation: STAT order means the medication needs to be administered immediately. PRN medications are given on an "as needed" basis for specific signs & symptoms. A "standing order" is a prewritten medication order and specific instructions from the Physician to administer a medication to a person in clearly defined circumstances.

381. The most appropriate and safest way to verify the patient's identity before administration of medication is

a. State the name of the patient aloud and ask her/him to repeat
b. Check the room number and bed number of the patient
c. Check the patient's identification band
d. Ask the patient his/her name

Scanned with CamScanner

Explanation: Checking the identification band is the safest to way to verify the identity before administration of medication irrespective of whether the patient is conscious or unconscious. The nurse should ask the name of the patient only after checking the Identification band.

382. Which is the most serious complication caused by bolus administration of KCl?
a. Arrhythmia and cardiac arrest
b. Respiratory depression
c. Paralytic ileus
d. All of the above

Explanation: Arrhythmia and cardiac arrest is the complication caused by bolus administration of KCl.

383. While administering albumin to a client, nurse need to give this drug .....
a. Rapidly and restrict water intake
b. Rapidly and increases the water intake
c. Slowly and increase water intake
d. Slowly and restrict the water intake

Explanation: The therapeutic effect of albumin will be achieved if it is administering slowly along with restricted water intake.

384. A client is receiving prednisolone. Which among the following is the most important nursing intervention?
a. Check the urine output hourly
b. Check hourly urine specific gravity
c. Check blood sugar hourly
d. Check the blood level of the drug

Explanation: Prednisolone causes increase in blood sugar level, so the nurse needs to check hourly blood sugar level. The abrupt withdrawal of the drug needs to be avoided because it will lead to insufficiency of adrenal cortical hormones.

385. Intradermal injection is given at an angle of .....
a. 15 degrees
b. 30 degrees
c. 45 degrees
d. 90 degrees

Explanation: ID at 15 degree; Subcutaneous (SC) at 30-45 degree; Intramuscular (IM) at 90 degree

386. Antidote for Heparin is: *(DSSSB 2013)*
a. Vitamin K
b. Protamine Sulfate
c. Aminocarproic acid
d. Amiodarone

Explanation: Protamine sulfate is an antidote for heparin. Protamine sulfate is a drug that reverses the anticoagulant effects of heparin by binding to it.

387. A patient's GRBS is 40 mg%. The immediate management is to administer: *(DSSSB 2013)*
a. 5% dextrose
b. 50% dextrose
c. 10 units Human actrapid insulin
d. Normal Saline

Explanation: Emergency and immediate management of low blood sugar is 50% dextrose to restore blood glucose level.

388. Sensitivity and reaction is tested by administering the drug *(DSSSB 2013)*
a. Intradermally
b. Intramuscularly
c. Intravenously
d. Subcutaneously

Explanation: Sensitivity and reaction is tested by administering a low dose of the drug intradermally. The allergic reaction can be easily observed on the skin if the drug or allergen is injected through intradermal route and the absorption is slower compare to other parenteral route.

389. Medications used for nausea & vomiting is known as: *(DSSSB 2013)*
a. Analgesics
b. Antipyretics
c. Anti-emetics
d. Antibiotics

Explanation: Anti-emetics are the medications used for nausea and vomiting. Analgesics for pain relief. Antipyretics to bring down temperature and antibiotics to treat infection.

390. The appropriate needle size for insulin injection is: *(DSSSB 2013)*
a. 18 G, 1 ½" long
b. 22 G, 1" long
c. 22 G, 1 ½" long
d. 25 G, 5/8" long

Explanation: 25G, 5/8" needle is the recommended size for insulin injection because insulin is administered by the subcutaneous route. Large needle like 18G is recommended for IM injection.

391. Which of the following is the preferred site for intramuscular injection in infants? *(DSSSB 2013)*
a. Deltoid
b. Rectus Femoris
c. Vastus lateralis
d. Ventrogluteal

Explanation: Vastus lateralis site is the preferred site for IM injections in infants.

392. Which among the following abbreviation indicates 'once in a day'
a. OD
b. BD
c. Td.
d. HS

393. Which among the following abbreviation indicates 'at bed time'
a. OD
b. BD
c. Td.
d. HS

394. Which among the following abbreviation indicates 'twice in a day'
a. OD
b. BD
c. Td.
d. HS

395. Which among the following abbreviation indicates 'at immediately'
a. OD
b. BD
c. Td.
d. STAT

396. Which among the following abbreviation indicates 'whenever required'
a. OD
b. BD
c. Td.
d. SOS

397. The preferred site for giving IM injection to infants is: *(DSSSB PHN, 2015)*
a. Gluteal
b. Deltoid
c. Vastus Lateralis
d. Umbilicus

398. Vastus lateralis is a site for *(Staff Nurse G II 2014)*
a. Intravenous injection
b. Intramuscular injection
c. Intradermal injection
d. Subcutaneous injection

399. What is the maximum volume that can be given as IM injection in adult? *(JIPMER 2012)*
a. 0.5 mL
b. 1 mL
c. 2 mL
d. 5 mL

Ans.

382.	a
383.	d
384.	c
385.	a
386.	b
387.	b
388.	a
389.	c
390.	d
391.	c
392.	a
393.	d
394.	b
395.	d
396.	d
397.	c
398.	b
399.	d

Scanned with CamScanner

400. Mantoux test is to determine: *(LNJP H D 2012)*
a. Tuberculosis b. Measles
c. Diphtheria d. AIDS

401. Which of the following is not a Parenteral route of administration of drugs ? *(ISRO)*
a. Subcutaneous b. Intramuscular
c. Rectal d. Intravenous

402. While administering medication, client stated that he is not remembering that he was getting this medication before. Appropriate nursing action is .....
a. Administer medication
b. Record client's statement
c. Verify the medication order again
d. Inform physician

403. Long term use of sedative and hypnotics in older persons lead to
a. Headaches and nausea
b. Altered level of consciousness
c. Depression and anxiety
d. Sleep disruption

404. A patient is on oral paracetamol 2 tablet every 3 hours. Priority nursing action for this client is .....
a. The patient's level of pain
b. Temperature of the patient
c. The amount of daily dose
d. Risk for bleeding

405. Which of the following drug increases the risk of gastro-intestinal bleeding?
a. Aspirin b. Acetaminophen
c. Tranexamic acid d. Dextran

406. Cholagogues are drugs used to .....
a. Increase the amount of secretion of bile
b. Increases peristalsis
c. Treat flatulence on of tissues and arrest secretions
d. Inhibit peristalsis

407. Astringents are drugs used _____
a. As cosmetics
b. Reduce bleeding from minor abrasions
c. To arrest secretions
d. All of the above

408. A drug that relieves flatulence is known as
a. Carminatives b. Purgatives
c. Antacids d. Astringents

409. Which of the following is not classified under parenteral route of drug administration?
a. Intramuscular b. Intradermal
c. Sublingual d. Intravenous

410. Enteral route of administration is all EXCEPT
a. Sublingual b. Intradermal
c. Rectal d. Oral

411. Intradermal injection is given at an angle of
a. 15 degree b. 30 degree
c. 45 degree d. 90 degree

412. Subcutaneous injection is given at an angle of
a. 15 degree b. 30 degree
c. 45 degree d. 90 degree

413. Intramuscular injection is given at an angle of
a. 15 degree b. 30 degree
c. 45 degree d. 90 degree

414. Size of the needle used for IM injection is.....
a. 16-18 gauge b. 18-20 gauge
c. 22-25 gauge d. 25-28 gauge

415. Hypodermal injection commonly known as .....
a. Intradermal b. Subcutaneous
c. Intramuscular d. Intravenous

416. 'After meal' is abbreviated as:
a. p.r.n. b. p.m
c. p.c d. h.s

417. h.s. means
a. Before meals b. After meals
c. Early morning d. At bed time

418. Patient is on continuous IV infusion develops edema at the IV site. It suggests .....
a. Pain b. Infiltration
c. Phlebitis d. Thrombosis

419. Immediate nursing action in a client with infiltration is .....
a. Stop IV infusion b. Hot application
c. Cold application d. Inform the doctor

420. All of the following are site for subcutaneous injection in adult, EXCEPT
a. Scapula b. Upper arm
c. Lower abdomen d. Anterior upper thigh

421. Which among the following sized IV cannula has the largest diameter?
a. 16 G b. 18 G
c. 20 G d. 22 G

422. Massaging medication over the skin is .....
a. Inunction b. Inhalation
c. Instillation d. Irrigation

423. Taking medication directly into the respiratory tract is termed as
a. Inunction b. Inhalation
c. Instillation d. Irrigation

424. Administration of medication directly into the eyes is known as
a. Inunction b. Irrigation
c. Instillation d. Inhalation

425. Most commonly used steam inhaler is .....
a. Ultrasonic b. Nelson's inhaler
c. Jet inhaler d. Marsh's inhaler

426. Current RIGHTS of medication administration are
a. Five Rights b. Seven Rights
c. Eight Rights d. Ten Rights

427. Adjuvant drug used during anesthesia is .....
a. Halogen b. Medicated air
c. Nitrous oxide d. Propofol

Explanation: Agents that are administered along with anesthetics to improve delivery, increase effectiveness, or decrease required dosage are known as adjuvants. E.g. Nitrous oxide, Sedatives etc. Propofol is an anesthetic agent.

428. What should be added to normal saline solution which is connected to arterial line measuring blood pressure?
a. Protamine b. Calcium
c. Potassium d. Heparin

429. The nurse should check the prescription _____ times before administering the medicine to a patient?
a. One b. Two
c. Three d. Four

430. Which of the following method is used to administer BCG vaccine?
a. Subcutaneous injection
b. Intradermal scratch injection
c. Intravenous injection d. Z-track injection

Ans.

400.	a
401.	c
402.	c
403.	d
404.	c
405.	a
406.	a
407.	d
408.	a
409.	c
410.	b
411.	a
412.	c
413.	d
414.	c
415.	b
416.	c
417.	d
418.	b
419.	a
420.	a
421.	a
422.	a
423.	b
424.	c
425.	b
426.	d
427.	c
428.	d
429.	c
430.	b

Scanned with CamScanner

431. Which of the following nursing action should NOT be performed when using Z-track method of drug injection?
a. Displace skin laterally 1–1.5 inches from injection site
b. Use a needle that's a least 1" long
c. Withdraw needle while applying alcohol swab directly over the site
d. Rub the site vigorously after the injection to promote absorption

432. When administering penicillin injection, the nurse observes a fine rash on the patient's skin. The immediate nursing action would be to
a. Administer the medication with CPM
b. Administer the medication and notify the physician
c. Withhold the medication and notify the physician
d. Apply ice packs on rashes

433. Cone shaped or oval shaped drug which is inserted into the rectum and which melt at body temperature is known as ....
a. Suppository
b. Enema
c. Foley's catheter
d. Rectal tube

434. All are retention enema EXCEPT
a. Stimulant enema
b. Nutrient enema
c. Oil enema
d. Emollient enema

435. Administration of medication into the sub arachnoid space is known as .....
a. Intrathecal
b. Intraosseous
c. Intradermal
d. Subcutaneous

436. Administration of medication into the bone is known as .....
a. Intrathecal
b. Intraosseous
c. Intradermal
d. Subcutaneous

437. Name the nerve which is more likely get injured in improper dorso gluteal IM injection?
a. Peroneal
b. Sciatic
c. Brachial
d. Femoral

438. Method used while administering irritating medication via IM route is
a. Z track method
b. Deep IM method
c. Sealing method
d. All of the above

439. The following statement is true about Z track method of injection *(ISRO)*
a. Painless
b. Prevent leakage of medication into the subcutaneous tissue
c. Easy to administer
d. A type of intra dermal injection

OXYGEN THERAPY

440. The nurse is administering oxygen to a client with chest pain who is restless. What is the method of oxygen administration that is least likely to increase apprehension in the client? *(RAK MSc 2018)*
a. Nasal Cannula
b. Catheter
c. Venturi mask
d. Rebreather mask

Explanation:
- Nasal cannula is the best method for administering oxygen as it does not interfere with the usual activities of drinking, eating and mobility. A nasal cannula is generally used wherever small amounts of supplemental oxygen are required.

441. Deficiency of oxygen in the tissue is known as .....
a. Hypoxia
b. Hypoxemia
c. Cyanosis
d. Apnea

Explanation: Deficiency of oxygen in the tissue is hypoxia, if it is in the blood it is known as hypoxemia. Bluish discoloration of skin and mucous membranes due to the lack of oxygen is known as cyanosis. Apnea is absence of respiration for more than 20 seconds

442. Equipment used to measure the oxygen saturation is .....
a. Billy blanket
b. Pulse oximeter
c. Ophthalmoscope
d. Goniometer

Explanation: Pulse oximeter is the instrument used to measure the oxygen saturation. Billy blanket is used in double surface phototherapy.

443. The percentage and the flow of oxygen in a red color venturi mask is: *(DSSSB 2013)*
a. 31% and 6 L/min
b. 35% and 8 L/min
c. 40% and 10 L/min
d. 60% and 15 L/min

Explanation:

Color	% of O_2
Blue	24%
White	28%
Orange	31%
Yellow	35%
Red	40%,
Green	60%

444. Color coding for oxygen cylinder is:
a. Black
b. Black with white shoulders
c. Light blue
d. Gray

Explanation: Nitrous oxide cylinder is Blue in color, oxygen cylinder is black with white cap, Chlorine: Yellow and Nitrogen: black

445. All of the following are complications associated with oxygenation, EXCEPT
a. Peau d'orange
b. Paul Bert effect
c. Lorrain Smith effect
d. Retinopathy of prematurity

Explanation: A pitted or dimpled appearance of the skin, especially as characteristic of some cases of breast cancer or due to cellulite is Peau d'orange. All other options are complications related to oxygen administration. Oxygen toxicity in central nervous system condition is called Paul Bert effect, and the pulmonary condition is called as Lorrain Smith effect. Oxygen toxicity in premature infant is known as retinopathy of prematurity.

446. In which of the following conditions is oxygen therapy not indicated
a. Drowning
b. Chest injuries
c. Poisoning
d. Normal uncomplicated labor

Explanation: In normal uncomplicated labor oxygen therapy is not indicated

447. Oxygen therapy is recommended in: *(ESIC Chennai May 2012)*
a. Severe respiratory distress
b. Acute myocardial infarction
c. Severe trauma
d. All of the above

Ans.

431.	d
432.	c
433.	a
434.	c
435.	a
436.	b
437.	b
438.	a
439.	b
440.	a
441.	a
442.	b
443.	c
444.	b
445.	a
446.	d
447.	d

Scanned with CamScanner

448. What is the recommended flow rate of oxygen via nasal cannula?
a. 1-4 L/min
b. 3-6 L/min
c. 4-7 L/min
d. 6-8 L/min

449. The dose of oxygen to be delivered through a nasal mask to a patient with chronic respiratory failure is
a. 1 L/min
b. 2 L/min
c. 5 L/min
d. 10 L/min

450. Concentration of oxygen present in expired air is .....
a. 78. 04%
b. 13.6% - 16%
c. 4% - 5.3%
d. 1%

Explanation: 78.04% nitrogen; 13.6% - 16% oxygen: 4% - 5.3% carbon dioxide; 1% argon and other gases.

451. The purpose of humidifying oxygen during oxygen therapy is that the oxygen is
a. A hot air and it may burn trachea
b. Easily absorbed because humidification add H-ion to it
c. Cleaned of pathogens by humidification
d. A dry gas may thickens the mucus

452. Which of the following symptoms would the nurse assess to determine the oxygen status of patient with iron deficiency anemia?
a. Increased breathlessness but increased activity tolerance
b. Increased breathlessness and decreased activity tolerance
c. Decreased breathlessness and increased activity tolerance
d. Decreased breathlessness and decreased activity tolerance

453. A prescribed amount of oxygen is required for a patient with Chronic Obstructive Pulmonary Disease (COPD) to prevent
a. Increased partial pressure of carbon dioxide in arterial blood ($PaCO_2$)
b. Inhibition of the respiratory hypoxic stimulus
c. Hypervolemia
d. Respiratory stimulation

NURSING PROCEDURE RELATED

454. In which of the following conditions blood transfusion is contra-indicated? *(AIIMS Bhopal Nursing Officer, 2018)*
a. Bleeding hemorrhoids
b. Hemorrhage
c. Congestive cardiac failure
d. Hemophilia

Explanation: In congestive heart failure already fluid over load is there. So blood transfusion may worsen the condition. In all other condition blood transfusion is the treatment of choice.

455. Cleaning of bedsore has to be done from .....
a. Inner to outer
b. Outer to inner
c. Wound part near to the care giver first then the further part
d. None of the above

Explanation: Bedsore is considered as a contaminated wound, in this wound periphery is considered as more clean, so cleaning of the wound has to be done from outer to inner. In surgical wound cleaning has to be done from inner to outer.

456. During the examination of ear of a 2-year-old child, the pinna needs to be held in ..... direction
a. Upward and backward
b. Downward and backward
c. Straightly back
d. Pull it downward

Explanation: For examination of ear, straighten the patient's ear canal by pull the pinna downward and backward in children <3 years. Pull upward and backward in children aged 3 years and above.

457. Physician ordered oral as well as nasal suction to a client. You will do suction first in .....
a. Mouth
b. Nose
c. Where the secretion is more
d. Where the secretion is less

Explanation: Always do first suction in the mouth, then the nose because doing suction first in the nose will stimulate pharynx and cause aspiration. To avoid this, always do suction first in the mouth.
TIPS: M comes before N in the alphabet.

458. Which of the following equipment is the most essential to prevent the risk of cardiac dysrhythmias in a patient receiving multiple transfusion of blood?
a. ECG Machine
b. Cardiac monitor
c. Blood warmer
d. Syringe pump

Explanation: Rapid transfusion of cold blood place the patient at risk for cardiac dysrhythmias. ECG machine and Cardiac monitor are used to assess the cardiac function but not for prevention of dysrhythmias. Syringe pump is used for infusion of very small amount of drugs but not used for blood transfusion. Blood warmer is needed to rewarm the cold blood to body temperature before transfusion.

459. Universal recipient blood group is
a. O
b. AB
c. A
d. B

Explanation: Blood group AB individuals have both A and B antigens on the surface of their RBCs, and their blood plasma does not contain any antibodies against either A or B antigen. Therefore, an individual with type AB blood can receive blood from any group (with AB being preferable), but cannot donate blood to any group other than AB. They are known as universal recipients. Blood group O is known as universal donor.

460. Hot application cause all of the following EXCEPT
a. Peripheral vasodilation
b. Increased capillary permeability
c. Increased oxygen consumption
d. Decreased motility of leucocytes

Explanation: Hot applications causes peripheral vasodilation, increased capillary permeability, increased oxygen consumption, increased local metabolism, decreased blood viscosity, decreased muscle tone, increased blood flow, increased lymph flow and motility of leucocytes.

461. Urine bile can be tested through ..... test
a. Hay's test
b. Benedict Test
c. Fehling's Test
d. Cold test

Explanation: Hay's test is used to detect urine bile presence. Benedict's and Fehling's test is used to detect urine sugar and cold test and hot test are used to detect urine albumin.

Ans.

448.	a
449.	b
450.	b
451.	d
452.	b
453.	b
454.	c
455.	b
456.	b
457.	a
458.	c
459.	b
460.	d
461.	a

Scanned with CamScanner

462. Methods used to reconfirm the position of NG tube each time before administering a feeding is/are
a. By dipping tip of the tube in bowl of water
b. Pushing some air and auscultating
c. pH testing of the aspirated fluid
d. All of the above

Explanation: X-rays are currently the gold standard for NGT placement confirmation because they can visualize the course of the NGT tube. However, dipping tip of the tube in bowl of water to observe for air bubbles, pushing some air and auscultating, or pH testing of the aspirated fluid are the methods used to reconfirm NG tube position each time before administering feeding because the tube can become displaced later.

This Explanation is also applicable for Q.No. 509.

463. Length of insertion of NG is measured from .....
a. From tip of nose to ear lobe then to xiphoid process
b. From tip of nose to xiphoid process
c. From tip of nose to forehead and to xiphoid
d. From tip of nose to stomach

Explanation: NG tube insertion length is measured from tip of nose to ear lobe then to xiphoid process.

464. While wearing sterile gloves, first glove need to be worn in .....hand?
a. Any hand
b. Dominant hand
c. Non-dominant hand
d. Always right hand

Explanation: Putting on the dominant hand glove first can minimize the risk of ripping or contamination to the hand that are likely used most.

465. While cleaning eye, it has to be cleaned from ..... *(AIIMS 2016)*
a. Inner canthus to outer canthus
b. Outer canthus to inner canthus
c. Middle of the eye to outer canthus
d. Middle of the eye to inner canthus

Explanation: Cleaning has to be done from more clean to less clean area, so inner canthus to outer canthus.

466. Pediculosis can be treated with all of the following EXCEPT
a. Lindane
b. Ivermectin
c. Permethrin 1%
d. Benzyl Alcohol 70%

Explanation: Permethrin crème, malation (0.5%) lotion, lindane lotion, and Ivermectin lotion are used in the treatment of pediculosis. Benzyl alcohol 5% is used in treatment of pediculosis.

467. Adequacy of collateral circulation before radial artery cannulation is done with the help of ..... test
a. Allen's test
b. Weber test
c. Rinnie test
d. Cold test

Explanation: Allen's test will be performed to find out the adequacy of ulnar circulation before radial artery cannulation. Option B and C belongs to hearing assessment. Cold test is a urine test done to examine urine for albumin.

468. Urinary bag of a Foley's catheterized patient needs to be kept :
a. At the waist level of patient
b. Below the level of patient
c. On the lap of patient
d. Above the waist level of patient

Explanation: Gravity promotes the drainage of urine, so it should be kept below the waist level of patient. Above the waist level of patient can cause back flow of urine and serious complications in the patient.

469. Mr. Alex was receiving transfusion of packed RBC's. He suddenly developed difficulty in breathing, chills and flushing. Which of the following nursing intervention should take priority?
a. Place the client on semi-fowler position
b. Check the client's temperature
c. Stop the transfusion
d. Administer Oxygen

Explanation: The patient is experiencing blood transfusion reaction. The priority action of the nurse is to stop the transfusion immediately before initiating other interventions.

470. Find out the true statement regarding eye irrigation
a. Irrigate right eye first then left eye
b. Irrigate from outer canthus to inner canthus
c. Most commonly using solution for eye irrigation is mannitol
d. Irrigate least infected eye first then more infected eye

Explanation: Option D is the only correct statement is regarding eye irrigation. While irrigating eye, least infected eye irrigated first not the right eye. Irrigation has to be done from inner canthus to outer canthus, most commonly used solutions for eye irrigation are normal saline, 2% boric acid and 1% silver nitrate

471. Find out the incorrect statement regarding colostomy irrigation
a. It is a clean procedure
b. NS and water can be used to irrigate the stoma
c. As the fluid moves in cramps can happen
d. Irrigation is recommended for patient with stomal prolapse

Explanation: Colostomy irrigation of patient with stomal prolapsed can increase the risk of further prolapse. Option A, B, C are correct statement regarding colostomy irrigation.

472. Laparoscopy is .....
a. Visualization of the abdominal organs through the opening in the abdominal wall
b. Visualization of the stomach
c. Visualization of the pelvic organs through the vaginal wall
d. Visualization of urinary bladder

Explanation: Option A is laparoscopy, option B is Gastroscopy, option C is Culdoscopy and option D is Cystoscopy.

473. Which of the following statement is NOT TRUE regarding paracentesis?
a. Empty the bladder to avoid injury to bladder before the procedure
b. It can be done at 2 cm below the umbilicus in the midline
c. It can be done at 5 cm superior and medial to the anterior superior iliac spines on either side
d. Paracentesis is usually performed with the patient in side lying position

Explanation: Paracentesis is a procedure in which a needle or catheter is inserted into the peritoneal cavity to obtain ascitic fluid for diagnostic or therapeutic purposes. Paracentesis is usually performed with the patient in supine position. The bed is flat or the head is slightly elevated. The face-down position with the fluid pooled in the dependent abdomen permits drainage of the last few milliliters of fluid.

Ans.

462.	d
463.	a
464.	b
465.	a
466.	d
467.	a
468.	b
469.	c
470.	d
471.	d
472.	a
473.	d

Scanned with CamScanner

474. Which of the following technique during IM injection helps to prevent the leakage of medication from the tissues? *(AIIMS 2015)*

a. Massaging the skin with antiseptic solution before injection
b. Stretching the skin
c. Administration at an angle of 90
d. Slow push of injection

Explanation: Stretching the skin leads to Z track technique. Stretching leads to zig-zag arrangement of skin and tissues which prevents leakage of medication.

475. Commonly used solutions for mouth care include.....

a. $KMnO_4$ 1: 5000
b. Hydrogen peroxide 1:8
c. Sodium chloride 1 tea spoon to 1 pint of water
d. All of the above

Explanation: All of the above solutions are used for mouth care. Other than these, commercially available solutions can be also used.

476. Recording of electrical activity of skeletal muscle is known as .....

a. Electromyography
b. Electroencephalography
c. Electrocardiography
d. Electro convulsive therapy

Explanation: Option A is the correct answer. Option B is recording electrical activity of brain, option c is recording electrical activity of heart and option D is a treatment modality used in severely depressed client.

Ans.

474. b
475. d
476. a
477. a
478. b
479. a
480. b
481. d
482. a
483. a
484. a
485. a
486. a

477. Frequent swallowing in a patient following tonsillectomy indicate.....

a. Hemorrhage
b. Active gag reflex
c. Thirst in patient
d. None of the above

Explanation: Frequent swallowing following tonsillectomy suggestive of hemorrhage in the patient.

478. Chest drain should not be clamped. Why?

a. It leads to accumulation of more blood
b. It leads to tension pneumothorax
c. Patient will complain pain
d. None of the above

Explanation: There is a risk of the patient developing a tension pneumothorax if chest drainage is clamped.

479. Milking of drainage tube will create:

a. Negative pressure
b. Positive pressure
c. Occlude the tube
d. None of the tube

Explanation: Milking of chest drains is only to be done with written orders from medical staff. Milking drains creates a high negative pressure that can cause pain, tissue trauma and bleeding

480. For managing hemothorax ICD is inserted in a patient. Continuous bubbling in the water seal indicate .....

a. It is a normal finding
b. Indicate air leakage
c. Time to remove the ICD
d. Fully expanded chest

Explanation: In a person with hemothorax bubbling in the water seal indicates air leakage. In pneumothorax, it is a normal finding.

481. Go through the following statement regarding swing of fluids in ICD and identify the correct statement

a. The water in the water seal chamber will rise and fall with respirations.
b. The swing will diminish as the pneumothorax resolves
c. Unexpected cessation of swing may indicate the tube is blocked or kinked
d. All of the above

Explanation: All of the above statements are correct in relation to swing of fluid in ICD drainage.

482. While shifting the patient from stretcher to bed accidental dislodging of ICD occurred, which is the most appropriate nursing action?

a. Apply pressure to the exit site and seal
b. Call the doctor immediately
c. Try to reinsert the tube
d. None of the above

Explanation: Apply pressure to the exit site and seal with steri-strips. Place an occlusive dressing over the top is the most appropriate nursing action.

483. Objectives of the Incentive spirometry includes all EXCEPT

a. To reduce transpulmonary pressure
b. To increase inspiratory volumes
c. To maintain airway patency
d. To prevent atelectasis

Ref: AARC Clinical Practice Guideline.

Explanation: Incentive spirometry is designed to mimic natural sighing or yawning by encouraging the patient to take long, slow, deep breaths. The objectives of incentive spirometry procedure are to

- Increase transpulmonary pressure and inspiratory volumes
- Improve inspiratory muscle performance
- Re-establish or simulate the normal pattern of pulmonary hyperinflation.
- When the procedure is repeated on a regular basis, airway patency may be maintained and lung atelectasis prevented and reversed.

484. Isometric exercise means .....

a. Muscle length do not change
b. Muscle length changes
c. Muscle tension rises and remain the same
d. Muscle length shortens

Explanation: Isometric exercise or isometrics are the type of strength training in which the joint angle and muscle length do not change during contraction

485. The normal intraocular pressure is: *(DSSSB 2013)*

a. 12-22 mm Hg
b. 16-25 mm Hg
c. 20-35 mm Hg
d. 19-38 mm Hg

Explanation: Intraocular pressure (IOP) is the pressure within the eyes and is measured with tonometry. Normal range is 12-22 mm Hg. Increased IOP causes glaucoma.

486. Which of the following need to be performed before radial arterial cannulation to evaluate radial and ulnar arterial patency? *(DSSSB 2013)*

a. Allen's test
b. Angiography
c. Buerger's test
d. Capillary refill test

Scanned with CamScanner

Explanation: A test for occlusion of radial or ulnar arteries: the patient makes a tight fist so as to express the blood from the skin of the palm and fingers; the examiner makes digital compression on either the radial or ulnar artery. Failure of blood to return to the palm and fingers when the hand is opened indicates obstruction of the blood flow in the artery that has not been compressed. Either this test or a doppler ultrasound examination should always be performed prior to insertion of a radial artery line.

487. Which of the following is used to assess the function of brain stem? *(DSSSB 2013)*

a. Cold calorie test
b. Glasgow coma scale
c. Braden scale
d. Intracranial pressure

Explanation: Cold calorie test is performed to assess the function of brain stem.

488. While instilling ear drops, the ear canal of an adult is straightened by pulling the pinna: *(DSSSB 2013)*

a. Down and back
b. Up and back
c. Straight down
d. Straight back

Explanation: For adults, gently pull the upper ear up and back. For children, gently pull the lower ear down and back.

489. While measuring central venous pressure the zero point of the manometer is adjusted to: *(DSSSB 2013)*

a. Anterior axillary line
b. Mid axillary line
c. Posterior axillary line
d. Shoulder level

Explanation: Zero level of the manometer is adjusted to mid axillary line, at the level of patient right atrium.

490. While performing lumbar puncture in an adult, the needle is inserted between *(DSSSB PHN, 2015)*

a. L3-L4 or L4-L5
b. Ll-L2 or L2-L3
c. L2-L3 or L3-L4
d. L1-L2 or L3-L4

491. What should be the temperature of water used for cold sponging? *(RRB SSNE 2015)*

a. 98° F
b. 105° F
c. 70° F
d. 0°F

492. All of the following instructions are given to a patient before computed tomography (CT) scan except: *(Banaras HU 2015)*

a. Wear comfortable, loose-fitting clothing
b. Remove all metallic objects such as hairpin, dentures, jewelry etc.
c. It will not affect the outcome of pregnancy in case of female patient
d. Nil per oral several hours before the scan

493. Insertion of a needle into the pleural cavity is: *(Kerala PSC, Nov 2014)*

a. Endoscopy
b. Paracentesis
c. Thoracentesis
d. Evisceration

494. The maximum height at which the enema should be held while giving it is: *(Recent Question 2012)*

a. 66 cm
b. 45 cm
c. 37 cm
d. 30 cm

495. Local hot application transfer heat from the body by: *(Recent Question 2012)*

a. Radiation
b. Evaporation
c. Convection
d. Conduction

496. Which of the following nursing measures should be avoided in a patient with increased intracranial pressure? *(Recent Question 2012)*

a. Suctioning for prolonged time
b. NG tube feeding
c. Fowler's position
d. Catheterization

497. Choosing the appropriate catheter depends on: *(ESIC Chennai May 2012)*

a. Knowledge of any allergies to latex or plastic
b. The expected duration of catheterization
c. The size of the patient's urethral canal
d. All of the above

498. Curved or coude catheters have: *(ESIC Chennai May 2012)*

a. A rounded curved tip
b. A single lumen with a small 1 1/24 cm opening
c. A single lumen with a small 1 ¼ cm opening
d. An inflatable balloon that encircles the tip near the lumen or opening

499. You are irrigating a draining wound with sterile saline solution. Which of the following would be the most appropriate procedure to follow: *(LNJP H D 2012)*

a. Prepare sterile field, put on sterile gloves and remove soiled dressing, wash hands
b. Wash hands, wear clean gloves, remove soiled dressing, remove gloves, wash hands, wear sterile gloves, prepare sterile field
c. Remove soiled dressing, flush wound and wash hands, prepare sterile field
d. Pour solution, wash hands and remove soiled dressing, prepare sterile field

500. Tracheostomy is usually performed between the tracheal rings of cartilage of: *(LNJP H D 2012)*

a. Fourth and fifth
b. Third and fourth
c. Second and third
d. First and Second

501. Which of the following infections agent can be transmitted by blood transfusion? *(LNJP H D 2012)*

a. Hepatitis
b. HIV
c. Plasmodium
d. All of the above

502. Which of the following procedure requires a nurse to wear gloves

a. Back massage
b. Providing passive exercise
c. Feeding
d. Providing Oral hygiene

503. Collaborative intervention refers to therapies that requires

a. Physician and nurse intervention
b. Nurse and client interventions
c. Nursing team interventions
d. Multiple healthcare professionals

504. The appropriate needle size for blood transfusion in an adult is

a. 12 to 16 G
b. 16 to 20 G
c. 18 to 24 G
d. 22 to 26 G

505. Which of the following learning domain is required for a patient to learn crutch walking?

a. Affective domain
b. Psychomotor domain
c. Cognitive domain
d. None of the above

506. The nurse has to administer ear drop to a 7-year-old boy. How does the nurse pull the patient's ear?

a. Outward
b. Backward
c. Upward and outward
d. Upward and backward

Ans.

487.	a
488.	b
489.	b
490.	a
491.	c
492.	c
493.	c
494.	b
495.	d
496.	a
497.	d
498.	a
499.	b

Scanned with CamScanner

507. Most important concern while providing oral care to an unconscious client is .....
a. Use ordered mouth care solution
b. Preventing aspiration
c. Look for denture
d. Provide oral care in each shift

508. A 35-year-old male patient developed air embolus while receiving parenteral nutrition through central venous catheter. Which among the following is the immediate nursing action?
a. Raise head of bed to 90 degrees
b. Notify the physician immediately
c. Turn patient to left lateral decubitus position
d. Instruct the patient to perform Valsalva maneuver

509. The most accurate method to check the position of a newly placed NG tube
a. Placing an order for X-ray to check position
b. Observing the color of gastric contents
c. Testing the pH of the gastric contents
d. Auscultating over the gastric area as air is injected into the tube

510. After a surgical procedure, stockings are usually used to _____
a. Prevent varicose veins
b. Promote venous return to the heart
c. Prevent muscular atrophy
d. All of the above

511. Post-operative period respiratory complications can be prevented by
a. Deep breathing
b. Coughing exercises
c. Incentive spirometer
d. All of the above

512. Which of the following teaching approach is appropriate for a client with chest pain having emergency cardiac catheterization?
a. Selling approach
b. Telling approach
c. Trusting approach
d. All of the above

513. Chest tube drainage is useful in which of the following conditions
a. Pneumothorax
b. Pleural effusion
c. Hemothorax
d. All of the above

514. After nasogastric feeding head end of the patient should be raised for
a. 30-60 degree at least for 15 minutes
b. 30-60 degree at least 30 minutes
c. 45-60 degree at least for 15 minutes
d. 45-60 degree at least for 30 minutes

515. Slow administration of NG feed help to reduce .....
a. Flatulence
b. Distension
c. Regurgitation
d. Indigestion

516. In an adult patient, length of insertion of Guedel's airway is measured between the first incisors to the _____
a. Angle of the mandible
b. Nasopharnyx
c. Oropharynx
d. Ear lobe

517. Anthelmintic enema is given to
a. Soften hard fecal matter
b. Destroy intestinal parasites
c. Remove flatus
d. Remove foreign particles from large intestines

518. Which of the following is a type of evacuant enema?
a. Nutrient enema
b. Sedative enema
c. Cold enema
d. Anesthetic enema

519. Carminative enema is given to
a. Soften hard fecal matter
b. Destroy intestinal parasites
c. Reduce body temperature
d. Induce sleep

520. Therapeutic effects of hot application includes
a. Vasoconstriction
b. Increased lymph flow
c. Decreased lymph flow
d. None of the above

521. The procedure that involves insertion of a tube through nose into stomach is known as
a. Nasogastric irrigation
b. Nasogastric intubation
c. Gastric gavage
d. Endotracheal intubation

522. Catgut suture is belongs to which among the following category?
a. Synthetic absorbable suture
b. Synthetic non-absorbable suture
c. Natural non-absorbable suture
d. Natural absorbable suture

523. To avoid pulling the urinary catheter nurse should tape the catheter on patient's *(Recent Question 2012)*
a. Lower thigh
b. Upper thigh
c. Hind leg
d. Foot

524. Which of the following procedure is likely to be performed in a patient who manifests symptoms of meningitis?
a. Culture and Sensitivity of blood
b. Lumbar puncture
c. CAT scan
d. USG

525. Site for bone marrow aspiration is
a. Iliac crest
b. Sternum
c. Both A and B
d. None of the above

526. The preferred site for bone marrow aspiration in children is
a. Posterior superior iliac crest
b. Anterior inferior iliac crest
c. Posterior inferior iliac crest
d. Anterior inferior iliac crest

527. The preferred site for bone marrow aspiration in obese patient is
a. Posterior superior iliac crest
b. Anterior iliac crest
c. Inferior iliac crest
d. None of the above

528. On application of hot compress to a client heat is transmitted through
a. Conduction
b. Convection
c. Evaporation
d. Radiation

529. Postoperative GI complication is .....
a. Gaseous distension
b. Paralytic ileus
c. Vomiting
d. All of the above

530. Complications of blood transfusion include
a. Anaphylactic reaction
b. Fluid overload
c. Hemolytic reaction
d. All of the above

531. Bronchoscopy is performed .....
a. To view abnormalities of the airway
b. To obtain tissue specimens of the lung in a variety of disorders
c. To remove secretions, blood, or foreign objects lodged in the airway
d. All of the above

Ans.

507.	b
508.	c
509.	a
510.	b
511.	d

527.	b
528.	a
529.	d
530.	d
531.	d

Scanned with CamScanner

532. A colostomy in the right side of the colon is known as .....
a. Dry colostomy
b. Wet colostomy
c. Double bared colostomy
d. Loop colostomy

533. A colostomy in the left side of the colon is known as .....
a. Dry colostomy
b. Wet colostomy
c. Double bared colostomy
d. Loop colostomy

534. Which part of the colon is the preferred site for permanent colostomy
a. Ascending colon
b. Transverse colon
c. Descending colon
d. Sigmoid colon

535. While performing colostomy irrigation what is the maximum height at which fluid container can be kept
a. 25 cm
b. 30 cm
c. 35 cm
d. 45 cm

536. Length of catheter needs to be inserted into the stoma while performing colostomy irrigation is .....
a. 5 cm
b. 10 cm
c. 15 cm
d. 20 cm

537. Identify the correct statement regarding reduction procedure?
a. In Open reduction devices such as metallic screws and plates, rails or rods are used to treat fracture
b. Closed reduction of bone is also known as manipulation
c. Both A and B
d. None of the above

538. Identify correct statement related to application of cast
a. Short arm cast type of plaster cast is used in the treatment of fractures of the carpal and metacarpal bones
b. Long arm cast type of plaster cast is used in the treatment of fracture of the radius and ulna bones and dislocation involving the elbow joint
c. Short leg cast type of plaster cast is used for treatment of fracture of the tarsal and metatarsal bones
d. All of the above

539. Which of the following advices is given to a client with plaster of Paris
a. Elevate the casted extremity
b. Cast should not to wet, cut, heat
c. Move the digits
d. All of the above

540. Culdoscopy is a visualization of the
a. Abdominal organs through the opening in the abdominal wall
b. Stomach
c. Pelvic organs through the vaginal wall
d. Respiratory tract

541. Laparoscopy is a visualization of the
a. Abdominal organs through the opening in the abdominal wall
b. Stomach
c. Pelvic organs through the vaginal wall
d. Respiratory tract

542. Gastroscopy is a visualization of the
a. Abdominal organs through the opening in the abdominal wall
b. Stomach
c. Pelvic organs through the vaginal wall
d. Respiratory tract

543. Antroscopy is a visualization of the
a. Maxillary sinus
b. Bone
c. Stomach
d. Hollow organ

544. In barium swallow the type of barium used is .....
a. Barium sulfate
b. Barium Meta bisulfate
c. Barium bromide
d. Barium citrate

545. Myelography is
a. X-ray study of the fallopian tube
b. Radiographic examination of the spinal cord
c. Radiographic study of biliary system
d. Recording of electrical activity of skeletal muscle

546. Electromyography is
a. X-ray study of the fallopian tube
b. Radiographic examination of the spinal cord
c. Radiographic study of biliary system
d. Recording of electrical activity of skeletal muscle

547. Salpingography is
a. X-ray study of the fallopian tube
b. Radiographic examination of the spinal cord
c. Radiographic study of cervix
d. Recording of electrical activity of skeletal muscle

548. During blood transfusion the most important nursing responsibility is
a. Draw a sample from the patient before each unit is transfused
b. Maintain patency of IV catheter with dextrose solution
c. Warm the blood to body temperature to prevent chilling
d. Start the blood transfusion at a slower rate during the first few minutes

549. If a client complains of abdominal cramps while administering enema, the nurse should
a. Continue to administer enema
b. Slow the rate of enema
c. Stop giving enema
d. Administer analgesic

550. Reason for administering Fresh Frozen Plasma (FFP) for a patient admitted after heavy bleeding related to Road Traffic accident is
a. To increase platelet count and treat platelet dysfunction
b. To provide clotting factors
c. To increase hemoglobin
d. To increase hematocrit

551. Packed RBCs can be stored up to
a. 14 days
b. 21 days
c. 30 days
d. 42 days

552. All of the following are the components of VAP care bundle, EXCEPT
a. Good hand hygiene practices
b. Regular oral hygiene for patient
c. Ensure limited patient movement while on ventilator
d. Elevation of the head end of the bed by 30-45 degrees

553. Medications used for pediculosis treatment includes
a. DDT 5%-10%
b. Carbolic lotion 1: 40
c. Kerosene coconut oil 1:1 ratio
d. All of the above

554. Tube inserted into the rectum for the expulsion of gas is called as .....
a. Flatus
b. Enema
c. Foley's catheter
d. Rectal tube

555. Solutions used for evacuant enema is /are
a. Soap and water
b. Normal saline
c. Tap water
d. All of the above

Ans.

Scanned with CamScanner

556. **Amount of evacuant enema used in adult is .....**
a. 250-500 mL b. 500-1000 mL
c. 1000-1500 mL d. 1500-2000 mL

557. **Amount of evacuant enema used in child is .....**
a. 250-500 mL b. 500-1000 mL
c. 1000-1500 mL d. 1500-2000 mL

558. **Solutions used in oil enema is/are**
a. Olive oil
b. Sweet oil
c. Castor oil and olive oil 1:1
d. All of the above

559. **Enema which irritate the mucosal lining and stimulate peristalsis is .....**
a. Oil enema b. Purgative enema
c. Carminative enema d. Astringent enema

560. **Anti-spasmodic enema is also known as**
a. Oil enema b. Purgative enema
c. Carminative enema d. Astringent enema

561. **Enema which contracts the tissue/ blood vessels, check bleeding and inflammation is**
a. Oil enema b. Purgative enema
c. Carminative enema d. Astringent enema

562. **Enema used to destroy and expel the worm is .....**
a. Oil enema b. Purgative enema
c. Carminative enema d. Anti-helminthic enema

563. **Size of rectal tube used in adult while giving enema is**
a. 10-14 Fr b. 12-18Fr
c. 18-22 Fr d. 22-30 Fr

564. **Size of rectal tube used in children while giving enema is**
a. 10-14 Fr b. 12-18 Fr
c. 18-22 Fr d. 22-30 Fr

565. **Enema can is placed at ..... height while giving enema**
a. 20-30 cm b. 25-40 cm
c. 30-45 cm d. 35-50 cm

566. **How long the patient should be encouraged to retain the enema solution**
a. 10-15 min b. 15-20 min
c. 20-35 cm d. 30-45 cm

567. **Length to which rectal catheter need to be inserted while giving enema is .....**
a. 5 cm b. 10 cm
c. 15 cm d. 20 cm

568. **Air conduction and bone conduction is tested using which among the following test?**
a. Weber's test b. Rinne test
c. Romberg test d. Allens test

569. **Cleaning of surgical wound is performed in ..... direction**
a. Inner to outer
b. Outer to inner
c. Divide the wound into equal half and clean each half
d. All of the above

570. **Heat application cause**
a. Vasodilation b. Decreases blood viscosity
c. Both A and B d. Vasoconstriction

571. **Cold application cause**
a. Vasodilation b. Decreases blood viscosity
c. Both A and B d. Vasoconstriction

572. **All of the following are types of dry cold application, Except:**
a. Ice bag b. Ice pack
c. Cold compress d. Ice collar

573. **Identify the solutions used for sitz bath**
a. Potassium permanganate 1:5000
b. Boric acid 1 dram to 1 pint
c. Eusol/Dettol (1:40)
d. All of the above

574. **Solutions used for bladder irrigation is/are**
a. Distilled water/normal saline
b. Sodium nitrate 1:8000
c. 2%boric acid
d. All of the above

575. **Eye irrigation is performed using .....**
a. Normal saline b. 2% boric acid
c. 1% silver nitrate d. All of the above

576. **Which of the following statement is NOT TRUE regarding eye irrigation procedure?**
a. Use strict aseptic technique
b. Irrigate less infected eyes first then more infected eye
c. Irrigate from inner canthus to outer canthus
d. Fluid flow should be allowed to fall directly onto the cornea

577. **Correct statement related to abdominal paracentesis is**
a. It is performed midway between the symphysis pubis and umbilicus
b. The position given to the patient for abdominal paracentesis is Fowler's position
c. Ask the patient to urinate before the procedure
d. All of the above

578. **Which among the following things require/indicate proper function of chest tube**
a. Chest drainage should be upright and below the level of insertion
b. Water seal fluctuate with patient's inspiration and expiration
c. Bubbling in water seal
d. All of the above

579. **Gastric lavage means.....**
a. Giving fluids and nutrient through a tube that placed in stomach
b. Irrigation or washing out of stomach cavity
c. Introducing nasogastric tube into the stomach
d. Removal of nasogastric tube

580. **Gastric gavage means.....**
a. Giving fluids and nutrient through a tube that placed in stomach
b. Irrigation or washing out of stomach cavity
c. Introducing nasogastric tube into the stomach
d. Removal of nasogastric tube

581. **Which of the following is NOT a skin traction?**
a. Buck's extension
b. Bryant's traction
c. Russell's traction
d. Crutchfield traction

582. **Plaster of Paris (POP) is chemically .....**
a. Calcium carbonate
b. Calcium sulfate
c. Calcium phosphate
d. Calcium magnate

583. **When a patient is getting shifted from the ward for CT scan a nurse should do the following** *(ISRO)*
a. Administer laxatives
b. Explain the procedure
c. Administer a radio isotope
d. Give plenty of fluids

Ans.

556.	b
557.	a
558.	d
559.	b
560.	c
561.	d
562.	d
563.	d
564.	b
565.	c
566.	b
567.	b
568.	b
569.	a
570.	c
571.	d
572.	c
573.	d
574.	d
575.	d
576.	d
577.	d

580.	a
581.	d
582.	b
583.	b

Scanned with CamScanner

FLUID, ELECTROLYTE AND ACID-BASE BALANCE

584. Potential adverse effects of surgery and anesthesia are as follows, EXCEPT *(ESIC 2019)*

a. Thrombosis from compression of blood vessels or stasis
b. Malignant hyperthermia/hypothermia
c. Dehydration and electrolyte imbalance
d. Myocardial depression, bradycardia, circulatory collapse.

Explanation: Dehydration and electrolyte imbalance are not the side effect of anesthesia. Hydration level and electrolyte balance can be maintained by adequate administration of intravenous fluid before, during and after surgery. Conditions given in other options are potential adverse effects of surgery and anesthesia.

585. Skin turgor test is used to assess: *(AIIMS BPL NO 2018)*

a. Hydration status
b. Level of pain
c. Consciousness
d. Infection

Explanation: Skin turgor means the elasticity of skin. Elasticity is usually seen when the skin is well hydrated and nourished. Poor skin turgor is a late sign of dehydration.

586. Slow infusion of isotonic fluid into subcutaneous tissue is called: *(AIIMS BPL NO 2018)*

a. Dialysis
b. Hypodermoclysis
c. Plasmapheresis
d. Enteroclysis

Explanation: Hypodermoclysis, also called interstitial infusion or subcutaneous infusion, is the subcutaneous administration of fluids to the body.

587. Which of the following is a hazard of immobility: *(Safdarjung NO 2018)*

a. Loss of bone calcium
b. Increased vital capacity
c. Venous vasoconstriction
d. A positive nitrogen balance

Explanation: The process of bone demineralization increases in immobility. Immobility causes slow bone formation while breakdown increases. That is when someone is immobile, the cells that make bone (osteoblasts) are not able to work. In addition, there is more activity of the cells that breakdown bone (osteoclasts). Moreover, during bed rest there is an increased loss of calcium and phosphorus in the urine and often higher blood calcium levels. Thus, loss of bone calcium takes place.

588. The nurse is caring for a patient with acute kidney injury. Which of the following actions should the nurse take to obtain the most accurate assessment of fluid balance for the patient? *(RAK MSc 2018)*

a. Document voiding pattern
b. Obtain daily weight
c. Review laboratory studies
d. Observe skin turgor

Explanation:

- Daily assessment of patient's weight is a reliable indicator of fluid overload in a patient admitted with acute kidney injury or acute renal failure.

589. A patient who is in unresponsive situation is reported to the emergency triage with unknown history. On assessment it is found. Respiration are deep and rapid. ABG values are pH, 7.20; $PaCO_2$, 21 mm Hg; PaO_2, 92 mm Hg and HCO_3, 8. You interpret these values to indicate: *(AIIMS Bhopal Grade-I 2018)*

a. Respiratory alkalosis
b. Metabolic acidosis
c. Respiratory acidosis
d. Metabolic alkalosis

Explanation: Metabolic acidosis is a type of acid-base imbalance in which a total concentration of buffer base (HCO_3^-) is lower than the normal with relative increase in the hydrogen ion (H+) concentration which is caused due to renal insufficiency or many more other reasons can be there like severe diarrhea, malnutrition etc. To compensate for the acidosis deep and rapid respirations (Kussmaul's respirations) occurs as the lungs attempt to exhale the maximum CO_2

590. Which type of solution causes water to shift from the cells into plasma? *(AIIMS Raipur staff nurse grade I-2018)*

a. Hypertonic
b. Hypotonic
c. Isotonic
d. Alkaline

Explanation: Hypertonic solution shifts fluids from cells to plasma while hypotonic solution shift fluid from plasma to cells. Isotonic solution has same osmolality as that of blood plasma. Alkaline solutions are those solution which has pH more than 7.

591. Which among the following sign/symptom will be present in a patient with hypovolemia?

a. Increased heart rate
b. Hypertension
c. Bounding pulse
d. Urine output 30 mL/hr

Explanation: In patient with hypovolemia, an increase in heart rate can be noted to maintain adequate tissue perfusion.

592. Calcium balance in the body is regulated with the help of ...

a. Aldosterone
b. Calcitonin
c. Parathormone
d. Both B and C

Explanation: Calcitonin produced by thyroid gland helps to mobilize calcium from blood to bone and parathormone produced by parathyroid gland help to mobilize calcium from bone to blood, both these hormones involved in calcium metabolism .

593. Plasma protein which determine oncotic pressure is

a. Albumin
b. Globulin
c. Heme
d. Prothrombin

Explanation: Albumin is the plasma protein responsible for determining oncotic pressure. Decrease in albumin causes edema over the body.

594. Isotonic saline contains ---------- amount of NaCl

a. 0.9 gm/dL
b. 9.0 gm/dL
c. 4.5 gm/dL
d. 5 gm/dL

Explanation: 0.9 gm of NaCl (Sodium Chloride) is present in 100 mL of isotonic saline (normal saline).

595. Which of the following IV fluid administration is contraindicated in patient with lactic acidosis and impaired liver function?

a. Normal Saline
b. Ringer Lactate
c. Mannitol
d. Dextran

Explanation: Ringer lactate solution (RL) is also known as sodium lactate solution and Hartmann's solution. It can be used to treat metabolic acidosis, if the cause of acidosis is other than lactic acidosis. Administration of RL is contraindicated in severe metabolic acidosis (caused by lactic acidosis) or alkalosis and in severe liver disease or anoxic states which affects lactate metabolism.

596. Clinical manifestation of hypokalemia include:

a. Spiky T wave
b. Prolonged PR interval
c. Positive chvostek sign
d. Muscle weakness

Ans.

584. c
585. a
586. b
587. a
588. b
589. b
590. a
591. a
592. d
593. a
594. a
595. b
596. d

Scanned with CamScanner

Explanation: Muscle weakness, paralytic ileus, abdominal distention. ST wave depression, abnormal U wave are the characteristic of hypokalemia. Option A and B indicate hyperkalemia, option C indicates hypocalcemia.

597. Which of the following is not an isotonic fluid?

a. 0. 9% NS
b. RL
c. Dextrose 5% in water
d. Dextrose 5% in Normal Saline

Explanation: Dextrose 5% in NS is hypertonic but dextrose 5% in water is isotonic. Isotonic fluids are those fluids which has same osmolality as that of blood plasma

598. Tapping over the facial nerve causes twitching of the facial muscles. It is known as .....

a. Chvostek's sign
b. Chadwick's sign
c. Trousseau sign
d. Homan sign

Explanation: Chvostek's sign is the twitching of the facial muscles in response to tapping over the area of the facial nerve. Trousseau's sign refers to the carpopedal spasm caused by inflating the blood-pressure cuff to a level above systolic pressure for 3 minutes. These two signs are present in hypocalcemia.

Chadwick's sign is an early sign of pregnancy in which there is a bluish discoloration of the cervix, vagina, and labia.

Homan's sign is characterized by pain in the calf muscles on forced dorsiflexion of the foot. It is present in case of deep vein thrombosis

Ans.

597. d
598. a
599. d
600. b
601. d
602. a
603. a
604. b
605. b
606. a
607. b

599. All of the following signs indicates dehydration EXCEPT

a. Dry mucous membranes
b. Sunken-appearing eyes
c. Hypotension
d. Bradycardia

Explanation: Clinical signs and symptoms of dehydration includes thirst, weight loss, dry mucous membranes, sunken-appearing eyes, decreased skin turgor, increased capillary refill time, hypotension and postural hypotension, tachycardia, weak and thready peripheral pulses, flat neck veins and oliguria.

600. An ABG analysis report shows: pH — 7. 55; PCO_2 -35 mmHg; HCO_3– -33 mEq/L. the condition is .....

a. Metabolic acidosis
b. Metabolic alkalosis
c. Respiratory alkalosis
d. Respiratory acidosis

Explanation: Normal pH is 7. 35–7. 45. Here pH is elevated which suggests that the condition is alkalosis. Carbon dioxide is within the normal range, so the condition is not respiratory. Bicarbonate levels are elevated, so the condition is metabolic in origin. So metabolic alkalosis is the right answer.

601. Which one is the most abundant anion in extracellular fluid?

a. Sodium
b. Potassium
c. Bicarbonate
d. Chloride

Explanation: Major anions and cations:

- Extracellular fluid:
- Major anion : Chloride
- Major cation: Sodium
- Intracellular fluid:
- Major anion : Phosphate
- Major cation : Potassium

602. Patient with liver problem develops edema because of .....

a. Fall in oncotic pressure
b. Increase in hydrostatic pressure
c. Fall in osmotic pressure
d. Rise osmotic pressure

Explanation: Albumin is produced in the liver and is responsible for oncotic pressure, due to the fall in oncotic pressure edema occurs in a patient with liver problem.

603. Solution of choice for bladder irrigation for a patient who is undergoing Transurethral Resection of Prostrate *(AIIMS 2016)*

a. Glycine
b. NS
c. RL
d. Isolate P

Explanation: Glycine 1.5% and sterile water are the most widely used irrigating fluids in urological endoscopic surgeries (TURP and certain transurethral procedures).

604. All of the following are the signs and symptoms related to hypocalcaemia EXCEPT

a. Numbness and tingling sensations
b. Shortened QT interval in ECG
c. Chvostek sign
d. Trousseau sign

Explanation: Hypocalcemia characteristically causes prolongation of the QT interval in the electrocardiogram. Prolongation of the QT interval is associated with early after-depolarizations and triggered dysrhythmias. Although electrocardiographic conduction abnormalities are common, serious hypocalcemia-induced dysrhythmias, such as heart block and ventricular dysrhythmias, are infrequent.

605. Major electrolyte imbalance occurs in water intoxication is

a. Hypernatremia
b. Hyponatremia
c. Hypokalemia
d. Hyperkalemia

Explanation: Water intoxication is a life-threatening disorder (hypo-osmolar syndrome) accompanied by brain function impairment due to severe dilutional hyponatremia. Inappropriate water retention causes the *dilutional hyponatremia.*

606. Which of the following is used in the management of Hyperkalemia? *(DSSSB 2013)*

a. Insulin with glucose
b. Sodium Bicarbonate
c. Potassium Chloride
d. Magnesium Sulfate

Explanation: Drugs used in the treatment of hyperkalemia include the following:

- Calcium Gluconate: it is the antidote of potassium.
- Insulin administered with glucose: Facilitates the uptake of glucose into the cell, which brings potassium with it.
- Diuretics: Causes potassium loss through the kidney.
- Nebulization with salbutamol also helps to decrease the potassium level in the blood. Because bronchodilators such as Beta2-adrenergic agonists: Promote cellular reuptake of potassium

607. Which of the following ECG findings indicate the presence of hypokalemia? *(DSSSB 2013)*

a. Tall, peak T wave
b. ST segment depression
c. Widening of QRS complex
d. Prolonged PR interval

Explanation: ST segment depression and abnormal U wave are the characteristic of hypokalemia.

Scanned with CamScanner

Compensated — pH - Normal 2 value abnormal
Partially compensated — 3 abnormal
Uncompensated — 1 normal 2 abnormal

608. Normal serum potassium Level in mEq/L is: *(DSSSB 2013)*
a. 2. 5 to 3. 5 b. 3. 5 to 5. 1
c. 5. 5 to 6. 5 d. 6. 5 to 7. 5

Explanation: The normal range is 3. 5 to 5. 1 mEq/L.

609. Chvostek sign is an indication of: *(DSSSB PHN, 2015)*
a. Hypernatremia b. Hypercalcemia
c. Hyponatremia d. Hypocalcemia

610. The symptoms of severe dehydration in an adult include all of the following except: *(Banaras HU 2015)*
a. Decreased thirst b. Dizziness
c. Weakness d. Palpitations

611. Hypokalemia is suspected when a client has serum potassium level falls below: *(Kerala PSC, Nov 2014)*
a. 5.0 mEq/L b. 3.52 mEq/L
c. 4.5 mEq/L d. 5.5 mEq/L

612. Which patient is at risk for metabolic acidosis? *(Kerala PSC, Nov 2014)*
a. Patient with uncontrolled diabetes mellitus
b. Patient with emphysema
c. Patient with chronic bronchitis
d. Elderly patient receiving IV therapy

613. Acid base imbalance that develops in acute renal failure is: *(JIPMER 2012)*
a. Metabolic acidosis b. Respiratory acidosis
c. Respiratory alkalosis d. Metabolic alkalosis

614. Which of the following solution is isotonic? *(Recent Question 2012)*
a. 0.9% saline b. Dextran
c. 0.45% saline d. Dextrose saline

615. The most important electrolyte of intracellular fluid is: *(Recent Question 2012)*
a. Potassium b. Calcium
c. Sodium d. Chloride

616. Lugol's solution contains: *(Recent Question 2012)*
a. Potassium iodide b. Sodium bromide
c. Ammonium chloride d. Calcium chloride

617. Normal serum potassium level is: *(Recent Question 2012)*
a. 2.5-3.5 mEq/L b. 35-45 mEq/L
c. 3.5-5 mEq/L d. 6-8 mEq/L

618. Dehydration is caused in the human body due to: *(ESIC Chennai May 2012)*
a. Loss of water b. Loss of salt
c. Less of vitamins d. Loss of minerals

619. Quantity of sodium chloride required to make 1 L of normal saline is: *(LNJP H D 2012)*
a. 900 grams b. 0.9 grams
c. 9 grams d. 90 grams

620. Interpret the following ABG results
pH - 7.53
$PaCO_2$ - 38 mm Hg
HCO_3 – 31 mEq/L
a. Respiratory alkalosis, uncompensated
b. Metabolic alkalosis, uncompensated
c. Respiratory alkalosis, fully compensated
d. Metabolic alkalosis, partially compensated

621. Interpret the following ABG results
pH - 7.35 $PaCO_2$ - 70 mmHg
HCO_3 – 36 mEq/L
a. Respiratory acidosis, uncompensated
b. Respiratory acidosis, fully compensated
c. Respiratory alkalosis, fully compensated
d. Metabolic acidosis, partially compensated

622. Arterial blood gas levels of patient shows: pH, 7.25; $PaCO_2$, 37 mm Hg; PaO_2, 92 mm Hg; and HCO_3-, 18. These laboratory values indicates _____
a. Metabolic acidosis b. Metabolic alkalosis
c. Respiratory acidosis d. Respiratory alkalosis

623. A patient on Furosemide therapy complaining of muscle weakness, which among the following laboratory value the nurse need to assess first?
a. Serum glucose b. Serum potassium
c. Serum Albumin d. Serum sodium

624. Which among the following patients require a sodium restricted diet?
a. Patient with fracture
b. Patient with heart failure
c. Patient with gastroenteritis
d. Patient with inflammatory disease

625. Which among the following electrolyte has to be replaced in a client with vomiting and diarrhea
a. Sodium b. Potassium
c. Calcium d. Magnesium

626. Patient with which of the following condition is at greatest risk for developing hypocalcaemia?
a. Hyperthyroidism b. Appendicitis
c. Acute pancreatitis d. Cardiomyopathy

627. An adult client with meningitis is receiving IV fluids and oral fluids. The fluid intake of the client should be monitored because fluid overload may cause
a. Hypovolemic shock b. Bradycardia
c. Cerebral edema d. Dehydration

628. All of the following are clear fluids, EXCEPT
a. Juice b. Shakes
c. Soups d. Lemon soda

629. Extracellular fluid constitutes
a. 33% of the body fluid b. 47% of the body fluid
c. 53% of the body fluid d. 67% of the body fluid

630. Intracellular fluid constitutes
a. 33% of the body fluid b. 47% of the body fluid
c. 53% of the body fluid d. 67% of the body fluid

631. The chief intracellular cation in our body is
a. K+ b. Na+
c. Ca^{++} d. Mg^{++}

632. The chief extracellular cation in our body is
a. K+ b. Na+
c. Ca^{++} d. Mg^{++}

633. Organ with major role in fluid regulation is .....
a. Kidney b. Lung
c. Skin d. Intestine

634. Isotonic normal saline contain ..... sodium per 100 mL
a. 0.09% b. 0.9%
c. 9.0% d. 0.45%

635. The chief intracellular anion in our body is
a. Potassium b. Sodium
c. Phosphate d. Chloride

636. The chief extracellular anion in our body is
a. K^+ b. Na^+
c. Cl- d. HCO3-

637. Osmolarity is defined as
a. Moles per mL of solvent
b. Moles per deciliter of solvent
c. Moles per kg of solvent
d. Moles per litre of solvent

Ans.

608.	b
609.	d
610.	a
611.	b
612.	a
613.	a
614.	a

Scanned with CamScanner

638. Hypoparathyroidism and vitamin D deficiency predisposes to
a. Hpokalemia b. Hperkalemia
c. Hypercalcemia d. Hypocalcemia

639. 5% Dextrose in water is _____ solution
a. Hypotonic b. Isotonic
c. Colloidal d. Hypertonic

640. 0.45% sodium chloride solution is
a. Hypotonic b. Isotonic
c. Hypertonic d. Colloidal

641. Amount of sodium chloride present in 1000 mL of normal saline solution is
a. 0.45 g b. 4.5 g
c. 0.9 g d. 9 g

642. Normal serum level of sodium is
a. 135-145 mEq/L b. 145-155 mEq/L
c. 3.5-5.2 mEq/L d. 9-11 mEq/L

643. Normal potassium value is
a. 135-145 mEq/L b. 3.5-5 mEq/L
c. 8-11 mEq/L d. 98 – 107 mEq/L

644. Normal serum chloride level is
a. 135 – 145 mEq/L b. 120 – 130 mEq/L
c. 98 – 107 mEq/L d. 50 – 70 mEq/L

645. Function/s of sodium is.....
a. Maintain normal blood pressure
b. Maintain normal function of muscles and nerves
c. Both A and B
d. None

646. Functions of potassium in the body is .....
a. Crucial to heart function
b. Skeletal and smooth muscle contraction
c. Normal digestive and muscular function
d. All of the above

647. Causes of hypernatremia includes
a. Nasogastric drains b. Diabetes insipidus (DI)
c. Cushing syndrome d. All

648. Causes of hyperkalemia includes
a. Immediate period burn injury
b. Addison's disease
c. Renal failure
d. All of the above

649. Cause of hypercalcemia includes
a. Hyperthyroidism b. Hyperparathyroidism
c. Malignancy d. All of the above

650. Burn injury, diabetic ketoacidosis etc will lead to .....
a. Respiratory acidosis b. Respiratory alkalosis
c. Metabolic acidosis d. Metabolic alkalosis

651. Vomiting, prolonged gastric suctioning, Cushing syndrome, hyperaldosteronism may lead to
a. Respiratory acidosis b. Respiratory alkalosis
c. Metabolic acidosis d. Metabolic alkalosis

652. Depression of the respiratory center or severe asthma attack will leads to
a. Respiratory acidosis b. Respiratory alkalosis
c. Metabolic acidosis d. Metabolic alkalosis

653. Excessive elimination of carbon dioxide from the body will leads to
a. Respiratory acidosis b. Respiratory alkalosis
c. Metabolic acidosis d. Metabolic alkalosis

654. Characteristic feature of hyponatremia includes
a. Nausea and vomiting b. Confusion
c. Spasms and cramps d. All of the above

655. Which of the following is the most significant symptom of hypokalemia?
a. Increased pulse rate b. Muscle weakness
c. Muscle irritability d. Hypertension

656. Laryngospasm with stridor is common among clients with
a. Hypernatremia b. Hyponatremia
c. Hypercalcemia d. Hypocalcemia

657. Trousseau's sign is associated with
a. Hypocalcemia b. Hyponatremia
c. Hypercalcemia d. Hypernatremia

658. Apart from Vital signs, which of the following assessment would provide most important assessment information of a ten month old infant with diarrhea and dehydration?
a. Stool specimen analysis
b. Infant's body weight
c. Inspection of infant's posterior fontanel
d. Urine specimen analysis

659. Five percent dextrose is *(ISRO)*
a. Isotonic b. Normotonic
c. Hypertonic d. Hypotonic

BLS/CPR, ACLS AND FIRST AID

660. A nurse enters a room and finds a client lying on the floor. Which action should the nurse perform first? *(AIIMS BPL NO 2018)*
a. Ask the client what happened
b. Call for help to get the client back in bed
c. Establish whether the client is responsive
d. Assist the client back to bed

Explanation: The first priority is to assess the patient's condition, therefore, assessing the response of the patient should be the first thing, which is then followed by calling for help to shift the client, assist client back to bed and then ask the client to explain the incidence. If the patient is unresponsive, Call or tell someone to call 911. Check the person's airway, breathing, and pulse. If necessary, begin CPR.

661. The nurse is caring for a patient who is bleeding from the puncture wound. Which of the following intervention should the nurse use to control the arterial bleeding? *(RAK MSc 2018)*
a. Pressure at the puncture site
b. Application of a tourniquet
c. Pressure point message
d. Pressure dressing

Explanation:
- The best method to prevent bleeding from a punctured wound is to apply firm pressure at the punctured site as it slows down the blood flow to the wound site, favoring clot formation and also preventing any further blood loss.
- If severe bleeding does not stop with direct pressure and elevation, apply direct pressure to an artery. Use direct pressure on an artery along with elevation and direct pressure on the wound.

662. Which of the following actions should be taken first for a patient who is found with hyperthermia? *(RAK MSc 2018)*
a. Undress the patient
b. Use tepid water as a mist spray
c. Remove patient from the hot environment
d. Place patient in continual breeze from electric fans

Ans.

661.	a
662.	c

Scanned with CamScanner

Explanation:
- The priority intervention would be that which prevents further exposure to the harmful stimuli, therefore, removing patient from the hot environment is preferred over all others.

663. Which of the following is an indication for Bag-valve-mask ventilation? *(AIIMS Bhopal Nursing Officer, 2018)*
a. Meconium stained delivery
b. Diaphragmatic hernia
c. Baby is apneic with heart rate less than 100 beats
d. Good respiratory efforts at birth with heart rate of 120 beats

Explanation: As per the guide lines bag and mask ventilations is indicated if baby is apneic and heart rate is less than 100. In Meconium stained delivery and in Diaphragmatic hernia bag and mask ventilations is contra indicated. Good respiratory efforts at birth with heart rate of 120 beats is a good sign and there is no need of bag and mask ventilation.

664. All of the below are signs of cardiopulmonary arrest, Except *(AIIMS Bhopal Nursing Officer, 2018)*
a. Constriction of pupil
b. Immediate loss of consciousness
c. Dilatation of pupil*
d. Absence of pulse

Explanation: Constriction of pupil is not a sign of cardiopulmonary arrest. It is seen in opioid poisoning.

665. The compression to ventilation ratio in adult CPR in case of single rescuer is: *(DSSSB PHN, 2015; LNJP H D 2012)*
a. 5:2 b. 15:2
c. 30:2 d. 2:30

666. The compression to ventilation ratio in adult CPR in case of two rescuer is: *(Recent question)*
a. 5:2 b. 15:2
c. 30:2 d. 2:30

667. The compression to ventilation ratio for CPR in child/infant in case of one rescuer is: *(Recent question)*
a. 5:2 b. 15:2
c. 30:2 d. 2:30

668. While doing CPR in an infant what is the compression ventilation ratio with two rescuers: *(LNJP H D 2012)*
a. 15:1 b. 5:1
c. 15:2 d. 30:2

669. The compression to ventilation ratio for CPR in neonate is: *(Recent question)*
a. 3:1 b. 1:3
c. 30:2 d. 15:1

670. Rate of chest compression in one person CPR is: *(Recent Question 2012)*
a. 150-170/min b. 120-140/min
c. 60-70/min d. 80-100/min

671. Carotid pulse should be checked for: *(LNJP H D 2012)*
a. 15–20 seconds b. Less than 5 seconds
c. 5–10 seconds d. 10–15 seconds

672. Chest compression in an unresponsive victim will be started: *(LNJP H D 2012)*
a. After giving two breaths to victim
b. After making an emergency call to ambulance service
c. After checking carotid pulse of the victim and find the pulse is absent
d. As soon as you find an unresponsive victim

673. CPR stands for
a. Cardiopulmonary revival
b. Cardiopulmonary resuscitation
c. Cardiopulmonary recycle d. Cardiopulmonary recovery

POSITIONS AND COMFORT DEVICE

674. A child is admitted to the emergency department with dyspnea related to bronchospasm. The nurse should place the client in which of the following positions? *(RAK MSc 2018)*
a. High fowler's b. Side-lying
c. Prone d. Supine

Explanation: High fowler's position is recommended in case of dyspnea as this position minimizes the tension of abdominal muscles which provides more space for lungs to expand, resulting in improvement in breathing. The High Fowler's position is a position in which a patient is placed when the head of the bed needs to be elevated as high as possible. The upper half of the patient's body is between 60° and 90° in relation to the lower half of their body.

Figure ■ High Fowler's position

675. When a patient experience difficulty in breathing, the most appropriate position to place him/her in is: *(AIIMS BBS NO 2018)*
a. Lateral position
b. Fowler's position
c. Dorsal recumbent position
d. Sims' position

Explanation: Fowler's position is a standard patient position in which the patient is seated in a semi-upright sitting position and may have knees either bent or straight. It is an intervention used to promote oxygenation via maximum chest expansion.

676. Complication that can be prevented by using foot rest: *(Safdarjung NO 2018)*
a. Bed sore b. Foot edema
c. Foot drop d. Rash

Explanation: Foot drop is a gait abnormality in which the dropping of the forefoot happens due to weakness, irritation or damage to the common fibular nerve including the sciatic nerve, or paralysis of the muscles in the anterior portion of the lower leg. Foot board or Foot rest is a comfort device used to prevent foot drop. The board supports legs and prevents planter flexion of legs.

677. This comfort device is used to support hips and thighs, preventing external rotation and keeping the feet in alignment in case of paralysis, fracture of femur and hip surgery. *(Safdarjung NO 2018)*

a. Trochanter roll
b. Sand bags
c. Bed boards
d. Bed block

Explanation:

- **Trochanter roll** is a safety device which helps to support hips and legs so that the femur does not rotate outward.

Figure ■ Trochanter roll

678. Position given to the client while administering enema is ....

a. Sims' left lateral
b. Prone
c. Knee chest
d. Sitting

Explanation: Position the patient on left side, lying with the knees drawn to the abdomen. This eases the passage and flow of fluid into the rectum. Gravity and the anatomical structure of the sigmoid colon also suggest that this will aid enema distribution and retention. So option A is the correct answer.

679. Comfort device used to prevent foot drop is.....

a. Bed cradle
b. Foot board
c. Sand bag
d. Pillow

Explanation: Foot drop occurs because of injury to peroneal nerve. Foot board helps to maintain the alignment of foot and thereby helps to prevent foot drop.

680. Best position for a client in hypovolemic shock is .....

a. Knee chest position
b. Trendelenburg
c. Fowler's
d. Lateral position

Explanation: Trendelenburg position promotes venous return in patient with hypovolemic shock.

681. Best position given to an unconscious client while performing oral care is .....

a. Supine
b. Sitting
c. Side lying
d. Fowlers

Explanation: Side lying position is the best indicated position, because it reduces the risk of aspiration.

682. Other name for Genupectoral position is .....

a. Lithotomy
b. Trendelenburg
c. Knee chest
d. Sims position

Explanation: Genupectoral position is also known as knee chest position.

683. Fowler's position given to a client with dyspnea help to relive dyspnea by .....

a. Making patient more comfortable
b. Facilitating expansion of the thorax
c. Reducing oxygen demand
d. All of the above

Explanation: Upright position facilitates diaphragm excursion and enhances thorax expansion. So Fowler's position helps to relieve dyspnea.

684. Before providing NG feed to the client, what all are the pre-procedural care a nurse needs to do?

a. Provide fowler's position
b. Take abdominal girth
c. Aspirate the gastric content
d. All of the above

Explanation: All of the above are the actions expected from a nurse before NG feeding. Abdominal girth monitoring and aspiration of gastric content will help to recognize feed intolerance.

685. Position used during pleural tapping is

a. Orthopneic
b. Supine
c. Prone
d. Knee chest

Explanation: Patients who are alert and cooperative are most comfortable in a seated position leaning slightly forward and resting the head on the arms or hands or on a pillow, which is placed on an adjustable bedside table. This position facilitates access to the posterior axillary space, which is the most dependent part of the thorax. Orthopneic position is the one in which a person sits upright in a bed, possibly bending forward

686. While giving NG tube feeding which of the following nursing actions prevents complications? *(DSSSB 2013)*

a. Advance tube 2 cm
b. Flush with 20 mL of air
c. Provide high Fowler's position
d. Plug the air vent during feeding

Explanation: High fowler's position helps in easy administration and also to prevent regurgitation.

687. Which of the following position is given to a patient with severe breathing difficultly? *(DSSSB 2013)*

a. Dorsal recumbent
b. Fowler's
c. Supine
d. Trendelenberg

Explanation: Fowler's position helps in proper expansion of lung by moving diaphragm downward and promoting lung expansion.

688. The position to be maintained for a patient with increased ICP is: *(DSSSB PHN, 2015)*

a. Fowler's position
b. Trendelenburg's position
c. Side lying
d. Supine position

689. Position in which the patient is to be cared after lower extremity amputation is: *(JIPMER 2012)*

a. Left lateral
b. Supine with head turned to one side
c. Side lying with amputated side up
d. Prone

690. Best method to prevent foot drop in client on bed rest is to use: *(Recent Question 2012)*

a. Splints
b. Blocks
c. Cradles
d. Sandbags

691. Patient recovering from general anesthesia should be positioned in: *(Recent Question 2012)*

a. Supine position
b. Fowler's position
c. Trendelenburg position
d. Side lying position

692. Position for enema: *(RRB Feb 2012)*

a. Left lateral
b. Supine
c. Rt lateral
d. Prone

693. **The best position for an unconscious patient to provide mouth care is**
   a. High Fowler's position b. Supine
   c. Side lying d. Trendelenburg

694. **Knee-chest position is also known as**
   a. Sims' b. Trendelenburg
   c. Genu-dorsal d. Genu-pectoral

695. **Which of the following is the best position for examining the rectum?**
   a. Lithotomy b. Sims'
   c. Knee-chest d. Left lateral

696. **To perform catheterization, the nurse should place a woman in the**
   a. Dorsal recumbent position
   b. Lithotomy position
   c. Supine position
   d. Side lying

697. **Risk for fall injury is highest among .....**
   a. School aged children b. Adolescents
   c. Toddlers d. Older adults

698. **Which of the following nursing intervention decreases the risk of aspiration while feeding a patient with dysphagia?**
   a. Sit the patient upright in a chair
   b. Provide liquid only at the end of the meal
   c. Provide only soft food
   d. Instruct the patient to lie down for 45 minutes after food

699. **Appropriate position to provide oral care of a conscious patient is**
   a. Supine position with head turned sideways
   b. Left lateral position
   c. Trendelenburg position
   d. Fowler's position

700. **Position given to patient while inserting gavage tube is .....**
   a. Knee chest b. Supine position
   c. Mid-fowler's position d. High-Fowler's position

701. **When helping a stroke patient nurse should assist** *(Recent Question 2012)*
   a. From behind b. On weak side
   c. On strong side d. From back

702. **Position given to patient during sigmoidoscopy is .....**
   a. Supine b. Prone
   c. Lithotomy d. Left lateral

703. **To provide Fowler's position, the head end of the client should be elevated to**
   a. 15° angle b. 35° angle
   c. 45° angle d. 60° angle

704. **The common position for administration of cleansing enema is**
   a. Lithotomy b. Prone
   c. Supine d. Sims left lateral

705. **Which of the following position is appropriate to do percussion and promote postural drainage of lungs in a patient with bronchiectasis?**
   a. Fowler's position b. Semi fowler's position
   c. Prone position d. Decubitus position

706. **After spinal injury position given to the patient is .....**
   a. Supine b. Prone
   c. Lateral d. Lithotomy

707. **Position used for visualizing internal sex organs is .....**
   a. Knee chest b. Trendelenburg
   c. Lithotomy position d. Prone position

708. **Position used for flatus tube insertion is .....**
   a. Left lateral b. Right lateral
   c. Knee chest d. Prone

709. **All of the following positions are used for enema administration EXCEPT**
   a. Sims' position
   b. Prone position
   c. Knee-chest position
   d. Supine with knees flexed and legs separated

710. **For assessing rectum position given to the patient is .....**
   a. Sims Position
   b. Knee Chest
   c. Both A and B d. Lithotomy

711. **In postural drainage, anterior segments of left upper lobes can be drained by providing .....position**
   a. Supine with head elevated
   b. Leaning forward 30 degrees
   c. Left side lying with pillow under the chest
   d. Right side lying with pillow under the chest

712. **In postural drainage, apical segment of upper lobe can be drained by providing ..... position**
   a. Semi-Fowler's position
   b. Leaned backwards from sitting position
   c. Left side lying with pillow under the chest
   d. Right side lying with pillow under the chest

713. **In postural drainage, posterior segment of lower lobes can be drained by providing .....position**
   a. Prone in Trendelenburg's position
   b. Supine in Trendelenburg's position
   c. Right side lying with pillow under the chest
   c. Bed forward about 30 degrees

714. **In postural drainage, anterior segments of lower lobes can be drained by providing which of the following position?**
   a. Upright at 30 degree forward leaning
   b. Semi-Fowler position
   c. Prone in Trendelenburg's position
   d. Supine in Trendelenburg's position

715. **Bed used to provide various position during postural drainage**
   a. Nelson's bed b. Cardiac bed
   c. Orthopedic bed d. Divided bed

CALCULATIONS, MEASUREMENTS AND NORMAL VALUES

716. **A child is to receive dexamethasone (Decadron) intravenously at the ordered dosage of 7.6 mg. The drug concentration in the vial is 4 mg/mL. Which of the following amount would the nurse administer?** *(RAK MSc 2018)*
   a. 0.05 mL b. 0.72 mL
   c. 1.9 mL d. 3.8 mL

Explanation:

Calculation of Drug dose of Liquid Drugs: $\frac{D}{H} \times Q = X$

D = Dose Desired

H = Dose on Hand

Q = Quantity

X = Dose to be administered

According to given question: D = 7.6 mg; H= 4 mg; Q = 1 mL

$X = \frac{D}{H} \times 1 = 1.9$ Dose to be administered is 1.9 mL.

Ans.

Scanned with CamScanner

717. A child is to receive 500 mL of an I/V solution over 12 hours via tubing that delivers micro drips at 60 drops/mL. The nurse would infuse solution at which of the following rates? *(RAK MSC 2018)*

a. 42 drops/minute
b. 48 drops/minute
c. 63 drops/minute
d. 84 drops/minute

Explanation:
Total volume of fluid to be infused = 500 mL
Drop factor = 60 drops/mL
Total time of infusion = 12 × 60 (To convert hours into minutes)
=720 minutes
Therefore,
Flow rate = Volume of infusion in mL x Drop factor (in drops/mL)/ Time of infusion in minutes
Flow rate = 500 × 60/720 = 41.66 or 42 drops per minute

718. One tea spoon = ... mL

a. 1 mL
b. 3 mL
c. 5 mL
d. 7 mL

Explanation:
- One tea spoon = 5 mL
- One table spoon = 10 mL
- One fluid ounce = 30 mL

719. 500 mL of IV fluid need to be administered over 5 hr. Drop factor is 20. Calculate drops/minute?

a. 32 drops/min
b. 33 drops/min
c. 34 drops/min
d. 35 drops/min

Explanation: Formula:
Drops per minute = (volume in mL × drop factor)/(time in minutes)
Here. . . . Time in minutes = 5 × 60
So. . . = (500 × 20)/(5 × 60)
= 33. 33
33. 33 is converted nearest whole number.
i.e. 33 drops/min

720. The normal Cholesterol level is: *(DSSSB 2013)*

a. 100-150 mg/dL
b. 150-200 mg/dL
c. 200-250 mg/dL
d. 250-300 mg/dL

Explanation: As per American Heart Association desirable level of cholesterol is less than 200 mg/dL

721. One tablespoon is equal to: *(DSSSB PHN, 2015)*

a. 5 mL
b. 15 mL
c. 30 mL
d. 20 mL

722. A physician orders 1000 mL of Normal Saline to be infused over 8 hours. What is the flow rate a nurse has to set if drop factor is 15 drop per mL? *(ISRO)*

a. 20 drops per min
b. 24 drops per min
c. 28 drops per min
d. 31 drops per min

723. What is the normal CSF pressure when the individual is lying on his side? *(Kerala PSC, Nov 2014)*

a. 15 cm H2O
b. 20 cm H2O
c. 10 cm H_2O
d. 25 cm H_2O

724. The normal adult intracranial pressure is: *(Staff Nurse G II 2014)*

a. 0–15 mm Hg
b. 60–70 mm Hg
c. 80–100 mm Hg
d. 20–40 mm Hg

725. How much will be the drop rate/min if 500 mL of fluid is to be administered over 24 hours via ordinary drip set with drop factor 15 drops/mL. *(Recent Question 2012)*

a. 3 drops/min
b. 5 drops/min
c. 24 drops/min
d. 50 drops/min

726. 1200 mL is equal to _____ liters

a. 1.2
b. 12
c. 120
d. 12000

727. Two teaspoon is equal to

a. 6 mL
b. 10 mL
c. 20 mL
d. 30 mL

728. A client is ordered 75 milligrams of Amoxicillin orally. 125 milligrams in 5 milliliters of Syrup is available. How many milliliters will you administer?

a. 2.5 mL
b. 3 mL
c. 3.5 mL
d. 4 mL

729. Digoxin 75mcg = ? mg

a. 0.75 mg
b. 0.075 mg
c. 7.5 mg
d. 750 mg

730. 1 fluid ounce is approximately equal to

a. 15 mL
b. 30 mL
c. 50 mL
d. 100 mL

731. Frusemide 90 mg IVI is charted. Stock dose is 20 mg/mL. How many mL would you give?

a. 0.45 mL
b. 0.9 mL
c. 4.5 mL
d. 9 mL

732. A patient requires 8 mg of Morphine IV. Morphine is available as 20 mg/mL. How many mls will you draw up?

a. 0.4 mL
b. 0.8 mL
c. 1.2 mL
d. 1.6 mL

733. Physician order reads: Eltroxin 60 mcg po daily. Available dose: Eltroxin 0.12 mg tab. How many tablets will you administer?

a. ¼ tab
b. ½ tab
c. 2 tabs
d. 5 tabs

734. A patient must receive 30 units of Humulin regular insulin. The label reads 100 units = 1 mL. How many milliliters should the nurse administer?

a. 0.2 mL
b. 0.3 mL
c. 0.5 mL
d. 1.0 mL

735. The physician's order reads "Administer 1 g cefotaxime in 150 mL of normal saline solution in 60 minutes." What is the flow rate if the drop factor is 20 gtt = 1 mL?

a. 25 gtt/min
b. 38 gtt/min
c. 50 gtt/min
d. 72 gtt/min

736. Physician order – Streptomycin 25 mg/kg IM q 12 hr; Available dose: Streptomycin 0.35 Gm/mL. How many mL will you administer for each dose to a 70 kg patient?

a. 2 mL
b. 5 mL
c. 7 mL
d. 10 mL

737. Doctor's Order: Infuse 500 mL DNS over 6 hr; Drop factor: 15 gtt/mL. What flow rate will you set?

a. 21 drops/min
b. 30 drops/min
c. 42 drops/min
d. 45 drops/min

738. Doctor's Order: Infuse 1200 mL of NS at 125 mL/hr; Drop Factor: 20 gtt/min. How many drops per minute will you set in the IV set?

a. 21 drops/min
b. 42 drops/min
c. 45 drops/min
d. 60 drops/min

739. **Doctor's Order: ½ L of RL to infuse over 4 hrs 10 mins; Drop factor: 20 gtt/mL. How many gtt/min will you regulate the IV?**
   a. 20 gtt/min b. 40 gtt/min
   c. 50 gtt/min d. 60 gtt/min

740. **A patient with cirrhosis of the liver has a serum bilirubin level of 30 mg/dL. In order to evaluate these laboratory results you need to know that the normal serum bilirubin level is:** *(LNJP H D 2012)*
   a. 0.2 to 1.0 mg/dL b. 10 to 20 mg/dL
   c. 3 to 10 mg/dL d. 20 to 30 mg/dL

741. **Normal fetal heart beat is:** *(LNJP H D 2012)*
   a. 120 to 140 regular b. 120 to 160 regular
   c. 90 to 100 irregular d. 100 to 120 irregular

742. **The fasting blood sugar value is:** *(DSSSB PHN, 2015)*
   a. 70-110 mg% b. 50-90 mg%
   c. 120-180 mg% d. 180-200 mg%

743. **Stroke volume is .....**
   a. 50 mL b. 70 mL
   c. 90 mL d. 120 mL

744. **97°F is equal to**
   a. 36.1°C b. 36.8°C
   c. 37.1°C d. 37.5°C

745. **37°C is equal to**
   a. 98.0°F b. 98.6°F
   c. 99.6°F d. 99.8°F

746. **Four teaspoon is equivalent to**
   a. 12 mL b. 20 mL
   c. 40 mL d. 60 mL

747. **gtt is an abbreviation of**
   a. Drop b. Milliliter
   c. Litre d. Gallon

748. **Formula to calculate BMI is**
   a. BMI= weight in kg/ (Height in cm)^2
   b. BMI= weight in Kg/ (Height in meter)2
   c. 2BMI= weight in pounds/ (Height in meter)^2
   d. BMI= weight in pounds/ (Height in cm)^2

749. **Normal pH of urine is in the range of**
   a. 4.5 to 8.0 b. 3.0 to 5.0
   c. 7.5 to 8.5 d. 7.35 to 7.45

750. **102°F is equal to**
   a. 38°c. b. 38.5°C
   c. 38.9°C d. 39.5°C

751. **38°C is equal to**
   a. 99.8°F b. 100.0°F
   c. 100.4°F d. 101.2°F

752. **Normal RBC range in adult**
   a. 4.3- 5.7 trillion cells/L
   b. 4.5 -5.5 million /mm3 of blood
   c. 150-450 billion/L
   d. 2000-3000 million/mm^3 of blood

753. **Normal WBC range in adult**
   a. 2000-4000 /mm^3 of blood
   b. 4000-10000 /mm3 of blood
   c. 7000-20000 /mm^3 of blood
   d. 10000-25000 /mm^3 of blood

754. **Normal platelet range in adult**
   a. 50000 to 150000 cells/ mm^3 of blood
   b. 150,000 to 450,000 cells/ mm3 of blood
   c. 350,000 to 600,000 cells/ mm^3 of blood
   d. 500,000 to 700,000 cells/ mm^3 of blood

755. **Calculate the IV flow rate for 100 mL over 1 hour. Drop factor is 20 gtt/mL.**
   a. 22 drops/min b. 33 drops/min
   c. 36 drops/min d. 40 drops/min

756. **The nurse inserting a Ryle's tube for an adult patient is aware that the distance between incisor teeth and Gastro esophageal junction is**
   a. 20 cm b. 30 cm
   c. 40 cm d. 50 cm

757. **Recommended duration for completing suctioning of the tracheostomy tube is**
   a. 5-10 seconds b. 10-20 seconds
   c. 20-30 seconds d. 30-45 Seconds

758. **1 Ounce is equal to ..... teaspoon**
   a. 2 teaspoons b. 4 teaspoons
   c. 5 teaspoons d. 6 teaspoons

759. **1 liter is approximately equal to**
   a. 33 ounce b. 34 ounce
   c. 40 ounce d. 45 ounce

760. **One teaspoon is.**
   a. 5 mL b. 7 mL
   c. 10 mL d. 15mL

761. **One fluid ounce is equal to**
   a. 10 mL b. 15 mL
   c. 25 mL d. 30 mL

762. **Body Mass Index (BMI) Range for overweight is** *(ISRO)*
   a. Above 30 b. 18.5-24.9
   c. 22.9-27.9 d. 25.0-29.9

SPECIMEN COLLECTION

763. **The most appropriate time for the nurse to obtain a sputum specimen for culture is:** *(AIIMS Raipur NO 2019)*
   a. Early in the morning
   b. After the patient eats a light breakfast
   c. After aerosol therapy
   d. After chest physiotherapy

Explanation: Fresh early morning sample is preferred because secretions accumulate overnight. Secretions must be of sputum for accurate findings.

After breakfast, sputum will be mixed with food and findings will be altered. Sample after aerosol therapy will alter findings. Chest therapy may help in excretion of secretion, but the sample should be fresh in the morning.

764. **Which test is done for identifying the presence of occult blood in stool?** *(AIIMS BBS NO 2018)*
   a. Fouchet's test b. Benzidine test
   c. Orthotolidine test d. Guaiac test

Explanation: The stool guaiac test screens for hidden (occult) blood in a stool sample. It is the most common type of fecal occult blood test (FOBT). The test involves placing a fecal sample on guaiac paper and applying hydrogen peroxide which, in the presence of blood, yields a blue reaction product within seconds.

765. **Which is the preservative used in 24 hour urine collection?**
   a. Toluene b. Boric acid
   c. 50% Acetic acid d. All of the above

Explanation: All of the above mentioned preservatives and concentrated HCl and chloroform are also used as a preservative agent in 24 hours urine collection.

765.	d

Scanned with CamScanner

766. All of the following are the methods used to assess urine specific gravity EXCEPT

a. Urinometer
b. Refractometer
c. Reagent strips
d. Biuret method

Explanation: Biuret method is used to determine protein in urine. All other methods are used for measurement of urine specific gravity. Most commonly used method is urinometer, which is simple and easy to carry out in the bed side of patient.

767. Elevated specific gravity can be seen in .....

a. Diabetes insipidus
b. Dehydration
c. Hypervolemia
d. Polyuria

Explanation: Adults generally have a specific gravity in the range of 1.010 to 1.030. Elevated specific gravity of urine is observed in dehydration and SIADH (Syndrome of Inappropriate Anti Diuretic Hormone). Low specific gravity is seen in diabetes insipidus, hypervolemia and polyuria.

768. All of the following can be a cause of milky-white color urine EXCEPT

a. Urinary tract infection
b. Uric acid crystals from eating purine-rich foods
c. Strenuous exercise
d. Phosphate crystals from excess parathyroid hormone

Explanation: Strenuous exercise can sometime result in blood getting into urine, hence turns the urine color into red. Cause of milky-white colored urine include uric acid crystals from eating purine-rich foods, such as anchovies, herring, and red meat (lamb, beef, and pork), and phosphate crystals from excess parathyroid hormone.

769. EDTA-containing tubes are not suitable for sample collection meant for coagulation studies because

a. It will lead to thrombolysis
b. It binds the calcium which is needed for coagulation
c. Calcium concentration will increase in the sample
d. It activates the fibrinogen to form fibrin.

Explanation: EDTA strongly binds to calcium in the sample which is need for coagulation. It will affect the coagulation time. EDTA tubes are purple or lavender-colored tube which is used for complete blood counts (CBC).

770. Anticoagulant of choice for estimating blood glucose is .....

a. EDTA
b. Sodium Fluoride
c. Sodium Citrate
d. Heparin

Explanation: Sodium fluoride inhibits the system involved in glycolysis and preserve the glucose.

771. Sputum sample for AFB should be collected

a. Morning after wake up
b. After breakfast
c. In the evening
d. Whenever the person cough

Explanation: Early morning sputum is ideal for mycobacteriological exam for tuberculosis. Cough reflex is usually suppressed at night. Thus, the first early morning expectoration represents overnight secretions accumulated in the chest.

772. Lipid profile does not include: *(Banaras HU 2015)*

a. HDL
b. Total Cholesterol
c. SGOT
d. VLDL

Ans.

766. d
767. b
768. c
769. b
770. b
771. a
772. c
773. d
774. a
775. d
776. a
777. a
778. d
779. d
780. b
781. d
782. b
783. a
784. c

773. In Benedict's test which of the end color indicates absence of sugar in urine? *(Banaras HU 2015)*

a. Yellow
b. Green
c. Orange
d. Blue

774. What should be the sequence of events during collection of blood sample.

a. Ask the patient his name → verify from file → collect blood → Label the sample at bedside
b. Look at the file→Collect sample→Label the sample at bedside
c. Prelabel the sample vials→Check the file patient details → Collect sample
d. Collect sample→Confirm name from file → Label the sample vial

775. Clay colored stool is suggestive of: *(JIPMER 2012)*

a. Amoebic dysentery
b. Typhoid
c. Ulcerative colitis
d. Obstructive jaundice

776. The reagent used for testing urine sugar is: *(RRB Feb 2012)*

a. Benedict's regents
b. Sahli's agent
c. Rothera's reagent
d. None

777. Stool specimen for guaiac fecal occult blood testing is done to screen for .....

a. Colorectal cancer
b. Irritable bowel syndrome
c. Fistula
d. Cancer prostate

778. Which among the following blood test is recommended to a client on heparin therapy?

a. Bleeding time
b. Clotting time
c. Prothrombin time
d. Activated partial thromboplastin time (APTT)

779. Which among the following blood test is recommended to a client on warfarin therapy?

a. Bleeding time
b. Clotting time
c. Prothrombin time (PT)
d. International normalized ratio (INR)

780. The correct method to collect urine sample for culture from urinary collecting system is

a. Collect from catheter
b. With needle aspiration
c. Empty urine from bag
d. Any of the above method

781. Glycated hemoglobin (HbA1c) is primarily measured to identify mean plasma glucose concentration of

a. Over 7 days
b. Over 30 days
c. Over 60 days
d. Over 90 days

782. A lethargic patient has fever, vomiting, and headache. The nurse has to prepare him for which of the following procedure?

a. Blood culture
b. Lumbar puncture
c. CAT scan
d. Ultrasound scan

783. Which of the following is one of the component of a solution present in blood transfusion bag?

a. Sodium citrate
b. Heparin
c. EDTA
d. Warfarin

BODY MECHANICS

784. Among the following, the factor that contributes to pressure ulcer is: *(AIIMS BBS NO 2018)*

a. Edema
b. Chronic disease
c. Shearing forces
d. Malnutrition

Explanation: The major factors contributing to pressure ulcers are Friction and shearing forces, loss sensory perception, exposure to moisture, lack of activity, and mobility

Edema, chronic disease and malnutrition may indirectly contribute to pressure ulcer but shearing forces is the direct cause of pressure ulcer.

Scanned with CamScanner

785. Identify the components of proper body mechanics
a. Move as close to the patient's bed as you can
b. Set your feet into a comfortable and solid wide base of support when lifting.
c. Keep the head upright and hold your shoulders up
d. All of the above

Explanation: Body mechanics is a broad term used to denote an effort coordinated by the muscles, bones and nervous system. It can either be good or bad and can be directly related to the occurrence of back pains. All of the above mentioned rules are correct regarding body mechanics.

786. When planning to move a patient, two workers lifting together.....
a. Allow more time to do tasks
b. Will reduce the workload by 50%
c. Provide more comfort to the patient
d. Will make work boredom free

787. All of the following actions increases the risk of injury at work place, EXCEPT
a. Repetitive movements b. Wrong body mechanics
c. Regular use of lifts and assistive devices
d. Awkward static posture

788. Which of the following Range of Motion (ROM) cannot be applied to a wrist?
a. Abduction and adduction b. Flexion and extension
c. Inversion and eversion d. Radial and ulnar flexion

789. What is the rule of thumb in lifting or transferring a patient?
a. Always ask for help even if you can do it alone
b. Do not attempt to lift more than 60% of your body weight
c. Do not attempt to lift more than 35% of your body weight
d. Always ask the patient to walk first

790. Patient complains of pain, muscles spasm and resistance while the nurse was doing a passive ROM exercise. Which of the following is most appropriate action in this scenario?
a. Assess degree of pain
b. Stop the exercise
c. Administer pain medication
d. Call physician

791. All of the following range of motion (ROM) can be applied to neck and cervical spine, EXCEPT
a. Lateral flexion and extension
b. Flexion and extension
c. Abduction and adduction
d. Hyperextension

792. Which of the following is not a correct practice?
a. Avoid bending from the waist
b. Work at height that is comfortable for you
c. Carry objects away from the midline of your body
d. Be aware of the maximum weight that is safe to carry

793. The nurse needs to _____ while lifting or carrying heavy object
a. Keep the knees close to each other
b. Maintain a wide base or support
c. Bend the back perpendicular to the body
d. Hold objects away from the body

RECORDS AND REPORTS

794. Time limit for registering birth is within: *(AIIMS Bhopal Grade-I 2018)*
a. 21 days b. 10 days
c. 14 days d. 7 days

Explanation: The registration of births and deaths act passed in 1969, for the regulation of registration of births and deaths and for matters connected therewith. The normal period of 21 days (from the date of occurrence) has been prescribed for reporting the birth, death and still birth events.

795. The disadvantages of Electronic Health Records are the following, EXCEPT: *(AIIMS Raipur Grade II 2017)*
a. Expensive b. Lack of integration
c. Downtime processes d. Increased medical errors

Explanation: The disadvantages of electronic health records are expensive, Lack of integration and downtime process.

796. The primary purpose of the patient record is
a. Education b. Communication
c. Research d. Funding

797. Which of the following record refers to short and objective description of incidents or events that are important to the observer?
a. Admission record b. Anecdotal record
c. Observation checklist d. Investigation report

798. All of the following are principles of record writing, EXCEPT
a. Accurate b. Error-free
c. Use standard abbreviation d. Data redundancy

END OF LIFE CARE

799. Palliative surgery is done: *(AIIMS BBS NO 2018)*
a. To improve self-concept
b. To reduce the intensity of illness
c. To confirm the diagnosis
d. To remove the disease

Explanation: Palliative surgery is surgical intervention targeted to make a patient's symptoms less severe, thus make the patient's quality of life better despite negligible impact on the patient's survival. It is done by debulking tumors so as to relieve several symptoms because of excessive large tumor.

800. The type of loss in which the client is aware that a loss will occur is known as: *(AIIMS-BBS SNO 2019)*
a. Anticipatory loss b. Observable loss
c. Actual loss d. Perceived loss

Explanation: *Anticipatory* grief refers to a feeling of grief occurring before an impending *loss*. Typically, the impending *loss* is the death of someone close due to illness.

801. Regarding the request of organ and tissue donation at the time of death, the nurse needs to be aware that *(AIIMS Bhopal Grade-I 2018)*
a. Requests are usually made by the nurse who case for the patient at time of death
b. Professionals need to be very selective in whom they ask for organ and tissue donation
c. Specially educated personnel make requests
d. only patients who have given prior instruction regarding donation become donors

Explanation: Regarding the request of organ and tissue donation at the time of death, Individuals specially trained in requesting organ donations facilitate the process. They are skilled in taking compassionately to people who are suffered a tragic, sudden loss and have answers to many questions that people have regarding the donation process.

Ans.

Scanned with CamScanner

802. At the time of death of patient, it is appropriate to make request for organ donation by _____
a. Specially educated counsellor
b. Nurse caring for the client
c. Family doctor
d. Any health care worker

803. 'Hospice' is the treatment concept for: *(AIIMS Raipur staff nurse grade I-2018)*
a. Terminally ill cancer patient
b. Psychiatric patients
c. Cardiac patients
d. All of these

Explanation: Hospice care is the best compassionate care for those patient who all are facing life limiting chronical disease condition. It is planned according to patient's wishes and to meet medical need, pain management, emotional support and spiritual need of the patient

804. Stiffness occur in the body after death is known as..... *(ISRO)*
a. Algor mortis
b. Livor mortis
c. Rigor mortis
d. Tardieu spots

Explanation:
- **Algor mortis:** decrease of the body's temperature
- **Livor mortis:** discoloration of the skin after death
- **Rigor mortis:** stiffening of the body that occurs about 2-4 hours after death.

Tardieu spots: Petechiae and purpuric hemorrhages that develop in areas of dependency secondary to the rupture of degenerating vessels under the influence of increased pressure from gravity

Ans.
802. a
803. a
804. c
805. b
806. b
807. b
808. b
809. a
810. d
811. c
812. d
813. a
814. a

805. Which of the following is the responsibility of the nurse to perform before rigor mortis occurs?
a. Providing a complete bath
b. Placing one pillow under the body's head and shoulders
c. Changing body's clothing
d. Allowing the body to relax normally

806. 'No not me' reaction of the patient is seen in which stage of death (terminal patients)?
a. Bargaining
b. Denial
c. Anger
d. Acceptance

Explanation: As per Kübler-Ross stages of grieving (DABDA) not to me is seen in denial stage. Denial, Anger, Bargaining, Depression and Acceptance are the various stages of grief process.

MISCELLANEOUS (DISEASE RELATED QUESTIONS)

807. The mode of transmission of trachoma from one person to other person is: *(AIIMS Raipur Grade II 2017)*
a. Air borne
b. Direct and indirect contact
c. Blood borne
d. Iatrogenic

Explanation Trachoma are spread by direct contact with fingers or fomites (indirect, eg. washcloths, handkerchiefs) contaminated with eye discharge from an infected person or by eye-seeking flies.

808. Congenital absence or closure of a normal body orifice or tubular organ is called: *(AIIMS Raipur Grade II 2017)*
a. Fistula
b. Atresia
c. Hernia
d. Stenosis

Explanation: Fistula is an abnormal connection between two hollow spaces or other hollow organs. Hernia is an abnormal exit of tissue or organ such as bowel through the wall of cavity in which it normally resides. Stenosis is the abnormal narrowing passage in the body.

809. During the time of any infection what will happen to the WBC count? *(AIIMS Raipur staff nurse grade I-2018)*
a. Increased
b. Decreased
c. Remain unchanged
d. Fluctuating

Explanation: WBCs are the fighter cells in the blood. If a person affected with any kind of infection WBC count will increase.

810. Which of the following is NOT a characteristic of cell wall of a gram positive bacteria? *(AIIMS Bhopal Nursing officer, 2018)*
a. Absent sulfur-containing amino acids
b. Thick cell wall
c. Absent lipids
d. Absent teichoic acid

Explanation: Except option D all the other given options are the characteristic of cell wall of gram positive bacteria.

811. Which of the following is the unit of measurement in bacteriology? *(AIIMS Bhopal Nursing officer, 2018)*
a. Joule
b. Newton
c. Micron
d. Pascal

Explanation: Micron is the unit of measurement in bacteriology. Joule is the unit of energy. Newton is the unit of force and Pascal is the unit of pressure.

812. The division of bacterial cells and the exponential increase in their number are indicative of which phase? *(AIIMS Bhopal Nursing Officer, 2018)*
a. Lag phase
b. Stationary phase
c. Phase of decline
d. Logarithmic phase

Explanation: Lag phase: when bacteria inoculate into a new media, it won't divide soon. It will take some time to adjust. So the time in which bacteria is metabolically active and not dividing is known as lag phase

Logarithmic phase: bacteria will grow continuously and multiply constantly and bacteria will increase in its number exponentially.

Stationary phase: bacterial growth reaches in a state where there is no further increase in its population.

Phase of decline: number of bacteria decreases continuously.

813. Presence of fresh blood in the stool is known as .....
a. Hematochezia
b. Malena
c. Hemoptysis
d. Hematuria

Explanation: Presence of fresh blood in the stool is hematochezia. Upper GI tract bleeding results in dark tarry stool that is known as malena. Presence of blood in sputum is called as hemoptysis. Blood in urine is known as hematuria.

814. Difficulty in breathing is .....
a. Dyspnea
b. Dysphagia
c. Dyspepsia
d. Dysphonia

Explanation: Option A is the correct answer, option B indicate difficulty in swallowing, C indicates difficulty in digestion and D indicates difficulty in speaking.

Scanned with CamScanner

815. Brown crusts formed on the lips and teeth is known as.....

a. Sordes
b. Halitosis
c. Cheilosis
d. Calculus

Explanation: Option A is the correct answer. Option B means bad odor of breath or mouth. Cheilosis refers to cracking and ulceration of lip and angles of mouth. Calculus means dental plaque remaining in the teeth become harder and form calculus.

816. All are the components of Braden scale, EXCEPT

a. Sensory perception
b. Shear
c. Mobility
d. Length of hospital stay

Explanation: Length of hospital stay is not a component. Components of Braden scale includes sensory perception, moisture, activity, mobility, nutrition, and friction or shear.

817. Raju is recently diagnosed with metastatic lung cancer, what is the expected reaction from him?

a. Denial
b. Anger
c. Depression
d. Acceptance

Explanation: According to Kubler Ross stages of grief process, first reaction will be denial, Raju won't accept the fact that he is having metastatic lung cancer. Kubler Ross stages of grief include Denial, Anger, Bargaining, Depression and Acceptance (DABDA).

818. All of the following are the responsibilities of a nurse while caring for a patient suffering from thrombophlebitis EXCEPT

a. Educate client to avoid straining during defecation
b. Leg should not be massaged
c. Administer ordered anticoagulant
d. Keep the leg in dependent position

Explanation: Option D is incorrect. While caring for a person with thrombophlebitis educate that person to keep the leg slightly elevated on pillows, and slightly flexed at the level of knee in order to enhance venous return

819. What is the management of persistent hiccups?

a. Ask person to drink water
b. Administer 3-10% carbon dioxide
c. Ask the person to walk in an open space
d. All of the above

Explanation: Hiccups is a diaphragmatic spasm which can be relieved by administering 3-10% carbon dioxide

820. Nursing measures for a patient who is complaining of difficulty with micturition includes

a. Sound of running water
b. Stroking in the inner thigh
c. Pour lukewarm water over the perineum
d. All of the above

Explanation: All of the above mentioned are correct nursing measures in a person who is complaining of difficulty with micturition. Other than these slight pressure over the bladder can also be applied which is known as cred's maneuver.

821. Thick yellow drainage from the wound is known as ..... *(AIIMS 2016)*

a. Sanguineous
b. Serous-sanguineous
c. Serous
d. Purulent

Explanation: Clear and watery drainage is serous. Sanguineous drainage is fresh blood that is prevalent among deep wounds of full and partial thickness. Serous-sanguineous leakage is thin and watery, and it's pink in color. Purulent drainage when the leakage from your wound appears milky. It's generally gray, green or yellow.

822. Degree of resistance against a pathogen is known as .....

a. Immunity
b. Health
c. Risk factor
d. Predisposition

Explanation: Immunity is the ability to resist infection by an invading pathogen. The body quickly launches an immune response and prevents the symptoms of disease occurring. This can happen in two ways – naturally or artificially.

823. Temporary end to the medical signs and symptoms of an incurable disease is .....

a. Remission
b. Relapse
c. Cure
d. Exacerbation

Explanation: Option A is the correct answer. Relapse is the reoccurrence of signs and symptoms which is most commonly observed in people with drug addiction. Cure means complete absence of disease. Exacerbation means sudden worsening of symptoms.

824. Thoracentesis is the treatment of choice of .....

a. Hemothorax
b. Empyema
c. Hydrothorax
d. All of the above

Explanation: Thoracentesis is a procedure to remove fluid from the space between the lungs and the chest wall called the pleural space. It is indicated in All of the above conditions.

825. The tube introduced into the rectum of patient to relieve gas is known as.....

a. Rectal tube
b. PEG tube
c. Foley's catheter
d. NG tube

Explanation: A rectal tube to facilitate expulsion of flatus. Foley's catheter is a type of indwelling urinary catheter. NG tube is inserted into stomach through nostrils. PEG tube stands for percutaneous endoscopic *gastrostomy*.

826. Collection of lymph fluid in the pleural space

a. Hemothorax
b. Pneumothorax
c. Chylothorax
d. None of the above

Explanation: Collection of lymph fluid in the pleural space is known as chylothorax. Chylothorax or chyle leak is a type of pleural effusion, resulting from lymph formed in the digestive system called chyle accumulating in the pleural cavity due to either disruption or obstruction of the thoracic duct.

827. Which of the following is the appropriate measure to prevent DVT and its complication?

a. Patients should wear elastic compression stockings.
b. Patients should observe special body positioning and perform indicated exercise.
c. Patients should use intermittent pneumatic compression.
d. All of the above

Explanation: Intermittent pneumatic compression (IPC) devices increase blood flow through the veins and prevent blood clot. Elastic compression stockings help increase circulation and prevent blood clot formation. Special body positioning and specific exercises also help improving the blood circulation.

Ans.

815.	a
816.	d
817.	a
818.	d
819.	b
820.	d
821.	d
822.	a
823.	a
824.	d
825.	a
826.	c

Scanned with CamScanner

828. Pain in the calf with dorsiflexion of the foot is known as...
a. Homan's sign
b. Trousseau sign
c. Chvostek sign
d. Kernig's sign

Explanation: Pain in the calf with dorsiflexion of the foot is known as Homan's sign. Homan's sign indicates thrombophlebitis or thrombosis or deep vein thrombosis (DVT).

829. Conditions that increases vulnerability to a disease is known as .....
a. Etiology
b. Precipitating factor
c. Risk factors
d. Pathophysiology

Explanation: Correct answer is option C. A risk factor of predisposing factor is any attribute, characteristic or exposure of an individual that increases the likelihood of developing a disease or injury.

830. A group of symptoms that sums up or constitute a disease is known as .....
a. Clinical manifestation
b. Sign
c. Symptoms
d. Syndrome

Explanation: A syndrome is a set of medical signs and symptoms that are correlated with each other and, often, with a specific disease.

831. Type of illness characterized by short duration is .....
a. Acute
b. Chronic
c. Major
d. Minor

Explanation: The duration of acute and subacute diseases are too short, i.e. less than 6 months.

832. Clinical manifestation of increased ICP includes .....
a. Vomiting
b. Headache
c. Blurring of vision
d. All of the above

Explanation: Drowsiness, separated sutures on the skull, bulging of the soft spot on top of the head (bulging fontanelle), vomiting

Older children and adults: Behavior changes, decreased consciousness, headache, lethargy, neurological symptoms, including weakness, numbness, eye movement problems, and double vision, seizures, vomiting.

833. Bleeding from the nose is known as: *(DSSSB 2013, DSSSB PHN, 2015)*
a. Epistaxis
b. Hemoptysis
c. Hematemesis
d. Hematuria

Explanation: Epistaxis, or bleeding from the nose. Epistaxis can be divided into 2 categories, anterior bleeds and posterior bleeds, on the basis of the site where the bleeding originates.

834. All of the following methods are used to assess the area of burn injury EXCEPT
a. Lund Browder Chart
b. Rule of nines
c. Parkland formula
d. Palmar method

Explanation: Parkland formula for burns is used to calculate fluid requirements for burn patients in 24-hr period. Other three given methods are used to calculate the area of burn injury. Wallace rule of nines is a good quick method for estimation of medium to large burn in adults. Lund and Browder method is an age specific chart and most accurate method. Palmar surface can be used to estimate relatively small burns (<15%) or very large burns (>85%).

835. The most common presentation in portal hypertension is *(DSSSB 2013)*
a. Asterixis
b. Hematemesis
c. Elevated blood pressure
d. Confusion

Explanation: Portal hypertension is an increase in the blood pressure within a system of veins called the portal venous system. Veins coming from the stomach, intestine, spleen, and pancreas merge into the portal vein, which then branches into smaller vessels and travels through the liver. They may develop life-threatening hemorrhage, with hematemesis or malena. Hematemesis is the commonest presentation in portal hypertension. Melena without hematemesis may result from bleeding varices.

836. Inflammation of the tongue is known as: *(DSSSB 2013)*
a. Gingivitis
b. Glossitis
c. Parotitis
d. Stomatitis

Explanation: Glossitis is an inflammation of the tongue. Gingivitis is inflammation of gum. Parotitis is an inflammation of one or both parotid glands, Stomatitis is the inflammation of the oral mucosa.

837. Abnormal lateral deviation of vertebral column is: *(DSSSB PHN, 2015)*
a. Lordosis
b. Kyphosis
c. Scoliosis
d. Osteoporosis

838. The paralysis of both upper and lower extremities is known as: *(DSSSB PHN, 2015)*
a. Hemiplegia
b. Paraplegia
c. Monoplegia
d. Quadriplegia

839. The nursing care of a patient with dengue fever include all of the following except: *(Banaras HU 2015)*
a. Provide cold compression
b. Provide proper hydration and electrolyte balance
c. Symptomatic treatment is given irrespective of the grade of the disease
d. Food rich in vitamin-D should be avoided

840. Bagassosis is caused by inhalation of: *(Kerala PSC, Nov 2014)*
a. Sugarcane dust
b. Cotton dust
c. Coal dust
d. Silica dust

841. Inflammation of the tongue is known as: *(Staff Nurse G II 2014)*
a. Glossitis
b. Gingivitis
c. Halitosis
d. Angular stomatitis

842. The key aspect of palliative care is.....
a. Pain relief
b. Emotional support
c. Ostomy care
d. General care

843. Blood in urine: *(RRB Feb 2012)*
a. Hemosiderosis
b. Hematopoiesis
c. Hematuria
d. None

844. Pus in urine is called: *(Safdarjung NO 2018)*
a. Pyuria
b. Polyuria
c. Pusuria
d. Dysuria

845. The highest concentration of HIV virus is found in
a. Saliva
b. CSF
c. Blood
d. Semen

846. Disease like chromosomal abnormalities, hemophilia and thalassemia are of _____
a. Infectious origin
b. Hereditary origin
c. Developmental origin
d. Psychological origin

847. A 60-year-old male patient had myocardial infarction one month ago. He is currently undergoing cardiac rehabilitation sessions at the gym. This is considered as _____ prevention
a. Primordial
b. Primary
c. Secondary
d. Tertiary

Scanned with CamScanner

848. **Patient with which of the following disease condition often gets relief through complementary therapies?**
   a. Ulcers
   b. Chronic pain and arthritis
   c. Myocardial infraction
   d. Diabetes

849. **The most common complication that can develop in a client with long history of smoking is**
   a. Peptic ulcer
   b. Cardiopulmonary disease and lung cancer
   c. Stress-related illnesses
   d. Diabetes and obesity

850. **A client is complaining of urinary urgency and frequency. Clean-voided urine sample appears to be cloudy. Most probable diagnosis will be**
   a. Cystitis
   b. Dysuria
   c. Nephrotic syndrome
   d. Hematuria

851. **A male patient with urinary urgency also have problem with starting and stopping urinary stream. The appropriate intervention for this client is to**
   a. Pour hot water over perineum
   b. Place a condom catheter
   c. Teach himself intermittent catheterization
   d. Initiate Kegel exercises

852. **Client is complaining of diarrhea and cramping after having dairy products. Most probable diagnosis will be .....**
   a. Celiac disease
   b. Irritable bowel syndrome
   c. Lactose intolerance
   d. Cystic fibrosis

853. **Straining during defecation cause .....**
   a. Polyps b. Diarrhea
   c. Hemorrhoids d. Constipation

854. **In which stage of pressure ulcer, hyperemia, increased temperature and redness with pressure is noticed?**
   a. Stage I b. Stage II
   c. Stage III d. Stage IV

855. **Inflammation of oral mucus membrane is termed as**
   a. Stomatitis b. Uvulitis
   c. Tonsillitis d. Mucositis

856. **Difficulty in swallowing is known as**
   a. Dyspepsia b. Nausea
   c. Dysphagia d. Phagitis

857. **Bluish discoloration of skin is termed as**
   a. Pallor b. Cyanosis
   c. Erythema d. Chromatosis

858. **Which of the following is considered as primary prevention strategy?**
   a. Early identification
   b. Reduction of disability
   c. Control of spread of disease
   d. Early treatment of disease

859. **Primary prevention of communicable diseases can be attained by**
   a. Quarantine b. Strict isolation
   c. Immunization d. Antibiotics

860. **The sudden onset of a disease is referred as**
   a. Acute disease b. Chronic disease
   c. Infectious disease
   d. None of the above

861. **Which of the following site is at high risk for pressure sore in side lying position?**
   a. Rib cage b. Buttocks
   c. Ear d. Occiput

862. **All of the following sites are at high risk for pressure sore in side lying position EXCEPT**
   a. Ear b. Hip
   c. Elbow d. Sacral region

863. **While assessing the client for pressure sore, the nurse noted skin loss and damage involving the top-most skin layers. This suggests**
   a. Grade I pressure sore b. Grade II pressure sore
   c. Grade III pressure sore
   d. Grade IV pressure sore

864. **Agnosia is .....**
   a. Inability to speak clearly
   b. Inability to recognize an object correctly
   c. Inability to do calculation
   d. Inability to identify the location of sound

865. **Kyphosis is the deformity of _____**
   a. Lower limbs b. Spine
   c. Ribs d. Upper limbs

866. **The diseases that can be transmitted directly from one person to another person is termed as**
   a. Contact diseases b. Communicable diseases
   c. Vector borne diseases d. Air borne diseases

867. **Common cause of ascites is**
   a. Dehydration b. Protein deficiency
   c. Appendicitis d. Bleeding disorders

868. **What is meant by Dysphagia?**
   a. Difficulty in breathing
   b. Difficulty in voiding
   c. Difficulty in swallowing
   d. Difficulty in speaking

869. **Which of the following is the confirmatory test for the diagnosis of tuberculosis?**
   a. Bronchoscopy b. Saline test
   c. Tuberculin test d. Sputum culture

870. **Which of the following diagnostic test helps to identify whether the patient has bleeding from the GI tract?**
   a. Complete blood court b. Abdominal girth
   c. Abdominal palpation d. Guaiac test

871. **The risk of HIV infection after needle stick injury with HIV infected blood**
   a. 1:50 b. 1:100
   c. 1:200 d. 1:300

872. **Which of the following intervention can prevent increased intracranial pressure in a patient with head trauma?**
   a. Maintain well lit room
   b. Elevate the head end of the patient
   c. Frequently change the position of the patient
   d. Elevate the foot end of the patient

873. **Which of the following guidelines has to be followed when caring for bed sore?**
   a. Wound must remain moist
   b. Tight packing of the wound
   c. Dressing to dry before removal
   d. All of the above

874. **A nurse caring a patient who is on pancreatic enzyme replacement therapy should assess for**
   a. Weight gain b. Orthostatic hypotension
   c. Bradycardia d. GIT irritation

875. **Bleeding time is prolonged in all of the following conditions EXCEPT**
   a. DIC
   b. Von-Willebrand disease
   c. Hemophilia-A
   d. Idiopathic thrombocytopenia

876. **Best method to make sure the functionality of intercostal drainage tube is to observe for**
   a. Continuous bubbling in water-sealed bottle
   b. Oscillation of water column in drainage bottle
   c. Continuous bubbling from suction tube
   d. All of the above

877. **Pus formation in the socket of teeth is .....**
   a. Periodontal disease b. Halitosis
   c. Cheilosis d. Sordes

878. **Cracking of lips especially at the angle of mouth is .....**
   a. Periodontal disease b. Halitosis
   c. Angular Cheilosis d. Sordes

879. **Inability to urinate despite of desire is known as .....**
   a. Incontinence b. Retention
   c. Enuresis d. Encopresis

880. **Involuntary passing of urine is called as .....**
   a. Incontinence b. Retention
   c. Enuresis d. Encopresis

881. **Sudden loss of urine while straining is called as .....**
   a. Stress incontinence b. Urge incontinence
   c. Overflow incontinence d. Functional incontinence

882. **Involuntary loss of urine preceded by strong desire to void is .....**
   a. Stress incontinence
   b. Urge incontinence
   c. Overflow incontinence
   d. Functional incontinence

883. **Leakage of urine due to weak bladder muscle or to blockage-when the bladder becomes over distended is known as**
   a. Stress incontinence
   b. Urge incontinence
   c. Overflow incontinence
   d. Functional incontinence

884. **Lower urinary tract is intact while other factors leads to incontinence such as immobility is .....**
   a. Stress incontinence b. Urge incontinence
   c. Overflow incontinence d. Functional incontinence

885. **Increase in number of stool and the passage of liquid, unformed faeces is termed as .....**
   a. Diarrhea b. Constipation
   c. Encopresis d. Incontinence

886. **Decrease in frequency of bowel movement associated with difficulty in passage of hard stool is .....**
   a. Diarrhea b. Constipation
   c. Encopresis d. Incontinence

887. **Varicose vein at or near anus is .....**
   a. Flatulence b. Hemorrhoids
   c. Impaction d. Dangling

888. **Passage of gas or air from urethra during or after voiding is called as .....**
   a. Pneumaturia b. Uremia
   c. Dysuria d. Strangury

889. **Slow and painful urination is called as .....**
   a. Pneumaturia b. Uraemia
   c. Dysuria d. Stranguary

890. **Blood in sputum is .....**
   a. Hemoptysis b. Hematemesis
   c. Hemothorax d. Hematochezia

891. **Blood in vomitus is .....**
   a. Hemoptysis b. Hematemesis
   c. Hemothorax d. Hematochezia

892. **Person with which of the following characteristics has highest chance to become infected with STD?**
   a. Intravenous drug use
   b. Unprotected sex with multiple partners
   c. Sex with people they don't know
   d. Homosexual

893. **Which of the following action is most likely to prevent diaper rash in infant?**
   a. Wash with a mild cleanser and water and dry thoroughly whenever stooling has occurred
   b. Wash with soap and water every time diaper is changed
   c. Wipe the buttocks with oil and powder the creases while changing the diaper
   d. Wash with soap before applying a thin layer of oil

894. **Ringworm frequently found in school age children is caused by which of the following?**
   a. Viral infection b. Allergy
   c. Fungus d. Protozoa

895. **Women are at higher risk for Human Papillomavirus (HPV) genital infections because**
   a. Of their hormonal influence
   b. Of their weak immune system compare to men
   c. They are passive partner in sexual act
   d. They have a larger mucosal surface area exposed in the genital area

896. **Syphilis infection is caused by a**
   a. Virus b. Fungus
   c. Spirochete d. Protozoa

897. **Excessive secretion of growth hormone by anterior pituitary in prepubertal children causes**
   a. Addison's disease b. Cushing's disease
   c. Gigantism d. Adenomegaly

898. **The substances that cause tissue necrosis and damage particularly when extravasated are:** *(AIIMS Raipur Grade II 2017)*
   a. Apoptosis b. Interleukins
   c. Vesicants d. Retinoids

Explanation: Apoptosis is programmed cell death seen in multicellular organisms. Interleukins are class of glycoproteins produced by leukocytes for regulating immune responses. Vesicants are chemical substances which causes severe skin, mucosal, eye and skin irritation. Retinoids are chemical compounds which are related to vitamin A.

899. **The activities of a person engages in believing himself ill in the characteristic of:** *(AIIMS Raipur Grade II 2017)*
   a. Health behavior b. Illness behavior
   c. Sick - role behavior d. Wellness behavior

Explanation: Illness behavior is the manner in which person monitors bodies and defines and interpret symptoms and take remedial action and utilizes various sources of help. Wellness behavior is a multifaceted approach to living that promotes being well in all areas of life. Health behaviors are activities undertaken of preventing or detecting disease or for health and wellbeing.

900. Which among the following is an excitatory amino acid receptor antagonist? *(AIIMS Raipur Grade II 2017)*

a. Phencyclidine
b. Quisqualate
c. Homocysteate
d. Kainate

Explanation: An excitatory amino acid receptor antagonist/ glutamate receptor antagonist is a chemical substance which antagonizes one or more of the glutamate receptors. The drugs include AP5, Barbiturates, Dextromethorphan, Dextrorphan, Dizocilpine, Ethanol, Ibogaine, Ifenprodil, ketamine, kynurenic acid, Memantine, Nitrous oxide, perampanel, Phencyclidine.

901. All among the following are cellular adaptations EXCEPT: *(AIIMS Raipur Staff Nurse Grade I-2018)*

a. Hypertrophy
b. Hyperplasia
c. Atrophy
d. Metaplasia

Explanation: Atrophy is break down and reabsorption of tissues. Hypertrophy means increase in cell size, hyperplasia is increase in cell numbers and metaplasia is reversible transformation of one type of differentiated cells to others.

902. Which one of the following is an example for a non-economic good? *(AIIMS Raipur Staff Nurse Grade I-2018)*

a. Doctor's service
b. Teacher's service
c. Mother's service
d. Banker's service

Explanation: Except mother's service which is unpaid all others are economic good.

903. Compression of bleeding carotid artery immediately leads to:

a. Vomiting
b. Stroke
c. Blindness
d. Loss of sense of smell

Explanation: Carotid artery supplies blood to brain so compression of them may cause stroke and it is followed by anticoagulant to be started.

904. The 'Kahn Test' for syphilis is an example of: *(AIIMS Bhopal Nursing Officer, 2018)*

a. Tube flocculation testt
b. Slide flocculation test
c. Coombs test
d. Ring precipitation test

Explanation: Kahn Test' for syphilis is an example of tube flocculation test. Slide flocculation test was employed as the routine serologic test for syphilis

905. 'Transportation of triglycerides from liver to adipose tissues' is the function of which of the following lipoproteins? *(AIIMS Bhopal Nursing Officer, 2018)*

a. Low density lipoprotein
b. Intermediate density lipoprotein
c. Very low density lipoprotein
d. High density lipoprotein

Explanation: Transportation of triglycerides from liver to adipose tissues' is the function of Very low density lipoprotein

906. The only endocrine gland which can store its hormone is: ...

a. Pituitary
b. Pancreas
c. Thyroid
d. Adrenal gland

Explanation: Thyroid is the only endocrine gland which can store its hormonal secretion and can secrete it into the blood whenever the body is in need. Pituitary stores the hormones which are secreted by hypothalamus.

907. Body tissue works better with temperature of .....

a. 32-34°C
b. 34-36°C
c. 36-38°C
d. 38-40°C

Explanation: Best functioning of body tissue ensured with optimal body temperature of 36-38°C

908. All of the following are the methods to calculate extent of burn injury EXCEPT

a. Rule of nine
b. Waterlow method
c. Lund Browder method
d. Palmar method

Explanation: Waterlow method is used to assess the risk of pressure ulcer in a bedridden client. Other methods are used in calculation of area of burn injury. Rule-of-nine estimates the body surface area on an adult that has been burned by using multiples of nine. Lund Browder is a method for estimating the extent of burns that allows for the varying proportion of body surface in persons of different ages. In palmar method scattered burn percentage is calculated by considering patient's own palm as 1%

909. PLISSIT model is for .....

a. Sex therapy
b. Spiritual therapy
c. Family therapy
d. Behavioral therapy

Explanation:

PLISSIT Model of addressing sexual functioning (Annon, 1976)

Explanation	Permission	Giving patients permission to raise sexual issues
	Limited information	Giving patients limited information about sexual side effects of treatment
	Specific suggestions	Making specific suggestions based on a full evaluation of presenting problems
	Intensive therapy	Referral to intensive therapy (includes psychological intervention, sex therapy and/or biomedical)

910. Active strategies of health promotion include .....

a. Weight reduction
b. Quit alcohol consumption
c. Smoking cessation
d. All of the above

Explanation: Active strategies for health promotion of individual are promoted to adopt a particular lifestyle or pattern, they are actively involved in the activity.

911. WHO definition of health is

a. Complete absence of disease
b. Physical and mental wellbeing
c. Complete physical, mental and social well-being not merely the absence of disease or infirmity
d. Complete physical, mental, psychological and social well-being

Explanation: Option C indicate WHO definition of health.

Ans.

912. The size of the intravenous cannula used for neonates is:
a. 18 Gauze b. 20 Gauze *(DSSSB 2013)*
c. 22 Gauze d. 24 Gauze

Explanation: Sizes of Cannula:
- 14 G- (Orange) adolescent and adult.
- 16 G- (Grey) adolescent and adult major surgery and trauma.
- 18 G- (Green) adolescent and adult major surgery and trauma.
- 20 G- (Pink) Older children, adolescent and adult.
- 22 G- (Blue) Older children, adolescent and elderly adult.
- 24 G-(Yellow) Neonate, infant and toddler.

913. An individual who does not believe in the existence of God is an
a. Agnostic b. Agenic
c. Atheist d. Anarchist

Explanation: Atheism is not a disbelief in Gods or a denial of God; it is a lack of belief in God.

914. Cell concentration techniques include all of the following except: *(Banaras HU 2015)*
a. Centrifugation b. Cytospin
c. Cell block preparation d. Plasmapheresis

915. What is the recommended maximum noise level? *(Kerala PSC, Nov 2014)*
a. 85 decibel b. 90 decibel
c. 80 decibel d. 75 decibel

916. An upper limit of noise which people can tolerate without damage to their hearing is: *(RRB Feb 2012)*
a. 85 db b. 65 db
c. 105 db d. 45 db

917. The amount of moisture in the air is recorded with: *(Staff Nurse G II 2014)*
a. Anemometer b. Hygrometer
c. Barometer d. Six's thermometer

918. What is the other name of thumb forceps? *(LNJP H D 2012)*
a. Needle holder b. Mosquito forceps
c. Kelly's forceps d. Mouse's teeth

919. Surgical needles are: *(LNJP H D 2012)*
a. 5/8 circle b. Straight
c. 1/4 circle d. All of the above

920. Temporary hardness of water is also called as: *(RRB Feb 2012)*
a. Chloride hardness b. Sodium hardness
c. Carbonate hardness d. None

921. Anemometer is used to measure: *(RRB Feb 2012)*
a. Air temperature b. Air velocity
c. Humidity d. Air pollution

922. A nurse stands to protect the needs and wishes of the patient. What role does she exhibits?
a. Caregiver b. Counselor
c. Client advocate d. Nurse manager

923. Which one of the following is NOT an attribute of a professional?
a. Concerned with quantity
b. Concerned with quality of outcome
c. Independent
d. Self-directed

924. A nurse in the critical care unit explains to the client and family regarding the future treatment and surgery options. Here nurse is performing the role of .....
a. Advocate b. Caregiver
c. Researcher d. Leader

925. Which of the following statement best describes 'knowing the patient'?
a. Anticipating the patient's personal preferences of shift nurse
b. Identify the patient's preference on physician
c. Collecting task-oriented information during assessment
d. Establishing an understanding of a specific patient

926. Holistic care refers to
a. Disease, spirit, and environmental interactions
b. Emotions of the patient
c. Mind-body-spirit of the patient and their families
d. Muscles and neurological disorders

927. Which of the following is the leading cause of death among adolescents?
a. Stress related illnesses b. Suicide
c. Communicable diseases d. Accidents

928. A process by which certain cells engulf and destroy foreign particles or microorganisms is known as
a. Cytolysis b. Phagocytosis
c. Apoptosis d. All of the above

929. Phagocytosis is considered as a _____ against infection
a. First line defense b. Second line defense
c. Third line defense d. Fourth line defense

930. All of the following are the goals of restraining the patient, except
a. To prevent injuries due to fall
b. To prevent self-directed violence
c. To prevent pressure ulcer
d. To impose control on behavior

931. Flush is defined as a
a. Sudden redness of the skin
b. Bluish discoloration of the skin
c. Pale skin
d. None of the above

932. Which of the following is the most common source of client injury?
a. Medication error and falls
b. Transfer from bed
c. Bedsore
d. Needle stick injury

933. Type of bandage used in head injury is .....
a. Spira. b. Figure of eight
c. Capline d. Sling

934. The primary source of heat in the body is
a. Sunlight b. Metabolism
c. Heart beat d. Circulation

935. What is the primary purpose of an incident report?
a. Identifying risks
b. Staff evaluation
c. Disciplinary action
d. Audiotape report

936. Bandage indicated in collar bone fracture is .....
a. Cap line
b. Spiral
c. Figure of eight bandage
d. Splint

937. A method used to assist individuals with disability or chronic illness to attain and maintain maximum function
a. Restorative care
b. Rehabilitation
c. Reconstruction
d. All of the above

"It is health that is real wealth and not pieces of gold and silver."
—Mahatma Gandhi

3 PHARMACOLOGY

SYNOPSIS

KEY TERMINOLOGIES

- **Pharmacology**: It is derived from Greek words 'pharmacon' which means drugs and 'logos' which means study or knowledge. It is the scientific study of the origin, nature, chemistry, effects and uses of drugs.
- **Drug/medications:** Any chemical substance which affects living systems. French word 'drogue' means 'dry herb.' – used for treatment of disease, for the prevention of illness of pathologic states and for diagnosing disease condition.
- **Chemotherapy: Therapeutic treatment of various local or systemic infections or malignancies by using various drugs or chemicals is called chemotherapy.**
- **Pharmacognosy**: The branch of pharmacology dealing with the economic, biological and chemical aspects of natural drugs and their constituents. Study of the sources of drugs and the physical characteristics of crude or unrefined drugs. E.g. Plants.
- **Pharmacodynamics** is the effect that drugs have on the body (what drug does to the body).
- **Pharmacokinetics** is the study of the way in which drugs move through the body during **absorption, distribution, metabolism** and **excretion** (what body does to the drug).
- **Absorption**
  - Physiological considerations in absorption: **Blood flow, total surface area, time of arrival of the drug** and **time of drug at absorption site.**
  - Other considerations for absorption: **Solubility, chemical stability** and solubility of drug in **lipids.**
- **Distribution**
  - Drugs are distributed into major body fluids (e.g. plasma).
  - Drug distribution is affected by the extent that the drug binds to plasma proteins and barriers.
- **Biotransformation**
  - It is a process of metabolizing drugs in the body.
  - Occurs mainly in liver.
  - Prodrugs are only activated by the hepatic metabolism. **E.g. Levodopa.**
- **Excretion:** Excretion includes renal (by active glomerular filtration and fecal elimination).
- The time of the onset of drug action is determined by the time taken by the drug to reach to the site of action. It is largely controlled by:
  - Route of administration
  - Rate of absorption
  - Manner of distribution
- **Bioavailability:** It is a measure of fraction of administered drug that reaches the systemic circulation in the unchanged form.
- **First Pass Metabolism:** It is the metabolism of a drug at the site of absorption during its passage from the site of absorption into the systemic circulation. All orally administered drugs undergo first pass metabolism. Drugs administered through sublingual, transdermal and parenteral routes does not undergo first pass metabolism (bypasses portal circulation)
- **Agonist**: These are the drugs which bind to the receptor and produce same biological effect as that of the receptor.
- **Antagonist**: These are the drugs which oppose the action of the receptor or an agonists.
- **Antidote**: A drug which can counteract a form of poisoning. E.g. Atropine is an antidote to organophosphorus poisoning.
- **Lethal Dose 50 (LD50):** Standard measure of the toxicity of a drug/substance that will kill half of the sample population of a specific test animal in a specific period.
- **Pharmacovigilance**: The science and activities relating to the detection, assessment, understanding and prevention of adverse effects or any other drug related problem.
- **Teratogenicity**: It is the ability of a drug to produce harmful effect of drugs on fetus when administered during pregnancy.
- **Anaphylaxis**: It is a severe allergic reaction (hypersensitive reaction), which occurs due to ingestion of drugs or any foreign protein material.
- **Antidote**: A drug or chemical substance which counteracts the harmful effects of other drug or chemical.
- **Contraindication**: Any condition or factor, which prevents or withholds the use of a medicine or drug.
- **Emulsion**: It is the mixture of two or more liquids that are normally immiscible (E.g. Mixture of water and oil). Milk is a natural emulsion.
- **Half-life**: It is the period of time required for the concentration of drug in body (usually plasma) to be reduced to one-half. It is one of the major factor influences the duration of action of a drug.
- **Iatrogenic**: Refers to condition or illness, occurs due to the action of physician or therapy. It is the result of diagnostic and or therapeutic procedures undertaken on a patient.
- **Idiosyncrasy**: It is genetically determined abnormal reactivity to a drug.
- **Loading dose:** Administering a drug at a dose higher than the routinely used dose is called as loading dose.
- **Synergism:** Drugs are said to be synergistic when the action of one drug is potentiated or increased by the other. It can be additive or superadditive.
  - **Additive:** Effect of drugs A + B = Effect of drug A + Effect of Drug B. E.g. 1 + 1 = 2
  - **Superadditive:** Effect of drugs A + B > Effect of drug A + Effect of Drug B. E.g. 1 + 1 = 10
- **Antagonism:** Drugs are said to be antagonistic when one drug decreases or abolishes the action of another drug.
- **Pharmacopoeia:** It is the official publication which contains all details about established drugs, being in a particular country. E g. Indian Pharmacopoeia (IP), British Pharmacopoeia (BP), United States Pharmacopoeia (USP)

Scanned with CamScanner

PRODRUGS

- A prodrug is a medication or compound, which is inactive, that needs to converted in the body into pharmacologically active drug.
- List of prodrugs and their active form are as follows:

Table 1

Prodrug	Active form
Acyclovir	Acyclovir triphosphate
Fluorouracil	Fluorouridine monophosphate
Bacampicillin	Ampicillin
Prednisone	Prednisolone
Sulindac	Sulfide metabolite
Enalapril	Enalaprilat
Alfa-Methyldopa	Alpha-methyl norepinephrine
Fosphenytoin	Phenytoin

THERAPEUTIC INDEX (TI)

- It is also called safety margin of a drug. It refers to the ratio between the dosage of a drug that causes **a lethal effect** and the dosage that causes a **therapeutic** effect.
- Therapeutic Index (TI) = LD50/ED50
  Where LD 50: Lethal Dose 50 and ED: Effective dose 50
- For the drugs with narrow therapeutic index: Slight deviation from the prescribed dose can be harmful to patients. **Plasma level monitoring is required.**
- For drugs with wide therapeutic index: Usually deviation from prescribed dosage may not be harmful for the patient.

Table 2 Therapeutic indices of some common drugs

Very narrow therapeutic index	Narrow therapeutic index	Wide therapeutic index
• Vancomycin • Amphotericin • B Polymyxin	• Warfarin • Levothyroxine • Carbamazepine • Lithium Carbonate • Digoxin • Phenytoin • Theophylline • Morphine	• Almost all Antibiotics • NSAIDS • Hypnotics/Sedatives • Beta-blockers • Benzodiazepines

DIFFERENT ROUTES OF ADMINISTRATION, ITS ADVANTAGES AND DISADVANTAGES

Table 3

Route	Advantages	Disadvantages
Oral route	Easy to take No professional assistance required Economical	Gastric acid may decrease the drug efficiency It causes GI irritation Variable rate of absorption will occur
Sublingual route	This helps to avoid the first pass metabolism and interaction with gastric acid	Not suitable for all the preparation
Rectal route	This helps to avoid the first pass metabolism and interaction with gastric acid	Not suitable for all the preparation Administration may affect the dignity of the patient.
Parenteral (refers to IV, IM and SC) Routes		
Intravenous	Fast action and 100% bioavailability	Lack of aseptic technique may lead to sepsis. Danger of extravasation. Phlebitis can occur if irritant drugs are administered
Intramuscular	Rapid absorption	Painful, increased risk for tissue damage
Subcutaneous	Provide drug over a period of time i.e. it promotes slow absorption of drug	Absorption rate will be varying
Inhaled drug	Large absorption area	Not suitable for all preparation

Contd...

SPECIAL DRUG DELIVERY SYSTEM

- **Dermojet:** This is painless and needleless method of drug administration. A high velocity jet of drug solution is projected through a micro-fine orifice using a gun-like device. The drug will get deposited in the subcutaneous tissue.
- **Pellet implantation:** The drug is in the form of solid pellet. It is introduced surgically with the help of trocar and cannula. The drug will be released from the solid pellet for weeks and month. E.g. DOCA, testosterone.
- **Implants:** Drug packed in tube or capsule is implanted under the skin. Uniform and slow release of drug occurs for months together.
- **Liposomes:** Minute vesicles made of phospholipids into which the drug is incorporated. It is used for targeted delivery. E.g. Amphotericin B and Anticancer drugs.
- **Monoclonal antibodies:** These are antibodies which selectively react with specific antigen. E.g. Rituximab, cetuximab.

Table 4 Drugs and their deposition in the various body tissues

Body tissues where deposition occurs	Drugs
Bone and teeth	Tetracycline, heavy metals
Skeletal muscle and heart	Digoxin, emetine (bound to muscle proteins)
Liver	Chloroquine, tetracycline, emetine, digoxin
Kidney	Digoxin, chloroquine, emetine
Thyroid	Iodine
Retina	Chloroquine (bound to nucleoproteins)

Commonly used Abbreviations in Prescriptions

- ℞: The symbol R is an abbreviation for the Latin word RECIPE, which means take thou or you take. The line on the foot of R is set to designate an invocation to Jupiter, the
- God of Knowledge, learning and healing.
- **Tab:** Tablet
- **Cap:** Capsule
- **Inj:** Injection
- **IM:** Intramuscular
- **IV:** Intra venous
- **SC:** Subcutaneous
- **I/D:** Intradermal
- **OD:** Once in a day
- **BD/BID:** Bis in die (Twice a day)
- **TDS:** Ter in die sumendum (To be taken thrice a day)
- **TID:** Ter in die (Three times a day)
- **QID:** Quarter in die (Four times a day)
- **HS:** Hora somni (At bed time)
- **Stat:** Stain (Immediately)
- **Rept:** Repetatur (Repeat)
- **Non rept:** Non repetatur (Non repeat)
- **AC:** Ante cibum (Before meals)
- **PC:** Post cibum (After meals)
- **NPO:** Nil per orally (Nothing to taken by mouth)
- **BBF:** Before breakfast
- **AD:** After dinner
- **SOS:** As and when required

CONVERSION EQUIVALENCE OF WEIGHT

Table 5

Unit	Symbol	Equivalent
1 kilogram	kg	1,000 grams (g)
1 kilogram	Kg	2.2 pounds (lb)
1 gram	g	1,000 milligrams (mg)
1 milligram	mg	1,000 micrograms (µg)
1 microgram	µg	1,000 nanograms (ng)
1 ounce	oz	28.35 g
1 pound	Lb	454 g
1 gram	g	15.432 grains

CONVERSION EQUIVALENCE OF VOLUME

Unit	Equivalent
1 drop (gtt)	0.05 mL
1 mL	20 drops
1 teaspoon full	5 mL
1 Tablespoon full	15 mL
1 mL	16.23 minims
1 minim	0.06 mL
1 pint	473 mL
1 quart	949 mL
1 gallon	3745 mL

Contd...

DRUG CALCULATION

- To convert a smaller unit (e.g. a gram) into a larger unit (e.g. a kilogram), divide by 1000, so
  - 3000 g ÷ 1000 = 3 kg
- To convert a larger unit (e.g. a kg) into a smaller unit (e.g. a gram), multiply by 1000, so:
  - 3 kg × 1000 = 3000 g

Basic Formula

There is more than one way to do a drug calculation, but the simplest and most widely used method is the basic formula shown here:

$$\frac{(D \times Q)}{H} = X$$

D = desired dose
H = strength available
Q = quantity or unit of measure (for tablets Q = 1, for liquids Q can vary)
X = dose to be determined/amount to be given

Some Examples

1. The doctor orders a dose of 100 mg to be given orally. You have 25 mg tablets.
   How many tablets should you give?
   $$\frac{(100 \times 1)}{25} = X$$
   X = 4 tablets
2. The patient requires 800 mg of liquid to be given orally. You have 250 mg in 5 mL of solution. What volume of drug should be given?
   Applying the same formula given above

Note

While calculating for tablets Q = 1; for liquids, usually Q is the no. of mL given. In this case 5 mL)

$$\frac{(800 \times 5)}{250} = X$$

400/25 = 16 mL

- The patient needs 270 mg of drug D by injection. 150 mg in 5 mL of liquid is available. How many mL will you administer?

$$\frac{(270 \times 5)}{150} = X$$

X = 9 mL

Scanned with CamScanner

CHEMOTHERAPEUTIC AGENTS

Table 6 Antibiotics, antifungals and antivirals with their examples, therapeutic uses and side effects

Class of drugs	Examples	Therapeutic uses	Side effects
Penicillins	**Natural penicillin** • Penicillin G (Acid-labile) • Penicillin V (Acid-resistant) Penicillinase-resistant agent • Oxacillin • Cloxacillin Aminopenicillins • Ampicillin • Amoxicillin β-lactamase inhibitors • Clavulanic acid • Sulbactam • Tazobactam	• Streptococcal infection • Gonococcal and syphilis • *Pseudomonas aeruginosa* • *Haemophilus influenzae*	• Hypersensitivity. • Skin rash to anaphylactic shock (penicillin allergy) • It is more common with parenteral administration of penicillin
Cephalosporins	**First generation** • Cefazolin • Cefadroxil • Cefalexin **Second generation** • Cefuroxime • Cefoxitin • Cefaclor • Cefprozil **Third generation** • Cefixime • Cefotaxime • Ceftriaxone **Fourth generation (parenteral)** • Cefepime • Cefpirome **Fifth generation (parenteral)** • Ceftobiprole • Ceftaroline	• Urinary Tract infection (UTI) • Pneumonia • Serious bacterial infections • Soft tissue infection	• Minor gastrointestinal complaints • Nephrotoxicity • Thrombophlebitis on IV (intravenous) administration
Aminoglycosides	Streptomycin, Amikacin, Gentamicin, Neomycin, Kanamycin, Tobramycin	• Gram negative pneumonias • Pseudomonas infections	• Nephrotoxicity • Ototoxicity • Neuromuscular blockage
Tetracyclines	Tetracycline, Doxycycline, oxytetracycline, Minocycline and Demeclocycline.	• Atypical pneumonias • Mycoplasma infection	• **Tooth discoloration in children Growth retardation** • Bone marrow depression • Hypersensitivity • Oral and vaginal candidiasis
Fluoroquinolones	**First generation** • Ciprofloxacin • Ofloxacin • Norfloxacin **Second generation** • Levofloxacin • Moxifloxacin	• Chronic bronchitis • Cystic fibrosis • Effective against *H. influenzae*, P. pneumonia, *N. meningitides*, Pertussis, Pseudomonas	• Ciprofloxacin contraindicated for children (below age 21).
Macrolide antibiotics	Erythromycin Azithromycin Clarithromycin Roxithromycin	• Respiratory infection • Genital, GI and soft tissue infections. • Drug of choice for mycoplasma	• GI upset • Anorexia • Diarrhea
Sulfonamides	Trimethoprim Sulfamethoxazole (Cotrimoxazole: Combination of above two drugs)	• UTI • *Pneumocystis carinii* pneumonia • Pneumonia	• Leukopenia • Rash • Fever

Contd...

Scanned with CamScanner

Class of drugs	Examples	Therapeutic uses	Side effects
Antifungal agents	Amphotericin B	Severe fungal infections (systemic antifungal)	• Nephrotoxicity • Hypotension
	Nystatin Ketoconazole Fluconazole	(Oral and topical) • Oral thrush • *Candida albicans*	• Allergic reaction • Itching, burning sensation and redness on local application
Antiviral	Acyclovir Ganciclovir Amantadine Rimantadine	• Herpes simplex virus • Herpes zoster • Cytomegalovirus	• Dizziness, nausea, vomiting, stomach pain and joint pain
	Antiretroviral • Lamivudine • Zidovudine • Stavudine	• HIV infection	
Antimalarial	Quinine Chloroquine Primaquine Mefloquine	• Treatment of malaria • Chloroquine use is safe in pregnant women.	• Stomach upset • Blurred vision

CARDIAC DRUGS

Cardiac Glycosides (Digitoxin)

- Cardiac glycosides are effective drugs for treatment of Congestive Heart Failure (CHF).
- **Drugs:** Digitoxin (0.05–0.3 mg/day), Digoxin (0.4-0.6 mg followed by 0.05–0.35 mg once or twice daily).
- **They increase the force of myocardial contractions** (positive inotropic).
- Increases the release of **Ca^{++}** ions in the myocardial cells.
- Used to treat cardiac **arrhythmia** because they decrease heart rate.
- **Pulse should be assessed before Digoxin administration and it should not be administered if heart rate (pulse) is below 60 b/min.**
- **Indications: CHF, cardiac arrhythmia** (atrial fibrillation, atrial flutter and sinus tachycardia).
- **Side effects:** Cardiac arrhythmia such as bradycardia (below 60 beat/minute), ventricular fibrillation (which may lead to cardiac arrest and death) and bigeminal rhythm and skin rashes. Vision changes including **blurring of vision, blind spots, diplopia** and **white halos.**
- **Digoxin and Potassium:** Hypokalemia in the body can increase the risk of digitalis toxicity. On the other hand, digoxin toxicity causes hyperkalemia.

Nitrates/Nitrites

- Treatment of chronic angina pectoris and hypertension associated with MI or CHF
- **Nitroglycerin ointment** for treatment of **Raynaud's disease.**
- **Dose: Sublingual–5 mg PRN; Oral–20–40 mg twice a day.**
- **Side effects:** Headache, syncope, dizziness, postural hypotension, transient flushing and palpitation. Topical application may lead to dermatitis.

Calcium Channel Blockers

- Diltiazem, Nifedipine, Amlodipine besylate, Verapamil
- Reduce myocardial contractility
- Inhibit spasm of coronary arteries
- Peripheral vasodilation

Antihypertensive Drugs

Antihypertensive agents are initiated when systolic blood pressure more than 140 mm Hg and diastolic blood pressure is higher than 90 mm Hg.

Angiotensin-converting Enzyme Inhibitors (ACE Inhibitor)

E.g. Captopril, Enalapril maleate.

- **Indications:**
  - Hypertension
  - In combination with diuretics and digitalis in the treatment of CHF
  - Most common side effect is dry cough.
- **Side effects:** Skin rash, loss of taste, neutropenia, nausea, vomiting, hypotension, proteinuria, renal failure and hyperkalemia.
- **Dose:** 12.5 mg 2–3 times per day (captopril).

Beta-Adrenergic Blocking Agents

E.g. Atenolol, Sotalol, Propranolol, Metoprolol, Timolol.

- **Action:** It combines with beta-adrenergic receptors to block the response to sympathetic nerve impulses, circulating catecholamines or adrenergic drugs.
- **Uses:** Hypertension, angina pectoris, cardiac arrhythmias, myocardial infarction, prophylaxis of migraine.
- **Side Effects:** Bradycardia, CHF, hypotension, cold extremities, edema, dyspnea, shortness of breath, nausea, vomiting, hepatomegaly and bronchospasm.

Centrally Acting Agents

- These agents are used for treatment of chronic hypertension, since it affects CNS.
  E.g. Clonidine hydrochloride, Methyldopa.
- **Uses:**
  - **Clonidine:** Mild to moderate hypertension.
  - **Methyldopa:** Hypertension and hypertensive crisis (parenteral).
- **Side effects:** Drowsiness, headache, malaise, dry mouth, **bradycardia** and constipation.

Scanned with CamScanner

Agents that act Directly on Vascular Smooth Muscles

E.g. Hydralazine hydrochloride.

- **Uses:** These agents are used with combination therapy to treat hypertension. Given **parenterally** in hypertension emergencies.
- **Side effects:** Orthostatic hypotension, tachycardia, nausea, vomiting, headache, dizziness, constipation and male impotence.

Table 7 Antihypertensive drugs with their examples and action

Category	Examples	Action
Diuretics	• Chlorothiazide • Hydrochlorothiazide • Furosemide • Amiloride	Thiazide diuretics are the 1st line drug in mild to moderate hypertension
β-Blockers	• Propranolol • Atenolol • Labetalol • Esmolol • Nadolol	• Block β-receptors thereby ↓Heart rate and CO. • Longest acting beta blocker: **Nadolol** • Shortest acting beta bloker: **Esmolol**
Calcium channel blockers	• Nifedipine • Nicardipine • Amlodipine • Nimodipine • Verapamil • Diltiazem	• Prevent entry of calcium • Causing relaxation of blood vessels • ↓Myocardial contractions.
ACE inhibitors	• Captopril • Enalapril	• Inhibit conversion of Angiotensin I to Angiotensin II (Angiotensin II cause vasoconstriction and increased BP)
Vasodilators	• Hydralazine • Sodium nitroprusside	• Dilate blood vessels

Antiarrhythmic Agents

- **Amiodarone hydrochloride (200–400 mg/day):** Reserved for life threatening ventricular arrhythmias which don't respond to other therapy
- **Lidocaine hydrochloride:** Used in acute ventricular arrhythmias which follows MI or cardiac surgeries.
  - **Loading dose:** IV bolus 50–100 mg, followed by intravenous **Infusion**: 20–50 mg/kg at a rate of 1–4 mg/m.
- **Procainamide:** Used in ventricular tachycardia, atrial fibrillation, digitalis intoxication.
- **Propranolol**
- **Verapamil.**

DRUGS ACTING ON CENTRAL NERVOUS SYSTEM

General Anesthetics

These are group of drugs which bring about a reversible loss of pain, sensation and consciousness.

Classification

- **Inhalational anesthetics**
  - Gases
    - Nitrous oxide (70–80% with other agents) (used as an adjuvant with other anesthetic agents).
    - Cyclopropane (5–25%)
  - Volatile Liquids
    - Ether (Diethyl ether) 3–10%
    - Trichloroethylene (0.25–0.75%)
    - Halothane (0.5–2.0%)
    - Methoxyflurane (0.1–0.3%)
    - Enflurane (1–3%)
    - Isoflurane (0.8–2.0% or not)
- **Intravenous Anesthetics**
  - Ultra-short acting barbiturates
    - Hexobarbitone
    - Thiopentone sodium (3–5 mg/kg)
    - Methohexital sodium (1–3 mg/kg)
  - Non-barbiturate intravenous anesthetics
    - Propofol
    - Ketamine
    - Diazepam
    - Lorazepam
    - Midazolam
- Nitrous oxide is also called **"Laughing gas".**
- The usual concentration used is 70 percent nitrous oxide + 30 percent oxygen with some muscle relaxants.
- **Prolonged administration of nitrous oxide as in cases of tetanus, may cause bone marrow depression and agranulocytosis.**
- **Cyclopropane** may produce a variety of **cardiac irregularities** such as **tachycardia and fibrillation.**
- **Ether was the first substance to be used for general anesthesia (1846).**
- **Halothane** causes relatively greater **respiratory depression.**
- **Methoxyflurane** is the most potent inhalational anesthetic. It also produces respiratory and cardiovascular depression like **Halothane** but **bradycardia** is more prominent.
- After thiopentone injection, **blood pressure falls** immediately but recovers rapidly.
- **Adverse effects of thiopentone include laryngospasm, shivering and delirium.**
- **Ketamine is a new non-barbiturate anesthetic agent. IV ketamine produces unconsciousness and analgesia within 30 seconds. It acts on cerebral cortex and subcortical areas.**
- **Fentanyl-droperidol combination** is recommended for endoscopies, angiographies, burn dressings etc.
- **Chlorpromazine (25 mg), trifluprozine (10 mg) or haloperidol (2-4 mg) IM are used as preanesthetic medication.**

SEDATIVE AND HYPNOTICS

Classification

- Barbiturates
  - Phenobarbitone
  - Pentobarbitone
  - Butobarbitone
  - Secobarbitone
- Benzodiazepines
  - Used as hypnotics
    - Diazepam
    - Nitrazepam
    - Midazolam

Scanned with CamScanner

- Used as antianxiety agents
  - Diazepam (long acting)
  - Chlordiazepoxide (long acting)
  - Lorazepam (short acting)
  - Alprazolam (short acting)
  - Oxazepam
- **Newer nonbenzodiazepines hypnotics**
  - Zopiclone
  - Zolpidem

- **Diazepam** and **Clonazepam** are also used as **antiepileptic agents also in emergency like status epilepticus.**
- **Barbiturates** produces CNS depression.
- **Phenobarbital is drug of choice for convulsion. It is also used as preanesthetic medication.**
- Manifestations of **Barbiturate poisoning** includes respiratory depression, circulatory shock, initially constriction of pupil and then dilated, hypothermia, renal failure and pulmonary edema.
- **Treatment of acute barbiturate poisoning:** Gastric lavage, mechanical ventilation, forced diuresis and dialysis.
- **Benzodiazepines** act by potentiating neural **inhibition in CNS** which is mediated by **GABA** (GABA facilitator).
- **Antidote** → Flumazenil

Table 8 Sympathetic and parasympathetic mediated actions on different organs

Site	Action of sympathetic	Action of parasympathetic
Heart	Stimulates HR (heart rate), conduction	Depress (↓es, HR, ↓es conduction)
Bronchus	Relaxes (bronchodilation)	Stimulates (broncho-constriction)
GIT	Relaxes (↓es movements)	Stimulates (movements)
Bladder	Relaxes (↓es urine flow)	Stimulates (↑es urine flow)
Pupil	Relax (mydriasis)	Stimulates (miosis)
Glands	Depress (secretions except sweating)	Stimulates (secretions except sweating)

ANTIPSYCHOTIC DRUGS

Classification

Typical Antipsychotics

- **Phenothiazines**
  - Chlorpromazine: 40–800 mg
  - Perphenazine: 12–64 mg
  - Fluphenazine: 1–10 mg
  - Thioridazine: 100–400 mg
- **Thioxanthenes**
  - Thiothixene: 6–30 mg
- **Butyrophenones**
  - Haloperidol: 1–20 mg
- **Dibenzothiazepine**

Atypical Antipsychotics

- Clozapine: 100–300 mg
- Olanzapine: 5–20 mg
- Aripiprazole: 15-30 mg/day
- Risperidone: 2–8 mg
- Quetiapine: 50–400 mg

Indications

- Acute and chronic psychosis.
- Selected agents used as antiemetics (chlorpromazine, prochlorperazine).
- Intractable hiccoughs (chlorpromazine, perphenazine)
- Tics and vocal utterances in Tourette's disorder (haloperidol, pimozide).
- Doc for Tourette Syndrome → ARIPIPRAZOLE

Action

Acts by blocking postsynaptic dopamine receptors in the basal ganglia, hypothalamus, limbic system, brainstem and medulla.

Contraindications

- Blood dyscrasias
- Parkinson' disease
- Liver/renal/cardiac insufficiencies.

Side Effects

- **Anticholinergic effects**
  - Dry mouth, Blurred vision, constipation, urinary retention.
- Nausea, skin rash, sedation
- Orthostatic hypotension
- Photosensitivity
- **Hormonal effects**
  - Decreased libido, retrograde ejaculation, gynecomastia, amenorrhea, weight gain.
- **ECG changes:** Prolongation of the QT interval, are possible with most of the antipsychotics.
- Reduction of seizure threshold.
- **Agranulocytosis:**
  - Clozapine: Weekly/biweekly blood investigation. Hypersalivation **(clozapine).**
- **Extrapyramidal Symptoms (EPS) mainly with typicals**
  - Pseudoparkinsonism
    - Tremor, shuffling gait, drooling, rigidity.
    - 5–30 days after initiation of antipsychotics.
  - Akinesia
  - Akathisia (5–60 days after initiation of therapy).
  - Dystonia: Men; <25 years of age. Earliest onset EPS
  - **Oculogyric crisis**
    - Treated as emergency
    - Physician should be contacted immediately
    - Management: IV benztropine mesylate
  - Tardive dyskinesia.
- **Neuroleptic Malignant Syndrome (NMS)**
  - Severe parkinsonian muscle rigidity
  - Up to 107°C, tachycardia, tachypnea
  - Fluctuations in blood pressure, diaphoresis and rapid deterioration of mental status to stupor and coma
  - This is rare but potentially fatal complication of treatment with neuroleptic drugs
  - It may precipitate within hours to years after drug initiation.
  - Discontinue neuroleptic immediately
  - Management: Bromocriptine (Antidote)
  - Dantrolene

ANTIDEPRESSANTS

Classification

Monoamine Oxidase Inhibitors (MAOI)

- **Moclobemide, Clorgyline**

Contd...

Scanned with CamScanner

Tricyclic Antidepressants (TCAs)

- NA + 5-HT reuptake inhibitors
  - Imipramine, Amitriptyline, Trimipramine, Doxepin, Dothiepin, Clomipramine
- Predominantly NA reuptake inhibitors
  - Desipramine, Nortriptyline, Amoxapine

Selective Serotonin Reuptake inhibitors (SSRIs)

- Fluoxetine, Fluvoxamine, Paroxetine, Sertraline, Citalopram

Atypical Antidepressants

- Trazodone, Mianserin, Mirtazapine, Venlafaxine, Tianeptine, Amineptine, Bupropion.

Monoamine Oxidase Inhibitors (MAOI)

- Mood elevating effect develops **after 3–4 weeks.**
- Excitement and hypomania may be produced even in nondepressed individuals.
- **Side Effects:**
  - They produce a variety of **CNS and autonomic side effects.**
  - Agitation, hallucinations, mania, peripheral neuropathy and hepatocellular damage are serious toxic effects.
  - **Cheese reaction**. Avoid consuming cheese containing foods. When taking MAOIs, food high in tyramine needs to be avoided because these items can cause high increase in blood pressure. E.g. Aged cheese, cured meats, fermented cabbage, soy sauce, and fish sauce.

Tricyclic Antidepressants (TCAs)

- The TCAs inhibit monoamine uptake and interact with a variety of receptors (muscarinic, alpha adrenergic, histamine H1, 5-HT1, 5-HT2 and occasionally dopamine D2).
- **After 2–3 weeks** of continuous treatment the mood is gradually elevated.
- **Adverse effects:**
  - Dry mouth, bad taste, constipation, epigastric distress, urinary retention, blurred vision, palpitation, sedation, mental confusion and weight gain
  - Some patients may switch to hypomania or mania
  - Sweating and fine tremors are relatively common
  - Seizure threshold is lowered-**fits may be precipitated**
  - **Postural hypotension**, especially in older patients.

Note

Dangerous hypertensive crisis with excitement and hallucinations have occurred when TCAs are given with selective serotonin reuptake inhibitors (SSRI).

Selective Serotonin Reuptake Inhibitors (SSRI)

- Their relative safety and better acceptability has made them **first line drugs in depression** and allowed their extensive use in **anxiety, phobias, OCD** and related disorders.
- SSRIs are preferred for **prophylaxis of recurrent depression.**
- **Side Effects:** Nervousness, restlessness, insomnia, anorexia, dyskinesia, headache and diarrhea is associated with them, but patient acceptability is good.

MOOD STABILIZERS

Classification

- **Anticonvulsant mood stabilizers**
  - Valproic acid (Depakene) and sodium valproate (Depacon, Epilim)
  - Lamotrigine (Lamictal)
  - Carbamazepine (Tegretol)
  - Gabapentin (Neurontin)
- **Other mood stabilizers**
  - Lithium carbonate
- **Calcium Channel Blocker**
  - Verapamil

Lithium

- Lithium is used to treat the manic episodes of manic depression.
- Lithium may enhance reuptake of norepinephrine decreasing the levels in the body, resulting in decreased hyperactivity **(may take 1-3 weeks for symptoms to subside)**
- **Indications**
  - Prevention and treatment of manic episodes of bipolar disorder.
  - Also used for bipolar depression
- **Contraindications:**
  - Cardiac or renal disease
  - Dehydration
  - Sodium depletion
  - Brain damage
  - Pregnancy and lactation

Table 9

Clinical condition	Dose
Acute mania	1200–2400 mg
Maintenance	300–1200 mg
Therapeutic plasma range	**Dose**
Acute mania	1.0–1.5 mEq/L
Maintenance	0.6–1.2 mEq/L

- **Side Effects**
  - **Adverse reactions:** Below 1.5 mEq/ L.
    - CNS problem including lethargy, muscle weakness, and fine tremor; polyuria (renal toxicity); Beginning of GI toxicity, with nausea, vomiting and diarrhea; weight gain
  - **Mild to moderate adverse reactions:** 1.5 to 2.5 mEq/ L
    - Intensification of all the reaction as mentioned above, with ECG changes.
    - At 2 – 2.5 mEq/L level, there will be possible CNS effects such as ataxia, clonic movements, hyperreflexia, and seizures; ECG changes, hypotension and polyuria (diluted urine) and dehydration; fatalities secondary to pulmonary edema
  - **Severe reactions:** 2.5 mEq/L and above.
    - Complex multi-organ toxicity, with a significant risk of death
  - **EEG Changes:** Diffuse slowing, widening of the frequency spectrum.
  - **ECG Changes:** Reversible flattening, isoelectricity or inversion of T-waves.

Scanned with CamScanner

- **Client/Family Education**
  - **Not to drive or operate dangerous machinery** until lithium levels are stabilized.
  - The client should drink **6–8 large glasses of water** each day and avoid excessive use of beverages containing caffeine.
  - Notify the physician if **vomiting or diarrhea** occurs. These symptoms can result in **sodium loss and an increased risk of toxicity.**
  - Includes **adequate sodium** and other nutrients while decreasing number of calories.
  - **Be aware of risks of becoming pregnant** while receiving lithium therapy.

Carbamazepine

- Carbamazepine (CBZ) is an **anticonvulsant** and **mood stabilizing drug** used primarily in the treatment of **epilepsy** and **bipolar disorder.**
- It is also used to treat **Attention Deficit Disorder (ADD), Attention Deficit Hyperactive Disorder (ADHD), schizophrenia, phantom limb syndrome** and **trigeminal neuralgia.**
- **Daily Dose:** 400–1200 mg for mania. (Plasma level 6–12 μg/mL).

Valproic Acid

- Valproic acid (VPA) has found clinical use as an **anticonvulsant** and **mood-stabilizing drug.**
- It is also used to treat **migraine headaches** and **schizophrenia.**
- Valproate is believed to affect the function of the **neurotransmitter GABA.**
- **Daily adult dosage:** 500–1500 mg (plasma range: 50–100 ug/mL).

DEADDICTION DRUGS

Phases in Treatment of Substance Abuse

- **Withdrawal phase:** Treatment of withdrawal symptoms
- **Maintenance phase**

Agents Used to Treat the Withdrawal Phase

- **Opioid withdrawal:** Buprenorphine, dextropropoxyphene, clonidine.
- **Alcohol withdrawal:** Long acting benzodiazepines (chlordiazepoxide/diazepam).
- **Benzodiazepine withdrawal:** Shift to long acting benzodiazepines.
- **Nicotine withdrawal:** Nicotine gums and nicotine transdermal patch.
- **General management during withdrawal:** Analgesics/sedatives/antiemetics and antidiarrheals.

Maintenance Phase

For Alcohol Use Disorders

- **Deterrent:** Disulfiram, calcium carbamide, metronidazole.
- **Anti-craving:** Acamprosate, naltrexone, Fluoxetine.

For Opioid Use Disorders

- Opioid agonist substitution: **Methadone, buprenorphine, morphine.**
- Antagonist therapy: **NALTREXONE** — in maintain phase
  NALOXONE — in acute positioning

Disulfiram

- Disulfiram irreversibly inhibits the activity of a particular enzyme **(aldehyde dehydrogenase)** in the body. This leads to disulfiram ethanol reaction (DER).
- Usually patient experiences nausea, vomiting, headache, redness, flushing, fall in BP and even coma may occur.
- **Dose:** 250 mg tab **(1–2 doses/day).**
- **Side effects:** Drowsiness, hepatotoxicity, peripheral neuropathy, skin reactions and psychosis.

Note

- All patients need to be monitored in regular 3 months for liver function tests and once a year ophthalmology checkup for rate ophthalmologic side effects.
- **Use of alcohol containing products** by patients is strictly prohibited, e.g. cough syrup, perfumes, etc.
- Patient must remain abstinent from alcohol for **2 weeks** from last dose of disulfiram.

ANTICONVULSANTS

- **Phenytoin**
  - Used in chronic epilepsy, premature ventricular contractions and tachycardia.
  - **Side effects:** Gingival hyperplasia, hirsutism and ataxia, fetal hydantoin syndrome
- **Ethosuximide**
  - Depress motor cortex and raise the threshold of the CNS to convulsive stimuli
  - **Uses:** Primarily, **petit mal seizure**
  - **Side effect:** Nausea, vomiting, anorexia, dizziness, drowsiness, fatigue, lethargy.
- **Acetazolamide**
  - Anticonvulsant, diuretic
  - Act as an anticonvulsant by inhibition of carbonic anhydrase in the CNS
  - **Uses:** Absence seizure (petit mal), grand-mal (tonic-clonic) seizure and glaucoma, mountain sickness
- **Carbamazepine [Drug of choice (DOC) for partial seizure]**
  - Anticonvulsant, antimanic, anticholinergic and antipsychotic effects
  - **Uses:** Epilepsy, tonic-clonic seizures, alcohol-withdrawal, resistant schizophrenia, trigeminal neuralgia.
  - **Side effects:** Photosensitivity, drowsiness, dizziness, unsteadiness, blurring of vision and aplastic anemia.
  - **Contraindication:** Bone marrow depression, **patient taking MAO Inhibitors**
- **Diazepam:** Discussed under sedatives hypnotics
- **Paraldehyde**
  - Emergency treatment of seizure
  - Delirium tremens
- **Valproic acid**
  - Anticonvulsant, used for the treatment of epilepsy.
  - **Side effects:** Sedation, depression, bone marrow depression, skin rashes, transient alopecia, hepatotoxicity.
  - **Dose:** Initially 5–10 mg/kg/day, increased at one week.

Scanned with CamScanner

- **Other drugs:**
  - Lamotrigine
  - Vigabatrin
  - Levetiracetam
  - Gabapentin
  - Topiramate

ANALGESICS

- **Non-narcotic or Nonsteroidal anti-inflammatory drugs (NSAIDS)**
  - **Nonselective COX inhibitors:** Aspirin, Ibuprofen, Naproxen, Mefenamic acid, Piroxicam, Ketorolac, Indomethacin, Phenylbutazone
  - **Preferential COX-2 inhibitors:** Nimesulide, Diclofenac, Meloxicam
  - **Selective COX-2 inhibitors:** Celecoxib, Etoricoxib, Parecoxib. Analgesic-antipyretics with poor anti-inflammatory action: Paracetamol (acetaminophen), metamizole.
- **Narcotic Analgesics**
  - **Examples:** Natural opium Alkaloids: morphine, codeine.
    - **Semisynthetic opioids:** Diacetylmorphine (Heroin), Ethyl-morphine, Oxycodone, Hydrocodone
    - **Synthetic opioids:** Pethidine, fentanyl, methadone, tramadol.
  - **Contraindications of Narcotic analgesics: Children less than age of 6 months, hepatic cirrhosis, Addison's disease, myxedema, emphysema, asthmatic conditions and convulsions.**
  - **Side effects of Opioid analgesics:** Respiratory depression, apnea, dizziness, euphoria headache, mental clouding, insomnia nausea, vomiting, constipation, dry mouth, skin rashes, laryngospasm, urinary retention and decreased libido.
- NSAIDs are **contraindicated** in peptic ulcer disease **(Except paracetamol)**
- **Oral N-acetylcysteine (mucomyst) is used for the treatment of paracetamol overdose/toxicity.**
- The anti-inflammatory effects of **Aspirin** decreases **prostaglandin synthesis**
- **Aspirin** also produces **inhibition of platelet aggregation**
- **Aspirin** is contraindicated in Vitamin K deficiency, chickenpox, influenza, pregnancy and lactation.

ANTI-GOUT AGENTS

- **Allopurinol is the drug of choice for chronic gouty arthritis (not useful for treatment of acute gout)**
- **Allopurinol** is contraindicated in **hemochromatosis and children (except those with neoplastic disease)**
- **Side effects** include skin rash, alopecia, fever leucopenia, arthralgia, nausea, vomiting
- Administer **allopurinol with food** to avoid gastric irritation.
- NSAIDs and Colchicine are used for prophylaxis and treatment of acute attacks of gout
- **Prolong administration** of colchicine may lead to bone marrow depression.

SYMPATHOMIMETIC (ADRENERGIC) DRUGS

- **Alpha receptors**
  - **Alpha 1-adrenergic receptors** (vasoconstriction, decongestion, dilation of eye pupil, contraction of urinary bladder sphincters)
  - **Alpha 2-adrenergic receptors** (decrease insulin secretion, decrease motility and secretion of GIT)
- **Beta receptors**
  - **Beta 1-adrenergic** (myocardial contraction, regulate heart rate, improves impulse, increases lipolysis and gluconeogenesis)
  - **Beta 2-adrenergic** (skeletal and coronary vasodilation, bronchial dilation, decreases renin secretion, decreases gastric motility.)
- **Albuterol (salbutamol):** Sympathomimetic agent. It stimulates **β2 receptors** of the bronchi leading to bronchodilation. Used in the treatment of bronchial asthma and status epilepticus (parenteral administration)
- **Dopamine Hydrochloride (adrenergic agent):** It produces direct stimulation of β1 receptors resulting in **increasing myocardial contraction, cardiac output** as well as **increase renal blood flow** and **sodium excretion.**
- **Dopamine is used in cardiogenic shock, hypotension due to poor cardiac output and cardiomyopathy.**
- This is a potent drug. It must be diluted before administration to the patient.
- **Contraindications for dopamine include** pheochromocytoma, uncorrected tachycardia and arrhythmias.
- **Epinephrine:** Commonly known as Adrenaline, a natural hormone produced from adrenal medulla, induce marked stimulation of alpha, β1 + β2 receptors causing cardiac stimulation, bronchodilation and decongestion.
- **Epinephrine** is used to get relief from respiratory distress due to bronchospasm and rapid relief from hypersensitivity reactions.
- **Nursing responsibility during epinephrine administration:**
  - Never administer 1:100 solution IV
  - Use 1: 10,000 solution For IV use.
  - Use tuberculine (1 cc) syringe to measure adrenaline/epinephrine.
  - In anaphylactic shock, adrenaline is given by intra muscular (IM) route (1:1000)

CHOLINERGIC DRUGS

- Acetylcholine, Methacholine, Carbachol, Bethanechol, Muscarine, Pilocarpine and Arecoline are **Cholinergic agonists.**
- **Pyridostigmine bromide and neostigmine bromide (Reversible anticholinesterases):** Used in the treatment of Myasthenia Gravis
- Carbachol, physostigmine salicylate and pilocarpine nitrate **(miotic agents):** treatment of glaucoma
- Irreversible anticholinesterases are used as insecticides (e.g. Malathion, Carbaryl, Diazinon, etc.)

Cholinergic Blocking (Parasympatholytic) Drugs

- **Atropine sulfate:** Cholinergic blocking agent. Used in the treatment of irritable bowel syndrome, treatment of spastic disorders of biliary tract, parkinsonism.
  - During anesthesia to control salivation and bronchial secretions
  - Used as prophylaxis and treatment of toxicity due to cholinesterase inhibitor including organophosphate pesticides.
  - Antiarrhythmic (prophylaxis) and ophthalmologic treatment of uveitis
- **Management of Organophosphorus poisoning:** Give Atropine 2-4 mg IV initially then 2 mg every 5-10 minutes until muscarinic symptoms disappear and signs of atropine toxicity begins to appear like dilation of pupils, flushing of face and tachycardia.

DRUGS AFFECTING THE RESPIRATORY SYSTEM

Antiasthmatic Drugs

- **Aminophylline** (theophylline + ethylenediamine): Relaxes smooth muscles of bronchi causing bronchodilation and increasing vital capacity of the lungs. It is also used in the treatment of neonatal apnea and bradycardia.
- Sympathomimetics such as salbutamol and salmeterol.
- Anticholinergics such as ipratropium bromide, tiotropium bromide.
- Corticosteroids such as hydrocortisone, prednisolone, budesonide, etc. are also used in the treatment of asthma.
- Most common dose related side effect of salbutamol is tremors.

Antitussives

- **Expectorants:** Expectorants liquefy mucus and facilitate its removal from the lungs through coughing. E.g. Guaifenesin.
- **Acetylcysteine (Mucolytic):** Reduces the viscosity of purulent and nonpurulent pulmonary secretion and facilitate its removal.
- Used along with treatment of chronic bronchitis, emphysema, tuberculosis, pneumonia, bronchiectasis and atelectasis.

Antihistamines

- **Drugs:** Astemizole, brompheniramine maleate, chlorpheniramine maleate, promethazine HCL.
- Antihistamines are used for the treatment of allergic conditions (e.g. Cetirizine) are referred to as H1-receptor blockers while those used for treatment of GI disorders as peptic ulcer are referred as H_2-receptor blockers (e.g. Ranitidine).
- **Contraindicated** in pregnancy, glaucoma, CNS depression, bone marrow depression.
- **Side effects include** sedation, deep sleep, dizziness, epigastric distress, paradoxical excitation, tremors, euphoria, hallucination, disorientation and convulsion.

DRUGS ACTING ON GASTROINTESTINAL TRACT

Antacids

- **Aluminum hydroxide gel, calcium carbonate, magnesium hydroxide, sodium bicarbonate.**
- Antacids act by neutralizing or reducing gastric acidity, thus increasing the pH of the stomach and relieving hyperacidity
- If the **pH is increased to 4**, the activity of pepsin is inhibited.
- Antacids containing **magnesium** have a **laxative** effect
- **Used in the treatment of** hyperacidity, peptic ulcer, duodenal ulcer and gastroesophageal reflux disease (GERD).
- **Contraindicated** in children less than 6 years of age, CHF, hypertension and pregnancy.
- **Systemic antacids:** Highly water soluble and rapidly absorbed from the gut. Rapidly neutralize the acid in the stomach. E.g. sodium bicarbonate, sodium citrate.
- **Non-systemic antacids:** Insoluble basic compounds and neutralize acid in the stomach. E.g. magnesium hydroxide, magnesium trisilicate, aluminum hydroxide gel, magaldrate, and calcium carbonate.

Antiulcer Drugs

- **Cimetidine, ranitidine (H_2 receptor blockers):** Decreases the acidity of the stomach by blocking the action of histamine which is involved in triggering gastric acid secretion
- **Omeprazole, pantoprazole (Proton pump inhibitors):** Inhibits activity of acid (proton) pump and binds to hydrogen-potassium adenosine triphosphatase at secretory surface of gastric parietal cells to block formation of gastric acid.

Laxatives

Table 10 Types of laxatives used in the treatment of constipation

Types of laxative	Action	Examples
Bulk forming laxatives	These are not digested but absorb liquid in the intestines and swell to form a soft and bulky stool	Psyllium, methylcellulose, polycarbophil
Stool-softeners	An emollient laxative	Docusate, glycerin, mineral oil
Osmotic laxatives (saline laxatives)	Act by increasing fluid in the small intestine	Magnesium oxide, sorbitol, lactulose, magnesium citrate, sodium phosphate, polyethylene glycol
Stimulant	Fastest-acting; Act by increasing peristalsis in the intestines	Bisacodyl (dulcolax), mineral oil (liquid paraffin), aloe, senna, cascara, castor oil
Chloride channel activator	Activates **chloride channels** in the intestine and increases secretion of intestinal fluid	Lubiprostone (used in constipation in inflammatory bowel disease), linaclotide

Digestants

- **Pancreatin:** This mixture of enzymes (pancreatin, lipase, and amylase) is obtained from hog pancreas. The preparation increases digestion of food.
  - **Indications:** Pancreatic deficiency as pancreatitis, cystic fibrosis and pancreatectomy.
- **Emetics:** Used in cases of acute poisoning to induce vomiting
  - **Apomorphine HCl:** Synthetic derivative of morphine which produces vomiting by stimulating the CTZ.
  - **Ipecac syrup:** Alkaloid extracted from Brazil root, acts both locally on the gastric mucosa and centrally on the CTZ.

Note

Ipecac syrup must not be confused with **ipecac fluid** extract which is 14 times as potent.

Antiemetics

- **Metoclopramide HCl:** It is dopamine receptor antagonist acts both centrally (CTZ) and peripherally (stimulation of upper GIT motility)
  - **Indications:** Nausea and vomiting as in chemotherapy. Facilitate diagnostic procedure such as barium meal. GIT pain, dyspepsia and regurgitation in peptic ulcer, reflux esophagitis and post-anesthetic vomiting.

INSULIN

- **Type I diabetes:** Insulin dependent diabetes mellitus
- **Type II diabetes:** Noninsulin dependent diabetes mellitus
- Insulin cannot be given by oral route as proteolytic enzymes will destroy it.
- Insulin is administered by subcutaneous (SC) route in routine and by IV route in case of emergency
- Insulin is broken down into amino acids and these amino acids are recycled and reutilized
- Adverse effects of insulin
  - Hypoglycemia is the most common and serious side effect
  - Lipodystrophy, weight gain and injection site reactions
- Insulin delivery devices
  - Insulin syringes, pen devices, inhaled insulin (available in USA and Europe only), Insulin pump and implantable insulin pump

Table 11 Class, onset of action and duration of action of insulin

Class	Drugs	Onset of action	Duration of action
Ultra short or rapid acting insulin	Lispro- Insulin	0.2–0.3 hours	3–5 hours
	Aspart- Insulin	0.2–0.3 hours	3–5 hours
	Glulisine - Insulin	0.2–0.4 hours	3–5 hours
Short acting insulin	Regular soluble insulin	0.5–1 hours	5–8 hours
	Semilente	1–2 hours	12–14 hours
Intermediate acting insulin	Insulin zinc or Lente	1–2 hours	20–24 hours
	Neutral protamine hagedorn or isophane insulin	1–2 hours	20–24 hours
Long acting insulin	Insulin detemir	1–4 hours	20–24 hours
	Insulin glargine	2–4 hours	24 hours
Ultra-long acting insulin	Degludec	30–90 minutes	24–40 hours
	Ultralente	6 hours	20–36 hours

ORAL HYPOGLYCEMIC (ANTIDIABETIC) AGENTS

- These agents are used for patients with noninsulin dependent diabetes (Type II).
- **Second-generation oral hypoglycemic agents** are more lipophilic and have greater hypoglycemic potency (200 times) than first generation.
- **Classification**
